The Access Association – Written Evidence (BEN0198)

This response to the House of Lords Call for Evidence has been submitted on behalf of the Access Association.

The Access Association is a membership organisation for access professionals and experts from a variety of backgrounds, including the private sector and local authorities. The Association’s current membership breakdown stands at:

- Public Sector: 44.7%
- Private Sector: 44.1%
- Voluntary Sector: 8.7%
- Local Authority: 29.8%

We are a national network of individuals who are passionate about access and inclusive design. The Access Association’s aim is to improve access and facilities for disabled people, and consequently for all people who would benefit from an accessible and inclusive environment. The Association is about providing peer support, sharing knowledge and having an influential voice.

Policymaking, integration and coordination

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

Guidance, policy, particularly inclusive design guidance, and creating an accessible environment for the diverse population of this country, including disabled people, have always been provided by a range of Government departments. It is felt that, at times, the co-ordination between departments and sectors could be improved, and, if a more integrated approach were achieved, the result could well be a more inclusive environment for everyone - including disabled people.

For example, access for disabled people and inclusive design are covered by:

**Planning:** the national planning policy framework and planning policy guidance. However, no design guidance is attached to this and British Standards documents are generally used as ‘the latest best design guidance’ under the planning process – however, the link to this guidance is not explicit.

**Building Control:** the Building Control process and the Building Regulations ‘cover’ access for disabled people at a fairly minimal level via Part M and Approved Document M of the Building Regulations. This standard cannot be described as providing ‘inclusive design’ solutions, and it is very possible to design an environment or development in accordance with Part M of the Building Regulations which is not inclusive – one which segregates disabled people and non-disabled people at the entrance to a building, providing a
secondary entrance for disabled people, so allowing ‘design discrimination’ to occur on a daily basis.
It is felt that Part M and Approved Document M of the Building Regulations require updating to not only remove barriers to access which disabled people experience on a daily basis, but also reflect a more ‘inclusive design approach’ which creates successful, sustainable environments which are suitable for the population of this country, with no segregation on the grounds of any ‘protected characteristic’, including disability / impairment.

The Building Regulations are one of the few ‘statutory’ processes in terms of creating an accessible environment, and play an essential part in the creation of the built environment. For this reason, an update to the design guidance found in Approved Document M, and to Part M’s ‘approach’ to access and inclusion, is desperately needed, and fundamental in terms of creating a successful and future-proofed environment for everyone, including disabled people.

**Department for Transport**: guidance on the highways environment. This is essential and plays a crucial part in creating a single environment which is well connected and provides the necessary links, following and going beyond ‘Lifetime Neighbourhood’ principles. The DfT’s guidance document ‘Inclusive Mobility’ is well used, but desperately needs updating, again, to reflect inclusive design principles and provide further guidance given disabled peoples’ improved mobility and (rightly) increased expectations in terms of the environment they live in.

Contradictions do exist in the design guidance provided by the above three departments / sections. For example, there are a number of different designs cited for something as simple as a disabled person’s parking bay. Contradictions in guidance and standards which are in need of updating causes significant confusion, often resulting in environments which can exclude, are not suitable for or can segregate disabled people.

Standards need updating to reflect the increasingly diverse population the environment has to, and should, accommodate.

Consistency between standards will simplify the design process and remove confusion - (i.e. highways require one standard, planning another and building control another again) - and will also result in a higher quality, more suitable, and barrier free environment.

High level policy and political backing will add weight to the ‘case’ for the creation of a high quality, sustainable and inclusive environment which is suitable for the increasingly diverse and ageing population of this country.

Both nationally and locally, and within local authorities and on specific development schemes, it is felt that the use of access professionals - both Local Authority Access Officers and access consultants - is essential in co-ordinating the many sectors involved in creating a single, inclusive environment. The Government should be promoting the use of specialist knowledge and the employment of Access Officers and professionals, to guarantee that the
needs of the population, including disabled people, are taken into account at every stage of the development process and across every sector, to ensure that a future-proofed, barrier free, truly inclusive environment is created.

**National policy for planning and the built environment**

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

It is felt, by many Access Association members, that there are significant national geographical inconsistencies in terms of the interpretation of the NPPF, and of how that guidance is translated into local plans.

The creation of a barrier free, inclusive environment is essential to protecting it and ensuring its continued suitability and effectiveness for the population in the future. Some plans lead the way in terms of the application of NPPF policies and guidance on Inclusive Design and providing suitable access for disabled people. Other core strategies / local plans do not appear to adequately address access or inclusion for disabled or older people.

It is felt that access and inclusion for disabled people, and the creation of an inclusive environment which is fit for purpose given our current population in terms of disabled and older people, and also our future population, should be prioritised. This prioritisation should also ensure a more consistent geographical approach, avoiding inconsistencies in terms of planning policy and Inclusive Design.

An inclusive environment is an environment which can be used by everyone. It should be seen as a baseline essential to all developments, and one which should be specifically addressed in all local plans, to a high standard and consistently throughout the country. Only this will allow people genuine choice in terms of where they choose to live, work or visit.

Disabled people and older people are often excluded from many activities due to an unsuitable built environment and barriers. These are often as basic as a step to a shop or no disabled persons’ toilet being provided. However, these will mean that many disabled people cannot use that service - or spend their money there. In terms of choice and the wider economy, planning should require that the highest standards in terms of inclusive design and access for disabled people are applied.

The provision of suitable access for disabled people cannot be left to a ‘civil’ approach such as the Equality Act 2010 - making it a disabled person’s responsibility to ‘enforce’ legislation - placing the ‘blame’ for the discrimination on them because they are disabled.

The planning process has a vital role to play in ensuring that all new developments are accessible and usable for the population as a whole, and that they do not segregate or discriminate against any group, including disabled people, due to their design.
Buildings and places: New and old

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

The recent Housing Standards Review (in which the Access Association was involved) has created new optional Building Regulations in terms of accessible housing. This is felt to be a positive step forward, ensuring consistency in standards and in what consumers can expect from accessible housing. However, the application of the optional Building Regulations is dependent on local plans and the planning process ‘requiring’ (and conditioning) the provision of these optional standards. There will be a significant time lag in the implementation of these standards in terms of local authorities revising their local plans, and, even when plans are revised, they may not incorporate any accessible housing requirements.

The ‘basic’ Part M standard (M4(1)) is not suitable for most disabled people to visit or live in. It is therefore disappointing that higher standards are optional and that some of the higher accessibility requirements were not incorporated in the basic M4(1) standard, as many of these benefit the population as a whole - older people, families with young children, and disabled people with a variety of impairments.

To help address this, it is felt that the Government, centrally, could do more to ‘encourage’ or help local authorities to understand the importance of providing suitable accessible housing, and how they should go about this. The potential cost savings in terms of health costs and adaptation costs and wider societal benefits should be highlighted, and attention should be drawn to the NPPF guidance, emphasising the need to provide suitable housing for the population. This could also be strengthened in terms of accessible and wheelchair accessible housing, given the volume of the country’s housing stock which pre-dates any such standards, and the poor level of choice available for people who require accessible housing.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

For built environments to be sustainable and resilient, they need to be inclusive and accessible for the diverse population of the country, including disabled and older people. They need to be suitable and inclusive, and not segregate some people. This country has an ageing population to accommodate, and the incidence of disability does increase with age. Unless inclusive design and access for disabled people is adequately addressed now, the built environment will not be resilient, sustainable or suitable for the population. Planning and building control processes therefore have an essential part to play in the creation of suitable inclusive environments.
The Equality Act 2010 (EA) and its predecessors, the Disability Discrimination Acts 1995 and 2005 (DDA), have made a difference to the life of disabled people, and have acted to raise awareness of many of the barriers disabled people can face in society. However, there are still areas relating to both the built environment and transport systems which need to be tackled, and which need to work much better, if disabled people are to have the same access to employment opportunities and to goods, facilities and services, (including key areas such as transport and education), and the same opportunities to contribute to the economic success of the country as people who are not disabled.

It is essential to legislate in this area. A ‘market’ or ‘litigation’ based approach does not work in terms of ensuring an equitable and ‘fair’ society for all members, including disabled people. (This is demonstrated by the fact that disabled people are still facing barriers to access and inclusion). In terms of how that legislation works, it is essential to address certain areas, specifically in terms of the enforcement of the legislation and how service providers and employers provide and/or maintain facilities to enable disabled people to access and use services and places of employment.

The discrimination of disabled people (whether direct or indirect) should remain unlawful; however, it is felt that ‘responsible people’ should be identified to carry out the task of enforcement. These might be Local Authority Officers, possibly Trading Standards Officers, or Environmental Health Officers when checking food premises’ ratings locally. These officers should have the power to, and should be required to, follow up any suspected breaches of the EA in relation to specific and identified areas of the duty to provide or alter a physical feature to enable access for disabled people.

A local authority should be able to request the provision of facilities which enable disabled people equality of access, and should be able to enforce the maintenance and continued provision of these facilities. One particular example which is often cited by our members is the provision of a disabled person’s toilet in a restaurant, pub or café. Often, as space is at a premium, these facilities are used as storage areas for cleaning equipment or beverages, making them unavailable for people who need to use them. In such instances, the EA requires the individual disabled person who experiences this discrimination to raise the issue with the service provider, which could eventually result in the disabled person having to take legal action against the service provider. In reality, many disabled people will often not bother going through this process, as it seems lengthy, costly and difficult - and the question should be asked: “Why should they?”

The EA method of enforcement is reminiscent of the now very dated ‘medical model’ approach to disability. The medical model school of thought placed ‘blame’ on disabled people, considering that, if they could not access a building, or any of the facilities and services in society that are available to non-disabled people, then it was their ‘fault’. In contrast, the approach currently adopted and followed puts ‘blame’ on the wider society, or the people responsible for an inaccessible building or service for not designing and providing for the diversity of population we have today, including disabled people.
The EA method of enforcement could be said to actually build upon the medical model approach, by stating that, if a disabled person cannot access a facility or service, then they should do something about it and address the issue themselves - as the reason they cannot gain access is because they are disabled. A more ‘up to date’ and equitable approach would be to accept that providing a suitable environment and services for the entire population of this country, including disabled people, is everyone in society’s responsibility – which includes service providers and Local Authority Officers.

Disabled people should be able to live an independent life, without facing barriers to their inclusion and participation, and without the extra burden of having to enforce the removal of any barriers which society places in their way. They should be able to go to work, visit facilities, access services and enjoy leisure, should they wish to do so, and not have to spend their time writing letters to every establishment that denies them equality of access. The fact that the EA expects disabled people to do this could, in itself, be seen as discriminatory, as non-disabled people do not have this expectation placed on them.

If a service provider is identified by a disabled person as not providing, or maintaining, the facilities they require to access the service, then the disabled person should be able to notify the relevant Local Authority and request that they follow up the issue. Another possible solution could be through licensing processes that local authorities undertake. Entertainment and alcohol licensing regulations could be amended to require a local authority to assess premises applying for, or renewing, a licence in terms of access for disabled people, and to require an establishment or event to provide suitable access and facilities for disabled people before a licence is granted or renewed. Currently, there is no such requirement, and the fact that many entertainment and alcohol licences are granted to establishments or events which do not provide suitable access and facilities for disabled people is a missed opportunity, and this should be addressed.

Even though some local authorities ‘encourage’ some applicants to look into access and facilities for disabled people, they currently do not have powers to refuse the granting of a licence on these grounds. To ensure national consistency, suitable access and facilities for disabled people should be added to the minimum requirements for the granting of, or renewal of, a licence. Again, this would prevent disabled people from having to spend their time complaining to, and possibly taking legal action against, the said service providers.

Therefore, to allow disabled people the same opportunities as non-disabled people, to live an independent life, this country should not expect disabled people to spend their own time fighting for physical access to services. It should be provided by local authorities, via the licensing system, and enforced through existing legislation.

The Equality Act approach is therefore not adequate on its own to address access for disabled people, and it is felt that additional measures and powers should be put in place as soon as possible.
Another route / method to address issues of access for disabled people within the existing building stock would be to re-evaluate / investigate the ‘limits of application’ of the Building Regulations. There is a fairly common misconception among many people, including some disabled people, that ‘Part M’ covers all building works - it does not. Part M of the Building Regulations is limited in terms of the types of building works it can be applied to under the Statutory Instrument that is the Building Regulations. Aside from new-build schemes, the building works to which Part M applies could be seen as being quite limited. If the scope or type of works that Part M applies to were increased, (for example, in relation to existing buildings, i.e. change of use or material alteration applications), then there could be significant improvements to the existing building stock in terms of access for disabled people. It is felt that an opportunity exists via the building control system which could be investigated further.

This would also apply to the creation and provision of accessible housing. Currently, the new ‘optional’ building regulations M4(2) and M4(3) are also limited in their potential application by the Building Regulations. Part M of the Building Regulations in terms of residential developments would generally not apply to dwellings created via a Change of Use application or a Material Alteration, and this has been a disappointment to a number of Access Association members. If the limits of application of the Building Regulations were altered and did not exclude this type of application, then more accessible homes suitable for the diverse and ageing population of the country now, and in the future, could be created (pending local planning policies).

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

England has a rich and diverse range of designated and non-designated heritage assets which contribute to its world class status and popularity as a unique visitor destination. The importance of the historic environment and national assets is recognised, and it is felt that crucial to the preservation of England’s national assets is the careful protection and adaptive re-use of heritage buildings and their settings.

“Easy Access to Historic Buildings” (English Heritage, June 2015) highlights the importance of ensuring that the diverse and changing population can access and use these assets now and in the future, as the following quotation illustrates:

“Historic Buildings, landscapes and places exist for the enjoyment and appreciation of everybody. Too many people think of the historic environment as being inaccessible. Historic England knows that this need not be the case. On the contrary, we know that good quality access can enhance our understanding of the historic environment and ensure its sustainability. What we have learnt is that with the right kind of thought and discussion a way can be found around almost any barrier. We also recognise that people’s expectations-and the technical opportunities to meet them- are constantly evolving.
While the needs of disabled people must be a priority, we also know that easier access will benefit almost all of us at some stage in our lives. Whether during pregnancy, as a parent pushing a buggy or an older person who is finding steps a bit harder to manage, we all value thoughtful and effective design for our access needs.

We want to see the broadest possible public access to the historic environment and to the interpretation that makes it come alive. For that reason we will continue to promote good quality solutions that make access easier while simultaneously encouraging responsible care of the historic places that matter to us all.”

Access Association members often report back on developers, service providers or building owners citing a building’s ‘listing’ as a reason why access for the diverse population, including disabled people, cannot be achieved. This is very, very rarely the case, although it is a regularly cited ‘excuse’ for providing and maintaining barriers for disabled people.

For heritage assets and listed buildings in this country to have a sustainable future, they need to be accessible to as many people as possible, including disabled people.

It is felt that stronger planning policy via the National Planning Policy Framework (NPPF) and specific planning guidance via Planning Policy Guidance (PPG) should be provided which covers the issue of access and the historic environment, for example along the lines of: when considering re-use or refurbishment of heritage assets, historic or listed buildings, opportunities should be explored to identify potential modifications to improve levels of inclusion and access for disabled people. This can be successfully achieved, adding a new layer of history to our historic buildings and landscapes, and ensuring their use into the future.

Many access professionals, including Access Officers and access consultants, have specialist knowledge in this field and can advise in this area. The use of such specialist advice should be encouraged and will ensure that successful design solutions can be achieved.

It is felt that, for too long, the ‘excuse’ of a building having a listed status has been (wrongly) used as a reason to exclude disabled people, and additional guidance is required, at a high, national and strategic level, via the planning system. This will dispel this myth and encourage the removal of barriers in the historic environment, to ensure a future for these assets and allow a diverse population, including disabled people, to access and enjoy them.

Funding allocated to the removal of physical barriers (as per the Equality Act) to heritage assets would assist many building owners and organisations responsible for such assets in ensuring that high quality, successful and inclusive solutions are achieved.

**Skills and design**

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?
It is felt that all professionals involved in the creation of the built environment should have some understanding of, and training in, Inclusive Environments and access for disabled people. A more inclusive approach to inclusion should be promoted!

For many years, access for disabled people and inclusion have been seen as an ‘add on’ or ‘added extra’, rather than a fundamental and basic requirement which should be addressed and incorporated at the start of the design process. It is felt that additional training is required in this area, and it is important that all professionals involved in creating the built environment undertake it and understand it.

The Design Council (CABE) is are currently putting together an Inclusive Environments CPD training programme which will be freely available. The Access Association has supported this project, both financially and ‘in kind’, from its inception, and is keen to promote the finished product. It is felt that the Government, via all relevant routes and departments, should endorse and assist in actively promoting this training to all relevant sectors, ensuring a baseline level of knowledge is achieved throughout the industry.

All local authorities should employ an Access Officer / Access Specialist to oversee all departments and processes involved in shaping and creating the built environment, to provide guidance and to check that inclusive design is addressed at every stage of the development process, and it is felt that the Government should be promoting such an approach.

Developers should be able to identify where specialist access advice, for example from Access Consultants, is required on large scale schemes, and this should be seen as an ‘essential component’ of the design process.

10. Are we using the right tools and techniques to promote high quality design and ‘placemaking’ at the national level? How could national leadership on these matters be enhanced?

The Building Regulations and the Building Control process play an essential part in creating an inclusive environment. Part M of the Building Regulations, both volume 1 (housing) and volume 2 (non-dwellings), do have the potential to promote and help provide good quality design and an inclusive environment, consistently, throughout the country. Part M volume 2 should be updated in terms of adopting a more suitable approach towards Inclusive Design, e.g. in avoiding the segregation that revolving doors can create. However, the Building Control process does potentially provide a nationally consistent tool which could be effectively used to shape the built environment.

Many Access Association members do have concerns in terms of how consistently the requirements of the Building Regulations, in particular Part M of the Building Regulations, are applied, and in terms of individual officers’ interpretation of ‘reasonable provision’ in accordance with the regulations. Experiential evidence has shown a lack of consistency in the application of certain clauses of the Approved Documents, one example being the
The provision of Lifts. Approved Document M is quite clear in terms of stating what type of lift should be provided, and where. The provision of level access via lifts is fundamental for the inclusion of many disabled people, including people who require level access.

Members often report back on Building Control Bodies - not necessarily from the private or public sectors - allowing developments to proceed and be completed without the provision of a lift (where it is felt one should be provided, in accordance with the approved document). One reason for this could be the ‘competitive environment’ in which Building Control bodies work. Building Control Bodies can be Local Authority based, or can operate in the private sector as Approved Inspectors. Due to this, bodies are competing for work, and this competitive environment may not always be the most effective environment in terms of ensuring that standards are met. Access for disabled people has been cited by some of our members as one of the areas that could be compromised as part of these negotiations.

Community involvement and community impact

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

It is felt that there is a lack of connectivity, communication and links between the various sectors and departments which are either involved in creating and managing the built environment, or involved in providing health and social services for the population using the built environment. The built environment in which people live has, for many, a profound effect on their health, wellbeing and ability to live their day to day life without barriers.

A more accessible environment, including the availability of suitable accessible housing, has the potential to save health services significant amounts of money, through allowing people to stay in communities and their homes for longer. Local authorities can also make adaptations to people’s homes via the disabled facilities grants process.

There is both a moral and financial ‘case’ for creating a more accessible environment, both in the short term and the long term.

The Equality Act 2010 (EA) and its predecessors, the Disability Discrimination Acts 1995 and 2005 (DDA), have made a difference to the life of disabled people, and have raised awareness of many of the barriers disabled people can face in society. However, there are still areas relating to both the built environment and transport systems which need to be tackled, and which need to work much better, if disabled people are to have the same access to jobs, goods, facilities and services (including transport and education), and the same opportunities to contribute to the economic success of the country, as people who are not disabled.
It is essential to legislate in this area. A ‘market’ or ‘litigation’ based approach does not work in terms of ensuring an equitable and fair society for all members, including disabled people. (This is demonstrated by the fact that disabled people are still facing barriers to access and inclusion). In terms of how that legislation works, it is essential to address certain areas, specifically in terms of the enforcement of the legislation and how service providers and employers provide and/or maintain facilities to enable disabled people to access and use services and places of employment.

The discrimination of disabled people (whether direct or indirect) should remain unlawful; however, it is felt that ‘responsible people’ should be identified to carry out the task of enforcement. These might be Local Authority Officers, possibly Trading Standards Officers, or Environmental Health Officers when checking food premises’ ratings locally. These officers should have the power to, and should be required to, follow up any suspected breaches of the EA in relation to specific and identified areas of the duty to provide or alter a physical feature to enable access for disabled people.

A local authority should be able to request the provision of facilities which enable disabled people equality of access, and should be able to enforce the maintenance and continued provision of these facilities. One particular example which is often cited by our members is the provision of a disabled person’s toilet in a restaurant, pub or café. Often, as space is at a premium, these facilities are used as storage areas for cleaning equipment or beverages, making them unavailable for people who need to use them. In such an instance, the EA requires the individual disabled person who experiences this discrimination to raise the issue with the service provider, which could eventually result in the disabled person having to take legal action against the service provider. In reality, many disabled people will often not bother going through this process, as it seems lengthy, costly and difficult - and the question should be asked: “Why should they?”

The EA method of enforcement is reminiscent of the now very dated ‘medical model’ approach to disability. The medical model school of thought placed ‘blame’ on disabled people, considering that, if they could not access a building, or any of the facilities and services in society that are available to non-disabled people, then it was their ‘fault’. In contrast, the approach currently adopted and followed puts ‘blame’ on the wider society, or the people responsible for an inaccessible building or service for not designing and providing for the diversity of population we have today - including disabled people.

The EA method of enforcement could be said to actually build upon the medical model approach, by stating that, if a disabled person cannot access a facility or service, then they should do something about it and address the issue themselves - as the reason they cannot gain access is because they are disabled. A more ‘up to date’ and equitable approach would be to accept that providing a suitable environment and services for the entire population of this country, including disabled people, is everyone in society’s responsibility – which includes service providers and Local Authority Officers.
Disabled people should be able to live an independent life, without facing barriers to their inclusion and participation, and without the extra burden of having to enforce the removal of any barriers which society places in their way. They should be able to go to work, visit facilities, access services and enjoy leisure, should they wish to do so, and not have to spend their time writing letters to every establishment that denies them equality of access. The fact that the EA expects disabled people to do this could, in itself, be seen as discriminatory, as non-disabled people do not have this expectation placed on them.

If a service provider is identified by a disabled person as not providing, or maintaining, the facilities they require to access the service, then the disabled person should be able to notify the relevant Local Authority and request that they follow up the issue. Another possible solution could be through licensing processes that local authorities undertake. Entertainment and alcohol licensing regulations could be amended to require a local authority to assess premises applying for, or renewing, a licence in terms of access for disabled people, and to require an establishment or event to provide suitable access and facilities for disabled people before a licence is granted or renewed. Currently, there is no such requirement, and the fact that many entertainment and alcohol licences are granted to establishments or events which do not provide suitable access and facilities for disabled people is a missed opportunity, and this should be addressed.

Even though some local authorities ‘encourage’ some applicants to look into access and facilities for disabled people, they currently do not have powers to refuse the granting of a licence on these grounds. To ensure national consistency, suitable access and facilities for disabled people should be added to the minimum requirements for the granting of, or renewal of, a licence. Again, this would prevent disabled people from having to spend their time complaining to, and possibly taking legal action against, the said service providers.

To conclude, to allow disabled people the same opportunities as non-disabled people, to live an independent life, this country should not expect disabled people to spend their own time fighting for physical access to services. It should be provided by local authorities, via the licensing system, and enforced through existing legislation.

Anchor – Written Evidence (BEN0206)

Background to Anchor:

- Anchor is a charity and England’s largest not-for-profit provider of housing and care to older people.
- It serves 40,000 older people across the country.
- Formed in 1968 as Help the Aged (Oxford) Housing Association, it adopted the name Anchor in 1975 and opened its first care home seven years later.
- Today, it provides retirement housing to rent and to buy, retirement villages and residential care homes, including specialist dementia care, from more than 1,000 locations across England.
- More information is available at www.anchor.org.uk

1. As a specialist provider of retirement housing and care to older people, we have some specific points to make in relation to the needs of older people and the provision of specialist accommodation.

2. We have therefore restricted our comments to those points and have not addressed all the questions raised in your call for evidence. The majority of our comments relate to your questions under the headings Policymaking, integration and coordination and Buildings and places: New and old.

3. As set out comprehensively in Ready for Ageing, the report from the House of Lords Committee on Public Service and Demographic Change, our society is woefully underprepared for ageing. Nowhere is this more apparent than in the built environment.

4. Increasing life expectancies are, of course, something to be celebrated. They also mean higher levels of dementia and multiple, complex needs which our ageing housing stock was not developed to accommodate.

5. However, the fact that demographic change creates multiple, interconnected challenges across departmental boundaries mean that it is not being sufficiently addressed.

6. The supply of appropriate housing for older people is seriously inadequate. The vast majority of older people live in mainstream housing. Demos reports 58% of over-60s say they are interested in moving but feel restricted by a lack of suitable alternatives.

7. Government projections suggest 60% of household growth through to 2033 will involve someone over 65. However, only 2% of the country’s housing stock is retirement housing.

8. A 2010 survey by the National Housing Federation found 65% of 60-65 year olds said they liked the idea of living in a self-contained home with support or care available in later life. Smaller homes would also be more energy efficient and manageable.
9. If additional retirement housing was built, it would create movement in the property market that will ultimately help first-time buyers onto the housing ladder. However, increasing supply has not been given the priority it deserves.

10. The National Housing Federation reported in 2010 that only 45% of local authorities surveyed had a housing strategy for older people. This, perhaps, goes some way to explain why a Reading University study found that two-thirds of planning applications for new retirement housing were refused first time round.

11. The amount of space needed for communal areas and to enable care provision mean retirement housing is more expensive to develop than mainstream housing.

12. Section 106 of the Town and Country Planning Act 1990 and the requirements of the Community Infrastructure Levy work to make it even harder for providers to develop affordable properties for older people.

13. Ready for Ageing states: “Central and local government, housing associations and house builders need urgently to plan how to ensure that the housing needs of the older population are better addressed and to give as much priority to promoting an adequate market and social housing for older people as is given to housing for younger people.” We have seen little evidence of policy change which has adequately addressed this point.

14. Any new housing also needs to be “future-proofed” enabling people to enjoy independent living throughout the different stages of their lives, a point stressed by the International Longevity Centre-UK, which also believes housing and society at large is not ready for Britain’s ageing population.

15. The Government needs to drastically overhaul parts of its housing strategy and provide strong leadership so that older people can live in safe, appropriately-sized accommodation which will enable other home buyers to move onto or up the housing ladder.

16. There is a dysfunctional relationship between housing, social care and health. Falls are the leading cause of ambulance call-outs to the homes of people over 65: around one in three people over 65 and one in two over 80 fall each year. Yet simple, cheap housing adaptations are increasingly hard to access.

17. Retirement housing with onsite support can also reduce the NHS bill yet planning obstacles are preventing such developments being built. The Communities and Local Government Select Committee recommended in 2009 that the Government establish “a more coherent strategy for the provision and funding of housing and support services for older people, making clear the role of sheltered housing” We’re still waiting.

18. Older people face a disproportionately high incidence of fatalities or injuries caused by road accidents, falls on pavements or while using public transport.

19. Many over 65s rely on their cars for independence, and this is likely to increase following the abolition of the mandatory retirement age. Just under half of those aged over 55 in Britain cannot walk to their nearest GP and 58 per cent cannot walk to their nearest bank.

20. The Department for Transport reports that older people are between two and five times more likely to be killed or suffer a serious injury as a result of a road accident.
than a younger person. The Parliamentary Advisory Council for Transport Safety (PACTS) believes more must be done.

21. PACTS called for well-lit, large road signs with junctions being kept clear of hedges and other obstacles which obstruct a clear view of oncoming traffic. The International Longevity Centre also believes the Government should lead on improvements in road infrastructure, including clearer signage.

22. Pavements are an even more significant issue. Over 65s are 10 times more likely to be admitted to A&E following falls on footpaths than because of road accidents.

23. Anchor’s research in 2012 found 43% of those surveyed thought many pavements were not safe. We support PACTS’ recommendations for better-maintained and well-lit pavements.

24. Poor quality pavements and dimly-lit streets make many older people less likely to venture out. This increases social isolation – another major challenge.

25. Safety is also an issue on public transport. Despite older people experiencing a large number of trips and falls relative to other age groups, PACTS found “transport operators do not view meeting the needs of older people as a high priority.” Simple measures, such as grab rails in train stations, would make public transport more user-friendly.

26. There needs to be a joined-up approach to these issues: investing in well-maintained pavements, road junctions and public transport means fewer older people will end up in hospital.

27. We believe the government should:
   • Create a national task force of developers, ministers and local government to produce a national strategy for increasing supply of retirement housing.
   • Exempt older people who are downsizing from paying stamp duty.
   • Provide grant funding as well as interest-free loans to retirement housing developers to encourage them to build affordable housing.
   • Introduce a similar policy to that suggested in Scotland’s Planning Policy Consultation Draft 2013 where developers who build retirement housing are not required by law to also build affordable housing.
   • Create a level playing field for retirement housing developers by excluding retirement housing from the onerous requirements of the community infrastructure levy and Section 106.
   • Ensure all local authorities have a robust housing strategy for older people and act on it to increase supply, including through the sale of publicly-owned land.

28. On the urban environment as it relates to transport, government should:
   • Introduce fines if local authorities or the Highways Agency fail to maintain unobstructed views at junctions which are accident black spots; and
   • Provide adequate funding so that pavements are maintained to safe standards.

Compiled by: Mario Ambrosi, Head of Communications and Public Affairs, Anchor

06 November 2015
Dear Baroness O’Cathain,

National Policy for Built Environment Committee and the provision of infrastructure

Thank you for your letter regarding the work that your Committee is currently undertaking on the challenges that exist in UK infrastructure provision and for inviting me to put forward some of my views. I share the Committee’s desire to try to ensure that infrastructure serves its purpose, but that it is effectively integrated into the wider environment. I also agree that the relationship between infrastructure planning and its implementation at a local level is of importance, particularly for transport.

The outcomes sought from an infrastructure project or programme of interventions are not always explained to local communities. This creates a separation between the asset and the user. While not everyone will accept a development in their community, we can do much more to gain active support from communities. Early engagement in infrastructure projects enables competing demands and interests to surface sooner in the development process. Addressing these competing interests early makes them much easier to manage and allows for compromise. This should be done before significant resource has been committed to a project.

There are a range of incentives to achieve community buy-in to a project. For example, when building a wind farm there are a number of steps that can be taken. These include allowing local communities to share a proportion of the profits, reducing energy bills or providing residents with a stake in the farm itself. This is not just a challenge for those involved with energy infrastructure; it is also one that extends to the transport sector. It is ultimately an endeavour in balancing competing differences in opinion.

Beyond place-making, there are a number of other factors that should be considered in the integration of transport infrastructure with the wider built environment. These range from sustainable accessibility; compatibility with wider transport networks and social infrastructure; interchanges that help shrink the concept of time and space in the built environment; efficient interfaces with compact and high-density mixed-use urban environments; and receptivity to emerging digital and smarter transport technologies.
As you will be aware, I have recently been appointed as an interim Commissioner for the National Infrastructure Commission (NIC) and as President of the Institution of Civil Engineers (ICE). While the NIC is in the early stages of its undertakings, I hope these are issues that it will address in due course. My vision for the NIC is that it will set out the long-term strategic priorities for the UK, which will then be delivered by national, devolved and local governments, as well as the private sector.

You may wish to consider the recent report "Independent survey of attitudes to infrastructure in Great Britain 2015", published by Copper Consultancy, Icaro and Peter Brett Associates (PBA), which assesses the importance of involving the public and building a consensus around the need and benefits of infrastructure. While the report confirmed that almost 9 out of 10 people in Britain want to see investment in new infrastructure, it also showed that many also want more of a say in how it's planned and delivered.

Only six per cent of British people think there is a 'very well co-ordinated' national or local plan. Many people feel that infrastructure projects happen 'to them', not 'for them' and they do not see any local or national coordination. When asked what would increase confidence in the infrastructure sector, British people highlighted community engagement (41 per cent), consultation (30 per cent), leadership from politicians (25 per cent) and technical experts (24 per cent).

I can also confirm that the ICE is looking at these areas as part of its forthcoming (May 2016) State of the Nation report on devolution and infrastructure. In particular, the report will examine the affects, both current and future, that devolution is likely to have on infrastructure provision. If you would like more information on ICE's emerging findings, I am sure that the report authors would be more than happy to engage with you. Please do let me know and I will put them in touch.

Yours sincerely,

Sir John Armitt
ICE President

Examination of Witnesses

Councillor Sue Derbyshire, leader of Stockport Metropolitan Borough Council and planning and housing lead for the Greater Manchester Combined Authority, and Councillor Gillian Brown, leader of Arun District Council and planning lead for the District Councils’ Network

Q41 The Chairman: Welcome, Councillor Brown and Councillor Derbyshire, to this evidence session of the Select Committee on National Policy for the Built Environment. It is very kind of you to come. I am sure you have both had long distances to travel, so I hope it is okay. In front of you, you have a list of the interests that have been declared by members of the Committee. There are additional interests, incidentally. Baroness Young of Old Scone has just been appointed chairman of the Woodland Trust. That has relevance to what we are doing, and we congratulate her on it. A transcript of the meeting will be taken and published on the Committee website. You will have the opportunity to make corrections to that transcript where necessary.

I shall begin, Councillor Brown, by mentioning that I am a resident of the Arun district. You probably did not know that. I will also highlight that you were invited via the District Councils’ Network and are very much here in your role as planning lead for the network. The
Committee’s questions will focus on national issues and issues that affect local authorities across the country, rather than focusing too much on any particular local area. This has happened throughout our evidence-taking, not that we have had the sort of clash that there is today. Could I please begin the session by asking each of you to briefly introduce yourselves to the Committee for the purposes of the record? You will get a transcript at the end and we want to make sure we allocate the correct names to the people who spoke. You can look at that transcript and, if you think there has been a mistake, please let us know.

**Councillor Brown**: My name is Gillian Brown. I am the leader of Arun District Council in West Sussex. I am also a member of the District Councils’ Network.

**Councillor Derbyshire**: I am Sue Derbyshire. I am leader of Stockport Council and I am vice-chair of the Greater Manchester Combined Authority. In that role, I hold the portfolio for planning, housing and low carbon.

**The Chairman**: That must be a massive job, and a very interesting one too, not that Councillor Brown is not interesting.

**Councillor Derbyshire**: It keeps me busy.

**The Chairman**: I have to watch my mouth. The first question is: what have the main impacts been on local authorities of recent government planning policy reforms? This is prior to yesterday—obviously things have appeared in the Statement. I have had a quick glance at them, but I really have not digested them. Have you seen them? That is only as an aside, but, if you have any observations, you can certainly make them here. How has the role of local authorities in the built environment changed in the light of recent government planning policy reforms?

**Councillor Brown**: Just having the NPPF was a huge change. Strategic planning coming to district councils through clusters and duty to co-operate made a huge difference, because we went from the regional system down to duty to co-operate. The rise of neighbourhood plans has made a huge difference in my own district. I think we have the largest number in the whole of the country; we have 14 made neighbourhood plans and three more in the pipeline. That is a very big difference. There is a huge tension between strategic planning and localism, particularly local residents’ perception of localism, in the neighbourhood plan preparation.
Then there is a big difference with the objectively assessed needs, setting our own housing targets, looking for that evidence, finding that the targets were much higher than the regional targets ever were. Many local authorities lost their five-year land supply when these new figures came out in March with these massive housing numbers. Local people find it very difficult to believe that we need that amount of housing, but they are the figures that we have to work to. In my own district, we had just finished our local plan, as we call it, and on the inspector’s desk when the new figures suddenly arrived within a couple of weeks. Now our plan has been suspended and we are looking at having to produce at least 200 houses more per year for the next 20 years. That has a massive impact on us.

The Chairman: What was the quantum? How many would you have produced per year for the next 20 years? You have to produce 200 more. Was it 400 you would have had to produce?

Councillor Brown: Unfortunately not. That is what the local population would have liked. We eventually agreed to 580, so we are now talking about 750 to 900. We have to look between those two figures. That is what we are doing now. The plan has been suspended for 12 to 18 months.

Q42 The Chairman: Can I ask about the process? Were you able to consult before these figures were imposed?

Councillor Brown: We consulted extensively on the 580. In fact, two separate consultants came to verify that we actually needed 580, because the local population were not happy with that, but we were not able to consult again. That will be part of the process that we are going through now.

The Chairman: Councillor Derbyshire, do you have the same problem?

Councillor Derbyshire: Yes, I would agree with that. A lot of the changes look fine, but on an objective needs assessment for housing, for instance, there is no right answer. It is about forecasting and projections. There can be quite a lot of difference in that. It can take a very long time and it is very expensive to get those projections. Current guidance says that we should start with the DCLG forecasts, but they are changed every two years, so you can be part of the way through the process and a very different set of figures comes up. It provides places where the plan can be challenged at various stages and creates tension between what local communities think and what should be done.
Currently, in Greater Manchester, we are consulting on a plan covering all 10 authorities. It is on the evidence base for the numbers, and the difference between the objective needs assessment, what the developers have put forward and the steady state is very, very significant. Calling it an “objective needs assessment” possibly gives a spurious idea that it is scientifically arrived at. It is forecasting; it is crystal ball gazing, in the end.

The Chairman: I see. Councillor Brown mentioned that she had to employ consultants to help you with this. Is this the same with you?

Councillor Derbyshire: Yes.

The Chairman: Who takes the burden of that expense?

Councillor Derbyshire: That is borne by the local authorities. In Greater Manchester, we are doing it collectively. I assume Councillor Brown has had to pay for that through her own council.

Councillor Brown: We spent more than £1 million—I should think around £1.2 million—in getting to the stage where we had our plan on the inspector’s desk, but immediately when those new figures came out we did not have a five-year land supply. We have now lost two appeals, with developers just coming in and putting in bids for houses, because we do not have that five-year land supply.

The Chairman: I should not and will not make an observation on that, but the fact remains that you go through all this work, you have it ready, and then suddenly it is scuppered, in effect. Is no allowance taken of what is done, or is there an easy way to build on your 580, or whatever it is, without too much more expense and without having to have another consultant?

Councillor Brown: Not really. We were grateful that our plan was not thrown out altogether and was only suspended.

Q43 Earl of Lytton: I am also Sussex-based, but not in your bailiwick. As you will probably know, I am a chartered surveyor. I am very interested in the numbers, because, not mentioning any names, I can think of one district in West Sussex in particular where, under the old regional spatial strategy, there was one figure, which was actually brokered between the counties and the districts. Then, when they got into the new phase of the local plan, they were going for housing numbers that were about a 35% to 38% discount on those figures. Of
course, the plan was then declared unsound because it did not meet the criteria, so they have to go back and have other things.

Councillor Derbyshire, you said that the figures were crystal-ball gazing. We seem to be on phase 3 of crystal-ball gazing, in fact. Could you explain the origin and sequence of these numbers and whether the numbers you are now talking about are the same as, more than or less than the ones that would have come out under a regional spatial strategy process?

**Councillor Derbyshire**: The numbers we started with under the regional spatial strategy, as you described, were probably brokered figures based on local authorities’ assumptions and what they thought they could deliver. We are going up from those. Clearly, there is a stated aim to create a lot more housing and we need to find ways to do that, but we have had several plans either suspended or rejected at the inspection stage within Greater Manchester, because the inspector has been unhappy that insufficient housing numbers have been presented.

When we went out with our first set of figures across the conurbation, which were based on an uplift from the regional spatial strategy to recognise our growth ambitions, that was severely challenged by developers and landowners. An organisation called Housing the Powerhouse has submitted its figures, which are significantly higher and based on us being successful on every single thing that we did, to the nth degree, and every new job creating the need for a new home. That is not what we believe will happen in Greater Manchester, but of course we have had to have consultants come in.

A lot of work has had to be done, in our area certainly, on the question of net immigration into the area, because if Greater Manchester’s plans for growth are successful, that will pull more people into the area than have lived there previously, and obviously we have a lot of travel to work across our boundaries anyway. There is an upward pressure on the figures, and because of the way the system is set up at the moment, if you are a landowner or a developer and you are in an area where land values are great, it gives you a lot of opportunity to challenge at the inspection stage. In my experience, the first thing inspectors look at is the housing numbers. If they are not happy that you are there with it, the plan does not usually get past day one.

**The Chairman**: At least you do not get involved in an awful lot of unnecessary expenditure.
Councillor Derbyshire: We have spent a lot of money to get to the inspection.

Earl of Lytton: Can I ask about Councillor Brown’s experience of these numbers?

Councillor Brown: It is very much the same. This is why we went back twice and spent money on other consultants: to really look at these figures and see if we could bring them down. There is this sort of policy-on, policy-off process, whereby you look at these figures without any constraints, and this is where you get to the final figure. I live in a very constrained district: I have the sea on one side and the national park on the other, and 50% is AONB, so we are very constrained. When you look at this policy-on and policy-off, they do not take any notice of the constraints that you have; that is the number of houses that you need. We need some, because we need jobs. We need housing, but I do not believe we need that amount. That is the problem.

Q44 Baroness Whitaker: I would like to go more widely than housing. As you know, this inquiry is about the whole of the built environment and how the elements interact. Councillor Brown mentioned tension between strategic planning and localism. I would like, if I may, to ask about one particular area of tension. I know that the only way some local authorities can get to their housing targets is to destroy worksites, particularly small firms. How do both of you view that tension? How do you balance the local economy’s need and the sense of local identity’s need for particular workplaces and housing?

Councillor Brown: In my particular area, the Government said, “If you do not develop commercial and business premises within a certain time, they can revert to residential”. In fact, we hung on to our commercial land from our last local plan. In fact, it has taken 12 years: we have a very large commercial area and it has just come to fruition now. The second Rolls-Royce motor car manufacturer has come to Bognor Regis, believe it or not. The first one was in Goodwood at Chichester. That will probably produce 2,000-plus jobs, plus a lot of apprenticeships.

It was the right thing to do, to hang on to that land, and I am very much opposed to changing commercial and business land to residential. It is one thing building houses, but people need jobs. We already have more than 16,000 people out commuting every day in my district, because we did not have the jobs. Although it took 12 years, which is a long time, we managed
it in the end and it is absolutely brilliant. That is a catalyst for a lot more companies that want to come into the area.

**Councillor Derbyshire**: I have a slightly different experience, coming from a northern area, where the employment land is not necessarily all the right land. We are looking very closely at what the employment needs are, which tend to be not quite such large units as historically the factories would have taken up. But there is a real need to preserve the employment land, and the pressure to release for housing can disrupt a strategic overview of what is needed, because once it has gone for housing it is lost and has all the impacts on the infrastructure of the roads if it creates commuting. We feel it is very important that they are looked at together and that we do not lose sight of the fact that we need employment sites. They may be of a slightly different nature than historically in some areas, but we still need them.

**Q45 Baroness Andrews**: I am going to go back to housing. There are quite different housing situations in Sussex and Manchester. Both of you have said, essentially, that you have had to lift the figures from where the regional spatial strategies were. It sounds as if you were quite comfortable with the regional spatial strategy, because those were negotiated numbers. This is my first question: there are no national housing targets any more, so where are you getting your instructions about numbers from?

Secondly, in West Sussex, as you say Councillor Brown, you are constrained geographically. To what extent can you build your expectations of housing numbers into, for example, the regeneration work that you are doing around the coast, which is clearly an important strategy, because it is quite depressed? In relation to Manchester, Councillor Derbyshire, given the housing market renewal programmes that were started and faltered after about 2010, to what extent are you reviving those sorts of plans in relation to your housing need? Is it a completely different strategy now?

**Councillor Brown**: The housing figures come from this wonderful thing called the SHMA, the strategic housing market assessment, which everybody has to have. I am not quite sure how they devise these figures, but this is what we all work from. They evaluate how many houses they believe we need and that is our starting point. I do not believe they are realistic figures, but when you get a whole sheet of figures, it is extremely difficult to dispute them.

**Baroness Andrews**: Do they come from CLG?
Councillor Derbyshire: No. We are required to employ people to do this assessment, to say, “Based on economics, trends and projections, this is what you will need”, and then we cannot really argue with it. Previously, the plans were based on local authorities setting what they thought was realistic within their plans and then meeting objections so that the plans were defensible and to some extent agreed with communities.

Now we have to pay for these assessments, which our communities may not agree with and we can be quite unhappy with, potentially, because, as Councillor Brown says, they do not necessarily take into account the ability of the area to deliver those plans. I have three river valleys running through my authority, for instance, which limits you considerably. It is meant to be objective. While the legislation sounds very good—it has to be based on sound evidence and be objective—it is not looking at local criteria and is creating a lot of legalistic points at which landowners, developers or sometimes objectors can challenge to the inspector or to the High Court. The planning system generates an enormous amount of judicial reviews for the courts.

Baroness Andrews: What about the other questions, which are about place, really? The regional spatial plans identified the growth points, so you had a steer about whether you were going to do an urban extension or whatever it was. Are those the same sort of criteria?

Councillor Brown: I think they are, yes. In my area, economic regeneration is our main objective, because we do not have the right jobs or skills. We have a very low skill base, so we are trying to upskill our workforce and have better jobs. So, yes, we are trying to do that. Rolls-Royce in particular has helped with that. But, through the local plan, we are ing much the same as we would have done through the regional strategy, so that is a whole-place plan.

Councillor Derbyshire: In terms of Greater Manchester, we are doing at least the overall plan on a Greater Manchester footprint, although there will still need to be local plans, because that is a coherent economic structure. We need to look at place. Planning is very important, but it is only an aspect of regeneration and of place-building. The Greater Manchester spatial strategy will have to fit in with our transport strategy. No planning document has ever built a house or a factory. You need your residential growth strategy; you need a whole raft of strategies that fit together. It is an element in a jigsaw or a patchwork rather than being the answer in itself, however you do it.
Q46 Baroness Young of Old Scone: In normal walks of life, where there is that degree of uncertainty about numbers, planners would be encouraged to think on a much longer timescale and then speed up or slow down depending on how things were panning out. Is there a case for having a much longer horizon for plans and housing targets, so that plans can emerge on a rolling basis rather than constantly being knocked back in the way that you have described?

Councillor Brown: That was our plan at the beginning. We decided when we had to have 580 houses that we would have 400 built in the first 10 years and then we would have 600—whatever the figures were—later on, but we were not allowed to do that, because you have to have this five-year land supply, and that meant we would not have one. There is this pressure all the time to build. Now our housing numbers have gone up. We had a land supply of 5.3 years and we were thrilled, because then you can hold back on planning on appeal. If you do not have a five-year land supply, it just goes on appeal and you are left with piecemeal developments all over the place instead of your local plan. This is what happens. We now have to get a five-year land supply, and we can only do that by building.

In my district alone, we have 3,000 planning permissions already granted, but not one of them has started. When you are trying to get a five-year land supply, this is the problem. We need developers to build out on the sites that they have.

The Chairman: It is similar in your area.

Councillor Derbyshire: Yes. We do not have quite the demand to build. For instance, the five-year supply is difficult to demonstrate, but the housebuilders are not building anything like that number, so we are being caught in both directions. Across Greater Manchester, I am not sure how many applications there are, but 47,000 units have planning permission but are not being developed because of viability issues. They affect the five-year land supply. It is a straitjacket that is not helping to create houses. It has been a little counterproductive.

Baroness Andrews: By “viability issues”, do you mean it is not profitable for developers to build them?

Councillor Derbyshire: Yes.

Baroness Andrews: That is the bottom line, essentially.
Councillor Derbyshire: Yes. There are different viabilities across Greater Manchester, but in an area like Greater Manchester land values are significantly lower than in London and the south-east. There is quite a lot of contamination, potentially, and infrastructure issues—the costs that you might load on—to deal with, and developers are not that keen on a lot of the sites that we would want to see developed, because the profit is not in it for them. For many years, until recently, the only real houses that were being built in Greater Manchester were being built by the social landlord sector. The volume housebuilders—I sometimes think that is an oxymoron—were not particularly interested. Parts of the conurbation they are now getting interested in, but it is very limited. Issues of viability and infrastructure costs, which I think is one of your questions, are big ones for us.

The Chairman: We need to crack on a bit. Baroness Rawlings, then Lord Inglewood.

Baroness Rawlings: You said that 47,000 units have planning permission. Do the permissions not elapse after a certain amount of years? They are not ongoing, so those would not be there for ever.

Councillor Derbyshire: They can come back for renewal at the end of each period.

Baroness Rawlings: Every three years?

Councillor Derbyshire: Every three years, yes, but I know of one that came back for 12 years until they forgot to come back at the end of the 15th year, as it were.

Baroness Rawlings: But they had lost the permissions then.

Councillor Derbyshire: They lost it because they did not put their paperwork in on time. It was never going to be developed. Even I could tell that it was never going to be viable.

Q47 Lord Inglewood: The responses you have given have taken you in the direction that I wanted to inquire about. Until the end of the discussion that we have been having, you talked a lot about allocations and plans and not all that much about demand. I do not know much about the south of England, but my understanding is that in places like the Arun district you could more or less build from the north end of the district to the sea if you just let it rip. What is the relationship between the real demand for housing and the allocations that you are being given?

Following on from that, to take up Councillor Derbyshire’s point, you illustrated something that people have said to me privately, which is that on occasions affordable local housing, for
example, means that on certain sites the combination of the price of the product and the margins is such that it is not worth doing. Is one of the answers as far as housing is concerned, therefore, contrary to what appears to have happened yesterday, to ease the burden of tax on housing rather than to increase it?

**Councillor Derbyshire:** I would not like to go into tax policy at this point.

**Lord Inglewood:** It is quite important, is it not?

**Councillor Derbyshire:** The viability is important. Houses are not just blocks that people live in; they are homes and they are parts of communities. We like to talk about community and place-building. The infrastructure implications of housebuilding are enormous—for example, the road networks and schools. Even if you take out the requirement for affordable housing, very often the costs of developing a site, if the developer cannot meet them either through CIL or Section 106 and you do not produce an enormous amount in a lot of the country, make it unviable.

**Lord Inglewood:** Can I just stop you there? Forget about precisely why. If you are the developer, if there is no margin, no profit, in it, you are not going to do it, yet the allocations you are given are such that this should be done. Is there not somehow a misfit?

**Councillor Derbyshire:** Potentially, yes, but I am not sure what the answer to that is, because the investment to make those houses viable within the communities in which they are built has to be made by somebody.

**Lord Inglewood:** Somebody has to pay for it.

**Councillor Derbyshire:** If the road network is already at 100%—and certainly there are parts of my borough and I am sure Councillor Brown’s borough that are at that—and if the schools are already well oversubscribed, even without taking into account other things such as play and social housing, there are costs to housing being produced over and above the cost of the bricks and mortar and the land. One thing we would like to capture in Greater Manchester is the uplift in land value of some of the land that is released for housing and is immediately worth a great deal more, which tends to reduce the developer’s margin, because they put that cost into their balance sheet.

**Lord Inglewood:** Yes, but it does not matter to the developer whether his disbursement is tax or infrastructure contribution, does it? The problem is—question mark—that in a number of
cases the costs of doing it exceed what the project will bear. Then there is a really big public question: if you need the housing and you have a land-use planning system, how do you deal with that?

_Councillor Derbyshire_: That is not in itself a planning policy issue, in that no plan can overcome that, which is why the residential growth and the other economic plans in areas are part of how we try to deal with it.

_Lord Inglewood_: I appreciate that. That must be right, but if stuff is not happening, the whole thing is a complete waste of time.

_Councillor Derbyshire_: Yes, and it is expensive to produce the plan. As I say, no plan in itself produced any houses.

_Lord Inglewood_: Councillor Brown, do you have any comments on that?

_Councillor Brown_: We have much the same problem. Yes, we need family housing. We have quite an elderly population too, but we need low-cost housing; we have a lot of young families. What happens on some of the building that takes place is that developers come back and say, “It is not viable any more”, so the bit you need, the affordable bit, is reduced. Instead of 30% affordable, you are lucky if you get 15%. On some, it is taken away altogether, or some of the infrastructure that was going to be part of that development is taken away. This is where the problems start.

_Lord Inglewood_: It is the conundrum that it may be affordable for the potential purchaser but it may not be affordable for the developer.

_Councillor Brown_: That is right. It is a huge problem.

Q48 _Lord Clement-Jones_: I would like to come on to some of the cross-boundary issues that we have touched on, and in particular issues such as the duty to co-operate, devolution, and so on and so forth. We have heard criticism of the duty to co-operate. I wondered where you both stood on whether that is working well in practice. Does it need change? It is fairly recent in terms of the 2011 Act. Coming on to devolution, virtually every major northern conurbation apart from Leeds now seems to have a combined authority or a city region—whatever you call it. Do you think that is going to be an effective way? Is it really effectively a substitute for the regional spatial planning framework that was there in the past in those particular areas? That of course begs the question about what you do where there is nothing.
**Councillor Brown**: Yes, absolutely. The duty to co-operate has been extremely difficult in some areas. You are bringing together local authorities that were in different places producing their plans, and with different political make-ups. The whole thing was quite new. In my particular area, we have done extremely well. I have to boast that we got an award for best practice. We have quite a large area in our duty to co-operate. It includes Brighton and Hove. There is one county council, we have the South Downs National Park, and there are seven districts and boroughs. We cross into East Sussex, West Sussex and Brighton and Hove.

**Lord Clement-Jones**: Why did you get the award? What was good about what you did?

**Councillor Brown**: We actually collaborated and worked together on a plan.

**Lord Clement-Jones**: I see—just by collaborating, in a sense, as you are meant to do.

**Councillor Brown**: Yes. That is right. We spoke to each other—members and officers. We had a good working relationship. We came together as a strategic planning board and we achieved something. We put forward our proposals and, yes, it worked very well. But we were taking into account a functional economic area rather than county boundaries. This is the way it works. You get a cluster of districts in an area that works, where people want to live somewhere, they shop somewhere else and they work somewhere else. That is the economic boundary, and it does not necessarily—I know the county councils do not like this—end at the county boundary, nor at the LEP boundary. That is why ours was successful: because we were an actual economic area.

**The Chairman**: And you spoke to each other.

**Councillor Brown**: And we spoke to each other, and we are still quite friendly. Even though there are quite large political differences between some of the authorities, we worked together for that.

**Lord Clement-Jones**: Going forward, that is going to be an effective framework.

**Councillor Brown**: Yes.

**Councillor Derbyshire**: Similarly in Greater Manchester, we are an economic area. We are working together as the 10, but the duty to co-operate involves the boundaries. It sounds blindingly obvious that you should co-operate. In practice, it has produced real difficulties as to what is meant by “duty to co-operate”. In some cases, you get a letter saying, “This is our plan. This is what we are planning to do”, and informing is seen as co-operation. A
neighbouring authority to my own nearly foundered on its first day of the inquiry, because we were asked, “Did they co-operate with you?” We said, “Yes, they did. We do not agree with some of their conclusions”, and the inspector started a long debate as to whether duty to co-operate was the same as duty to agree. We said that we were happy that they had co-operated and that we had the information and we were clear between the two authorities where we disagreed on analysis. It was suspended for other reasons, and it has come back. It is one of those phrases that, again, can be used as a way of trying to stop or derail plans, because even objectors or developers, if they can see a way in, will go, “We do not think there was sufficient co-operation between the authorities”.

**Lord Clement-Jones**: Is that superseded, though, by the combined-authority structure? Is that structure going to be more effective?

**Councillor Derbyshire**: Our combined authority involves the 10 working together, but we have neighbours all around our boundaries, so we will be co-operating on the GM strategic framework with all of them. That will be Lancashire, Merseyside, Cheshire, Derbyshire and probably a couple of others I have forgotten.

**Lord Clement-Jones**: That takes you wider. My supplementary was going to be: in terms of major infrastructure, you need to have co-operation of a higher order, in a sense, between city regions and combined authorities as well.

**Councillor Derbyshire**: Potentially, but, as I say, there is no real definition of what it means to co-operate. In the end, with Cheshire East, they accepted that we were aware of their plans, we understood their plans and we had made comments, but then our reservations stood. It does not necessarily mean that the issues have been dealt with; it is more about awareness, which obviously should happen. It has caused difficulties in areas where it was not meant to do so.

**The Chairman**: Would it be an idea if, instead of calling it a duty co-operate, they called it “duty to show common sense”? It seems to be just crazy.

**Councillor Derbyshire**: I am not sure that that would overcome some of the difficulties that we have had, which require investment in further highway engineers to look at the traffic impacts of the proposals. The soundness requirement—again, it sounds blindingly obvious
that the plans should be sound—can require years of evidence and consultation. Did you say that it cost about £1 million to get yours ready?

_Councillor Brown:_ Yes.

_Councillor Derbyshire:_ It leaves it open to being questioned. In any planning where you are looking ahead, whether you are projecting five years or 20 years into the future, there is an element of uncertainty that people can challenge on.

_Councillor Brown:_ The duty to co-operate, I believe, needs some review. The District Councils’ Network has put forward some suggestions. You can get to the end of the local plan process with your thing on the inspector’s desk and he can then rule that out by saying that he does not believe you co-operated. This happened to Mid Sussex. One of our suggestions would be that we have a staged local plan. Ours has taken nearly five years. After two or three years, you have done the main bulk of the work you need to do. At that point, you could go before the inspector and he could tell you whether or not you were on the right road to co-operating and put you right there, rather than waiting until you get right to the end of the process and him then saying, “Sorry, I do not believe you have met that requirement”.

_The Chairman:_ You have done this; you have a template for co-operating. Is there any chance that we could have a copy of that?

_Councillor Brown:_ I can send that to you, yes.

_The Chairman:_ If you could. Somebody used a jigsaw analogy recently, and that is what it seems to be.

Q49 Baroness Andrews: I should declare an interest because I live in East Sussex. I know the ecology of West Sussex and East Sussex is rather different. If you have a strategic planning board that covers the entire plan, what you effectively have is a sub-regional plan, which is to put a new narrative on it, frankly. You also have this Coast to Capital initiative. I would just like to ask a bit about that. Councillor Derbyshire, one thing that has worried me about the creation of sub-regions that are city regions is how you ensure that those smaller towns, not least like Stockport, really get a fair share of airtime, resources and influence. They sometimes get lost, do they not, in the great magnetic pull of the city itself?

_Councillor Derbyshire:_ Greater Manchester’s geography suits us in that the city of Manchester is not enormously larger than the other nine authorities, and it literally sits in the middle; it is
our regional centre. Our geography works very well for us. We have had this long history of working together after the metropolitan county councils were abolished in the mid-1980s. We have a mayor model, and will have a mayor model, where the 10 leaders of the local authorities are the cabinet. I have responsibility; each of the 10 leaders has responsibility. That is a model—it is more of a joint committee, in all honesty, but “combined authority” and “mayor” are the chosen phases that we have to use—that works for us. I appreciate that it would work differently in other areas—in areas such as Birmingham, where the city council is so large compared to the others, or rural areas where you do not have that large conurbation. The thing is functional economic areas where there is a common advantage. We have a joint growth and reform strategy that we can all sign up to. That is probably the basis that you need for any kind of combined authority or devolution agreement.

The Chairman: I am being pressured from my left about time.

Councillor Brown: I will be very brief. Building on our good working relationship on our duty to co-operate, we are putting in a devolution bid from East Sussex, West Sussex and Surrey. Next week, I think, we are going to see Government. We have put in our initial bid. We are quite excited about that.

Baroness Andrews: Where does the national park sit on that? The national park is a very complicated element in all this.

Councillor Brown: They will be part of it.

Baroness Andrews: They are part of it. They complain because they have 17, or whatever, local authorities represented, all fighting for their space.

Councillor Brown: I know they do, yes. I have heard them.

Baroness Andrews: It is a very complicated national park.

Councillor Brown: There are 26 local authorities involved from East Sussex, West Sussex and Surrey, but we are very confident that we may be one of the first areas to get it.

The Chairman: Well done. Best of luck. That is terrific.

Q50 Baroness Rawlings: From all that you have explained very clearly, I wonder what powers and resources local authorities need to ensure planning departments can carry out their functions effectively. In the case of reforming planning fees, have you had time to evaluate a little the effect of the Autumn Statement?
Councillor Derbyshire: It is very clear that planning authorities have been running at a significant loss, given some of the expertise that you need. A lot of planning officers have been lost and a lot of authorities do not have some of the more specialist staff available to them, at least directly, because of costs. The ability to put fees up will probably help with that, but there is a question about whether it will allow us to fund to the level that we are at. Some of the changes—for instance, being able to change from office or shop to residential without planning permission—create work for planning authorities but without any fees. The potential in the Bill for the brownfield designation will also do that and take away some of the strategic view that we can have. There is a tension there. To run a proper planning authority, you need some specialist staff, and the planning fees do not cover that. I think developers would prefer to pay a decent amount and get a good service, in all honesty. A lot of us do pre-planning for free, which saves quite a lot of money. Sometimes you can put a lot of time into pre-planning discussions and a planning application does not come forward at all—possibly for very good reasons, such as that you have advised that it would not meet policy or it would be too difficult—but the cost is falling on the local authorities at a time when the ability of local authorities to meet it is limited. That, again, is one of the reasons for working together, as we are doing and as it sounds is happening in the Sussex area.

Councillor Brown: Through the District Councils’ Network, we have put forward a very robust case for at least two years to have full cost recovery on planning fees—to set our own local planning fees. The announcement yesterday is just another uplift. We want to be cost-neutral, but I do not think the Treasury trusts us to do that. It is very counterproductive not to be able to recruit and retain good planning officers. This is the problem. We are eight short at the moment. We have to pay consultants. It is a huge cost.

The Chairman: I was going to ask that question. Other witnesses we have had have said that there has been a reduction in the number of those who are training to be planners, that planners are moving on and that there is a real serious situation. In both your areas—particularly Councillor Brown, with your national hat on—is that valid? If it is valid, how important is it to get working on it now? Should it be a major recommendation of ours, or, indeed, is it just being bigged up?
Councillor Brown: I believe it is a major problem that we need to sort out. No, we do not have enough planners, but the ones we have are all going to the private sector. You cannot really blame them. In my own case, I am looking at having one set of planning officers between maybe two, if not three, authorities, but still keeping the local planning determination, because it is very important that you have the local input. But in order to get specialist and well-trained officers, we cannot afford now, with our loss of income, to have a separate planning department.

The Chairman: I take it that it is the same in your area.

Councillor Derbyshire: Yes, I would agree with that.

Q51 Lord Inglewood: I would just like to pursue this a bit further. A generation and a half ago, the planning service was a municipal phenomenon; it was all paid for by the rate-payers. We have now moved to a world where you say you cannot afford it, which I am sure that is right, but at the same time we are therefore privatising, in one sense, the planning system. If you end up getting full cost recovery, first, is it desirable in constitutional or institutional terms that this public service is all being paid for by individual people in the private sector? Forget about where you raise the money from for a moment; it is a comment in principle. Secondly, if those who are applying for planning permission are paying for the whole thing, what, if any, redress do they get when the planning system is incompetent?

Councillor Derbyshire: If they do not get their decision within a certain amount of time, they can go directly to the inspectorate.

Lord Inglewood: Yes, but it is not very satisfactory.

Councillor Derbyshire: That is not very satisfactory, no.

Lord Inglewood: I am just questioning you.

Councillor Derbyshire: We are running a planning department, as all the authorities are, but we are all looking at ways in which we can maximise. It is probably true that a lot of developers would tell you that things have got slower because there are fewer planners, or there are fewer specialists, when certain things need to be done, so it takes longer to do it. There has been an enormous growth in the number of people working in planning agencies for the private sector, who are then trying to persuade the planning department that something is
acceptable despite local policies, or whatever. In a way, it is becoming almost more confrontational.

It would be desirable if planning were seen as completely independent of the developers, but given the pressures on local authorities—a cut of, I think, 41% was announced yesterday, on top of what we have already had—planning is part of the reductions that we have faced. As I say, the calculation is that, without change, the bins and social care will take up all the available resources. That does not include planning. Somebody has to pay for it somewhere. Whether or not it is being paid for by the planning fees, applicants should have redress if they are not getting good service. That does not always mean getting the answer that they want, but getting the appropriate service is something that all applicants should expect.

Lord Inglewood: I am not saying that I subscribe to any question I put, or that I subscribe to this one, but you have made the case that we cannot afford proper planning any more.

Councillor Derbyshire: We have a system where planning is often seen as the answer to all sorts of problems. It is an aspect of the answer, but it has not been given the resources to do that, which is a very difficult position for planning authorities to be in.

Lord Inglewood: You have told us they are not there, as it were.

Councillor Derbyshire: A lot of local authorities are running like mad to try to keep the show on the road. It could be a lot better if it was better resourced. I would say that is true of many public services, of course, and it is a question of priorities, but if we want to see the growth in housing and employment, we need a properly funded planning system to do that, however that funding is produced.

The Chairman: What is the situation in other countries? Do they have this awful block on progress that is created by a lack of planners or planners who are not properly skilled? Is there any information about that?

Councillor Derbyshire: I would not really know. Strategic planning is very different in France, for instance, and in some countries there is a different culture towards local planning.

Q52 Baroness Andrews: I want to ask you about CIL and Section 106. CIL is designed to streamline the accumulation of benefit, as it were, but Section 106 lingers on, because there is a transitional arrangement. What is it doing to your ability either to deliver affordable homes or to deliver proper strategic planning for infrastructure? Is it helping or is it not?
**Councillor Derbyshire:** We do not have a lot of experience of CIL. We only have one authority in Greater Manchester that has gone for CIL. There are six that are not even looking at it, and three, including my own, that are looking at it. One of the things about CIL is that it looks simpler, but simpler does not always meet the complexity of life. You have a flat rate. That does not allow for negotiation on perhaps the more difficult sites, where, for strategic reasons, you might want to show flexibility. There is more flexibility in the 106 system, but there is a limit now, under the transitional arrangements, to the number of 106 agreements. As I say, the problem generally in a lot of the north-west, certainly, is viability. Regardless of your policies with regard to CIL or to 106, if a developer is coming forward and saying that a site is not viable, you start to compromise if you really want to see the development. Very often, affordable housing is almost the first one to come under pressure; if you need the highway improvements, they tend to take priority, because they have to be in, so affordable housing gets squeezed. Many authorities have aspirations for affordable housing out of development that are very often not met, or are met only in small proportions.

**Councillor Brown:** We are exactly the same. We have not really entered into the world of CIL yet; we are still in Section 106.

**Baroness Andrews:** Are you recommending that we revisit CIL? Could something be done to make it more effective or more accessible and useful to you?

**Councillor Derbyshire:** The evidence from my area is that it is inflexible, because you need to look site by site. You might want to bring a site forward for strategic reasons—either as employment or perhaps major housebuilding—but it is not going to be terrifically viable if you apply CIL. There are very limited exemptions from it. It does not have that degree of flexibility for an authority to say, “We would forgo this because of the other benefits”, or, “You particularly want to go here. Can you put some more in?” It does not have the flexibility. Equally, 106 agreements can take a long time to negotiate and can be quite piecemeal.

**Baroness Andrews:** Also, sometimes, you simply do not get what you expect out of them at the end.

**Councillor Derbyshire:** Yes.
**Councillor Brown:** The Government are looking into an investigation into CIL. I know the District Councils’ Network has been asked to input into that review. They announced it last week, if I remember.

**The Chairman:** Too many things are happening, but there you are.

**Q53 Baroness Young of Old Scone:** Can we just stick with infrastructure? The planning system needs to look at a whole range of infrastructure issues. You have talked about transport, but they also include healthcare provision, schools, water, sewage, flood defence, energy—you name it. How effective is the system currently at being able to bring into play these issues? If it is not, what would you like to see changed in the system that would allow that to happen?

**Councillor Brown:** In my area, we have a huge deficit in infrastructure before we even start talking about building one more house. We have a big problem, and that affects the economy of the area and everything like that. We need a national approach to infrastructure that supports housing and economic growth. We need a little more flexibility within CIL and Section 106 to advance-funding the infrastructure maybe from your CIL, but we need to front-load it. One of the problems that we have with, say, infrastructure is the fact that we have this deficit but local communities are against any further development because they cannot see the benefits of it. I talked about my last big strategic allocation with the commercial land. It took 12 years to build 1,800 houses and we are waiting for the relief road to be opened next March. We need to have some up-front funding for infrastructure. That would make it a whole lot easier to sell the fact we need more housing and to actually move around the area.

**Councillor Derbyshire:** There are a lot of problems with infrastructure: strategic, financial, and sometimes the politics of local areas about what you do—communities have different views. Planning is part of it, but I do not think that planning can be the sole answer to creating the infrastructure, because the value is not there in a lot of the areas.

**Baroness Young of Old Scone:** I have to declare an interest from the past: I was chief executive of the Environment Agency. There are whole swathes of the south-east where, quite frankly, there is simply not enough water around to sustain development aspirations for the future. Are you able to take a broad enough view across a range of authorities? Does the duty to
co-operate mean that you can take a strategic view about things like the housing and sewage need or the transport need, or is that a really difficult proposition?

Councillor Brown: Yes, you can. In my local area in Chichester, they had to stop building for that very reason. That is definitely part of what we look at in the duty to co-operate and the strategic planning.

Councillor Derbyshire: Yes, it is something that we take into account. Within GM, we have an open-source infrastructure map, which has a lot of the information on it that allows people to see what is there and what is not there, which hopefully will help with forward planning.

Earl of Lytton: In the old days, a lot of this infrastructure was provided centrally; one thinks particularly of trunk roads, which were provided through the old Department of Transport, as it was in those days, which presumably then provided funding to the county to deal with roads that were not Department of Transport roads. First, am I right in thinking this has just been shunted down wholesale somehow for you lot to sort out?

Secondly, when you are dealing with these infrastructure things—just picking up a point that Baroness Young made, and thinking about the privatised water companies and the people who provide telephone, IT, drainage facilities and stuff like that—how do you corral all these things? I have some experience in my professional work of this. On one particular site I can think of in the past, the sewerage authority said that it would not put anything in its forward plan unless it was in the local plan. The local plan said, “We are not putting it in our local plan unless we know there is capacity in the sewage treatment works”. Do you come across all this sort of stuff as well?

Councillor Brown: We have the same problem, because we are working on a 20-year plan and most of the other utilities seem to be working on a five-year plan. This is where the difficulty came in forward planning. On the road network, I am not quite sure where we are with it. We still have what is not the Highways Agency any more; it is called something else. Part of the devolution bid that we are making is that we take over transport—road and rail—because it is really important. It is a very big ask, and I am not quite sure whether we have not bitten off more than we can chew, but that is what we are trying to do with our bid. I think that is the only way forward.
Lord Inglewood: Might I first ask a question of Councillor Derbyshire? We are talking about infrastructure and costs and so on. I put it to you specifically because you come from Stockport. I live in Cumbria. The water you drink comes from where we are, and we do not get a penny piece from you all for it. Do you think that is right?

Councillor Derbyshire: That sounds right, although the Greater Manchester area has quite a lot of rainfall of its own and a number of reservoirs. Yes, there are all sorts of anomalies in the system. As I say, all our boundaries are very permeable in terms of travel, natural resources such as water, and the infrastructure that has been set up. That is why it is important to have these overviews, and the networks, the partnership and the communication between the organisations. It is quite difficult to legislate for that, because then it becomes a tick-box system, but you have to require that areas work together.

Q54 Lord Inglewood: If the volume of water you all drink was a volume of oil that had been extracted from Cumbria, we would be the richest part of the United Kingdom. My real concern is the inhibitions that we have talked about, particularly on housing and bringing land forward. The general question is: are there any particular new powers that might enable this to happen more smoothly? In particular, do you think that the CPO powers that you have are adequate to bring some of these things forward in the wider interests of the communities you are serving? If you have a site that has been sitting with consent and planning permission for housing for, say, 10 or 15 years and you need that, there seems to be a case for thinking that perhaps it should be progressed.

Councillor Derbyshire: It is difficult to use CPO powers locally for purely regeneration purposes directly.

Lord Inglewood: Is that because the legal inhibitions on the criteria are too tightly drawn?

Councillor Derbyshire: Yes. It is a very cumbersome process as well. You have to take a very deep breath before you get into it, so that is an inhibition. Part of the budget in the spring was a land commission for Greater Manchester. We are hoping to start meeting in January. We hope that will help us to bring together the public sector. That is part of the work that we are doing, because we believe there may well be public sector land that can be released. That is obviously a lot easier for us to get hold of than the rest. In many cases, though, it is the resources that are needed to develop the sites. A lot of our private sector sites, if we could
put something into the remediation, would probably come forward. It is a whole range of things, but I am not convinced that our CPO powers are as strong as they should be, given the demand and the aspirations that we have for housing and for employment land.

**Lord Inglewood:** Are you saying that what you need is a CIL in reverse? There are some sites where, as a matter of course, some public money—do not let us get into where that comes from, for a moment—should go into the site to take it through the threshold of viability.

**Councillor Derbyshire:** Yes. I am not sure about Councillor Brown’s area, but Greater Manchester has an industrial legacy, some of which is very beautiful but much of which leads to pollution and to site contamination that needs work. If they could be productively brought back in, they could make a massive difference to local communities, but they are not viable for the private sector as they stand.

**Baroness Andrews:** Where does that leave the brownfield provision that is in the new planning Bill? Are you saying that is not going to work for you?

**Councillor Derbyshire:** A lot of the brownfield within Greater Manchester would fall within that. The deemed permission, which takes away the strategic view of how sites might play into an area—I have some concern over that—would still have the viability issues. There is also the issue that what is brown to a developer or to a planner is sometimes very valued green-looking space to communities. They are not always lacking in controversy. Just making it easier to get permission would not in itself bring those sites forward, because of the viability issues that are tied up with them.

**Baroness Andrews:** Presumably in greater Sussex, or whatever it is going to be, there is a lot less brownfield.

**Councillor Brown:** Absolutely.

**Baroness Andrews:** So it is not going to help you with your land supply issues.

**Councillor Brown:** No, it will not help.

**Baroness Andrews:** Yet that is where the pressure is for housing.

**Councillor Brown:** Yes, it is. We would like to see the CPO process made much easier for councils to exercise when it is necessary.

**Baroness Andrews:** Would that be the one single thing that would make the biggest difference to you—if you freed up CPO a bit?
Councillor Brown: It would not make the biggest difference, but it would be a good thing to do where it is necessary.

The Chairman: Would you put it at the top of your list of priorities?

Councillor Brown: It would not be at the top of my list, but it would certainly be on it.

Lord Inglewood: What would be at the top of your list?

Councillor Brown: Getting developers to build out the sites they already have permission for, where they are viable. That would be right at the top of my list.

Lord Inglewood: Are you then saying you would like to have access to central government money, or money from somewhere, so you could say to these people, “We will put some cash on the table here. You do the rest”? Is that how you think it should happen?

Councillor Derbyshire: Yes, that would unplug a lot of sites.

Councillor Brown: Yes, it would.

Lord Inglewood: But it is less easy to do.

Q55 Baroness Parminter: I declare an interest as a former district councillor in West Sussex and a resident of Surrey. My question follows on from Baroness Young’s and is about how you build communities that have the necessary infrastructure along with the housing. I wanted to ask particularly about low-carbon futures and the failure—or not—of the present system to ensure that those communities in the future have the resilience to deal with the impacts of climate change and the statutory requirements that you have on low carbon.

Councillor Derbyshire: That is a good question. We have a carbon implementation plan. At the moment, we try to, but there is variability in the environmental standards that local authorities ask for, and then there is that viability discussion with developers. Some developers are planning for the long term, but if you build and sell you do not necessarily worry about the running costs. We are working with some of those who are building to hold in the private rented sector and who perhaps have a different attitude. Putting in some of the low-carbon things is still seen as a bit of a luxury, an add-on, an extra cost, rather than as something that would benefit. As I say, given sites’ difficulty with viability, that is difficult. On some of the sites where they really want to go, developers will offer you higher standards. It would be good if the building standards that people had to work to clearly required them to build for the future. We have the sustainable urban drainage system coming in. It would
be better if that was built into the system, but it is very difficult for an individual authority to do it and it usually loads costs on to the initial building process.

**Baroness Young of Old Scone:** I was talking recently to people who were active at the time of the green building code and the standards that were in place then, and I was given assurances that the majority of the code standards were now in building regs. Is that not the case?

**Councillor Derbyshire:** The higher ones have not come in. It is a lot easier to put in a gas central heating system, and everybody understands gas central heating, but for long-term sustainability, particularly if it is a large unit, you might want to look at district heating, at heat source pumps, for which we have pilots going, or at routinely putting in solar where it is appropriate, and those things are not built in. A lot of the carbon that is produced is produced domestically and it is through the grid—either gas or electricity. Even if we go to electricity, whether or not it is a low-carbon usage depends on how the electricity is being produced. There is a presumption that every house has its own gas boiler and suchlike when things are being built.

On the whole, people are probably building houses with good insulation, because that is important if you are going to try to sell it, but they are not necessarily doing some of the things that would reduce carbon costs over a longer period of time, because it is not an immediately saleable thing. If you are a developer, you are going to sell and you are going to move on. As I say, we have seen landlords who plan to stay taking perhaps different views of biomass boilers and making the running costs of the building cheaper, which tends to make the carbon output lower as well. Low-carbon tends to be a win-win from the point of view of costs of running buildings.

**The Chairman:** Do you find the same thing, Councillor Brown?

**Councillor Brown:** Yes, I do. We were working towards every home being level 6 of the code by almost this time, but the financial viability just would not allow that to happen. We still have our own housing stock. We have made it as good as we can, and everybody has new windows and it is very high-quality stock. We were just starting on a programme of building our own council houses again, after 25 years, and they were going to be built to a very high specification. Unfortunately, the Government’s announcement that 1% has to come off all
the council house rents for the next four years has cost us £4 million and we have had to stop our building programme, which is very sad.

**Baroness Andrews:** You have completely stopped it.

**Councillor Brown:** We just cannot afford to do it. It is a very long story with the HRA, but there is a cap on that, so we are not allowed to borrow. We have got to the position where unless the Government take away the cap, we cannot borrow to build—and it is a very cheap rate to borrow at the moment.

**Baroness Andrews:** Just to be accurate, are you saying that because of the combination of the cap and the second factor, which I have forgotten—the regulation, or whatever—you will not be building the local authority housing that you thought you would be able to build? How many houses would that have been a year?

**Councillor Brown:** We knew that we could build 30 a year; we were hoping to build 50. When you build your own council stock, you can keep the rent low. You do not have to do it at the housing association rates, which are—I cannot remember exactly—around £150 a week. Our council housing we can set at a social rent of about £90 a week, which makes a big difference to people who can never afford to buy.

**Baroness Andrews:** If you gross that up across the whole of your region, you would be talking about hundreds of houses.

**Councillor Brown:** I cannot remember the amount of housing that will not be built across the whole country, but it is a lot of housing.

**The Chairman:** This is really quite incredible. This is silos gone mad. We are not going to be able to recommend anything if we have this rubbish going on.

**Councillor Derbyshire:** We have not done a calculation for houses, but we know that across Greater Manchester the loss to the social housing sector over four years is over £300 million. That would have represented housebuilding as well as improvements to existing stock. It is over £300 million.

**Baroness Andrews:** It is a difficult equation. Do you think that the £400 million that is being made available nationally, as of yesterday, to build new homes is going to be completely discounted by the impact of the loss of homes?

**Councillor Derbyshire:** Yes.
Councillor Derbyshire: More than.

Baroness Andrews: In fact, more homes will now be lost than will be built.

The Chairman: I cannot believe it. Something has to be done. The two of you have certainly made an impact. This is quite remarkable.

Councillor Derbyshire: It is a situation where there are aspirations but policies are not lining up on the ground.

The Chairman: I am being reminded of the time by my clerk. You have the last question, Baroness Whitaker, but please make it very quick.

Q56 Baroness Whitaker: We need a quick word about the people who are going to live in all these places. Councillor Brown mentioned local resistance to more housing and people being against infrastructure development. What is the best way to draw in local communities to these decisions, which affect the whole of the way they live their lives? How ought people to be better informed about all their built environments so that this can play a bigger part in the decisions? What are your ideas on this?

Councillor Brown: In my area, the residents are very much involved. As I was saying, we have 14 neighbourhood plans. That is the opportunity for the communities—

Baroness Whitaker: At what stage are they asked what they want their place to be like?

Councillor Brown: They compile their neighbourhood plan. They start from scratch as a group. It is not done by the council; it is done by local residents. They say what they want in it. They have to align with our local plan, though. This is where there is the tension. In some of the village areas, because we do not have any brownfield sites we have to allocate greenfield land for housing.

Baroness Whitaker: How do you ensure that they are fully aware of all the factors that you think they need to be aware of?

Councillor Brown: They are fully aware. At our local plan meetings, we can have upwards of 200 people turning up. We can only get 100 into the council chamber because of the fire regulations, so the rest are downstairs on a monitor. They are very much aware. We have had even more than that.

Baroness Whitaker: If they are on the monitor, can they ask questions?
Councillor Brown: They can ask questions at the beginning of the meeting, yes. We have a lot of two-way communication with our residents.

Baroness Whitaker: Is it their opinion that they have enough communication?

Councillor Brown: I think they do. They do not like the decision because, at the end of the day, this is where localism clashes with strategic planning. We are bound by certain things that we have to do, and they think, with localism, that they can say they do not want that number of houses. I wish that was so, but unfortunately it is not. That is where the tension is—that localism does not actually exist in reality.

Councillor Derbyshire: I would have to agree with that. We had one area that was looking at a local plan until they realised it could not be used to stop the planning application they were concerned about. I think all local authorities try really hard to communicate when they are in the planning process. It is something that you are required to do anyway, because if you get to inspection and there are a lot of objections because you have not followed the process, that will derail you. We have local planning committees.

Baroness Whitaker: There is consultation and there is involvement right at the beginning. These are not quite the same thing.

Councillor Derbyshire: No. As Councillor Brown said, there is perhaps a belief out there that planning is locally determined, whether it is an application or whether it is the planning, and very often there is a frustration from communities that then we are saying, “We cannot do that”, or, “We cannot change that, because it is centrally set”. That can cause residents to feel discouraged and maybe excluded. Although they have had their say, having their say does not always mean that they get their answer.

I personally feel that because we need to look at releasing land, there have to be conversations with communities about communities and growth. Most people recognise there needs to be more housing; they hope there is somewhere else it can be built, but if it is going to be built in their community, what is it that their community needs? What are the benefits? This comes back to the fact that it is very often difficult to put those benefits in place in advance, or to guarantee them. It is a bit like jam tomorrow but you have the building works today. There is a lot of frustration, I would say, in local communities with regard to planning.

Baroness Whitaker: We could develop this, but I do not think there is enough time.
The Chairman: I am afraid again we have run out of time. I just want to say that I am sure everybody agrees with me that this has been a brilliant session. You have been very co-operative and you have put up with some nonsense questions from me and some very erudite ones from the members of the Committee. If there is anything that you think we have really glaringly forgotten, could you just drop us a line and let us know? If you have any other thoughts in the middle of the night or, indeed, even the middle of the day, we would be very grateful to have them. We just want to make sure that our report works well and makes a decent impact. You will be getting the transcript anyway, and eventually a copy of the report. Thank you very much.

26 November 2015
Mr Nigel Spencer Atkins – Written Evidence (BEN0223)

Dual National British / French (naturalised 1982)

Czech Resident

1982 – 1992 Chief Executive of Wimpey France
Subsidiary of George Wimpey now Taylor Wimpey
3,000 homes built in the Paris Region
1992 Founder and Chief Executive of 2 development companies
Federal SA in the Paris Region
Atkins & Langford in Prague
4,000 homes built
2006 – 2013 Associate Professor Sorbonne University Paris and Abu Dhabi
Master in Urban and Regional Planning
Lecturer at the Paris Business School (ESSEC) in Globalisation Comparatives Studies of World Metropolises 2013
Deputy Mayor of Chatou in the Paris Region (population 30,000)
Delegation Urban Planning
Member of the Western Paris Agglomeration Council (population 334,000)
Member of the Urban Planning Commission
General Secretary of the Association of Mayors of the Paris Region – Economic Council
Member of the European Urban Regeneration Council of the ULI (Urban Land Institute)

Although I have spent nearly forty years of my career in France I have kept close ties with the UK building industry through my connections with Taylor Wimpey and the Urban Land Institute.

I am a liveryman of the Workshipful Company of Paviors.

I have as well an extensive experience of Central Europe and the Emirates.
I feel however that France has many relevant comparisons with the United Kingdom in its population size, mature economy, and a strong sense of home ownership. Both economies are driven by vibrant Metropolises.

I will conclude with a comparison between the British and French built environment concentrating on planning aspects

1. In order to explain the French building environment it is necessary to briefly describe the French political and local government systems. France is a centralised country. Under the Bourbon dynasty notably Louis XIV (1638-1715) all executive power was concentrated in the monarchy. The French Revolution confirmed Paris’s domination. Modern France is the achievement of Napoleon. Laws were codified. The Central Bank created and the military universities (Les Grandes Ecoles) were founded which exist to this day – Ecole Polytechnique, Central Supelec, Ecole des Ponts et Chaussées.

After 1945 the business schools HEC and ESSEC were founded and moreover the Ecole Nationale d’Administration (ENA). General De Gaulle created ENA to form top level civil servants and politicians. 80 students are enrolled every year. Each year is named after a French writer or philosopher. In the year “Voltaire”, was François Hollande, Segolène Royale (the current Minister of Environment), Michel Sapin (the actual Minister of the Economy), Dominique de Villepin (Jacques Chirac’s last Prime Minister), Henri de Castres (Chief Executive of Axa France’s main insurance company).

The meritocratic education system leads to an elitist ruling class.

2. France’s territorial administration is organised in several layers the Regions, the Departments, Agglomeration of Communes and the Communes.

There are 18 regions, the largest being the Paris Region (Ile de France) with a population of twelve million inhabitants. The Regions are responsible for transport, hospitals, secondary schools and strategic urban planning.

There are 92 Departments (equivalent to a British county) with responsibilities for social welfare roads and primary schools. There are 36,000 communes in France, each with their own Mayor/Council. Paris is considered a commune!

In all there are 616,000 elected officials in France!

Until 1983 all planning and building consents were administrated by the State.

The then President, François Mitterrand, passed a major devolution law giving communes the authority to grant building permits and the right to modify their structure plans.
The underlying philosophy in the French built environment is coherence and logic... a Cartesian logic as developed by Descartes.

A key person in the French territorial system is the Prefet. He or she is appointed by the Government through a state decree. They report to the Minister of the Interior (Home Office) in each Region and Department. Their role is to represent central government and to ensure all laws are applied by the communes. The Prefet’s Office (La Prefecture) has to control all council decisions by the communes and to verify that building permits are in conformity with the law. Prefets are generally past graduates of the elitist university ENA.

One important change is that in 1999 the Central Government has encouraged the grouping of communes into agglomerations (EPCI – Etablissement Public de Cooperation Intercommunale) to ensure a better co-ordination of transport, economic policy, and housing. Initially this was voluntary.

As and from 1st January 2016 my town Chatou will be part of a new agglomeration with 20 communes covering a population of 334,000.

Planning and building permits remain the prerogative of the communes.

As and from 1st January 2016 Paris will be creating a new Metropolise structure to cover 131 communes with 7 million inhabitants. A transition period of two years has been granted to establish its full powers.

3. The French planning process is as follows:

Each of the eighteen Regions elaborates a strategic master plan SDR (Schema Directeur de la Region) which covers transportation, housing directives, open spaces, and economic development. This plan is generally reviewed every twenty years. It is the backbone for all urban planning documents. It was first implemented in 1965 by General de Gaulle to give an impetus to the Paris Region. The first plan created five new towns, the regional express metro (RER) and launched Europe’s largest business district La Defense. In coherence with the Schema Regional, the Agglomeration of Communes (EPCI) develops a more detailed structure plan called the SCOT (Schema de Coherence Territoriale) which at a local level sets objectives of transportation, economic development and housing. This plan is usually reviewed every ten years. It was first implemented in 2000 as it was felt that there was a need for an intermediary planning document between the Region and the communes. The communes in coherence with the SDR and the SCOT develop their own neighbourhood plan PLU (Plan Local d’Urbanisme). This plan gives detailed planning directives to be applied to all properties in a commune and is subject to a public inquiry. The PLU is reviewed generally every ten years but can be modified to suit specific needs. We have a national planning law since 2000 (SRU – La Loi Solidarité et Renouvellement Urbain) which obliges all communes
to have a minimum of 25% of their housing stock classified as social. If the commune does not meet its objectives it has to pay a heavy fine to central government. If a commune refuses to comply its planning rights are withdrawn by the State. My town Chatou has 14% social housing, so in my town’s neighbourhood plan PLU I am identifying zones which can be for mixed use. The Paris Regional Plan (SDRIF) of 2013 has laid down that 70,000 homes are to be built every year. A town such as mine in its District Plan (SCOT) has to justify in a housing programme (PLH/Plan Local Habitat) that its quota of 70,000 homes can be achieved.

Paris Regional Plan (SDRIF) 2013 – Grand Paris Project:

In 2007 when the Paris Regional Council voted the new Regional Plan SDRIF the Regional Prefet on the orders of the President Nicolas Sarkozy refused to sign it. Nicolas Sarkozy felt that the plan had no vision towards making Paris a world metropolis. He decided on major rethinking of the Region calling upon ten leading architect urbanists including Richard Rogers Partners. After two years of debate, a new transport network was agreed. The objective was to link living areas with workplaces, as well interconnections between airports and the TGV hubs. For instance, Saclay one of Europe’s main research hubs is only 10 kilometres from Orly airport. By public transport one has to go to the centre of Paris and then take a non-express train out to Saclay. This can take up to one and a half hours.

4. When the French Government decides that a project is in the national interest, there is very little local public debate. The best example is the TGV fast rail network. The Grand Paris project was created by an act of Parliament in 2010. It was integrated into a new Regional Plan in 2013. It comprises a new automated system and the creation of 72 metro stations. The estimated cost is 32 billion euros which is financed from local rates and company taxes and land enhancement values. All land in a radius of 200 metres will be compulsory purchased by the State and then sold at a profit to developers and social housing associations. A high density spatial plan for each station is being prepared by private planners. A State company, Societe du Grand Paris, has been set up to ensure delivery of the project. Guidelines have been set down for each station dependent upon its location and density. The English web site: [www.societedugrandparis.fr/english](http://www.societedugrandparis.fr/english) makes for interesting reading. It describes the future built environment. The President of the Societe du Grand Paris is of course a Prefet!

5. Urban Renewal: France and in particular Paris has an important stock of high rise social housing. These flats were built in 1960’s and 1970’s to accommodate an influx of over one million people from France’s past colonies from Algeria, Marocco and Tunisia. There was a heavy influence from the Swiss architect urbanist Le Corbusier. The sites chosen were often on the outskirts of towns with poor transport facilities. In autumn of 2005 riots took place
essentially in the northern Parisian suburbs notably in the towns of Clichy sous Bois and Montfermeil. Under the impulsion of an energetic Housing and Environment Minister Jean-Louis Borloo, a state agency ANRU (Agence Nationale pour la Renovation Urbaine) was established in 2003 to coordinate the renovation of areas suffering from poverty and degeneration. The onus was on the communes concerned to propose to the Prefet an urban project with demolition of the high rise buildings, a proposal of mixity of population and new retail and public realm. The finance coming from a levy on employers Action Logement (which I explain later) and social housing associations.

Private developers were encouraged to participate in the projects. In France new housing is subject to a 20% VAT and in the ANRU areas it was reduced to 5.5%. In ten years 490 projects have been completed. 4 million people have been rehoused. 45 billion euros of construction work has been carried out. I have personally been involved in several ANRU projects and it is true that towns such as Clichy sous Bois, and Montermeil where the 2005 riots started, have been radically transformed. Social problems, unemployment and illiteracy remain.

The phase 2 ANRU is about to start concentrating on the social aspects. The site www.anru.fr is instructive…. Although written in French there is an international section and one can read in English that the ANRU framework has attracted considerable international interest. Joint pilot studies have been started in Johannesburg.

Action Logement: for over sixty years French employers have paid a payroll tax to finance housing especially social housing. Originally it was a 1% levy on gross salaries. This was reduced to 0.45% in 1992. In 2014, 1.8 billion euros were collected. Action Logement also enables staff of companies contributing to receive top up mortgages at privileged rates.

6. Land Policy: any mature economy with a need to create housing (France nationally 500,000 homes per year and 70,000 in the Paris Region) is confronted with the essential issue of land availability and then the planning issues. Under French law all communes on the declared sale of any land and built property have the prior right to purchase. This is a delicate matter as communes do not have the financial resources and planning changes can take up to 2 to 3 years. The Paris Region in 2008 created a land agency (EFIF-Etablissement Foncier Ile de France) with powers to purchase land on the account of communes. This is now applied to 13 regions nationally. Finance is raised through a regional tax and long term loans. The communes have to sign a convention with the Land Agency on designated land with an obligation to purchase the land within five years from the Agency or substitute with a private developer or housing association. Twenty five per cent of the housing must be social. Although priority is given to housing land can be developed for retail or commercial use if there is a proven need for the commune. In my town I have signed a Convention with the Land Agency to build 170 homes. There are 15 landowners and they can only sell to the Land Agency on a valuation from the State assessor. This helps to avoid speculation. As a
developer I am purchasing land from the Land Agency of the Department of Oise to build 130 social houses. The Paris Land Agency in seven years has signed 320 conventions with different communes and now has a land bank of 300 hectares (741 acres) for a total investment of 680 million euros. In 2016 land will be released to build 10,000 homes in the Paris Region with an annual objective of 12,000 homes annually. Priority will be given to the Grand Paris project.

7. Private Housing for Rent / Fiscal Advantages: there is a world phenomenon of urbanisation of main metropolises. In 2015 50% of the world’s population lives in urban areas. This will increase to 60% by 2030. This puts pressure on Governments to satisfy housing needs. France is no exception. This urbanisation encourages speculation and forces young couples to abandon the idea of owning property and to rent in the private sector. Despite a sophisticated social housing system France still needs to build 500,000 homes every year. Private home ownership is dependent upon mortgage rates and speculation. Since 1986 France has introduced a series of laws encouraging private investment in housing for rent. It is used for stimulating the market when house sales slow down. Over the past thirty years the private rental market accounts for 40% of all homes built in France. In recent years in the Paris Region on an annual average of 20,000 homes in the private sector 50% are built for rent. During the financial crisis of the autumn 2008 the French housing market grounded to a halt. In February 2009 Parliament passed a law which allowed the deduction on income tax at a favourable ceiling for nine years on new housing for private rent. Overnight the market took off. It is true to say that as house prices in France include 20% VAT a depressed market means less revenue for the State so it is justifiable to plead for tax incentives for new build to rekindle sales. There are restrictions. The homes must be let for a minimum of nine years and if the properties are empty for longer than six months the tax concessions will be cancelled. Many developers offer a rental guarantee service. Fine on paper but there have been several cases of developers filing for bankruptcy and leaving the owners stranded. France did not suffer from a depressed housing market 2006-2011 as did the UK and Ireland.

8. Planning Education in France: France has in modern times a rich architectural and planning heritage. It was the Baron Haussmann (yet another Prefet) under Louis Napoleon who transformed Paris (1853-1870) in creating broad avenues, elegant buildings with coherent designs and open spaces such as the Bois de Boulogne. In the 1930’s under the impulsion of Le Corbusier Modernism was born with the «Functional City» leading to the regrettable high rise policy after the war as previously discussed. Since the 1960’s urban planning in most French universities is under the geography faculty and separated from architecture. This was the case at Paris Sorbonne where I was Associate Professor. Priority is given to understanding the layouts of cities, transportation, and planning laws. Extensive field trips are organised to other continental countries and the Erasmus exchanges encouraged.
architectural schools include spatial planning in their syllabus but few State planners are qualified architects. In my town of Chatou I have four planners very well qualified who have the task of approving building permits and assisting me with revising the towns neighbourhood plan (PLU). Building design assessment is left essentially to the Council. Qualification wise France is well prepared to handle both regional and town planning. The development of the Grand Paris has a pool of trained planners.

CONCLUSIONS:

France and Britain have similar populations. France’s is estimated at 66 million and Britain’s at 64.5 million. One could assume that their global housing needs are similar.

The UK Housing and Planning Minister in his oral evidence on 17th December 2015 refers to 240,000 homes completing planning in 2014. According to an editorial in the Times dated January 5th 2016 only 140,000 homes were built in 2014. Comparable figures in France are 360,000 in planning and a similar number built. In 2007 France attained a peak of 500,000 homes which remains the annual objective.

To compare the French and the British built environment is a complex matter. How can one explain that France is capable of building consistently more homes?

The difference in my opinion comes essentially from the market driven private housing in the UK and the planned economy in France. The French are able through regional spatial plans with powers over transports, schools and housing to coordinate public expenditure and to allow the communes to administrate local neighbourhood plans. One has the impression listening to the evidence of Sue Derbyshire, leader of Stockport Metropolitan Borough and member of the Greater Manchester Authority, that local community coordination in the UK is ad hoc. In France if you go from Calais to Strasbourg to Nice the framework is the same. This allows planners to have more mobile careers with more job satisfaction. There is no outsourcing of planning in France. I am currently preparing a new neighbourhood plan for my town based on national directives but I still have considerable freedom and I encourage public participation. In France we have excellent relations between private and public housing sectors. We have a well-oiled social housing sector essentially financed by deposits from the National Savings Bank. A system which goes back over 100 years. We build 80,000 social units a year. The private sector can build for social housing associations on stage payments.
A fundamental difference listening to the evidence from the two Builders Federations is that in France new homes are built off plan. The conveyance system and the mortgage finance is so structured to facilitate stage payments. In France bank finance for construction is only released when 40% to 50% of the project is presold off plan. The developer receives payments at stages of land purchase, foundations, wind and watertight, and completion. In the UK the homes are only conveyed upon completion. This reduces substantially the equity involved in France.

I will give a recent example of one of my projects.

I sold in 2015, 100 flats to a social housing association in the town of Bondy, one of the deprived northern suburbs of the Paris Region. The time schedule was as follows:

- February 2014: Signing of a land option with three owners - purchase subject to full planning
- September 2014: Filing for detailed planning with the town of Bondy on a neighbourhood plan
  PLU
- May 2015: Obtention of full planning despite an objection from the Historical Department
- 14th June 2015 morning: Purchase of the land
- 14th June 2015 afternoon: Sale of project at the land stage to the social housing association
  OSICA with a 25% advanced payment.
- 15th June 2015: Construction starts.

My company is contracted to build with a bank completion bond.

No equity was required except for initial architectural and engineering fees.

On the average in France we only need 7% to 10% equity.

When Brandan Lewis confirms that a UK 500 unit’s site would take ten years to build. Seen through French eyes this is a not efficient. I have recently completed two projects of 400 units each in less than three years. I act as coordinating developer encouraging a mix of
products with social housing, houses for private rent, and two projects for sale catering for different market sectors.

In France developers pay no fees for planning to local authorities. For me this is logical. The town conceives the plan with public participation and through in-house planners controls all the planning process. To pay £24,000 for planning is non-productive. It makes developers hesitant and slows the process.

As well I believe that the 106 sections for the developer’s contributions appears to be too complex with little coherence. In France we have a developer’s tax on planning fixed annually by the Department based on construction values to cover infrastructure and primary schools. If there is a specific need this is discussed and contracted before the planning process starts but due one year after planning is granted.

Brandan Lewis is adamant that regional planning is out. It is needed. But the territorial administration in the UK is not designed for it. I was impressed by the initial stages of Thames Gateway but it fell apart due to differing local authorities’ objectives. It is now centred on Ebbsfleet which is tied into the high-speed train network.

What has happened to the spatial planning between there and Lea Valley?

Again I was impressed by the initial impact of the Olympic Games Delivery Authority but there seems no legacy plan. This past summer I visited the Stratford area. The private rented flats which were originally the athlete’s village have no community feel... There is not one ground floor retail space let. The Westfield shopping centre which I have followed since the outset is clearly a commercial success but from a spatial planning point of view it is a walled city, not at all opening out to the community.

Density is an important ingredient and Brandan Lewis recognises that the densities around the Crossrail stations are too low. Density is a means of improving building capacities and making land prices more affordable.

I recommend that the British Government, if it has not already, takes a look at the Grand Paris project. We can lend them one or more of our Prefets!

In the mid 1980’s I was seconded by George Wimpey to represent the Channel Tunnel Consortium in France during the bidding phase.

I worked directly under the project director now Baron Tony Berkely and the Chairman Sir Nicholas Henderson.

One day Sir Nicholas Henderson said to me Nigel how can you work with the French. I replied my wife is French.
He said I mean that the French start with the conception and stumble on the details and the British start with the details and stumble on the conception!
Post Committee Hearing Evidence

At the oral hearing on September 10, 2015 I was asked to respond on three issues: data about vacant public and brownfield land; why the ecotowns initiative failed and any extra thought on key issues around housing policy which the Committee might wish to consider. There is not a great deal I have to add on the first two of these, and by and large the third was covered in the Committee hearing. However a brief response is given below.

Data on publicly owned vacant land and vacant brownfield land

There are various sources of data for land. The vagaries of the Gov.UK website does not always make it easy to uncover them. The Homes and Communities Agency (HCA) own a considerable amount of land on behalf of the Government, including sites inherited from the Regional Development Agencies. I tried briefly without success to find up-to-date information on their website.

In the private sector, Savills have spent some time of this. I have attached a recent note of theirs to the email though it is not on public land as such, but drawn from the DLCG database. They published an article in autumn 2014 on the potential of public land for housing which I also attach. The Mayor is reported to be creating a public land database for London.

DCLG are improving their land data – there is a database there of MOD land for example. I would recommend that the Committee asks the Department for vacant public land data.

The eco-towns initiative

Here I would not claim any special knowledge. Certainly some of the sites attracted local opposition which is a cautionary tale for those of us who propose there should be new towns. In one or two case, the sites were suggested by private landowners and were places which had failed to be included in regional plans. These were likely to be opposed by the planning authorities. In other cases, the realisation that the housing provision might have to be additional to existing plans deterred local authorities from pushing sites forward.

The project was not a complete failure as at Bicester at least a development is taking place using those principles. One problem perhaps was that the proposal had two aims – building to higher environmental standards and pushing up supply. There may have been a thought that the environmental standards would lessen opposition to the sites – but of course building better does not make a site work necessarily in terms of wider spatial planning considerations.

Any additional key points

At the end of the hearing I argued for three important improvements:
1) Better public consultation on plans, bringing out why more residential development would be positive as well as honesty about people for whom it would be detrimental (loss of views, etc). These are hard choices for local authorities to make.

2) An independent assessment of the environmental costs of better housing provision (ie more space per person) – clearly not easy to relate this to sites, but there are general questions about energy, water, waste and bio-diversity which could be discussed. This would enable a clearer view of costs and benefits of better housing to answer the question: ‘why do we limit development?’ and also perhaps provoke work on how to reduce these costs.

3) An overall government and Bank of England policy view about housing. At present the Government wishes to promote home-ownership, but the Bank wishes to ensure mortgages are sustainable for households. These are both important goals – but may lead to inconsistency.

Other points which I would like to stress are:

4) A review of the whole system of housing taxation would be useful, with the aim of creating less of an incentive for households to consider housing as an investment. Reforms to council tax and to capital gains tax are the most plausible candidates.

5) A recent report (also attached) recommends that large-scale housing is considered as a candidate for becoming part of the nationally significant infrastructure. This would be quite contentious, as it would run counter to localism. The eco-towns experience suggested it is not always easy to marry up local and national interests. Taking this as a lesson and starting from a wider spatial view than the local, it would be good to start a discussion with local communities about the benefits they might receive if large-scale housing were accepted. This recognition of costs and benefits between local and national would obviously be a negotiation.

6) This leads on to the question of compensation where costs of a new development are very direct. This is anathema to the planning profession – but perhaps this should not be the defining answer.

7) Finally, I attach a paper recently given at a Planning Law conference. It suggests that just using the household projections is not enough – as well as commenting in a reasonably careful way on the present state of planning for housing in Hertfordshire.

Examination of Witnesses

Dame Kate Barker, economist, author of the Barker Review of UK Housing Supply, former member of the Bank of England Monetary Policy Committee, and Toby Lloyd, Policy Director, Shelter

Q57 The Chairman: Good morning everybody, and welcome to this evidence session of the Select Committee on National Policy for the Built Environment. You have in front of you, Dame Kate and Mr Lloyd, a list of the interests that have been declared by members of the Committee. A transcript of the meeting will be taken and published on the Committee website. You will have the opportunity to make corrections to that transcript where necessary. Could I begin by asking each of you to briefly introduce yourselves to the Committee, please, starting with Dame Kate?

Dame Kate Barker: Thank you. I am Dame Kate Barker. I have a history of advisory work for the Government on housing policy, but it is now a very long time ago; the report was published in 2004. To declare my interests as well, I am presently a non-executive director of Taylor Wimpey and a non-executive director of the Yorkshire Building Society, so I retain a very active interest in housing policy from various sources. I want to be clear that I am not here representing either organisation; I am simply representing my own views.

The Chairman: Your own expertise. Thank you. Mr Lloyd.
Toby Lloyd: I am Toby Lloyd. I am head of policy at the housing and homelessness charity Shelter. I have been a housing policy professional for the last 12 years, working for local government, national government, private consulting and the charity sector, in a range of different roles. I am here very much representing the views of Shelter, which as you know is the leading charity in the housing space and we have done an awful lot of work on all aspects of the housing problem in this country.

Q58 The Chairman: Thank you. I am sure your evidence will be most welcome. There is a degree of political consensus on the need for more housing, but in practice housing completions rarely meet the targets that have been set. In your view, what are the reasons for this, Dame Kate?

Dame Kate Barker: It is interesting to say that there is political consensus. I spent a bit of time ahead of the last election reading all the different manifestos to see what they said about housing supply in particular. It is certainly true that both Labour and the Liberal Democrats had targets for housebuilding in England—well, I assume it was England. In the case of Labour it was 200,000 a year, and in the case of the Lib Dems a rather ambitious 300,000 a year. The Conservatives did not in fact produce a supply target, although they have been very clear that they would like to see supply increase; they did of course have targets for things like starter homes, over the course of the Parliament.

The difficulty is that the national targets very obviously do not necessarily translate into local targets, and of course these come from local plans. I am sure we will get on to this later—the change under the coalition towards locally driven targets. When you think about the costs and benefits of housing supply, it is usual to argue, and I would argue, that the benefits are seen in some sense more at national level. If you think that building more houses helps house prices generally or the housing benefit bill, you get those benefits coming through at national level, whereas it is the people who live locally who will bear the costs of having houses built near them. Either they are concerned that it will reduce their own house prices because it is right in their view, or, if it is not right in their view, they think the roads or the schools will become more crowded or they will never get an appointment at the doctor’s surgery, all of which is true to some extent. It will often bring pressure on infrastructure, and even if your
infrastructure has the space to cope with it, it is nice to live with an ample infrastructure; people do not necessarily want other people moving in. Often people will say, “We really would be prepared to see homes, but only for local people”, which is a little bizarre, since most of us are aware that many people nowadays do not live anywhere near where they were brought up. I certainly do not, and I am sure many people here do not. At the local level, the argument has often proved very difficult to make.

I recently did a very rough piece of work looking across the councils in Hertfordshire, which I just decided to take as an example; it is a county relatively near to where I live. I was trying to find out where they were on their local plans and where they seemed to be going. When you added them all up, they only added up to 75% of the most recent household projections for that area. Housing projections can be quite variable, but actually household projections are probably not enough. Because of rising incomes, you probably need to build even more than the household projections. That just shows that there is still this gap between what is happening nationally and what is happening locally.

**The Chairman**: How would you suggest it should be addressed?

**Dame Kate Barker**: I thought we might get on to that when we talk about the NPPF. How would I address it? As a whole, I like the National Planning Policy Framework—this is one of your other questions—but one of the problems with the coalition’s and now the new Government’s approach to policy is the fact that they have made it very locally based. Councils of course have something called the duty to co-operate, and it is clear, again from the experience of reading through some of the planning documents for Hertfordshire, that inspectors look to see if they have made an attempt to co-operate with other local authorities, but of course they are all bringing their plans along at a different pace and they have them inspected by different people. Actually getting something coherent across a wider area is quite difficult, and a local authority that does not really want to play the game or whose people do not really want to play the game—because of course councillors do respond to what their constituents think—or a council that does not want to persuade its people to take their share of the responsibility will find it easy not to co-operate with the wider picture.

One of the things I would like to see is some focus back on a sub-regional housing market level, looking across the area, not just because I think it would help supply but because it
would help with the infrastructure and even the environmental questions. A local authority is not necessarily the right spatial level at which to think about questions such as biodiversity or water supply; they will very often run a little wider. This is pretty difficult, because we have local authorities being very much encouraged by central government to produce their plans quickly now. If you are going to specify something slightly different and sub-regional, it would be quite awkward to add it on but it would not be impossible to add it on as an adjunct and, specifically when inspectors look at soundness, to try to give more force to that, so that you could be sure that you were getting something across a housing market area that made more sense. It does go on to some extent. I am not suggesting that it does not go on at all, but not sufficiently.

**The Chairman:** I will just ask the final piece of this. Do you really think that at a sub-regional level you would get enough support for new housing that would meet up with the overall national plan for housing? The BANANA factor, as we have been told, is to not build anything anywhere at any time.

**Dame Kate Barker:** Getting local support remains terribly difficult. I am saying that I understand why it was felt that the downward pressure, which the Labour Party had introduced with the regional structures, should be stripped away. What we have now is still pressure from the centre, but it is coming through the planning system and the Planning Inspectorate in a way that in some sense I find less democratic and less efficient, because of the divergence of views between different inspectors. It’s not clear that my proposal would solve the problem, but it would help to get housing built in the right place, because local by local does not do it.

Alongside that, you might have to consider financial questions. Everybody says that the new homes bonus has not been effective, but at the margin it has made councils more prepared to think about housing. Personally, I would be prepared to go further. Planners do not like you saying that you should compensate people for losing their views, because they say, “You do not buy the view, you just buy the house and you understand that the view may or may not stay”. I would be sympathetic about saying to people, “You have lost this view. Maybe you should have some compensation”.

Page 74 of 1964
The Chairman: Surely that comes in the pricing mechanism. If you put up an estate of 800 houses or something and some had really lovely views, the same houses in a different part of the estate would sell for less anyway, I would have thought.

Dame Kate Barker: The point is that if you are on the edge of that estate and have the lovely view, and then another estate is built just beyond you and your lovely view goes, that does have an effect on your price.

Q59 The Chairman: The evidence we have had so far is that we have to consult locally, because too much goes on without proper consultation. Mr Lloyd, what do you think on this particular one?

Toby Lloyd: While I would not disagree with anything Kate has said, I do think there is more to it than just the planning system. The failure to build enough homes in this country, I would contend, is not fundamentally a failure of planning, although planning is clearly an important part of that process. It is a fundamental failure of the entire housing supply system, which includes private sector actors, landowners, developers and, as we have touched on, individual homeowners, just as much as it does public policy and public bodies.

Even the obvious point that has been raised about planning permissions is not really the be all and end all. In fact, there is plenty of evidence that planning permissions have been going up very fast and housebuilding has not. There is actually very little direct evidence and connection between the number of homes that get built and the number of planning permissions that are secured. It is always very easy to beat up the planners and say that it is their fault: if there is a failure—there is clearly a market failure; as you said, there is a consensus that we are not building enough homes—it must be the dead hand of the state getting in the way, surely. If not, the market would work perfectly and everything would flow. We would build more homes and prices would come down.

Clearly there is more to it than the planning system obstructing supply. In fact, the market has a very clear vested interest in not oversupplying homes, because developers quite rationally have no interest in building so many homes that prices are lowered. Therefore, it makes absolute market-logic sense to constrain housing supply to maintain maximum sales prices. That is how you maximise the value of your land assets. What this comes down to, therefore, is why it is that this market allows that sort of perfectly rational market behaviour
to occur. You cannot do that in other markets. You do not increase your profits as a mobile phone manufacturer by producing fewer phones so the price goes up, because someone else will come in and sell into that market. The key point is that of course housing relies on land and land is in fixed supply.

It is often said that land is only scarce because of the planning system. That is the wrong way round. In fact, we have a planning system because land is inherently scarce. That is why even the most liberal free market economies in the world all have some sort of land use planning system, because it is a fundamental fact of life that land does not operate as other factors of production, because it is in fixed supply. Therefore, the relationship between the market and the planning system is merely one factor in the way in which developers behave in the market so, if we are looking for why we do not build enough homes, we also have to look at developer behaviour. That is my first point.

The Chairman: There is another question in this session that will look at yet another issue.

Toby Lloyd: There is a real risk, though, of going round and round in circles over planning systems and planning targets. We can all argue about angels on the head of the pin and whether the targets should be X or X+10. We are not building half the homes we need. Targets are almost irrelevant in this context.

Q60 Earl of Lytton: This is probably for both of you. As you probably know, I am a chartered surveyor, so I know something about the issues, but when we are dealing with planning and new homes, even on the best shots the numbers that we are producing are a tiny percentage of the housing stock and it is the generality of the housing stock that makes up the market. Am I right in thinking that it is not realistic to look at just the annual input into that as a means for the 1% to control the other 99% of the market?

I ask that question because, it seems to me, there are not very many constituent bodies or groups out there that have any interest in lower prices other than the first-time buyer trying to get their foot on the ladder. How do we try to square that, given what this Committee is looking at, which is the built environment as a wider construct, in this context of planning and affordable new house or whatever type of new house development?

Dame Kate Barker: I just want to respond to something that the Chairman said. When I talk about going to a sub-regional level, it does not mean that I do not think you should consult
local communities. You have to consult local communities. The difficulty is working out ways
to deal with the in-built bias of local communities, particularly in the south-east, not to want
very many homes.
My other point about sub-regional is in some cases that I am sympathetic to local
communities, because their local communities may not be the best place to build and it may
be a neighbouring council. We need to have a mechanism to overcome that. I absolutely
think both that you need to consult local communities about the numbers and, indeed, that
developers need to work with communities in the way that is described. I do not have any
problem with that.
To answer your question, it is absolutely true that focusing on the rate of new supply will only
resolve very slowly the problems that we have in the housing market. This is a general
problem with the housing market: that policy changes produce their benefits after several
years. It is very difficult for politicians, because when they make the policy change there is a
great fuss and the benefits accrue down the line to subsequent politicians who have not had
to put up with the fuss. That of course is a problem in many areas of policy.
You say that it is just first-time buyers who have a problem, but—and I am sure Toby is going
to say this as well—it is not just first-time buyers. The people who really have a problem
today are the people in private renting, who are now 20% of housing. Sorry, it is not 20%
now, but it has gone up an awful lot. It is probably on its way to 20%. That is a lot of people.
Eurostat publishes some figures on housing stress: people who pay more than a certain
proportion of their income in housing. The proportion of people in private renting are the
ones who are struggling.
In some sense you are quite right: once, as a first-time buyer, you have your foot on the
ladder, unless you lose your job or have some financial crisis, particularly given the
affordability criteria that are used nowadays, your house is pretty affordable. If you are in
private renting and the rents go up and up, you may never be in a position where you are able
to deal easily with your cost of housing. I think it is really important not to have the debate
just about first-time buyers, but to have it about everybody in housing.

**Toby Lloyd:** On the point about the constituencies for increased supply, there is a very strong
perception in this country that a large majority, or at least a very powerful bloc, are absolutely
wedded to ever-rising house prices and will oppose any housebuilding. Actually, the evidence does not bear that up so much. It is the experience of people at planning committees: we get 20 people who all object, but that is a tiny minority. Actually, if you look at the British Social Attitudes survey, which has been asking the same question about nimbyism and attitudes to building in your local area, nimbyism and BANANA-ism—build absolutely nothing anywhere near anybody—have been declining dramatically in recent years. In fact, in the last five years alone, the percentage has completely flipped round from people saying, “I would support more housebuilding in my area”, to those saying, “I would not”, so it has changed dramatically.

In terms of who can actually speak up for it, the problem is that it is very vocal minorities who oppose. The people whom we represent—those in private renting who are stuck spending more than 50% of their income to secure a grotty and insecure home to raise their children in, or, even worse, those who are actively homeless and have literally nowhere to call their own—are the people who have a vested interest in more homes being provided, but their voices are never heard in planning debates or policy discussions.

The Chairman: If you have that information, a statistic or an article about how it has changed, that would be very useful. Certainly I have it in my mind that it is all a problem of nimbyism.

Dame Kate Barker: I may be unduly influenced by the fact that I live in a village where virtually every house has a notice in the window opposing greenfield development.

Toby Lloyd: To give you one story to counteract that, at Shelter we developed a toolkit called Shelter Housing Insights for Communities, which enables people, anybody—developers, planners—to look at different areas by postcode and identify which places and groups of people are likely to support development. The first time we tried this, just to help identify who might support a development, was for a greenbelt, greenfield affordable housing development. The planning committee, as a result of our action, got 60 spontaneous letters of support for the development. They said they had never seen anything like it, because they are only ever used to getting angry, screaming objections. It is because no one ever asks the people who do want more homes to be built and they do not go out of their way to tell planners that.
Baroness Young of Old Scone: I just wanted to follow up the point that was made about land being a finite resource. There are some who say that the land issue is the primary problem. I think you are right that it is a multi-faceted multi-organisation issue that we are talking about. From both of you, I would be interested in your perspective on how much land is currently being sat on by developers or local authorities and, indeed, how much of the current brownfield land is still undeveloped.

The Chairman: If you could give us those figures if you have them, they would be very useful. I am not trying to hassle you, but we do have a lot of questions to ask and it is always a problem: we get stuck on one.

Toby Lloyd: I can answer that very quickly. Yes, land is the central question, but it is not a simple matter of just an absolute shortage of land. There is plenty of land in England. It is sitting in developers’ land banks, quite sensibly. It is sitting in local authorities. Most of it is sitting just in agricultural use, to be honest. The issue is about how we organise its supply and the prices at which it is supplied for development. It is not about the ultimate quantum. We use more land for golf courses than homes in this country.

Dame Kate Barker: This question about the figures is very difficult, but in some sense I am not sure how helpful it is to know. There is a lot of brownfield land around, and much more work is being done by the Homes and Communities Agency, which I hope you will see, and by government in building up a central land bank. I happen to come from Stoke-on-Trent, which is full of brownfield land, but frankly the world is not full of people who are burning to go and live there. That is another difficulty: do we want to try to persuade people to live somewhere else? This is something else that we do not explore properly.

I have been encouraged very recently by one thing, however. Toby has talked about local authorities. This is not just local authorities. When we talk about landowners, we often think about fat cat farmers or whatever. Actually, the public sector, as we all know, is a massive landowner in many local authorities. I am encouraged that the Government are really starting to put pressure on to get public land developed and to develop it in a more imaginative way, so that the public realm will get more back for it. That is a very positive strand to what is going on at the moment.

The Chairman: Thank you for giving us that steer.
Q61 Baroness Andrews: Kate, if I may, I have to declare an interest, having been in the department when you produced your report. I wanted to take you back a little. In order to make a proper diagnosis of what we can address, what things we can change as opposed to things that are really difficult to change, I want to ask you about your report in 2006 and whether, if you had to revisit it now, if the Government had commissioned that sort of report today, your analysis would be very different. We have heard a lot already about the obstacles to development and the problems with consensus, and so on. We had a chance, in that particular Government, to take a big strategic look at housing for the first time. It was the first analysis of its kind, with big targets. I just wonder, if we revisited it, whether it would be different. Apart from what you have said already, what do you think were the crucial problems that we had as a Government in implementing it, and would that be the same for any Government?

Dame Kate Barker: Since the Chairman has encouraged me to be brief, I will attempt to be so. I produced the housing report in 2004. The 2006 report was about planning more generally. That was just for clarification.

The first thing is that when I wrote the report, and in some sense other people kindly said this on my behalf, I was slightly frustrated by the fact that I was only able to write about things that really affect supply. Mostly it was about planning and I did not have much ability to talk about the tax system, which is also relevant, or indeed about the mortgage market, partly because there was a simultaneous report on long-term mortgages being conducted by David Miles. If I were to write the report again today, and if I were to leave you with any thought at all today, it would be the one I really think about a lot: the failure of government to be coherent across itself in its approach to housing. You see this in many places, and because of looking at only part of it, I was guilty of partialness. I was appalled on realising how complex the housing supply problem was. I would never have agreed to write that report if I had known the issues.

Actually, some of the things raised in the 2004 report are better now. At the time, PPG3 had recently been introduced, which I thought was unnecessarily prescriptive for local authorities and was very focused on high density, not much parking and no building in villages. I thought that was very constraining. The move to the NPPF is a big improvement. One of the reasons
why supply is so low today is not because of failings in the report or, indeed, the Government’s response to it. It is actually because of the long tail of the financial crisis, which we struggle with everywhere, the loss of all the small builders and the changes in the mortgage market. As the housing market is rather slow moving, we have not yet fully adjusted to these, and indeed there is the slow response from government in getting public land out.

If I were to do it again today, I would say many of the same things. Some of the things are better. The ability to deal with planning conditions has improved post my review, as a result of the work of Adrian Penfold on administrative problems in the system. All that has got better. The NPPF’s focus on growth and encouragement of developers to do better local consultation, not this endless “We hate you”, is all very good. The planning side has got quite a lot better since I wrote the report.

I have talked about the fact that there are still some problems on the planning side, but I would be much more concerned today about something that I was bothered about at the time, which is already coming out in this session, and that is really good communication. I like Toby’s example that you can find places that are prepared to accept development, but actually local authorities are not prepared very often to try to put the arguments to people about what they are trying to do and why. They very readily say, “Well, central government wants to do this”. The Government then feel, “We will localise everything and it will all go away”, but the problems have not gone away. We have to try to get local government motivated to work with central government in putting this problem forward, which I do not think has really changed since I wrote the report.

**The Chairman**: Is it a case of passing the buck?

**Dame Kate Barker**: Yes.

**Q62 Baroness Parminter**: You have both touched on the issue of the NPPF in your responses to the first question. Could I invite you to say in a bit more detail, particularly you, Toby, about what you think works well and what does not work well? Dame Kate, could you say a little more about this idea that you have expressed about being able to add sub-regional planning to the end of the process, which is an interesting idea but I am struggling to understand how it could actually work?
**Toby Lloyd:** With an eye on time, I will try to be brief. The best thing that can be said about the NPPF is that it is there and that upheaval and more fundamental reform are probably very unhelpful, because it takes the industry an awfully long time to adapt and these are slow-moving systems. We are absolutely not calling for massive upheaval in the planning system. Where it fails is to really follow through on the logic of a plan-led system. The point of a plan-led system is to exert democratic control in determining what development will happen.

Unfortunately, the NPPF repeats the mistake of the entire post-war planning settlement, which is that it is reactive. Ultimately, it sets vague policies and then waits for proactive developers to come forward with proposals, to which the democratic response is “maybe” or often “no”. It is entirely reactive and passive, whereas a planning system ought to be determining what development needs to happen and will happen. Therefore, it can write the land values. Therefore, it can capture the value that is needed to support infrastructure, provide affordable housing and to allow for quality development that people actually want. Unfortunately in this country, we get the democratic involvement in planning at the wrong point in the process. It comes right at the end, when all the values have been baked into trading, the land market and so forth, so that there is very little real room for manoeuvre. At that point, we offer people the illusion of choice, but they do not really have it. What you end up with is a simple yes/no, and the answer is often no. Really, the place for democratic involvement is at the plan-making stage, which should then determine what is actually economically viable, not the other way around.

**The Chairman:** That is very interesting. That is actually looking for the real way that it would work, but how would you set about it? If you were in charge of all this, how would you set about doing that—i.e. consulting first and then getting the views of people—instead of imposing on them and then sweeping up afterwards?

**Toby Lloyd:** The late great Sir Peter Hall used to say that everyone extols the Dutch planning system, and I am one of these people who extol the Dutch planning system, but it is exactly the same as the British one. The difference is that they take it seriously; they do it properly. It is not about the system; it is the way we use it. If you look at most local plans, they do not exist, are massively out of date or are just woefully vague. They do not actually say anything
about most of the area. Most of the time, it just relies on developers to come forward with proposals, which the local authority then judges against fairly poorly defined criteria. A local plan or a neighbourhood plan, if that is the way it is going—and either is fine by me—needs to have a strong proactive vision for the whole area that it covers, and that can involve huge amounts of not just consultation but active participation of local people.

**Baroness Andrews:** I entirely agree with you, Toby. Is not part of the problem actually that most local plans deal with things as they are? At the very most, you are looking at a bit of urban extension or a bit of translation of local infill. There is not the massive opportunity for the big design, the big greenfield site or whatever it is, so somehow we have to feed possibilities into the culture of training and education.

Would you agree that in infrastructure planning we did try in the 2008 Act to introduce the notion of local democratic accountability earlier in the process, so that people were part of the argument and part of the formation, rather than just reaction at the end? That was not very successful at all, because there are all sorts of democratic tensions between the people who get a benefit and the people who cannot see a benefit. Although we do not want to reform the planning system again, we are looking at what effective change would be, which is likely to have the greatest impact.

**Toby Lloyd:** At this point, I would say that it is insisting that local authorities come up with proper, comprehensive plans as soon as possible and that those are given sufficient teeth, so that, rather than being seen as something that is there to be fought and argued over, they are the strong planning documents that write the land value. If your local policy says, “Fifty per cent affordable housing”, that is what it means, because then the market adjusts, the prices adjust accordingly, and development is viable. As soon as you accept that, “We will flex on that”, you have dug yourself a hole, a viability, which you will never get out of.

**Baroness Andrews:** Is that not a case for national planning?

**Toby Lloyd:** No, it can be done at a local level, too. It does not really matter which level it is done at as long as it is strong and clear. Where it does matter is when you are talking about very large developments, where you need a national steer, but the principles are exactly the same, whether it is at neighbourhood or national level.
**Dame Kate Barker:** I will try to be brief. You have embarked on something where I do not quite agree with Toby. I do not disagree, by the way, that the planning system simply does not work now because local plans are not very good. The habit of waiting for people to bring land to you, rather than saying, “Actually, we would quite like this land to be developed”, is a difficult one. Of course, you cannot force a landowner today to sell a piece of land if they do not want to. You can say, “We think this is a great place for development and we want 50% affordable housing. Therefore, the price is lower than it was 10 years ago”, and the landowner says, “I think I will just wait for this council to go away”.

That is a big problem. I do not say this happily, but trying to think about how you persuade landowners that you have changed the land market so they are not going to be able to make huge sums of money from selling for housing is fundamentally one of the problems, and I do want to distinguish here between landowners and developers, because it is often landowners, including the public sector, who are very keen to get these large sums of money.

On the sub-regional, I am completely with Baroness Andrews about not wanting to tear up the system. You are quite right. You and Toby are both saying the same thing: you want to identify quite big places where you might do a new town or a big urban extension. That will be easier if it is seen at a larger area than a local authority. It is about trying to work with a group of authorities, making the duty to co-operate have more teeth, so that in the plans the consultation between local authorities is much more real. It is getting the Planning Inspectorate to approach it with a more consistent view, so that if you have two planning inspectors looking in the same area, they do not take different views of where would be a good place to build in that area, because that is not going to give you a sensible and comprehensive plan. In that sense, I want to reintroduce it. From the environmental point of view, environmental issues do not sit in local authorities; they sit much more widely, and it is genuinely harder to address that.

**Q63 Lord Inglewood:** I had better declare an interest as a landowner. To some extent, Kate Barker replied to some of the points I was going to put to Toby Lloyd. It seems to me that you are not right in describing the planning system quite in the way you did, because there is a residual CPO power in local authorities to promote schemes. It is not merely its use, but actually its existence that acts as a kind of catalyst towards bringing things forward. I do not
disagree with you that there are many instances where, either for reasons of greed or perhaps sometimes reasons of sentiment—for example, wind farms—landowners decide not to do something. I do not think that the analysis you have given is necessarily completely balanced.

**Toby Lloyd:** I make no apologies for the fact that, as a representative of Shelter, our interest is in ensuring that the nation is adequately housed primarily, rather than that the sentiments of landowners are satisfied. I appreciate that there is often a tension there, and I declare my interests as to which side of that tension I sit on.

**Lord Inglewood:** I entirely accept that you are an advocate for Shelter, but if you are describing the planning system, which is what we are interested in here—I am not trying to argue the interests of landowners—we have to see a picture that is as closely in agreement with the reality of the arrangements that are in place as we can. Then we can politically, quite properly, argue on the barricades, either the same one or different ones.

**Toby Lloyd:** Where I would agree with both you and Kate is that the planning system alone is only one part of it. The zoning approach that I have outlined is only one element. You also then need the mechanisms for making sure that it happens, including compulsory purchase, which is a vital tool within the operation of the land market, the planning system and the development industry as a whole, which has fallen into terrible disuse, effectively because of a series of case law, which has meant that it only really works now to overcome very egregious blockages. It does not work to give that zoning approach to planning teeth.

In other words, it does not serve to communicate to landowners that the price you will get is that which reflects the local plan, including all the infrastructure, affordable housing and environmental requirements that that plan specifies. You need compulsory purchase to act exactly as you say—as that last-resort incentive to encourage landowners to participate positively. If it is there, you never have to use it, because then you can strike reasonable deals, based on reasonable land values that reflect the requirements of the local community.

**Lord Inglewood:** I entirely agree with your general approach, but is there not a problem with things like the European Convention on Human Rights if you approach compulsory purchase on the basis that you will not compensate people fully for the market value of the asset?

**Toby Lloyd:** No, there is not. The European Convention on Human Rights is very clear on this point. After all, it is European and its methods are used all over Europe far more effectively.
than they are here. As long as there is a clear planning policy that says, “This is what the community requires”, it is perfectly acceptable to human rights.

**Lord Inglewood:** You still have to pay full market value.

**Toby Lloyd:** The market value will be determined by what the planning policy says.

**Lord Inglewood:** That is right, but there is an argument that we have seen canvassed, and again I am not trying to argue one way or the other—I am trying to stand back—that says that in certain circumstances the public sector should be entitled to acquire the underlying asset, i.e. the land, at less than its market value. This is what Kate Barker has been suggesting. I am saying that I think there is a problem with that, forgetting about any other consideration, from the perspective of the human rights legislation.

**Toby Lloyd:** We have had councils’ advice on this matter and it is less significant a concern.

**Dame Kate Barker:** There are examples where land is compulsorily purchased. I have to say that I am kind of with Toby on this, because if we are talking about urban extensions and new towns, you would have to make this kind of land deal there. The question about the market value is a tricky one. I accept this and I hope that perhaps this Committee can produce some legal argumentation on it. In some senses, particularly if you are identifying a site for a new town, the truth is that if the new town is not built, your land is probably of agricultural value. Of course, if it is built, it goes up to several millions a hectare. The cost difference is enormous. The question is where in that you might think would be a reasonable place to put the price. I would not, for example, support trying to give people agricultural value. That would seem to me to be quite wrong, because you are forcing them to change their land into a new use willy-nilly, when they might not like it. Equally, if I was building a new town I would not want to give them the full price that you would get for a development on a more normal site. There is a serious question as to how you set up a national policy that would enable you to do that. I also agree with Toby that, although we are talking about the land market, this is such a regulated market that the public sector sets the price to some extent. It is the outcome of the planning system and the incentives around it that enables land price to be very high or result in land prices that are very high. A different planning system could quite well result in a different land market. The problem is persuading landowners that what you have changed is going to be changed permanently. That is very hard and we have plenty of history of people
who think that they will wait it out. Unless you are prepared to use compulsory purchase, that is where it falls foul.

**Lord Inglewood**: I entirely accept the generality of the problems as you have analysed them, but it is not straightforward, as we know. My only stone to throw in this particular pond is that of course the characteristics of the land market as you have described them—and I do not disagree with quite a lot of what you have said—are probably the same as the characteristics of the art market. Two pictures of the same size, one by Rembrandt and one by me, are worth very different amounts of money.

**Dame Kate Barker**: Yes, absolutely. It is entirely site-specific. It is one of the reasons why policy is so difficult.

**The Earl of Lytton**: I was only going to make a very brief comment. I am with Lord Inglewood on this, because the Land Compensation Acts, as we have them at the moment in this country, provide a very clear framework. If you are going to have wholesale compulsory purchase, I would suggest that in order to achieve your aims we would have to rewrite those particular bits of primary legislation.

**Toby Lloyd**: You absolutely would, and I am very pleased that the Treasury is looking at this question.

**The Chairman**: Lord Inglewood, you have a question. Have you been sufficiently informed?

**Lord Inglewood**: I am quite interested in a sort of rider to it about zoning. The system of planning is not based on zoning, and each of you has indicated to some extent that it would be a shift in the right direction to go that way. If you were to do that, do you think it is realistically possible, then, to make sure that the quality of what is subsequently built is going to be of as good a standard as we would like? Clearly, living in well-designed, well-built housing is a better experience than the opposite.

**Toby Lloyd**: Yes, I absolutely do. In fact, all the evidence is that zoning tends to deliver far higher quality than the speculative model that we currently use.

**Lord Inglewood**: That is by its inherent nature.

**Toby Lloyd**: Yes.

**Lord Inglewood**: You do not need to do any more.
**Dame Kate Barker**: I would quite like to ask Toby why, but anyway. Zoning gets used in lots of different ways. I am sorry to ask you this, but what exactly do you mean by “zoning”?

**Lord Inglewood**: Basically, the way I see it is that once you have an allocation on a map, you can more or less go ahead and build.

**Dame Kate Barker**: That is fine, but in order to get the quality that you then want—I talked about this back in the 2004 review—you have to specify building to a certain standard and quality, and then that is fine. You cannot just say that it is fine to build housing, and I am sure that is not what Toby is saying either.

**Lord Inglewood**: We have building regs and all the rest of it.

**Dame Kate Barker**: Yes, but you probably need to go beyond building regs. Everything that is built coincides with today’s building regs. You might want to say something specific about that area and that you wanted a particular type of housing. You will more readily get that—and in a sense Toby is right—because you have the certainty that you will get the permission. That will then be a bit more like the Dutch system. I agree with Toby that the thing with the Dutch system is that they have much more weight on democracy in the plans, and people take the plans more seriously. Once those plans are in, objections to stuff being built under them are pretty much dismissed, but it would be psychologically tricky here to make that shift, because people are used to ignoring the planning system.

Again, to go back to my experience trawling through these local plans, I was interested to see that the planning consultation for Stevenage, which is not a small area, received 188 letters. I bet you that every single development in Stevenage gets close to 188 letters about it, and it is because we have somehow not persuaded people that they should take more of an interest in the plans and be exercised at that level, and then that things have more chance of going ahead.

**Lord Inglewood**: As an ex-chairman of a planning committee, I agree with you about that.

**Toby Lloyd**: That is why zoning is the answer. A masterplan zone gets people very exercised. It is a really good opportunity for people to engage positively. The reason why it drives up quality, assuming you have set proper minimum standards, is because within a zoned environment, where planning permission is guaranteed and the land value has been written in advance, the competitive pressures on different developers are not who can get the most
planning permissions for the smallest units and build them cheapest; the competitive pressures are who can make the best quality product, because that will deliver them the best return. The land price is already fixed. What you build is already fixed. Therefore, you only make more money than your rivals by making better, whereas at the moment the competitive pressure is all the other way round and drives quality down, rather than up.

**Lord Inglewood:** I admire your optimism.

**Baroness Whitaker:** It is very reassuring to hear that zoning can improve quality, but it would be very helpful to us if there was hard evidence of this. Maybe you can send us something.

**Toby Lloyd:** We have huge amounts of evidence, mainly from Holland and Germany in particular.

**Q64 Baroness Young of Old Scone:** The greenbelt has done not a bad job of stopping ribbon development and maintaining the character of the countryside, but do you think that it is now getting in the way of delivering sufficient new housing? If change to greenbelt policy is required, how would you stop the public from doing what they did when we wanted to do something to the forest estate?

**Dame Kate Barker:** I was really reluctant to say anything negative about the greenbelt, because my experience is that it can result in a lot of unpleasant post. I am saying that because it is important background. When you look at the greenbelt, of course, you discover that it occupies more of England than built-up areas, which is the first surprising fact that people should think about and hang on to more. The second thing, of course, is that it is not an environmental designation; it is a planning designation. I completely agree with you: in a lot of places, the greenbelt has done a very good job at keeping developments apart and looking after the setting of historic towns. All those things are really important, but it does not mean that it is right to have it in exactly the same place for all time. It is right for local authorities to be encouraged to do greenbelt reviews.

I am increasingly of the opinion that that is the right way to go: to give authorities guidance about greenbelt reviews and encouragement to think about whether the bits of greenbelt that they have are still in the public interest or not and are still or not performing their planning designation. I am not one of these people who say, “We just get rid of the greenbelt
and all our problems are over”. That is to misunderstand the importance of the greenbelt and to overstate the value of just removing that designation, because actually people do not like greenfield developments either.

This is one area in which the new planning guidance, which on the whole I welcome, was unhelpful, because it says that unmet housing need is probably not a good reason for going into the greenbelt. As a matter of fact, I do not think that is right. You just have to look at it in a more constructive way. Actually, lots of local authorities do greenbelt reviews. As I say, they should be encouraged to carry on with them. I am not sure, as you rightly imply, that drawing huge amounts of attention to it, as opposed to making it a locally thoughtful matter, would be very helpful. You would just get a big negative response.

Toby Lloyd: I entirely agree with everything Kate has said and would just go one step further. If you were to remove greenbelt restrictions at a national level, all you will do is spark a massive speculative land trading frenzy, which will quite probably end up with no more homes being built and certainly not in the right places. The greenbelt is a huge opportunity, precisely because it has suppressed land values in the very places where the market wants to develop most. It is a great opportunity to release land at low cost, enabling the uplift to fund infrastructure, affordable housing and all the things that people want to see.

We need to treat it as an opportunity to release bits intelligently, rather than as an environmental designation, as Kate says, but also not to treat it as some kind of sclerotic dead hand of the state getting in the way of the market. It is actually a great opportunity to get development in the right places, at the right price.

The Chairman: You have got my brain stirred. If there was a certain amount of greenbelt—a hypothetical situation—and the decision was made that in order to fulfil the obligation of getting more and more houses, you really had to create something that was a sense of place, which we have heard from Professor Carmona about, there would be a very strong argument to release greenbelt, which would make the subsequent housing estate or housing quarter much more acceptable and add to the overall whole.

Stevenage is a fortunate one to think about. You probably saw on the television last night about it being the first new town of Queen Elizabeth’s reign. As a result, they are always celebrating it and they have a great sense of pride there apparently, but there are other areas
where developments have looked really ghastly and could be hugely improved overall by adding on new satellites around them, which use the greenbelt.

**Toby Lloyd**: Absolutely, and that requires exactly that proactive approach to it, rather than incremental nibbling away at the edges, which leads to crummy developments, which are what really riles people: crummy developments on the outskirts of existing settlements. Strong confident bites out of the greenbelt are a far better way to go, whether it is doubling the size of Stevenage, urban extensions to other places or even smaller things. The M25 is entirely on greenbelt land. No one is really suggesting that every inch of that motorway verge is the most precious environmental designation in the country. There are huge amounts of industrial land in London that do not really need to be there. It would much rather be next to motorway junctions in the greenbelt, freeing up industrial land for high-density housing in London, for example.

**The Chairman**: Is that hypothetical thing I talked about likely to gain traction?

**Toby Lloyd**: It is not, under the current system. This is the failing of the planning system at the moment, which does not have that national level to drive significant growth like that. Stevenage is the perfect example. Stevenage wants to grow, but it cannot get co-operation from its surrounding authorities.

**Dame Kate Barker**: That is indeed another good reason for mentioning it. It is a good example where the duty to co-operate has not worked, and there are plenty of other examples. Nottingham is an example.

I do not know if you remember the Wolfson prize, where people were asked to design garden cities. The winner of the prize in fact produced an urban extension, which they gave an odd name to. It sounded to me a bit like Uttoxeter, but was not; it was actually based partly around Oxford. Cambridge has been good on releasing its greenbelt. Some of the development around Cambridge is good and some of it is less good, but on the whole they have been doing some quite interesting stuff.

**The Chairman**: Actually, we are coming on to that in the next question.

**Dame Kate Barker**: Oxford has not released its land. What happened the day after the Wolfson prize was announced? The then Minister said, “We would never do anything like that”.
Q65 Baroness Whitaker: That leads us really nicely on to garden cities. There have been warm words about garden cities ever since Ebenezer Howard came up with the idea, but not an awful lot of them have actually happened. I would like to ask both of you if you would agree that one of their chief advantages is that the increase in the land value accrues to the local community. Can you say what you think the prospects are for new garden cities and the factors that will determine whether they come about and really work? Can you focus a little on how one would ensure a proper social mix, neither a dump for just affordable housing nor elite tax-advantaged people? How can you continue keeping it thriving? Can you help?

Toby Lloyd: I came second in the Wolfson prize with our proposal for a new garden city. To answer your many questions, the first answer is yes; garden cities are a good way of doing precisely this. In fact, whether we are talking about zoning or urban extensions, these are all the same thing; these are just ways of doing large-scale developments that get land in at reasonable prices and capture that value to ensure that there is adequate provision for affordable housing, infrastructure and quality. They are all the same thing. It does not matter whether it is the public, private or voluntary sector. The great estates of west London are kind of an aristocratic version. Letchworth Garden City was a philanthropic, charitable version. Stevenage New Town was a state-led version of exactly the same model. The Olympic development in East London is exactly the same model. It really is not rocket science. The great thing about garden cities is that they have the name “garden” in the title, which makes them more acceptable to a lot of people. That really is the only difference. It makes perfect sense. Let us talk about garden cities, rather than new cities, which sound scary.

Baroness Whitaker: Do you think a garden city is the same as a new town?

Toby Lloyd: In its key economic aspects, yes, it is. The design aspects are different, but to be honest those have changed anyway. No one would design a new garden city in the same way that Ebenezer Howard designed Letchworth, for example. It would be considerably higher density. The housing composition would be different. The design aspects have changed in any case. What matters is the economic model and the social model that the garden city envisaged.

The Chairman: Can I ask a question? I just have to ask it. Have any of you been on the High Line in New York?
Dame Kate Barker and Shelter – Oral Evidence (QQ41-51)

_Toby Lloyd_: I have not, no.

_Dame Kate Barker_: Yes, I have.

_The Chairman_: The change that has happened there over the last five years is incredible. It was done in this awful sort of warehouse part off the river. When I was there last time, just about a year ago, all those warehouses had been converted into condominiums and social housing. Right through the middle of it is this ex-railway, with a wonderful garden, for a mile and a half. I know we cannot do that, we cannot actually replicate something in New York, but the very idea is bringing greenery into the centre of a ghastly area and then building all these brownfield sites into huge homes.

_Toby Lloyd_: That is exactly what we are doing in Stratford. There is a fantastic new park there. There are fantastic revived urban waterways, and tens of thousands of homes being built. It is exactly what is called “regeneration”.

_The Chairman_: I must go there.

_Baroness Whitaker_: If I may clarify your argument, is it your contention that we just need to apply the sort of good planning ideas that we would to any urban redevelopment to get what other people might call a “garden city”?

_Toby Lloyd_: What makes a garden city unique is, first, that it is a single large planned development. Secondly, it captures land value, but, again, you could do that without calling it a “garden city”. Thirdly, it gives a strong element of community ownership and control to preserve that ethos. Those are the three key elements that make a garden city, in my view.

_Baroness Whitaker_: What about its economy and jobs?

_Toby Lloyd_: In any decent place, whether it is a garden city or not, you would want to have a decent economy and jobs. Those are universals of development.

_Dame Kate Barker_: I sort of agree with Toby that the key thing that both of us want is to see some ideas for big new places developed, where the public sector puts itself forward, in the way it did with the new towns, and gets the land value in. I completely agree with that. Garden cities are slightly different, because they place a bit more weight on the greenery and environment, but you would hope that anywhere would do that. I rather dislike the habit of calling things like Ebbsfleet garden cities, in a slightly random way, where something was already going on, and designating it as a garden city. I am not sure what that would do.
I also agree that one thing that is interesting about the garden city movement, and is interesting about Letchworth today, is the continuing way in which it is managed and run so that it has more community involvement. That is incredibly interesting. If you ask whether garden cities will solve the planning problem, Milton Keynes built at an average rate of 2,500 a year. You just have to bear that in mind.

The key thing for me is not: should we have garden cities? Yes, but they will not do the job on their own. Plenty of work has been done, partly in the Wolfson prize, about how you might design them and make them really interesting and exciting places where people will want to live. Milton Keynes and Stevenage are not places that trip off the tongue as great places to live, but we know that both of them are places where people enjoy living and get a lot of value from that.

The Chairman: Perhaps we should ask Ebbsfleet, if they extend all around Ebbsfleet, what name they would like to give to it, other than “garden city”.

Lord Inglewood: A quick point arising out of this is if you can say what differentiates the ones that work from the ones that do not, really.

The Chairman: That is a good point. If you cannot give us that answer straight away now, could you write to us about it? I am very conscious that we have been carried along.

Dame Kate Barker: To some extent, that is the point that was made. It is about economic connections. New towns that were built with not particularly great building standards and in places that were not especially economically vital do not really work. Towns rise and fall. I referred earlier to the fact that I come from Stoke-on-Trent. It has probably never been a pretty town, but when I grew up there it was an economically vibrant town. It is not the fault of the planning system that today it is not a very pleasant place, although I would like to say that I am enormously loyal to it and one day hope to go back and have a house there.

The Chairman: It is all the fault of table-top industry not keeping up to date.

Dame Kate Barker: Should we get distracted on to the pottery industry?

The Chairman: Seriously, that is what happened, with Johnson and Wedgwood.

Dame Kate Barker: Sorry, I could dribble on about this—and the closure of the mines and steel, of course. It is not the fault of the planning system and it is not wrongly located. It sits on the M6 and the main line.
Baroness Andrews: Perhaps our two witnesses could give us a note on what they think are the lessons we can learn from the eco-towns, because that has been our only attempt in recent years to plan, from scratch, for coherent locations and towns. They were very problematic.

The Chairman: I will make a submission, because I was deeply involved locally on that one.

Q66 Baroness Rawlings: Dame Kate, you mentioned earlier on that you regretted that your 2004 report did not include taxation problems. We would all agree that the taxation of land and property is a complex topic. Could you expand on three points? Then I have one question. The three points were about the stamp duty reformed to end its slab structure and the lost revenue, partly replaced with the site value tax on vacant land that is both urban and brownfield. Your other point is that higher bands should be added to council tax and that the single adult discount should be abolished. Could you say why, and expand a little on why VAT should be removed from major household renovations and extensions?

Finally, what tax incentives might be used to encourage developers to build faster on land already allocated for housing that has planning permission? Sorry, that was quite a lot.

Dame Kate Barker: Yes, there is a lot there. I would make two general points about tax first. One is that if you are going to use tax very actively to improve the housing market, you have to be aware—and I am slightly concerned that some of the things Toby was saying would fall foul of this—of doing too much to values today. Values today sit on lots of people’s balance sheets. If you disturb land values incredibly rapidly, because you disturb house prices incredibly rapidly you have to be aware that there will be a lot of collateral damage. Changes to the system often have to be introduced gradually and thoughtfully. In fact, the Chancellor’s proposals to change mortgage tax relief on buy-to-let landlords, which on the whole I support, were announced two years before anything happens, and a four-year period is very helpful because it enables a good adjustment process. That is a general point.

My second general point is that when I wrote about the tax system I tried to think about it coherently rather than address it point by point, otherwise you get unintended consequences in different places. People often put forward a tax proposal that they think addresses one thing, but it has spillovers. I was trying to think about changes that went in two directions: partly changes that helped the market to work a little better and encouraged some land into
the system, but partly changes that changed the incentives for homeowners, which is much more contentious.

To answer your question specifically, on stamp duty the Chancellor has now got rid of the slab structure since I wrote about it, so that is great, but he did not pay for it by introducing a site value tax; he paid for it by having much higher rates of stamp duty at higher levels, which I would do. I wanted a site value tax on vacant brownfield land because it is important to try to get brownfield land into better use. It was one of the things I very much wanted to introduce in one of the reports. I now cannot remember which one, but anyway it proved quite difficult.

Why do I want to increase council tax higher up and reduce the single person’s discount? This all comes back to a view about the housing market overall. Like Toby, I want to see everybody adequately housed. I do think that there are some environmental costs to building more housing, actually, because it uses up land. I also do not think that land is finite, but there is some evidence that if people live in bigger houses relative to smaller houses, they use more water. You might think that you do not necessarily want to encourage everybody to live in the big house that they might otherwise want, because the more money you have the more space you want. Housing is an income-elastic good, so if you are richer you tend to want more of it. That is why the household projections would not be enough to stabilise prices. You have to build more than household projections to stabilise prices if incomes are rising. Of course, with the financial crisis, incomes did not rise. Sorry, this is proving to be a terribly long answer.

If you therefore think that from an environmental point of view you want to constrain how much is built but you do not do anything about demand, you will end up with what we end up with today, which is that some people have a lot of money and live in very big houses. We know that there is more housing stock per head than there used to be; it is just that we share it very badly. I live in a reasonably sized house and I dare say a lot of you do. Something like 8.1 million people live in underoccupied homes, but at the other end you have these people often in private renting who live in overcrowding.

Part of the reason why this occurs is that we all have an incentive to invest in housing. It is absurd to say that there should not be an investment motive for housing, because it is clearly
part of your financial planning to put money into a house. That is perfectly reasonable, but the fact that government constrains housing development for environmental reasons and then you have an incentive to invest in it does not seem right. The reasons for wanting to increase council tax on higher-value properties and to reduce the tax relief for single persons is really to try to have some way of discouraging investment in housing and discouraging underoccupation, in order to ensure that our housing stock is shared more fairly. I have to say that this is politically pretty tricky, as indeed is my proposal on CGT, which you did not mention.

VAT is a bit simpler. If you have a house and you want to make a big extension to it, it may be cheaper to knock it down and start again. This seems to me absurd. A good way of increasing supply and densification would be to make that a little cheaper, so actually I think I would just clean the VAT system up. It is a much more trivial argument. It would also help revive the small building community, which would be a good idea, because then they might go on and build houses. That is a relatively simple one. I am sorry that was such a long answer.

The Chairman: The other thing you have not mentioned of course is the fact that families are much smaller now and that there is huge demand, particularly away from London, from people who live in big houses trying to reduce to downsize to get more equity back. Also, 40% of households are now one or two people apparently. Can you check out those figures and let us know?

Dame Kate Barker: The average household size in the UK is still around 2.3. Unlike other countries, our household size has not been declining, partly because of the constraint. For homeowners, household sizes are quite small and they have quite a lot of rooms. Private renters and other people are quite crowded. To sum up the point I am trying to make, it is that because we live in a small place we feel we should huddle up. At the moment, only poor people huddle up. Rich people do not have to bother.

Q67 Baroness Rawlings: Can I just ask you about encouragement to developers? What tax incentives?

Dame Kate Barker: I apologise for not answering that question. I declared my interest at the beginning of this meeting, so perhaps you would not want me to answer that question. If I were to answer, I would say that I am not in favour of necessarily placing a tax on
permissioned land. First, the issue about permissioned land is misunderstood. Toby was right about the fact that permissions do not quickly lead to building. They do not, partly because if you have a very big site you do not build it out all at once. Actually, probably nobody would want you to build it out all at once.

If you go back to all these figures about these unbuilt permissions, you find that not so many of them are on projects that have not been started. When they say that there are 400,000 unbuilt houses, that is because if you get permission for 1,000 houses and you have only built 100, which is very often the case, the whole site goes down as being unbuilt. Do you see what I mean? It is an exaggeration of what is unbuilt.

The other thing is that if you start from the date of the permission, you will almost certainly get a delay, because you then have to clear your planning conditions, which can often take quite a long time. To put my developer hat on very briefly, at the moment it often takes a disproportionately long time, because local authorities have had to reduce their staff and we just cannot get people to clear our planning permissions. It is not surprising that there is a delay.

Then the question is whether we can do something at the margin to force developers to build out a bit more quickly, so that they do not necessarily get quite as high a price as they would have got. Of course, the tax system will do that, but you have to remember that that will then increase developers’ risk and the cost of that will get borne somewhere else. If you did it today of course, people would build out more quickly, but they would be a lot more cautious about the next set of planning permissions they applied for, so actually it might make the future market less elastic. Today, if there are permissions about and demand rises, the industry can respond. If you make it expensive for them to hold permissioned land, they will not have as much permissioned land and that may make the market less elastic. You have to be very careful in thinking about that.

It is perfectly possible on public land, and I am quite supportive of this, for the public sector to say, “We are going to give you a contract and you have to build this out”, but then the public sector has to recognise and bear the risk of that build-out rate, and that is a slightly different proposition.

The Chairman: There is just one point.
**Dame Kate Barker**: I think Toby ought to be allowed to reply to that, because I am sure he has a different view.

**The Chairman**: Is there a case for looking at some fiscal penalty on developers or people who hold large land banks and do not even pretend to want to build on them, on the basis that land has gone absolutely through the roof?

**Dame Kate Barker**: This is terribly difficult, is it not? Taylor Wimpey holds several years of land—let us be straightforward about it—but you would not want us to build on it all tomorrow. When a local authority produces a plan, it produces a plan for 15 years. If we, the developers, all said that we wanted to build on it today, they would not give permission for the whole 15 years at once, because they have views about sequencing. I am not suggesting for an instant that the land market works terribly well.

The other reason why you have a large land bank, though, is that you do not necessarily know where your permissions will come from. You want to have a lot of land, because you are uncertain about where the permissions will go. If you go right back and read the report that the OFT wrote about housebuilders and the land bank, it explains why it is an important part of the business model.

You could change it by deciding to have a tax on all land, but that would not necessarily just be aimed at developers. It would be much more differently motivated. It would actually be motivated on the fact that land is, in some sense, an undertaxed thing, but it would not necessarily help the permissions. That would be about equality, which gets you into Piketty territory, which I do not want to get into.

**The Chairman**: Can I just ask for about three sentences from Mr Lloyd on that one? I suspect his attitude will be quite different from yours.

**Toby Lloyd**: It may not be as different as you think. Kate’s answers are extremely thoughtful and well considered. I absolutely agree about the complexity and the delicacy of this area, but she is also absolutely right that tax changes are a potentially very important tool, which we have underutilised, in order to change incentives, both in the homeownership market and in the development market. We do need to be looking at both ends: the demand and the supply side.
There is no simple answer on the developer side, and, again, I agree that it is too easy just to point at current land banks. Actually, the real issue there is probably more about strategic land banks, which no one really has any handle on, because developers are slightly tricky about admitting what they are. Most of these are optioned sites, so they are typically still owned by a farmer and under agricultural use, but are optioned for development at some point in the future. It is complicated; I do accept that.

The one element I would just like to chip in on, in addition to everything Kate has said, is to consider levelling the playing field more between buy-to-let investors and homeowners. At the moment, buy-to-let investors have a colossal tax advantage, and then we wonder why a whole generation is being priced out of ever owning a home of their own. There will be collateral damage in any change; there always is, and the losers will always scream.

I would just like to make one final plea; 90,000 children will wake up on Christmas morning homeless in this country. Are they just collateral damage or are we not prepared to be a little brave about trying to change some of these systems so that they work better for the people who are already losing out from the current system?

**The Chairman:** That is a wonderful note on which to end your session. I am sure that we could go on for ever, but we have another set of witnesses. Are there any other issues that you would like to raise with the Committee? Would you like to tell us about them? Perhaps you could write just a few points. Also, if you were in my position, what do you think would be front of mind in the things you would like to see in the report coming out, say three recommendations? You have one minute. In fact, think and write.

**Dame Kate Barker:** I would like some stern stuff on public understanding, ensuring that public consultation is done in a more interesting and imaginative way when you are doing plans, although it is pretty hard to interest people. I would like the Government to do more solid work on the costs and benefits, in environmental terms, of extra housing. I would like government to be really joined-up, so that the Bank of England, DWP, the Treasury and CLG actually think about each other.

**Toby Lloyd:** I would agree with all that. We need a serious coherent plan from government. From this Committee, what would be really useful is to bottom out what “zoning” actually means. There is a lot of talk about it at the moment, and as with garden cities—a whole series
of crack developments labelled “garden cities”, which do not live up to the name—we are in danger of doing the same with the zoning approach, where it will be a label slapped on things that does not do what it needs to, which is to get to the land value question at the heart of development.

The Chairman: Thank you very much indeed, both of you. It has been very stimulating. You can see by the questions asked that we are engaged and very excited about this. I want us to report with a report that is going to be of use in the future, as your two were. Thank you very much.

10 September 2015
Introduction

I would like to relate experiences I and others in the local community had with certain aspects of the Northern Line Extension (NLE) project which is currently taking place in London. This is relevant to your questions 11 and 12 below:

Community involvement and community impact

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

Although this is a single case, it reveals some problems with the system, in particular the legal framework, currently in place.

Background

I am a Chartered Surveyor working and living in London. The Northern Line Extension (NLE) project is happening on my doorstep and will continue to have a major impact on my life, and the lives of hundreds of other local residents living adjacent and thousands of people who pass through the area on a daily basis, for years to come.

During the planning stages of the project, which formed a Transport and Works Act Order (TWAO) and deemed Planning Permission application, I tried to meaningfully engage with the promoter of the scheme (at first Treasury Holdings, and latterly Transport for London), as I had ideas and opinions regarding their plans.

Overview of this particular case

During the consultation, in relation to a particular aspect of the project, I identified and suggested a better alternative. Briefly, the NLE promoter’s plan is to locate ventilation shaft underneath Kennington Green, connected by a shallow connecting tunnel to a 3-storey ‘head house’ building at the side of the Green.

Kennington Green was a small public open space with a number of mature trees. The Green was a valuable amenity used by local residents and by local workers. On two sides of the Green are Grade II or Grade II* listed Georgian houses and the whole area is within the Kennington Conservation Area which is notable for its smart terraced housing. The Green therefore has high heritage and townscape significance. The Green is surrounded by numerous buried utilities including a 36-inch gas main from the nearby Oval Gasholders.
Utilities diversions started in February this year and are expected to continue until the end of November. To build the head house requires the taking of land from the Beefeater Gin distillery; it also required the demolition and rebuilding elsewhere of the distillery’s tanker filling station. To achieve this the promoter had to purchase additional land on the opposite side of the distillery to the Green and add it to the distillery’s site. Montford Place (which leads off Kennington Green) is a popular route for pedestrians as it provides access to Tesco and towards Vauxhall Station and local schools. The promoter’s pedestrian survey recorded over 2,000 people passing during one 12-hour period. Currently, residents and those passing through the area are subject to road and pavement closures and diversions and this will continue for another 3+ years. Once the works are completed, the Green will be reinstated, but due to the connecting tunnel under the Green, the areas where trees can be put back are significantly limited.

The Secretary of State’s official recorded view is that the scheme has “a seriously negative effect on the character and appearance of the [Kennington] conservation area and the setting of the surrounding listed buildings”¹.

I proposed an alternative location for the ventilation shaft, at 373 Kennington Road. This is on the other side of the road to the Green and is directly above the Northern Line running tunnel, so no connecting tunnel would be required. The site is currently occupied by a number of post-war light industrial buildings which are not positive contributors to the Conservation Area (i.e. ‘neutral’ as stated in the Conservation Area statement) and which are likely candidates for redevelopment in the short to medium term. The current buildings form a hostile high blank wall along the frontage with Aulton Place. There are no trees on site. The site is self-contained, so the effect on Pedestrians and traffic would be significantly less. There are likely to be far fewer utilities to divert as no roads are within the site. It is closer to Kennington Station, so has engineering and safety advantages. The site could be redeveloped after the NLE works to provide a positive contribution to the Conservation Area and a significantly improved public realm, particularly for Aulton Place. The main drawback is that some of the buildings on site were in use as an art gallery and some as offices (some were vacant); these companies would have to be moved and the owner of the site compensated. The promoter made a lot of that issue, although elsewhere on the scheme they are demolishing significantly larger buildings that are in active use (for example, Banham Security’s building). The art gallery and offices could have moved to the land on the opposite side of the distillery.

The 373 option was brought to the attention of the promoters in June 2011, approximately two years before the application for the Order was made, and the promoters advised at that time that it would be assessed. Unfortunately, they did not until too late (in their own chosen timetable). The promoters pressed ahead with the scheme on the basis of the inferior option.

It should also be noted that in general the consultation and engagement with the local community was poor; many local residents did not hear about the proposals until very late in the process. For example, the promoters held some meetings to talk about the reinstatement of the Green once the project had finished; these were poorly advertised and attendance was 9-13 people per meeting. The design of the head house was revealed as a fait accompli at the last meeting, so there was no consultation allowed to local residents on that very important aspect. The design for the head house is considered by many in the community to be poor; an ‘alien object’ in the townscape, juxtaposed with the listed Georgian heritage in an area of high significance.

Further details of the scheme and associated references are contained in the Appendix.

**The Decision made by the Secretary of State**

1. The Secretary of State decided that “in spite of any deficiencies in the evolution of the NLE proposals and the criticism by objectors of the approach to consultation by TfL and Treasury Holdings, the uncertainties, delay and cost implications of pursuing the 373 option tip the balance in favour [of] the Kennington Green site”. ²

2. The Secretary of State’s decision, based on the Inspector’s opinion, is that deficiencies in the consultation process were cured by the fact that the Public Inquiry allowed a full review of events leading up to the Order application.³

**Discussion**

The Department for Transport’s Guide to TWA Procedures (2006)⁴ states that the “carrying out of wide and thorough consultations in advance of an application is a crucial part of the whole authorisation process.” This is not only because it is good practice in a democratic society. It is also for the very pragmatic reason that consulting persons who may be affected “can provide helpful feedback into the design development process” (paragraph 2.2).

The onus should be on promoters/developers to design their schemes intelligently, and to respond diligently and intelligently to consultation. Developers are being paid for working up their proposals; the local community are acting as volunteers (and are forced into it, in the sense that they happen to be living in a particular location). In this particular case I would argue that the benefits of the alternative option were easy to see and to comprehend. Even with the promoter’s numerous paid advisors fighting a rear-guard action trying to justify why the use of the Green was better, they failed to convince the Inspector and the Secretary of

---
State. And yet, the proposals gained approval ‘as is’ with the justification of “uncertainties, delay and cost implications.”

The main driving factor behind making the inferior proposal seemed to be an unwillingness to properly engage in consultation (i.e. being willing to seriously examine alternatives), and a compressed timetable, which the promoters were not willing to vary. I do not know what was driving this urgency.

There obviously needs to be a balance between the powers of developers / promoters to achieve the delivery of building projects without being ensnared by vexatious or ‘NIMBY’ objections; and communities / individuals to engage in the process of delivering major projects and if necessary to object to proposals that are unnecessarily damaging. When it comes to challenging a decision such as a TWAO, resources of the parties are fundamentally mismatched. My understanding is that for challenging a planning application via Judicial Review there is a cost cap of £5,000 under the Aarhus Convention. However, for a statutory challenge, my understanding is that there is no cost cap and therefore the potential liabilities (legal fees of the promoters who will be large corporate bodies with expensive legal representation) of making such a challenge will effectively preclude individuals and community organisations from doing so.

This situation is against the public interest because it effectively gives carte blanche to promoters of schemes (particularly larger schemes with significant expected benefits) to fall significantly short in their proposals and yet proceed nonetheless with a needlessly more damaging scheme by using uncertainties, delay and cost implications as the justification.

This situation is unfair to the public; it defeats the object of the consultation and inquiry process, and ratifies a deficient process of the promoter (especially in this case given the promoter’s knowledge of a potential better alternative at an early date).

It should be noted that the alternatives were only investigated when a party with financial firepower i.e. the distillery objected to the scheme, much later in the process. My earlier ideas were effectively ignored.

Further, the Public Inquiry is too late a stage for proper changes to be made to such schemes. The fact that there is a Public Inquiry does not substitute for proper consultation and engagement.

**Conclusion - Community involvement and community impact**

Therefore, in answer to your questions above, my experience is that the decision-makers did not take sufficient account of the way the built environment affects those who live and work within it; they did not engage properly with the local community; and the local community’s ideas were largely ignored by developers and decision-makers.

The whole process has had caused a considerable amount of worry and stress, and most importantly frustration, for many in the community and this will continue for years to come.
As long as there is the inequality in resources (and potential liability for crippling costs for individuals and community organisations) there is little incentive for developers and promoters of major schemes to consult, engage, plan and develop the highest quality schemes.

As long as developers and promoters develop good quality schemes they can be confident that they will not be subject to legal challenge. If they develop poor or mediocre proposals, there should be an effective ability for communities / individuals to challenge them in a court of law.

I am not a legal expert but from my experience both (1) a more stringent requirement to consult and engage properly; and (2) legislation to cap an individual or community group’s potential liability for costs in respect of statutory or other legal challenges that could relate to such schemes, seems necessary.

Bat Conservation Trust – Written Evidence (BEN0172)

About the Bat Conservation Trust

The Bat Conservation Trust (BCT) is the UK’s leading NGO dedicated to the conservation of bats. Working with a network of members, volunteers, academics, professionals and partner organisations we help to tackle threats to bats such as land use change and the loss of roosts.

Bats are important indicators of biodiversity that make an essential contribution to ecosystems and their associated economic benefits. BCT has significant expertise in the built environment and plays a critical role in ensuring the planning system contributes to halting the decline in biodiversity.

Policymaking, integration and coordination

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

Decision making should be encouraged at the administrative level best equipped to respond to local needs. Whereas national policy-makers have a duty to uphold the principles of sustainable development across the planning system they should not dictate to local planning authorities how this is achieved.

At the local level decision making should be based on effective local plans that reflect the identified, evidence-based needs of communities and the natural environment. These local plans must be developed within a national policy framework that is unambiguous in giving equal weight to the natural environment as economic matters in planning decisions.

A National Policy for the Built Environment should establish standards to improve the quality and consistency of advice and implementation of existing safeguarding mechanisms across the sector.

Consistent and informed advice is needed by developers and applicants from all those involved in the built environment. This means standards and knowledge need to be raised, reviewed and enforced within the private sector, local authorities and Statutory Nature Conservation Organisations.

BCT is currently leading a Partnership for Biodiversity in Planning to improve the consideration of biodiversity in the planning process. Further information is provided
2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

It is worth pointing out that the natural environment is not mentioned in the question above, which would suggest already that it is not prioritised in the way that it should be.

Nevertheless, policy for the built environment has continuously been divided between government departments. A National Policy for the Built Environment should include policies on the natural environment that are implemented consistently across all departments that have the built environment in their portfolio.

At a national level, coordinating the consistent implementation of policy should take place at an official and Ministerial level. One such step would be tasking the Cabinet Committee on housing to ensure that changes to the built environment make a positive contribution to the natural environment.

In addition to coordinating policy across national government there is a need for improved connectedness between local planning authorities to encourage consistency across boundaries, the sharing of skills and expertise.

National policy for planning and the built environment

3. Does the National planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? What should be prioritised and why?

The Committee should be reminded that the NPPF requires that economic, environmental and social dimensions of sustainable development are given equal weight. Of core concern to the Committee here should be how this requirement is being applied in practice. The BCT’s concern is that the environment is not being given equal weight to economic and social matters.

The Communities and Local Government Select Committee released their report on the Operation of the National Planning Policy Framework at the end of 2014. The report concluded that “Communities need greater protection against unsustainable development”. They recommend a number of steps to make sure that the planning system delivers the what was promised in the NPPF, ensuring that the same weight is given to the environmental and social as to the economic dimension; that permission is only given to development if accompanied by the infrastructure necessary to
support it; and that the planning system places due emphasis on the natural environment.

The report laid out the recommendation that the *NPPF provisions on the natural environment have an important role to play in ensuring sustainable development is delivered. Local authorities are missing an opportunity if they do not set out a clear vision for the biodiversity of their area. Moreover, if they do not set out clear policies in respect of the environmental aspects of sustainable development, it may be harder to resist the economic aspects taking a more dominant role. We strongly encourage all local authorities to make the natural environment an important theme in their local plans. To do so, smaller authorities may need to tap into ecological skills available elsewhere, be it in other local authorities or the Planning Advisory Service.*

There is also a need to consider what should be prioritised within the NPPF against what is being prioritised in practice. Local planning authorities do not often have the level of ecological expertise necessary to give equal weight to the natural environment in planning matters. A recent report from the Association of Local Government Ecologists for example found that only 35% of local authorities in England currently employ an ecologist. A third of all planners have no in-house ecological expertise. In practice this may make it harder to resist economic aspects taking a more dominant role. A first step to address this would be to support authorities to utilise ecological skills available elsewhere, be it in other local authorities or other experts.

BCT recommends that the Committee call for much improved support to local decision making bodies as part of a National Policy for the Built Environment. Local planning authorities must have access to expert ecologists to help them make informed decisions, either in-house or via service level agreements with neighbouring authorities.

**4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?**

Integration of spatial perspectives is fundamental to the concept of Landscape Scale Conservation (LSC). This can mean integrating biological and cultural approaches to landscape, heritage and biodiversity conservation. However, the successful implementation of a spatial element to national policy is reliant on high quality data interpreted robustly. In the context of the natural environment these would be biological records and evidence of how species use the landscape, which can then be used to protect and maintain connectivity. Without sufficient base-line information there is a risk of creating a network of habitats that although well maintained are absent of the unique species reliant on these areas.

A National Policy for the Built Environment should adopt a landscape scale approach based on the concept of creating the right habitat in the right place.
A spatial approach to planning, if based on robust scientific data and expertise, has the potential to deliver significant benefits to biodiversity. However, a key challenge is to ensure that heterogeneity is maintained. England’s landscapes have become increasingly monotonous with certain land use change resulting in a landscape with fewer ecotones. It is essential that a National Policy for the Built Environment incorporates principles that ensure heterogeneity is maintained.

The Biodiversity and Planning Project (http://www.biodiversityinplanning.org/) is a cross-industry partnership of 17 organisations, led by BCT, representing the planning and conservation sectors, who are working together to simplify, streamline and improve the consideration of biodiversity in the planning process. Part of this work will be to provide a spatial tool to help with the development and assessment of local and strategic plans.

5. **Is there an optimum timescale for planning out future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?**

The tendency to give greater weight to economic matters, over environmental or social considerations (due in part to the reasons outlined above), encourages short-termism in the implementation of policy for the built environment.

Protection of the natural environment for the long-term should be a cornerstone of any new National Policy for the Built Environment. This must include recommendations for ecological enhancements in developments as an important way of helping with the recovery of bat species. Securing a long-term view would help ensure that the natural environment is not vulnerable to the pursuit of short-term political priorities.

**Buildings and places: New and old**

6. **What role should the Government play in seeking to address current issues of housing supply? Are further interventions properly coordinated at central Government level required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?**

The government is committed to encouraging more house building within the planning system. Local planning authorities are encouraged to calculate their own housing figures and set aside enough land to satisfy housing demand. Decisions about the allocation of land and the subsequent development of new homes need to be made with a full and complete understanding the potential impact on habitats and species. Bats, for example, should be considered at the earliest stages of planning. However, as made clear above, key participants and decision makers in the planning process do not often have the level of ecological expertise necessary to do this. Government proposals to introduce a zonal system for brownfield land also risk
undermining the ability of local planning authorities to negotiate appropriate and sustainable development in their areas.

The government is also committed to legislating for statutory registers of brownfield land suitable for housing in England. The Committee must note that brownfield land can support a wide range of terrestrial and aquatic habitats. The NPPF is explicit that ‘previously developed’ land, treated as synonymous with ‘brownfield’, should be prioritised for development as long as it is not of ‘high environmental value’. Statutory registers must be required to comply with this requirement and include information about any protected species on brownfield sites. Greater guidance is also needed on what ‘high environmental value’ means, how to identify it and how to prevent biodiversity losses on these sites.

Proposals to extend permitted development rights could have serious implications for bat species. Prior approval requirements must be introduced to ensure that protected species legislation is taken into account. To fail to do so would risk misleading a property owner or developer into potential breaches of the law.

Extending permitted development rights in the name of boosting house building will unfortunately increase the vulnerability of property owners to prosecution should they negatively impact protected species as a result of their actions. The simplest way to prevent this in the context of the proposed policy would be to exclude from the changes properties that host protected species.

7. **How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?**

It is estimated that 80 per cent of wildlife and habitat loss is as a result of development. Integrating biodiversity into the built environment is of critical important to sustainable design. However, current biodiversity approaches taken by industry, planners and designers are often tokenistic, contributing little to overall ecological value and resilience.

To address this issue, a four-year partnership study between BCT and University College London was launched in September 2012. The research aims to overcome barriers to integrating biodiversity into the built environment by developing simple tools that measure the ecological value of urban green infrastructure.

BCT are also on the Project Steering Group for the Construction Industry Research Information Associations Biodiversity Interest Group, that ‘work collaboratively across
the construction industry to identify best practice, develop new approaches and to identify and enable innovation’ in relation to the built environment.

BCT urge the Committee to recommend that any National Policy for the Built Environment set a clear vision for how buildings can be designed to protect and enhance biodiversity.

Skills and design

9. Do the professions involved in this area (e.g.) planners, surveyors, architects, engineers etc.) have the skills to adequately consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

A recent report from the Association of Local Government Ecologists found that only 35% of local authorities in England currently employ an ecologist. A third of all planners have no in-house ecological expertise. Without capacity or competence to undertake effective assessment of planning applications where biodiversity is a material consideration, local planning authorities are at risk of failing to fulfil statutory duties.

Furthermore, the lack of ecological skills in local planning authorities is reducing efficiency and slowing down the planning process. In particular, a lack of capacity to offer pre-application advice significantly increases the risk that a planning application will be held up further down the line.

The Committee should make recommendations to address the lack of ecological skills in local planning authorities so that policies to design buildings for the protection and enhancement of biodiversity can be implemented. The Planning Inspectorate must also be given the necessary resources to ensure that local planning authorities understand and adhere to national and local biodiversity policies and statutory obligations.

As mentioned above, these recommendations must include ensuring local planning authorities have access to expert ecologists to help them make informed decisions, either in-house or via service level agreements with neighbouring authorities.

Community involvement and community impact

Financial measures

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other
mechanisms that would encourage better design and place making by private sector developers?

It is worth highlighting some of the benefits and challenges associated with valuing the natural environment, and in applying these values to planning and the built environment.

Valuing biodiversity, ecosystem function, and the services they provide is incredibly difficult, as not all of the benefits and values of the natural environment can be quantified. However, this does not mean that these benefits are less essential and valuable than other more measurable assets. In placing an economic focus on the natural environment we run the risk of ignoring some of the essential and irreplaceable benefits the natural environment brings. BCT believe that with appropriate input from those knowledgeable within the field, valuing natural resources could result in more responsible approaches to help safeguard the natural environment and ensure that short term economic gains don’t result in long-term damage to species and the habitats they rely on.

Biodiversity Offsets are an emerging valuation system relevant to the built environment and they have become increasingly accepted as a potential system for counteracting the negative impacts of development.

Biodiversity offsets are conservation actions designed to compensate for the residual impact on biodiversity caused by development and other land use change activities, to ensure no net loss of biodiversity. Establishing an offsets market has the potential to help stem this loss in an efficient manner. It also streamlines the development process by indicating to developers which land is ecologically preferable to build upon. This may help direct local planning decisions and create more transparency throughout the planning process. However, it is essential that these systems and the principles they founded on are fully understood and supported by local government and the staff charged with determining applications against them to ensure that it is applied appropriately.

Current valuation systems are open to interpretation resulting in inconsistencies in their application, particularly with the aforementioned lack of skills in local planning authorities. To ensure compliance with European Directives it is essential that any processes allocate sufficient training, resources and high-level support to ensure efficient and consistent implementation across local planning.

07 October 2015
Examination of Witnesses

Mr Simon de Beer, Planning Policy and Environment Manager, Bath and North East Somerset Council, Mr Joe Henry, Service Director, Development Management and Building Control, London Borough of Barnet, and Ms Anneliese Hutchinson, Service Director, Development and Public Protection, Gateshead Metropolitan Borough Council

Q68 The Chairman: Good morning. First, thank you very much for giving up your time, submitting your ideas and being willing to be grilled by us, although I can tell you that it is quite painless. Welcome to this evidence session of the Select Committee on National Policy for the Built Environment. You have in front of you a list of the interests that have been declared by members of the Committee. A transcript of the meeting will be taken and published on the Committee website and you will have the opportunity to make corrections to that transcript where necessary. Could I begin by asking each one of you to briefly introduce yourselves to the Committee, please? This is for the purpose of the record and so the transcribers can put the name to the voice.
Simon de Beer: My name is Simon de Beer. I am the Planning Policy Manager at Bath and North East Somerset Council, which is a smallish district council adjoining the city of Bristol, with a population of around 180,000, half of which lives in the city of Bath.

The Chairman: So you actually call it Bath and Bristol?

Simon de Beer: No, it is Bath and North East Somerset Council. We are part of the West of England group of authorities, which is the former Avon County Council, which after reorganisation became a unitary authority.

Joe Henry: My name is Joe Henry. I am service director of planning and building control for Barnet Council. Barnet is a large local authority in London. We are projected to be one of the most populous boroughs in London next year.

Anneliese Hutchinson: Anneliese Hutchinson. I am the service director for development and public protection at Gateshead Council. For those of you who do not know, that is on the south banks of the Tyne, so we share our urban core with Newcastle. We have both green belt and urban areas and a population of around 200,000 people.

The Chairman: You have a wonderful concert hall there.

Anneliese Hutchinson: We have, yes.

The Chairman: You did not come down this morning, did you?

Anneliese Hutchinson: No, I came last night.

Q69 The Chairman: Thank you all. The first question is: what are the principal challenges faced by local authority planning departments in the current climate and how are they responding to these challenges? Who would like to start? I take it all three of you would like to answer this.

Anneliese Hutchinson: I am happy to start. There are a number of challenges, the first of which is staffing. We are probably staffed to deal with the economic downturn, so the issues are to do with recruitment and retention of staff. Obviously, the economic climate has improved greatly and the universities et cetera have not necessarily caught up with that, and certainly in the north-east we struggle to recruit new planners and to find students to come in, help us out and be trained. We have also lost a lot of expertise with austerity cuts in the local authority—I do not have anybody in my service over the age of 55—and we have a
considerably reduced workforce, so we are having to work more closely with other authorities to share that expertise. For example, we will have the expertise perhaps for flooding in the area, where another authority will have expertise in, say, retail planning.

One of the key things is uncertainty, in that the legislation has changed considerably over time, and often at short notice, which creates its own problems when trying to understand where you need to put your limited resources. On the horizon at the minute is the idea of us having to produce a brownfield land register and local development orders by 2020. Really, I should be putting my service in place to do that now to get to that position by 2020, but there is a lack of detail.

Despite some of the changes, the system is more complicated now. When submitting an application, for example, a lot more information and a considerable amount of upfront investment in terms of the information required, and often some of the things that we have to look at as planners are far more complicated than they were a number of years ago. We need to be experts in sustainable urban drainage systems or the viability of sites, and that has issues as well.

In response, we are obviously much more flexible, we have looked at where we can obtain temporary funding, we are looking at how we can use capital rather than revenue to fund posts, we are looking at how we can work more closely with other authorities, both on a formal and an informal basis, and we look at how to be more commercial in terms of what we can charge for. Also, looking ultimately at why planning is there, we are there to improve economic and housing growth, so we are looking at how, as a council, we can play a role in that vision.

The Chairman: Dealing with that last point, do you think it is also part of your role to try to make the system work quicker and be more customer-friendly?

Anneliese Hutchinson: Definitely, yes. If you get that right, life becomes so much easier. Obviously, the planning system is about making sure that you get the balance between the requirements of local communities, what the developer wants, and the vision for the area. That is my key role as a planner. Sometimes, in some respects, some of the changes have made that more difficult.
The Chairman: I understand absolutely staffing to the downturn. It is nice to know that there is an economic uplift, but it is not great for you. You are a university city. Do you have any link with the university to do sandwich courses for training or apprenticeships?

Anneliese Hutchinson: Yes. Newcastle University runs a planning course and we work very closely with it, both in the work that we do and the help that it gives us on some of our longer-term strategic thinking, but it has reduced its numbers on the courses and the private sector has greatly increased, so obviously if there is a choice it would normally prefer to go to the private sector, I think.

The Chairman: Thank you very much. Mr Henry.

Joe Henry: I agree with a lot of what Anneliese said about bringing in the right people. It is a very competitive market now for the right skills. On the question of how we have addressed that, Barnet’s solution is to outsource. We are now a joint venture company between Barnet Council and Capita. Capita has a 51% share in the company and Barnet Council has a 49% share. The whole of operational management has been outsourced to Capita. The idea was that Barnet wanted to ensure that it could maintain a very high level of service, but obviously with the cuts and the austerity pressures that we were under, it was looking for a company to guarantee a certain price, looking to commit to putting additional revenue into the services, and hopefully being able to share in any profit the company may generate.

The contract ensures a very high level of performance at a set cost. The customer focus, which you mentioned, is the key going forward. The key to our model is also growth, by which I mean that we are looking to generate income to bring in additional resources. We have a number of ideas about additional planning services. For example, you can now fast-track a planning application at a premium price. We are the only council in the country doing that at the moment. We offer premium services on pre-application advice; we now have specialist teams on pre-application advice. We give developers the opportunity to pick their own planner if they have a relationship with one, because relationship management is all part of good customer service. There has been a tendency to go away from that because a conflict of interests may be seen as an issue, but we think that the relationship between planners and developers should be a strong partnership to deliver outcome.
There is one challenge: obviously, when you have contracts, you have clauses to ensure a certain level of performance. Targets can drive bad behaviour. You probably hear that in a lot of senses. That is true for planning as well, and we wanted to make sure that, while we had very strong key performance indicators and performance indicators within the actual contract, we still focused on outcome, the key being the customer experience throughout the whole process and coming to the right outcome, which is in the public interest. The key for our growth model is that we want developers to come into Barnet and deliver good, sustainable development. If we are not attractive to them, the company fails and the community loses out, so the contract in a sense is incentivising the right way to deliver the right outcomes.

As for recruiting the right people, we are still competing in the market. We cannot pay over the odds and there is a lot of competition. One of our long-term strategies in Barnet has been to “grow your own”, and we employ people who are non-planners but might have, say, a geography background. We say to them, “We will invest in you to go to university”—and there are plenty of universities in London—“on day release”. Retention of staff is important, so we have golden handcuffs in a sense: we invest in you, we will pay for your courses. Of course, if you want to leave, you can, but you will have to pay back your course fees. That is an incentive to stay with us.

The model has also helped us to attract people, because they see it as something different. We also offer private consultancy work. As Anneliese said, you are competing against the private sector for planners. There is, I suppose, this idea that the local planning authority has one type of planning officers, and private sector planners are different. That gulf in perspective is quite large. We offer both; we offer people the opportunity to work in the private sector as well, because we have our own private consultancy.

**The Chairman**: That is very interesting. Can I ask a supplementary question? I will be quick, because we have to watch the time. First, did you invent this model? Has it been taken up by other local authorities?

**Joe Henry**: This model is unique to Barnet.

**The Chairman**: You should flog it on a consultancy basis.
Joe Henry: We are trying to.

Baroness Rawlings: How long has it been in existence?

Joe Henry: We have been operating it for two years up to last October.

Lord Inglewood: Chairman, presumably they cannot offer consultancy for money in their own area?

Joe Henry: Yes, we do, and I will explain why and how. We form relationships through the planning process when dealing with planning applications. We have a monopoly there, but in terms of the private consultancy we are competing with the outside world. We prefer to work with people, and rather than have these sometimes difficult relations with private consultants acting for people, we say, “We can act for you”, but the people who do that are separated from the decision-makers, so we have a very strong and clear conflict of interest protocol. The industry likes that, so we are developing a strong partnership with developers, and they are not just using us because they think they have an angle in the authority—because they are using us for outside Barnet. We recently acquired a £50,000 job in Dover, because the client was really happy with the service that we were offering in Barnet and saw the skillset that we could transfer into other authorities. They also see it as an advantage that we know how local authorities work.

The Chairman: So long as they do not use that to skim off your good people.

Joe Henry: No, obviously we have to have very good people to do that work, and that is a recruitment challenge again, but you have to have a good balance between business as usual and the consultancy work.

The Chairman: We have to crack on. Mr de Beer, your initial comments, please.

Simon de Beer: I will not repeat anything. Some of the comments I concur with. Our authority in particular is retaining public confidence in the planning system. We in our authority have embraced neighbourhood planning and working with our local communities on the provision of neighbourhood plans. We have advised them that being in control of development in their communities is the way forward for them, which they have understood, and they have done a phenomenal amount of work locally on local village character assessments. For the first time in my history—and I have been a planner for nearly 30 years—our villages are offering us
housing sites. If a site is coming from them, they are quite happy to propose a development site—or two development sites, which I have never seen before—and nearly all our villages are happy to propose a site if it is a product of the work they have done locally. However, because you can give no weight in the planning decision system to a plan until it is adopted, if a developer comes forward midway through the process and puts an application in that is not bad enough to refuse, it usurps the local community’s hard work, and some of them are quite disillusioned with this process where there is a lot of development pressure. The fault is that there is an inability in the system to give any weight to an emerging plan that a community is producing. It has virtually no weight until it is almost right past the process. So whilst the Government and the authorities are promising to hand power to communities, it does not happen because of the nature of the system.

**The Chairman:** Are you going to unblock all that and make sure that you have the answer?

**Simon de Beer:** We are working as best we can to support them. We have devoted an officer to give them assistance so they can progress their plans as quickly as possible.

**Q70 Baroness Andrews:** I have a couple of quick questions. Do you each have a local plan in place?

**Joe Henry:** Yes.

**Simon de Beer:** Yes.

**Baroness Andrews:** So your housing sites are now basically determined. Are they very different in number and distribution from what they would have been under the old regional plan? That is one for each of you.

**Anneliese Hutchinson:** If I could go first, we have a joint plan with Newcastle. Looking at the population change, we had to take sites out of the green belt in our local plan to become housing sites, so we did a strategic land review. Our previous plan obviously did not have those sites in, if that was the question.

**Baroness Andrews:** That was absolutely the question.

**Joe Henry:** We have an adopted plan, but we are still going through a site allocation process. Where there are any opportunities whatever in our area, developers are coming forward very quickly, because of the nature of London.
Simon de Beer: We have an adopted plan. The housing figure is half what the RSS was proposing.

Q71 Baroness Andrews: That is the sort of answer we need. My next question follows from that. You talked about uncertainty. Clearly what no planning department wants is greater uncertainty about planning, yet you have the Housing and Planning Bill coming down the track. What will be the impact of that on your plans, particularly when you put it together with the changes in brownfield policy?

The Chairman: Can I just interject before the answers? Are we sure what the format is likely to be at the end of the parliamentary process on this Bill?

Baroness Andrews: Probably the greatest change will be to zoning, so that will be different. The rest of the Bill will be more targeted at changes in things like housing associations, but zoning presents a real challenge for local authority planning, I think.

The Chairman: Let us not go into that at the moment. If we have time, perhaps we could explore that.

Q72 Baroness Young of Old Scone: I have a factual question for Mr Henry. Is everything outsourced, or do you keep your plan preparation in-house?

Joe Henry: The whole planning service—regeneration, environmental health and highways—has been outsourced.

Baroness Young of Old Scone: So your plan preparation is outsourced as well?

Joe Henry: It was, yes, but the plan was adopted before it was outsourced.

Baroness Young of Old Scone: If you are coming to a review of the plan at some stage, can having it done by an outsourced organisation work?

Joe Henry: It is the same people who are employed, so I see no reason why not.

Baroness Young of Old Scone: Thank you.

Q73 Lord Inglewood: Having been a chairman of a development control committee myself, I know that the relationship between the officers and the members is very important. Clearly, I do not want to embarrass you, but have you, over your careers, seen any general change in the nature of the relationship between the officers and the members? Secondly, and following on from that, do you think that the balance between what I might call political
decision-making and professional decision-making, where the officer delegation lies, is right in general? There are two parts to each question to each of you, in short form please.

**Anneliese Hutchinson:** I think it has changed over time for the better, and it is really within the hands of local authorities to make sure that that balance works between the professional officer giving advice and the members making that decision. The key to that, and one of the reasons why it has got better, is partly technology, in that for the planning committee it is easier now to provide full information in relation to the application that is being considered. We work with members to make sure that we train them in relation to any new issues on the horizon and that we get good legal advice.

The other key thing that has helped in smoothing the way, which is probably related to some of the things that Mr Henry said, is that we ensure that members have pre-application presentations, so at the first thought of a developer wanting to develop a big site in the area, or one that we know is likely to be contentious, we will ask the developer to come in front of the committee, and any other members of the council who want to come along, to give a presentation of their thoughts, so that we get a feel for the issues in the local area.

**Joe Henry:** Obviously member engagement is key. I have noticed that they have more confidence in officers, and we have seen an increase in the delegated powers that are given to them. That is key for a quicker decision-making process. Four years ago, 85% of all decisions were made by officers. Now it is 96%. The comfort that we give to members is that if they want to call an application in, they can. That is how we sell giving us more powers. They are on board in terms of the need to deliver more housing, but obviously the challenge is that people want to protect the status quo. That will always be a challenge. There will be the odd occasion where members go against officer advice, but we make sure we have training that outlines the clear risks of going to appeal. The Planning Inspectorate can of course overrule a decision and allow something. Also, we may lose contributions that have been offered, and more onerous conditions that members might have wanted and the developer was happy to put on before might not be re-imposed. There is also the financial risk of being unreasonable in the approach: if you cannot robustly defend a decision—and we are clear to members about this—there could be a big financial penalty in terms of costs.
Lord Inglewood: Taken in the round, at the most general level, are members quite sensible, in your own authority and elsewhere?

Joe Henry: In my experience in Barnet, yes.

Simon de Beer: On the whole, yes. The officers are aware that they have a different driver—a political driver, and it is about being wise to that. But at the end of the day in the planning preparation process, people make recommendations based on technical information, not necessarily on a political basis, and once they have understood that—and we have member training and a close working relationship—they realise that will be the outcome, so they need to take the technical aspects in sight and not just their own political drivers.

Q74 Baroness Whitaker: I have a question about outsourcing. I am very interested in the Barnet example. My question is first to Mr Henry on the challenges and opportunities that are associated with outsourcing. In particular, I have been very interested to see how you assure yourself that the design of the whole place, place-making, is properly contributed by Capita. I think you said that you outsourced health.

Joe Henry: Environmental health.

Baroness Whitaker: What is the liaison between Capita and your other outsourced functions in the areas that affect the whole of a place, such as health, transport, environmental protection? That is one area I would be very interested to hear about. The other is the management of your relationship not with officials of any kind, in or out, but the ratepayer and the education of the ratepayer to accept developments that might be a bit of a surprise or long-standing problems. For instance, do you have any Traveller sites in Barnet?

Joe Henry: No.

Baroness Whitaker: Anyway, the management of the relationship with the citizen is the other area I would be interested in, in view of outsourcing.

Joe Henry: The way we operate has not really changed in terms of who we consult, how we deal with interested parties who are engaged and statutory consultees. Nothing has changed in that respect. In terms of the pressure that may come about in coming to an outcome more quickly, because obviously the more quickly you come to an outcome, the cheaper it is to deliver that outcome, there are a lot of checks in place, the key ones being the public and
members. As I said, they can call any application they want to committee, and that is where the check is. We also monitor how many we refuse and how many we approve.

**Baroness Whitaker**: Am I right that you consider the involvement of local people after proposals have been made? You do not involve them in the early development of the vision for Barnet.

**Joe Henry**: Like most authorities, we encourage developers to engage early on with the community.

**Baroness Whitaker**: On specific proposals?

**Joe Henry**: On any specific proposal, yes. When they speak to us through pre-application, we advise them to engage with the community to try and get them on board, because that will make it easier to go through the process, and ultimately, if it has to go to a committee, if the committee can see that they have engaged with the community and the community are on board, or that they have at least tried to address what the community has put forward—you will always end up with a product which the community may not want overall because it is close to them but you have to look at the public interest, but at least they have tried to address those concerns—that is seen as a big positive.

**Baroness Whitaker**: Just one more on this aspect: how does that allow an opportunity for the local people to think about the externalities of a particular development—say, the impact on amenity, leisure, transport or health?

**Joe Henry**: That will still be considered, as it always was, and that is a very important consideration. We have to have robust justification of all our planning decisions.

**Baroness Whitaker**: What about the general place-making function on the part of Capita? How are you sure they have the state of the art there?

**Joe Henry**: There are strong relationships and engagement with the main client, which is Barnet Council. They have commissioners who we are always working with. We have a champion for designing the place, a director of place. That was a specific part of the contract, and was not a title or position before we outsourced, to try to ensure that we are delivering to the aspirations the council envisaged.
Baroness Whitaker: Before Lady Andrews comes in, I would like to hear from the other two witnesses the arguments for and against in-house and outsourcing, particularly in view of the two considerations that we have aired so far.

Anneliese Hutchinson: We have considered outsourcing. Obviously every authority has had to consider the best way of delivering its services in the future. For us, in terms of development, compared to what is happening in the south-east, there is not that much going on. We do not make a profit from planning alone. If it were to be considered, it would have to be part of a package with other uses. For example, our planning fees last year were just over £500,000, so not a huge amount. The other issue is exactly what you mentioned: the place-shaping element. When we have had the discussion with our councillors, one of the benefits of keeping everything in-house is that we have place-shaping very much at the forefront. It is considered at cabinets and in portfolio briefings, and there has been some concern about how we would maintain that through local decision-making if it were outsourced. We have also looked at what other authorities have done, and some are starting to change. When we are talking about shared services, those that have jumped earlier on and gone with a particular package now have less flexibility but face much stronger budget concerns than a few years ago. The issue for most local authorities in the north-east is trying to keep things in-house so that we can grow our way out of this and encourage economic growth, and that gives us the benefits to help subsidise other services in the council.

Simon de Beer: In light of the financial pressures, we continue to look at different ways of providing the service, and we have never got very far down the road of considering outsourcing. The most we have done is put elements of the service out, particularly development management, if there are high workloads or particular expertise needed. We have generally found, though, that the in-house approach provides the service more economically, and we retain the benefit of a cohesive and effective provision of service because we can retain the knowledge that you build up doing a bit of work. If you put a project out to propose, as we did to a consultancy to make proposals for some of our large greenbelt site releases, it can take a lot of time to brief them and bring them up to speed with local
knowledge. Once the consultancy had done the work, it left and that was all lost. If we had kept it internally, we would have had the benefit of that.

**Baroness Whitaker:** So it was a loss of value from your point of view?

**Simon de Beer:** In that wider context, yes, and it was fairly expensive. That bit of work cost us nearly £30,000—it was a fairly high-level project—whereas internally we could have done it with staff at a lower cost.

**The Chairman:** Do you make massive use of the developments in technology to communicate with the ratepayers, as they are called—council tax payers? I have seen towns where the local post office has the local news, say the West Ham television news, and you see that in pubs. I will not mention my town, but that is what happens, so when people queue to buy things in the post office they see this, and it is a way of communicating with them, for example, that there is a meeting in the town hall. Have you thought about that? Some companies are doing just that. It might be a way. People’s homes are their biggest investment and interest, and we want to make sure they have a bit of an input, if not a huge amount. Has anybody heard of this or thought about it?

**Anneliese Hutchinson:** I know that some authorities broadcast their planning committees on the web. We have certainly tried to make the best use of technology, for example in presentations using Street View, satellite photos—that type of thing. In terms of the local plan, we tried to do some things on Facebook and that kind of thing, and it was not that successful. We engaged with all our voluntary organisations and tried to build on that. If we knew that the local history society would be at a local pub on a Tuesday night, we went and talked to them, and we found by having a face-to-face dialogue on some of the very important issues we may be able to communicate much more closely.

**The Chairman:** I do not want to disrupt the discussion, and it is not a question, but I just thought of this point of trying to make the contact between the customer and the provider.

**Q75 Lord Woolmer of Leeds:** Does the national system of planning fees affect the ability of councils to carry out their planning functions? Do you have a view on whether or not fees should fully devolve to local authorities? Separately, are there other initiatives that councils
can undertake to increase their planning income? Mr Henry has already mentioned some, of course, but I would be grateful if you could deal with the first two questions initially.

**Anneliese Hutchinson:** Yes and yes. Our fees do not fully cover the costs of dealing with a planning application, so it would be wonderful if we could meet our full costs through planning fees. It is subsidised by the taxpayer, and it may not affect everybody, particularly in determination of planning applications. We recently calculated what the local plan had added to our economy, and in council tax, business rates and the new homes bonus alone it was £104 million between now and 2030, and £1.7 billion in terms of the supply chain. If you look at that for a very small authority like Gateshead and what it would be for somewhere like Barnet, obviously we have a significant impact on the economy, but at the minute, particularly looking at how local authority finance might change over coming years, I would need to be much more self-sufficient, and being able to get back the full costs of dealing with a planning application would be very helpful. Like Mr Henry, we charge for pre-application advice. We work with other authorities either on a mutual aid basis or by allowing officers to maybe work with them on particular specialisms. We are working with the development community to see what they would be prepared to pay for, but obviously, first and foremost, it is about customer service.

**Lord Woolmer of Leeds:** So that we get a feel for what this actually means, taking one case in the past, how much would a planning fee have been and what would it be if you charged full cost?

**Anneliese Hutchinson:** I thought you might ask me that, so I have brought some figures, particularly in relation to some of the more recent changes in relation to how we now deal with permitted development. In the past a fee might be charged for a planning application for some of the smaller developments. There has been a change in the system, so now a determination of prior approval is requested and that attracts a smaller fee. In Gateshead we have had 116 of those types of applications. If we had had them in as planning applications, it would have been £19,000, so we have lost about £19,000 on that. There have been changes to the system there. We reckon that in the last year we have lost nearly £4,000 on that as well. That is a very small example of it.
The other thing is that, say, an application for a quarry would obviously involve a lot of local discussion about the environmental impacts, lots of liaison with the Environment Agency and other statutory consultees. It can take a long time to get the right decision in the right place, and the fee might be 20% of the cost.

**Joe Henry:** Fees are set nationally, and part of our concern is obviously that costs to deliver in certain areas are a lot higher than in other areas. In that sense, the fees are not properly reflective. I agree that they do not cover the cost of providing the planning service. Our response to that has been, as I just pointed out, additional services. For example, our enhanced pre-application service is projected to generate £500,000 by the end of this year, which is equivalent to all the planning fees Ms Hutchinson just mentioned in Gateshead. All those services are subsidising our services to the point where we are self-reliant, and are actually producing a little bit more than our costs, I suspect.

The cost of applications is an interesting point. We did a benchmark exercise with some local authorities about five years ago; the Government were looking at devolving planning fees around that time, so we were doing that exercise. We deal with 3,000 to 4,000 planning applications for householder extensions—lots of people want to do extensions to houses in Barnet. The fee for that at the moment is about £170, and when we did the analysis of the cost to deliver that, five years ago for Barnet it was £230 to 240, from memory, but the London average was £500, so if fees were devolved you would see individual house extension fees going up quite significantly, because meeting that cost could be justified. Major applications and other applications in a sense subsidise those smaller applications, so the residents we are trying to look after actually get a benefit from the major applications fee. All the other work that we do, all the planning performance agreements that we have the developers, all feeds into subsidising a lot of work we do. For a lot of the permitted development stuff that has come in recently, the fee is nowhere near the cost to administer, but we absorb that through all the additional services I have just mentioned. We always forget about the Cinderella of planning: enforcement. There is a considerable cost to deliver that, and very little income. There is also plan-making.

**The Chairman:** Do you have anything to add, Mr de Beer?
**Simon de Beer:** I would just add that the cost of delivering, as my colleagues have said, is topped up by the taxpayer, and that makes the service vulnerable to cuts, which then would impact on service delivery and the service the customer receives. In somewhere like Bath and North East Somerset, Bath, which is a world heritage site, some of the very complex proposals we receive are obviously nowhere near covered by the cost of a planning application, so we do what colleagues do pre-application: we give proposals a dedicated officer to take a scheme through and have a development team approach whereby an applicant can present and discuss a proposal with a variety of specialists—a paid-for service—to get an early understanding of what improvements they could make to their scheme before submitting it for a planning application.

**The Chairman:** Thank you.

**Q76 Earl of Lytton:** I am interested in this question of charging the full rate for fees, particularly what Ms Hutchinson said about the relatively low economic values being dealt with in her part of the world as against the London Borough of Barnet. Would these fees be disproportionately higher in, say, the north-east compared with Barnet, where there is perhaps more activity, or in Bath and North East Somerset? Secondly, would you charge for listed building work, where a lot of applications have to be made for things that would not normally attract planning? I declare an interest as an owner of several listed buildings. Thirdly, how does all this, in terms of the permitted development policy the Government are pursuing, interact with your ability or otherwise to make Article 4 directions, which I believe is still a facility? Chairman, that is where a local planning authority can make a direction that certain permitted development rights are removed within the authority area or part of the authority area. Those are the things I am interested in on that score.

**Anneliese Hutchinson:** In terms of devolving fees locally, we have had to do a lot to be more efficient. My understanding is also that we could charge only in terms of recovering our costs. It is not something that we would be able to make a profit on, so the costs would reflect the actual cost of determining that application. Certainly across the board, with the help of the Planning Advisory Service, we are all looking at how we can cut those costs and be as efficient as possible. With that national overview, I would hope that would help in setting fees.
Certainly building control has local fee-setting, and it has had various working groups that have worked together to come up with a regional approach so, based on all the information that it has on the costs to deal with particular applications, it has come up with a level playing field on that.

Listed buildings are probably something that, again, would need to be considered locally. It is difficult to comment at this time, as obviously there are particular costs associated with listed buildings, and they would have to be considered in light of that.

In terms of Article 4 directions, yes, there is that availability, which means that we can look at areas where we may not want permitted development rights to be considered, but there is a considerable amount of work associated with that, so it is done infrequently, basically because of the amount of time and effort involved in bringing together an Article 4 direction.

**Lord Woolmer of Leeds:** I wonder if I could have an answer to my third question: are there other initiatives that councils can undertake to increase their planning income? Mr Henry, you have had a go at it. Could you let the others have a go first and, if you want to add anything, come in?

**Anneliese Hutchinson:** I mentioned charging for pre-application advice. The other thing we are looking at is how we can offer our specialist services to other local authorities, such as tree advice or landscape advice. We have spoken to local agents and asked if they would be willing to pay for a lesser, quicker service, and their answer has been no. Again, that might be because in the north-east we deal with things quite quickly anyway, so we have to look at that. There is a limit. Obviously the other issue is that we can charge but we have to look at only recovering our costs; we cannot make a profit on a lot of what we do.

**Simon de Beer:** Particularly focusing in our case on planning performance agreements with developers on particular schemes, offering them a particular service through an agreement that we give an enhanced level of service with a dedicated officer does generate income to cover the additional costs.

**Lord Woolmer of Leeds:** Is this significant or is it at the margin?

**Simon de Beer:** I do not have the figures, I am afraid, but it does make quite a bit of difference to the council’s income.
Joe Henry: Planning performance agreements can make a significant difference to bringing in income. I have mentioned the enhanced service that we do pre-application, and I gave a figure of what is coming in now. The fast-track service is a premium service in a sense, but it is an optional service, so just because someone might say they do not want it, it is still an option, and I would rather give that option. That is our philosophy: we want to give as many services as possible to the customer, but they are optional. That is key to everything we do.

Another service we offer which residents really like is that if you want to build an extension to your house, we say, “We can send someone down there and tell you what you can do under permitted development, but if you want to go a bit bigger, you need planning permission”. We will do the drawings and submit the application for you, and a colleague will process the application. From beginning to end the process is very fast. Then we link that with the building control service. In a sense, we are trying to concentrate on a one-stop shop approach to delivering services. I apologise; what was the other question?

Lord Woolmer of Leeds: Other initiatives that a council can undertake to increase their planning income.

Joe Henry: I have mentioned the ones we are undertaking.

The Chairman: I am very taken with the option one. I think that is a brilliant way of looking at it.

Joe Henry: It is just an option.

Lord Woolmer of Leeds: You get a different feel depending on where you are from what the development pressures are on it. If you are in an area where there is a lot of development pressure, it is easier to pass on costs and to have other services than it is if you do not have those pressures, you really want development and you do not want to discourage it. Is that a fair assessment of the situation?

Joe Henry: I would say, from my experience talking to developers, that they are more than happy to pay premium fees because of the land values in London. Every day is money. That is why, while the fees can be a lot higher than the planning application fees themselves, they see the benefits. Planning performance agreements are key, and most authorities now adopt
them. Where they get a bespoke, dedicated resource to deal with one particular application and they are more than happy to pay for it.

Baroness Andrews: The logic of that suggests, however, that there ought to be some sort of equalisation between the resources available for planning authorities—top-slicing some of your income and that of other boroughs that are doing really well—to be redistributed to local authorities that need all the help they can get to create imaginative development strategies. Otherwise, we are going to have a polarisation of planning resource in capacity across the country. Would you agree with that?

Joe Henry: We need an incentive to generate additional income. If we devolve planning fee setting, the concern I will have—I do not think it is shared by any of my peers—is that we are a monopoly in planning. In my opinion, there would be an upward pressure on costs and there would be no strong incentive to deliver cost savings. You can always justify increasing your fees because you say that you need to do this additional work. I am service director of building control as well, and we do local fee setting for building control, but it competes against the market. If we do not set it at the right level, you can use another service, whereas in planning you have a monopoly; you have no choice but to go to the local planning authority.

Baroness Young of Old Scone: As a bit of a sideline, can I just challenge that? I used to run the Environment Agency. We were a monopoly service, and the downward pressure on our fee structure from British business and because we set ourselves RPI-minus targets every year was huge. So it does not always mean it goes up; other fee offers are available.

Joe Henry: Going back to whether we should have a fee for listed building works, I would advocate that we should not, because there is a lot of work involved in listed building applications. They are exempt from fees at the moment, but it is very important to protect our heritage, and the last thing we want is to encourage people to do works without permission and have a significant detrimental impact on the heritage value. So I would strongly advocate that we do not set fees at the local level for listed building applications, because I see the benefit of not doing that.

Q77 Lord Inglewood: Mr Henry touched on this. Plan-making seems to me to be a community benefit that is being created there. Surely, the community as a whole should pay for it through
council tax, the rates. Secondly, specifically for Mr Henry, did you receive criticism on the grounds that the premium service was one law for the rich and another one for the poor?

**Joe Henry:** Yes, and I addressed that. I had to get it through a committee and that problem was voiced to me. I was clear that the only way this could work in the perception of the public was not to have a two-tier system, and the only way to demonstrate that is if the ordinary service—maybe that is the wrong word to use—is still an excellent service when you benchmark it against other local authorities. So long as we can demonstrate—and that is the challenge that I have to keep meeting—that the ordinary service is still excellent, if someone wants to pay for the Rolls-Royce of all services, why not?

**Lord Inglewood:** What about my comment to the three of you about whether plan-making should be paid for by the council tax/rate payer?

**Anneliese Hutchinson:** Obviously, it does benefit the whole of the community, and the spatial plan is almost the embodiment of each council’s sustainable community strategy, so yes, it is for the benefit of the community. Maybe though, when you look at the whole of it, the delivery of some of the things in the plan becomes difficult because of the difference, say, between the north and the south and the workload required to get the vision from that plan into bricks and mortar on the ground. That is where there may be a gap, in that there is not the viability in the development increase in the north as opposed to the south, and therefore maybe not the ability to fund the staff in a way to make that happen.

**Simon de Beer:** The outcome of a plan-making would be that certain landowners would benefit from land, and that is recouped to the community through CIL or the new homes bonus. At the moment plan-making is subsidised, it is paid for by the ratepayer, and the community gets the benefit through CIL payments and Section 106 contributions.

**Lord Inglewood:** My point is simply, looking at it conceptually, whether that should be paid for by the wider community or by the planning applications.

**Simon de Beer:** At the moment it is by the wider community.

**Lord Inglewood:** Yes, but is that right?

**Simon de Beer:** It is. The planning fees do not even cover the development management process.
Joe Henry: You could argue that the other people who benefit from plan-making are the developers.

Lord Inglewood: But they are paying for the applications they put in anyway. I am just raising it as a point in the debate; I am not taking any sides in the argument.

Q78 Baroness Rawlings: Could I ask Mr Henry this? This seems like a completely new approach—new to me—a different approach. Is this Capita’s first project like this? Have other councils taken on this format because they see the success of it, or is it mainly because of the area you are in? All three of you mentioned that fees do not cover the costs, and the costs of enforcement, and I wondered in what other areas fees are raised that would cover the costs. I am sorry; there are a lot of questions here. Finally—a question I think you have sort of answered—what has been the impact on planning teams of the national reforms, such as the extension of permitted development rights? I was really interested in the first one.

Joe Henry: I apologise. What was the first question again?

Baroness Rawlings: Is it Capita’s first project, and have other councils followed suit?

Joe Henry: There are a couple of outsourced planning services. There is one in north Tyneside, and there has been a secondment model in Salford, but they operate differently; it is a completely different model. The model we work under is unique; no one else has adopted that model. We have tried to talk to other local authorities to see whether they are interested in buying into our model, but planning is quite difficult to sell as a service that you could outsource because of the political pressures to keep it in-house, and you hear the benefits of keeping it in-house. What was the second question?

Baroness Rawlings: The fees do not cover the costs and the costs of enforcement, so do you raise fees from other areas to make ends meet, if it is going to be on a profitable basis?

Joe Henry: In the model that we have adopted, enforcement was seen as key. It was a member priority, so we had to protect the resources that go into enforcement. There are a number of key performance indicators, planning performance indicators, which have to be met contractually, so the risk of delivering enforcement, the cost of it, is all met by Capita. The council has a commitment to deliver those services at a certain cost, and Capita absorbs
that cost. Obviously, we then have to generate additional income through other avenues to pay for that.

**The Chairman**: Do you constantly update your negotiations with Capita?

**Joe Henry**: No, the contract is set in stone now.

**The Chairman**: For how long?

**Joe Henry**: Ten years.

**Lord Clement-Jones**: Costs as well over ten years?

**Joe Henry**: Yes. There are uplifts. I do not know the mechanisms of the contract in detail but there are changes in fee base that come in, and actually the cost to the council decreases over time, because it is anticipated that, as the business grows, with benefit to Capita and the company itself, which the council then share in any profit, which we see as a justification to reduce the core fee, as we call it.

**Q79 Baroness Andrews**: I want to ask you about the extension of development rights, and I would like to ask you one thing in particular. This is one of the things that is really changing your room for manoeuvre, is it not, within local authorities, and it presumably will be affecting you in quite different ways. I have a specific question for Bath and North East Somerset because of the weight of your historic environment and the impact on conservation areas. One of the things we are concerned about is whether, by extending permitted development rights, there is any danger that we are going to degrade the historic fabric, because people will be trying to manoeuvre around it, as it were. Are you concerned about these issues? What are the things that really concern you about the impact of that extension?

**Simon de Beer**: We have found that introduction quite unhelpful, and even quite perverse in its outcome. To my understanding, it was intended to help flexibility, to respond to the housing crisis, and for the areas where there is surplus or vacant offices, to convert that to residential. In the case of our authority, we have made provision for sufficient housing to meet our identified need, including land out of the green belt, including redeveloping brownfield sites. We are quite a growth-oriented authority. We are trying to maximise or change the nature of employment from a heavily retail, low-paid, base—which is surprising in Bath, but that is the case—tourism and retail base, to more of a high-tech, office-based
centre. A lot of our high-grade office has now gone to residential. We did not need to go there; there was a sufficient supply of housing. Also, some of the key office space—for instance, some of the starter office units and mixed use offices, and also some of the seedbed office base—now also has permission in principle to convert to residential.

**Baroness Andrews:** That is change of use regs, is it, rather than permitted development?

**Simon de Beer:** They have change of use under the permitted development rights. That did not apply previously in conservation areas or heritage sites. The extension now does, so whilst we were marginally affected before in parts of the district, we are going to be potentially severely affected by the extension, which does relate to the city of Bath.

**Baroness Andrews:** With Bath, because of the historic protections on so much of your fabric and your conservation areas, what are you most concerned about, and how will you be able to fight that?

**Simon de Beer:** We could consider an Article 4 direction. We did consider seeking exemption in the first round.

**Baroness Andrews:** Take a whole conservation area out?

**Simon de Beer:** That is a possibility, in order to safeguard at least our higher grade office base. We were expecting to lose some of the old Georgian office stock back to residential, which would not have been a particular problem; we could have coped with that. What is happening is not so much that that is going—that is staying in office; what we are losing is the change of use from modern office space to apartments.

**Baroness Andrews:** Does it lend itself to apartments?

**Simon de Beer:** It is not necessarily a good living environment. It is more the loss of the opportunity to start-up businesses that is the problem. We have units that are full of start-up businesses, the seedbed of economic growth, which the whole thrust of this proposal I suppose is intended to address, losing the office space and their base as a community group of businesses to residential. There is a loss of needed space for offices, and in an area where there is pressure, in Bath, we have very limited space to create new offices because of the heritage situation.
Baroness Andrews: So it is actually working against the development presumption in the NPPF, is it?

Simon de Beer: Absolutely perversely, contrary to what it was intended to achieve.

Baroness Andrews: That is very interesting. Thank you very much. What about the experiences in the other areas?

Joe Henry: The office-to-residential permitted development rights have led to a large number of offices being converted into residential. You could argue, though, that that is helping to deliver housing units, but the problem is twofold, as has been touched upon. One is that the offices could have existing people in them who have had businesses going for many years. We had an example recently where a whole office block was converted. It had existing tenants, and it was converted into 112 residential units. I understand that the whole floor space was occupied by businesses, and they had to find somewhere else. The other disbenefit is that there are no planning standards, so you could theoretically build rabbit hutches, as people sometimes refer to them, if you wanted to, whereas planning standards that define a good-quality size of units are almost set in stone. They still have to meet the building regulations. I am just talking about space standards.

Baroness Andrews: This is really important. You are saying that when you convert an office space to housing, you are not required to observe planning standards in relation to space.

Joe Henry: Correct.

Baroness Andrews: That is extraordinary. We did not know that. Or presumably design. What about ventilation? Building standards presumably cover that.

Joe Henry: You do not have to meet anything, so there could be environmental concerns. No, actually, if you have environmental concerns, we can raise them through the prior notification process, so there is some safeguard.

The other permitted development rights that I think you are concerned about are extensions to houses. That affects Barnet significantly, because we have a lot of suburban dwellings. They are generous but in conservation areas, which I think is your main concern, I do not think you can actually apply for the prior notification. In any case, as touched upon, if local authorities feel they need extra control, they can impose an Article 4 direction.
**Baroness Andrews:** What about the loss of gardens? Presumably that will happen. Are you losing a lot of garden space, for example?

**Joe Henry:** We will be losing garden space, but a typical garden in Barnet is quite large, so the extent of the extension would not have a significant impact on character. In inner London areas, where gardens are smaller, you might see that being an issue.

**The Chairman:** Can I just make a point to the members of the Committee? As always, we are running out of time, so can we keep supplementary questions short?

**Baroness Young of Old Scone:** This is very important.

**The Chairman:** You can get important things in a few words too. Limit it to three minutes.

**Baroness Young of Old Scone:** In three minutes, can you tell me your feeling about the Housing and Planning Bill and the zoning proposition that is virtually de facto brought about by it? A minute each.

**Simon de Beer:** In relation to the zoning, the issues will be similar and will relate to the lack of control over quality of the new scheme. We are not quite sure how much control there will be. We often find, without being rude to developers, that a lot of their schemes are considerably improved through the process of a planning application. Some of the schemes that are submitted are quite poor in terms of the design and the urban design, and they are improved through the planning application process, whereas with permission in principle I can see that all we are going to be able to control, as I understand it, would be some of the very basic highways issues, plus flooding. I am not quite sure what the other elements are until we see the scheme, but I can imagine it would quite easily lead to a poor quality scheme in some of the key parts of our towns.

**The Chairman:** Are you following its development in the Commons at the moment?

**Simon de Beer:** At a high level.

**Joe Henry:** Yes, not at a detailed level. We wait for the detail before we put too much resource into trying to second-guess.

**The Chairman:** Good point.

**Joe Henry:** I share the views of Mr de Beer. I do not think it will impact Barnet, so I have not really looked in detail at what the impact would be.
Anneliese Hutchinson: I would echo that. The devil will be in the detail, and obviously that is not available at the minute so it is difficult to tell. I have some concerns in that I think the existing planning system works quite well, and I am not really convinced as to what improvements zoning will lead to.

Q80 Baroness Whitaker: This is the obverse of Lady Andrews’ question really. To what extent does the present system allow you to preserve workplace sites that are threatened, when they contribute to jobs and economic development?

Joe Henry: We have a policy to protect workplaces.

Baroness Whitaker: But under the system of laws now.

Joe Henry: We mentioned the permitted development of offices.

Baroness Whitaker: It enables you nevertheless to safeguard workplaces. We cannot safeguard the offices, but we can serve an Article 4. The problem with serving an Article 4 to stop permitted development rights of offices to residential is that you have to pay compensation for the difference in values, so we would have to give 12 months’ notification of what we intend to do. If you do that, you are not liable to compensation.

Baroness Whitaker: So it is cumbersome.

Lord Clement-Jones: That is for an individual office block, is it?

Joe Henry: You could do an Article 4 for the whole borough area but you have to have a justification for it, and the Secretary of State has to sign it off, so we cannot willy-nilly say that we want to serve an Article 4; there has to be robust justification for it. As I say, we would always give 12 months’ notification because of the cost implications of compensation.

Anneliese Hutchinson: Interestingly, under national policy we can safeguard land for housing but we cannot safeguard it for employment, so one of the issues might be looking at the urban areas for the future and where you might want offices. That cannot be safeguarded through the local plan.

The Chairman: Do you intend through your trade associations or whatever groupings—the National Federation of Builders, et cetera—at least to give input when the Bill comes, for example, to the House of Lords from the House of Commons? Has it struck you that this might be a way to do things?
Joe Henry: We go through our professional bodies. The Planning Officers Society is one that we would feed into, and then there would be one view put forward that represents all of us, because we feel that is stronger than doing it individually.

Q81 Lord Clement-Jones: I am going to ask what sounds like rather a general question but it has a specific point. In your experience, how can local planning teams deliver more efficient and effective planning, and what plan-making models are available to achieve this? What we are really trying to get at is that, given your experience with joint arrangements, the duty to co-operate, upcoming combined authorities, do you think those can deliver that in the light of regional spatial strategies being abolished?

Anneliese Hutchinson: I think there has been a gap as a result of regional spatial strategies going, and the duty to co-operate has been a difficult procedure to follow to try to fill that gap. Certainly in the north-east we are very keen, across all the authorities, to have economic growth, and that has been demonstrated in our SEP, our strategic economic plan, which has been produced by the local enterprise partnerships. There is a difference between that and the National Planning Policy Framework in terms of what it tells us to do for local plans, so there is an ambition, and then there is a spatial plan, which is based on the evidence, and there is a gap between the two. I think the regional spatial strategies helped us to have that discussion. It might well be that combined authorities will help us do that.

Lord Clement-Jones: You might return to some of the larger—

Anneliese Hutchinson: Yes.

Lord Clement-Jones: That will include a broader range of matters that you will be able to plan for as well?

Anneliese Hutchinson: Yes. That is one of the things we are looking at in our devolution bid for the north-east. We have suggested that we probably need a north-east spatial strategy, and one of the things we are tasking ourselves with is what form that will be in, whether it would be a strategy document or something different, and what would it need to cover.

Lord Clement-Jones: I have seen you have this great agreement with government. Does that allow you to do that under a plan?
Anneliese Hutchinson: That is one of the asks. Obviously, we are still having negotiations on what that will mean. Basically, the duty to co-operate is across seven authorities in the north-east, but they are all at very different stages in the plan-making process, so it is difficult to get agreement on where you want it to go in the overall strategic view.

Lord Clement-Jones: So people will be relying on your experience in your current joint working in order to go across seven authorities. Is that going to happen?

Anneliese Hutchinson: Yes, obviously to get our local plan—Newcastle and Gateshead’s joint plan—through, we had to work with our neighbours anyway, and that dialogue is ongoing, but at the same time the seven authorities have been developing the devolution deal and a strategic economic plan. Things also change over time, so it is definitely work in progress.

Lord Clement-Jones: We will come back to all the resource issues and so on and so forth, I have no doubt.

Anneliese Hutchinson: Definitely, working together makes life easier and has probably meant reduced cost. We shared the cost of the evidence base. Some of the evidence base we did across seven authorities, some we did across two. I think it helped with the inquiry costs in that we shared them between ourselves and Newcastle. We had a critical friend there as well, which was great in terms of getting into the detail of draft policies, actually having somebody sitting at your elbow saying, “Does that make sense? What are you trying to get to?” That has all helped, but the duty to co-operate has not necessarily filled the gap left by the regional spatial strategy.

Lord Clement-Jones: But your new structure might?

Anneliese Hutchinson: Yes.

Lord Clement-Jones: That is very interesting, because you have two entirely different contexts here. London borough?

Joe Henry: Obviously, a strategic view and vision is critical in plan-making. We could say that we are lucky in London, because we have that vision through the London plan, so, unlike colleagues, we feel comfortable in that set-up.

Lord Clement-Jones: In terms of relationships with neighbouring boroughs, you have a very clear structure.
Joe Henry: We have to be compliant with the London plan, so that brings us all together with one strategic vision.

Lord Clement-Jones: London exceptionalism in a sense already.

The Chairman: Whose idea was that? Was it Livingstone?

Joe Henry: I cannot remember, to be honest.

Lord Clement-Jones: But it is longstanding?

Joe Henry: It is longstanding, yes.

The Chairman: That is interesting.

Simon de Beer: I think it is a big ask for a small authority like Bath and North East Somerset, which has only 180,000 people, to provide both a strategic planning level and the detailed planning level. In the first round of post-RSS plans in our area the wheels almost came off all the plans. We went through a really arduous process, trying to work together, trying to work out the duty to co-operate. We managed to get through it, but I think it was a very inefficient process and took a lot longer and was a more expensive way to write a plan. We missed that level of strategic direction.

In the first review process we are joining the authorities around Bristol to do a joint spatial plan, so there will be one statutory plan covering the four authorities, to deal with high-level issues like housing, employment and infrastructure. One thing we hugely benefit from is being able to test the housing figure through some kind of examination process before we finalise our spatial strategy, but the system does not allow for it at the moment and you end up going to an examination with a housing figure and a strategy untested, and if the housing figure is wrong, the strategy is wrong.

Lord Clement-Jones: Do you have more clout as a result of having done that exercise with the other authorities?

Simon de Beer: There are benefits in terms of economies of scale, as was discussed; it is cheaper to have one commission to do the housing requirement. In terms of clout, the biggest challenge is for the politicians, because you are dealing with a big city and three surrounding rural authorities, and a city that is full and needs to overspill, so technically you can do the work but it is down to the politicians in the end. There is no obligation, so the vulnerability at
some point is that if one of them does not like what is coming their way they can pull out of the process, and I think that is a big vulnerability, which we have lost from the strategy planning.

**Lord Clement-Jones:** Does the duty to co-operate provide any pressure, or could this have happened without any duty, so to speak?

**Simon de Beer:** I think it has been a bit of a lever, but it has been a very difficult learning process as to what the duty to co-operate actually means. Pressures such as five-year housing land supply are a greater lever on our political masters to actually get on and review the up-to-date plans, because obviously they want to stay in control of the development.

**Lord Clement-Jones:** Can you see moving forward in terms of some sort of combined authority in your region?

**Simon de Beer:** The four authorities have made a devolution bid that entails a combined authority, but obviously the devil is in the detail in terms of precisely how that works and who has the power: the elected mayor or the authority leaders.

**Lord Clement-Jones:** Quite. What is the deal?

**The Chairman:** Of course, you are very widespread geographically.

**Simon de Beer:** We are, but Bristol and the three surrounding authorities are a surprisingly compact sub-region.

**Q82 Baroness Young of Old Scone:** Is green belt policy still fit for purpose, or would you like to see changes?

**Simon de Beer:** It depends on what you are trying to achieve. I know that is a bit of a glib answer, but it has been extremely successful in terms of containing the growth of large cities. We have a Bristol and Bath green belt, which has been there for the last 50 years, and has been very effective in doing it. However, we have managed to remove bits of the green belt where we have shown that there is a particular need to take land out. In our adopted plan we had to take four locations out of the green belt. They were not massively strategic; they were about 300 to 500 houses, so they were not large, but we were able to do it. We have been able to protect the outward sprawl of settlements and keep land open and meet the needs for development in a sustainable way. In a sense, from our point of view—and I know that
many criticise green belt for forcing unsustainable patterns—it has been fairly successful in the Bath and North East Somerset context.

Joe Henry: I would agree. Green belt policy, if you are looking to restrict or stop growth into those areas, has been successful. The challenge, though, is that sometimes you might identify some green belt areas and could question how valuable they are. You can review, but it is quite a cumbersome and long process. You might only identify one little site, but you have to review the green belt in the whole area to justify taking something out. If there were an easier way to take out maybe a bit of land in the green belt in isolation, that might be helpful.

Baroness Young of Old Scone: You do not think that will be death by a thousand cuts?

Joe Henry: I am just putting a view forward and suggesting that you might identify one area. I do not think it is right to put a process in place that is very cumbersome and long just to try to stop you doing something in isolation. In a sense, if the will was there to take a small, isolated area out, you will go through the whole review process, but why go through all that when you are clear about what you want to deliver? There could be proper checks and challenges. I do not know what the solution is; I am just saying that it could be an issue if you identify one particular site.

Baroness Young of Old Scone: You raise the question of small sites that you cannot see the purpose of. What sort of criteria are in the back of your mind when questioning the value of those particular sites as compared to the rest of the green belt?

Joe Henry: We have metropolitan open land as well in Barnet, which has the same protection status as green belt, so I look at it in exactly the same way. I know of one particular site sitting amongst a residential development, surrounded by the very busy North Circular Road. It was earmarked for a pavilion to be built. The pavilion was built through an old Section 106 agreement, but there is nothing in place to ensure its longevity, and this piece of land is going to waste as far as I am concerned. Car boot sales come now and again; we serve enforcement notices to stop that. That is an example I have seen on the ground where I personally think that perhaps we should look at taking that particular site out of the green belt.

Baroness Andrews: Is that green belt or greenfield?

Joe Henry: It is just a field right beside the North Circular.
Baroness Andrews: Is the distinction between greenfield and green belt a problem? There is less now to distinguish, and the degraded bits of the green belt you could say are not only more vulnerable but maybe should be a bit more vulnerable if we are so desperate for land? That is a radical proposition, but is it dangerous to say that?

Joe Henry: I think we should have the ability to review quickly.

Simon de Beer: Could I just add one point there? I think the value of green belts is their permanence and the strength of policy, but there are ways round it. As well as the four sites we have taken out of the green belt for housing, we have allowed a large Gypsy Traveller site and a small Gypsy Traveller site, and we have allowed a sub-regional fire station, all in the green belt, so if there is an overwhelming and demonstrable need in that location, you can permit development in the green belt as appropriate, but you still have the protection.

Joe Henry: You have to demonstrate very special circumstances. That is the key test for any development in the green belt. Most development in the green belt is considered to be inappropriate by definition, and you could justify development only in very special circumstances. In a sense we are looking at schools, because we have run out of sites, but we have to demonstrate very special circumstances to be able to deliver that.

Anneliese Hutchinson: Very quickly, I think the green belt policy works well. I think the issue is how we review that. It should be done only in exceptional circumstances, through a local plan process, and if it operates in that way, it works. The issue is probably the guidance on how you would do a green belt review, because there is no national guidance, so everybody adopts their own opinion as to how that should happen, which is probably why it sometimes takes an awfully long time: because it has to be justified so much in the local area. If we had national guidance about how to do it, or best practice, that might be helpful.

The Chairman: That has really been a very helpful session. Thank you very much indeed. We touched on a few things that we probably should have gone into more deeply, and we probably went too deeply into some things that we could have done more easily or quicker. If you have any ideas that come to you, particularly on your train back to Gateshead—and we are very grateful to you for coming down—perhaps you could scribble a few words, because we want to make this report really important, and we have been so blessed in having really
good witnesses, amongst whom of course I would name you. We are still not there, but it is all systems go until March or thereabouts, so we would be most grateful. Thank you very much indeed.

03 December 2015
Introduction

1. This submission has emerged from a new initiative to raise the profile of the arts in place-making in the context of the Farrell Review of Architecture and the Built Environment (www.farrellreview.co.uk). The initiative is being led by arts charity Beam (www.beam.uk.net) in close collaboration with Farrells, and with strong support from artists and other built environment and cultural professionals. In the past year over 100 individuals have contributed to the initiative through a series of open forums in London and Yorkshire. Further events and an action plan are in preparation and the initiative is now part of the recently formed Place Alliance movement (https://www.bartlett.ucl.ac.uk/placealliance).

2. As part of the development of national policy for the built environment, we believe that the arts are a very important, and too often neglected, part of the agenda of place-making. Although there are references to the role of heritage and the historic environment, the arts are omitted from the Questions of the Call for Evidence, even though involvement of artists in place-making can contribute significantly to achieving high quality design and place-making (Question 10). Also in relation to Questions 11 and 12, community involvement and community impact, these are areas where the involvement of artists can have a hugely beneficial impact.

3. Apart from public engagement, more broadly artists have creative skills and knowledge that can contribute to all stages of the planning and design process. However there is a lack of knowledge within the built environment and public realm management professions about the contribution artists can make - a skills issue relevant to Question 9. Therefore we would like to see recognition of the role of arts in place-making becoming a priority.

4. The initiative is aimed at bringing fresh perspective and impetus to the promotion of the important role of artists and the arts in place-making and has been involved a range of artists and cultural professionals. Their ideas together with Graham Henderson’s essay, *Putting Soul in the City*, which follows, have informed the drafting of the Manifesto, included as an annex at the end.

5. As powerfully expressed in Graham’s essay, the initiative places the role of artists, and culture more broadly, at the very centre of the planning, design, and revitalization of
'place' - not at their edges nor as an afterthought. In asserting this, it also centralizes the role of individual citizens and communities.

1. **Essay by Graham Henderson**: Putting Soul in the City – towards a manifesto

**Using public art to transform the 21st Century urban landscape**

1.1 This essay is a call to radical action. It is a call to create William Blake’s *future city of the arts* in the digital age, and to use the arts and culture not only to beautify the public realm but also to express our values, provide social identity and cohesion, and provide new opportunities for science and enterprise. It is a call for a complete change in the way public art is taught, planned, commissioned, delivered and built, making it a key part of place-making in every urban development. It is also a call to empower culture and the arts, restoring them to their rightful place at the heart of the social project, encourage and stimulate the building of social capital, and contribute to a new kind of active citizenship. And it is a call to create environmentally sustainable cities, fit for the future. We live in a bland and bureaucratic age where originality, beauty and difference are usually crushed. And when a place is anonymous and without identity we describe it as *soulless*. This is a call to put the soul back into the city, and to recognise the central importance of public art to our shared humanity, to allow the free expression of a democratic culture, whether in material forms or through live street arts, and to liberate culture and the arts to create bold new public expressions of who we are in the 21st Century. It is a call for a manifesto for these public arts.

2. **Sense of place**

2.1 Sense of place is not a new idea, but is grounded in our history and philosophy. Our definition of it goes back to its classical roots. In Ancient Athens, the first ever democracy, public art was everywhere. Its streets, temples and law courts were filled with a vast array of multi-coloured statues, carvings and text art, used to embody the city’s democratic ambitions. The sense of place as we know it developed from the ancient Roman concept of *genius loci*, the idea that every place has a unique identity and a protective spirit. This idea was brought firmly into the modern age by the poet Alexander Pope (1688-1744) whose ideas of garden and landscape design, and the placing of public art within them, still influences landscape architects to this day.

2.2 Modern philosophers have explored this idea from a more contemporary viewpoint. Heidegger was one of a group of 20th Century philosophers who took as their starting point the way human beings actually experience the world (phenomenology). This approach

---

5 Graham Henderson, Public Art Consultant at Poet in the City
allowed him to explore the many layers of meaning and significance that people attach to the places they inhabit. The ways we regard places, and use them, is influenced not only by practical factors but by all of the ideas, associations, hopes and dreams which we bring to them. The best of public art responds to and articulates this sense of place.

2.3 The Czech philosopher Jan Patocka (1907-1977) took the sense of place a step further, connecting it not only with the human capacity for projecting or reflecting ideas, but also with our lives as social and political beings, and members of a community. Returning to the starting point in ancient Athens he noted the close relationship between private virtue, participation as an active citizen in a democracy, and the expression of these social and political values in the built environment of the city. Patocka called upon the modern age to learn from this example, and to find ways of putting soul in the city.

2.4 This was very much the project pursued by Jane Jacobs (1916-2006) the urban design campaigner and critic who fought to preserve Greenwich Village and other historic neighbourhoods of New York under threat of demolition in the 1980s. In her seminal book *The Death and Life of Great American City* she observed in great detail the ballet of the streets, the way that real people behaved and interacted in in her street and neighbourhood. Her work demonstrated persuasively that human beings like their communities to be bustling and varied, that they benefit greatly from the casual contacts with neighbours and shopkeepers, and that their world is rendered much safer and friendlier by many eyes on the street. Our public art too should reflect our need for such community and social capital, in other words the friendships, participatory networks, associations and civic relationships which characterise a properly functioning democratic society.

2.5 Finally, sustainable city theorists, activists and ecological architects like the Australian Paul F Downton are writing about the important connections between eco-cities, the environment and the arts. The sustainable city of the future needs not only to be an economic success, but also to be sustainable indefinitely in terms of its ecological impact. For instance, it needs to be able to feed itself and to have a symbiotic relationship with the surrounding countryside. It needs to power itself from renewable sources of energy, and to produce minimal quantities of pollution. And it needs to use land efficiently, to compost, recycle, and convert waste into energy. In short it needs to have the smallest possible ecological footprint. For this kind of city to be born it is clear that we also need a transformation in the approach to both politics and culture. Public art becomes one of the most important ways of symbolising and championing the values that need to underpin a decisive transformation in our approach to city-building.

2.6 In other words public art is not external to our society and its sense of itself, but is a fundamental way of expressing our identities, history and values, of celebrating, exploring,
commenting and questioning, and of championing a sustainable future. It is from our sense
of place that we construct our meanings and our communities, and from which we can
develop our social capital. Together these strands of thought provide a firm foundation for a
fresh philosophy of place based on real people in their communities, on a commitment to
the importance of art, and on a powerful sense of public virtue, civic pride and social
cohesion.

3. Reclaiming the language of place

3.1 In order to transform our approach to public art we must challenge the lazy and
corrupted use of phrases like ‘place-making’, ‘public engagement’ and ‘participation’ which
are wheeled out thoughtlessly to justify every piece of urban design. The involvement of the
community in public art must be real. Instead of clichéd talk of ‘regeneration’, ‘urban
renewal’ and ‘renaissance’ resulting in the same old soulless, windswept and
underpopulated urban wastelands, we are calling for a real relationship between place and
people. There must be a debate and a reconciliation between the demands of artistic merit
and the needs and wishes of people who use and own the public spaces concerned. We
must reclaim the sense of place and involve real communities in reinventing it.

3.2 We must challenge the tyranny of the bland, which leads directly to depression,
disillusionment, nihilism and extremism. The procurement of public art must reflect and be
inextricably linked with the education of citizens for a democracy, and their active
participation in their communities. It must allow them to influence what happens in their
place, in their town, and empower artists to make these places different and distinctive.
Artists have a crucial part to play in developing a purpose-built humanist landscape, in
creating the urban spaces, buildings and thoroughfares which reflect the values of the 21st
Century urban community. The future city of the arts contributes directly to identity,
happiness and involvement in a community of shared values. Our shopping malls,
motorways and suburbs really do damage the functioning of our societies. Our squares,
clubs, gathering places and public fairs really do make a direct contribution to them. Public
art provides a means of championing a new sense of liberty and identity in our society.
What matters in our approach to public art are the communities, identities and histories it
represents and embodies, the meanings associated with it, and the sense of place.

3.3 New approaches to public space are being informed both by the physical design of
the spaces themselves and by the virtual or transient uses to which they are being put.
‘Public art’ in this context does not just mean the monument in the square but also the
plethora of live arts, digital art, transient art and ‘band stand’ performance which has the
potential to reinvigorate our sense of place.
3.4 We have the ability to use the arts to create ‘smart’ public spaces, using a combination of virtual and physical elements, embedding technology in the built environment connected with the technologies in our pockets and worn in clothing. Public art in the digital age encompasses everything from temporary lighting installations, screen technology, augmented content, and information hubs. It also includes participatory experiences, ‘happenings’ designed to challenge our perceptions of the uses of public space, and the riotous carnival of street arts. Outdoor festivals and the cultural activities associated with them are already playing a more important part in how we live, and we are guided to them ever more efficiently by our mobile technology. Whether it is permanent or semi-permanent, physical or digital, beautifully crafted design detail or grand electric spectacle, eclectic public art has the capacity to celebrate who we are.

3.5 In the painting by Pieter Bruegel the younger, *The Fight Between Carnival and Lent*, we see observational scenes of a community working out its tensions and re-enacting its own cohesion through a chaotic conflict of cultural activities in public spaces. New technology allows us to imagine modern riots of colour and cultural meaning filling our streets in a similar way, witness for instance the recent Will Self installation in Brixton which displays overheard snippets of dialogue. In fact this sense of carnival has the potential to contribute directly to the new forms of community participation and social capital building we are advocating. This is a call to put the soul back into all of our places, our buildings, our squares, our streets and our parks.

3.6 And in an age where climate change, a rising human population, and the degradation of the natural world are facts of life, the need to create environmentally sustainable cities is essential. Far from being a luxury extra, an ideas-led approach to our urban environment is perhaps one of the only ways to produce the necessary change in our mind-set. Public art can represent and symbolise a new vision of what a sustainable modern city can and should be like.

4. **Transforming our approach to public art**

4.1 Planning our future built environment now requires an understanding of how the quality of our public places connects with the functioning of our communities and the health of our democratic institutions and a sustainable approach to the natural environment. This is the time for visionary thinking and for imagining a future city of the arts which is more beautiful, more connected, and more fit for 21st century democracy. In keeping with the digital age it is no longer possible or acceptable for such planning to be top-down, for grand projects to be imposed on people for whom they have no obvious meaning or resonance. Now is the time for us to reassert the importance of a sense of place and to empower local communities to make their own places *special and different*. Bringing together talented designers, architects and public artists with places and the communities who live in them
creates the opportunity for great public art which also answers the strong human desire for meaning, identity and the public expression of civic pride and values. It is that energy which will produce relevant public art and new relationships between communities and their public spaces.

4.2 Some public art may be big and ambitious, but this is not the point. Projects can also be small scale and intimate, bringing character, beauty and utility to a small plaza, an alleyway or a street corner. We should not think in terms of scale but of design quality and context. The complete change we are calling for is a revolution in the skills dedicated to making ordinary places better. Every community has a right to great public art. The triumphal arches, military equestrian statues and grand boulevards belong to the past. Public art should respect the past, and learn from it, but must also reflect the way we live now, be playful and experimental. The decisions to monumentalise or memorialise, or to embody our values in our built environment are very important. We must be sure that the meanings are culturally rich and varied in their associations, relevant to their communities, and resonant of their values. Designing public art is a project which goes to the heart of our human project. Equally, public art which is bland, ill-conceived, badly managed or poorly executed, says something about the lack of quality in our urban life and our sense of community. Public art should explode the concept of the ordinary, and introduce quality and aspiration into all of our lives. It should tell us where we are, where we came from, and what we would like to be. Real life may sometimes fall short, but the architecture constantly reminds us to aspire to be our better selves, fully engaged citizens, active participants. This essay is, in the best sense of the word, political. It calls for a fundamental change in how we regard our public and urban spaces, our polis. It draws on the passion and the expertise of many professionals across the field of architecture, planning, design and the arts.

4.3 Transforming our approach to public art requires a complete change in the approach we take: an education in the possibilities of public art (Education), an improvement in skills and techniques (Design), and a renewed association of public art with the culture, history and identities of our places, both past and present (Culture); It is also requires a clear-sighted understanding of the social and business benefits of great public art and the vital role it can play in stimulating this wider economy (Value); It is going to require government to play an enabling and empowering role, creating and implementing policy (Strategy); Finally, it is going to require bold and inspiring leadership by those responsible for all aspects of public art and the built environment (Leadership). We shall take each of these areas in turn:

5. Education
5.1 If we are to transform public art for the better we must start with education. Architecture, design and the sense of place should be taught across many subjects including design, geography, aesthetics, history, maths, technology and engineering. Young people should be introduced to the great possibilities which attach to public art. This is not a matter of top-down learning either, but an education in citizenship. The task of reflecting our values, aspirations and political structures in our public spaces is inseparable from the project of involving individuals in active citizenship and social capital building. Young people must be empowered to be creative, to solve problems, and to change things for the better. Teaching them about public art and the built environment is also promoting a better future for a pluralistic participatory democracy. If we believe in this, we need to champion it in our schools and reflect it in our public art. With the help of architecture and planning organisations teachers need to be enlisted and trained to pass on their passion and belief in a better built environment to younger generations.

5.2 A passion for place is also a necessary foundation for another important aspect of education: the encouragement and dissemination of skills. The digital age is an age of blurring boundaries between old professions and crafts, of intelligent and surprising cross-arts collaborations, making use of new technology, new techniques and new materials, by individual makers with entirely new design and fabrication skills. The training of architects, planners, landscape designers, engineers and artists should reflect this new eclecticism, and embrace its new possibilities. It is no longer sufficient to work in specialist silos. We are entering a new age of the maker, in which technology will allow artists to manufacture beautiful craft objects on a scale and at a cost that should make them available to a lot of people. Instead of waiting for others to take the lead we should be exploring and experimenting with the use of these new tools and encouraging a new generation of high tech craftspeople to innovate. The means of skills acquisition are themselves evolving rapidly, and every opportunity should be taken to promote and encourage these future makers.

5.3 Government also has an important role, especially in ensuring that this new approach to public art and the built environment extends across our schools, colleges and skills academies. It is important that the importance of the arts is taught in business schools, that the value of business is understood in architecture schools, and that planners are persuaded of the role of art and architecture in social capital building. All education should prepare students to be flexible, to engage in broader decision-making, give them cross-disciplinary understanding, and encourage them to step up into leadership roles. The one-size fits all educational model, which is rigid and over-specific, will not produce the talented individuals we need for a rapidly changing world. Lack of opportunity and creativity in education squanders the innate talents of young people and under-uses the assets of our
society. Young people should be encouraged to think creatively about their home, street, neighbourhood and urban community.

5.4 The sociologist and educational philosopher Emile Durkheim identified two distinct functions of secondary education: identifying and encouraging talented individuals and enabling them to succeed in their chosen field; and educating individuals for a life of active citizenship. In concentrating on the former it seems that we have almost completely forgotten the latter, equally important objective. In an age of new kinds of job, porous boundaries between subjects, and portfolio careers, this distinction is perhaps also collapsing. The answer to what is most important really is ‘Education, Education, and Education’ but we are still waiting for it to be given the priority it really requires for the future health and prosperity of society.

6. Design

6.1 Design has the potential to create and communicate a transformation in our built environment. Mass produced, poor quality designs for everything from cutlery to building materials are not a necessary part of our future. The age of the 3D printer opens up the possibility of an explosion of creative new design, starting in the design studio or urban room and spreading to every area of our lives. We need less stuff, but this stuff should be much better designed and built. Good design does not happen by itself. It needs skills to be acquired and passed on. It needs patrons, clients and customers who are design-literate.

6.2 This is the century of city-making. Human beings are moving to and living in cities on a scale never previously imagined. British architects and designers lead the world in sustainable city building. It is time that this great strength in design is connected to a bigger vision of how human beings should live in their communities. Public art provides an important way in which artists and architects can project bigger ideas about human values, community, and social capital building. It provides a way to champion and set out a vision for a civilised, prosperous, tolerant and inclusive future city which is also environmentally sustainable. A new era of cultural, intellectual and professional exchange between cities is emerging and there is an opportunity for British designers to be at the forefront of a new model.

6.3 We need to unlock this potential transformation by placing culture at the heart of our thinking and adopting a new approach to place-making. If we do so we can dramatically change our urban landscape, with significant implications for community development, business and international relations, and the environment. If we do so, the world will beat a path to our streets and squares, to our new public spaces, and our new symbols of popular participation. We should not just lazily evoke or imitate the cityscape of ancient Athens, we
should build our own modern and dynamic version of it here, in our green and pleasant land.

7. **Culture**

7.1 The great battle of modern versus traditional, new versus heritage, does not exist now in the same way as it did in the 20th century. Our culture is gradually absorbing the great ruptures of that century and understanding that a sense of place, identity and history can be combined with modernity and sustainability. The new era is more likely to seek intelligent and practical ways of combining the old with the new, breathing new life into historic buildings rather than demolishing them, and converting them to new social and commercial uses. New developments are more likely to try and rediscover and amplify the sense of place than they are to sweep away the past entirely in an attempt to create a brave new world. Our built environment is more likely to be built for the way we want to live rather than the way it is thought that we should live, and for a sustainable future. This bold marriage of the old and the new, this sense of place, has the potential to reinvent our streets, towns and communities. It has never been a necessity for all places to look the same or to be reduced to a similar formula. The sense of place allows us not only to preserve our heritage but to create a future heritage, transmitting what is most special about our places to new generations.

7.2 Once again the question of what makes good public art is inseparable from a wider approach to the role of culture in our civil society and its importance to building social capital. Periods of great creativity in the arts such as the Renaissance do not flow from economic success alone, but from a passionate desire on the part of patrons and clients, artists and the wider public to express cultural values on a public stage. Its symptoms are a promiscuous explosion of art and creativity led by ideas, and by experimentation, breaking down the artificial barriers between the arts and sciences, and an enthusiasm for projecting social, political or religious beliefs into the public realm, along with our aesthetic ones. Without sufficient social capital, plazas will remain empty, and open air theatres will be permanently empty. With it, you will see a proliferation of user groups and income streams.

7.3 A creative renaissance of this sort cannot be mandated by a government or a planning authority alone. It must come from the empowerment of the wider community through education, skills acquisition and ideas leadership. Above all it comes about because of a recognition of the central importance of culture to society. It is not an ‘add-on’, something which is ‘nice to have’ if there is any money left in the budget. Nor is it something merely instrumental, only of value if it helps to achieve some other social welfare objectives. Treating culture as a luxury extra is a grotesque error. Far from being something surplus to requirements and therefore easy to cut, culture lies at the very heart of what it means to be human beings living in a political community. It is not a luxury, it is a necessity.
Public art is merely the most obvious manifestation of this, and poor public art (or its complete absence) is one of the clearest indications of a society that is alienated, disengaged from politics, and vulnerable to radicalization. We neglect culture and public art at our peril. It affects the whole quality of our public life and our society.

7.4 This essay therefore opposes all those who treat culture as either a mere luxury or as an instrumentalist device to achieve welfare objectives. These views represent the historical materialism characteristic of the 20th century, and shared by both the Left and the Right wings of the political spectrum. It represents an inversion of the truth. In reality culture comes first. It defines what is valuable and important to us, as human beings and as members of a community. Once culture is given its rightful place it quickly becomes apparent that it can determine new and innovative approaches to all of society’s other issues. It mandates a broader and better education rather than a narrowly technocratic one, it calls for a questioning attitude and creative free expression over blind obedience and bland uniformity, it encourages active participation over passive consumption, it celebrates life over mere existence, and it asserts human dignity in the face of cruel and soulless systems.

7.5 The materialist demotion of culture has resulted in soulless public spaces and landscapes of bland uniformity. We fight to protect ‘heritage’ landscapes like Grantchester Meadows, the view of the Thames from Richmond Hill, or the moors behind Haworth parsonage without examining why philosophically they are so important to us. The answer in all three cases is entirely cultural. Without the poetry of Rupert Brooke, the paintings of JMW Turner or the novels of the Bronte sisters respectively it might have proved hard to resist the overwhelming of these landscapes by urban sprawl. It is art and culture which gives them their meaning and significance. Meanwhile many places have had their identity thoughtlessly crushed, despite the fact that they all have their own distinctive histories and identities. Public art provides a way, perhaps the only sensible way, of restoring these places to us.

7.6 Ideas can and do change the world. And acknowledging the central importance of culture in our lives will have direct results in the quality and experience of our built environment, a landscape which will be created for people and communities, not for machine-like automatons and mere consumers. It is time we left these 20th century ideological dogmas behind us and returned to a view of culture based on human values and on the way we actually live.

8. Value

8.1 Materialism and narrow instrumentalism ironically blind people to the very real economic and social benefits of culture and the arts. If we insist on treating these as a minor
sub-set of ‘the creative industries’ and as ‘cultural exports’ we have already gone badly wrong, putting culture, which is actually the life blood of our society, in a sub-category of business, somewhere below computer gaming. We must start by reasserting the primacy of culture and meaning to the entire social project. If we do so we shall rapidly see that culture and the arts are far more important economically than a narrow materialist ideology suggests. For instance it has long been recognised that a significant work of public art (such as the Angel of the North), or a new gallery or museum (such as the Turner Contemporary Gallery in Margate) can have a massively disproportionate effect on the economic regeneration of a place or a town. This is the so-called ‘Guggenheim effect’ named after the bold new art gallery built on the decayed industrial riverside in Bilbao in Northern Spain. The effect clearly goes far beyond the sale of mugs and t-shirts from the Museum shop. The art comes to represent and promote an entirely new attitude to the place concerned, providing a powerful boost to its existing businesses and encouraging innovative new industries to locate there.

8.2 We must go much further than this and assert that good public art has the potential to regenerate and revitalise all of our urban spaces. Any such art, large or small, will encourage greater footfall, sustain more small businesses, create a new sense of local pride, and make a place more attractive for new enterprise. The sense of place comes first, and business follows. Nor does it need to be a case of stealing people from one place to feed another. New community and identity in our high streets, squares and housing blocks has the potential to reverse long term trends towards suburban living, out of town superstores, and passive forms of entertainment, creating new focal points for social and community life. As Jane Jacobs shows, as human beings we thrive in mixed use communities, where we know our neighbours, establish fierce loyalties to our local shop-keepers and café owners, and look out for familiar faces on the street. The reason we flock to Soho or Greenwich Village on the weekend is because these buzzing urban places provide a simulacrum of the bustling village atmosphere which we as human beings love so much. Empty suburban streets, car parks and gated compounds do not cater for our basic human needs, and do not even keep us safe. Safety comes from neighbours and community, from eyes on the street and a sense of place.

8.3 If we challenge the obtuse idea that culture is not important we can suddenly see how new approaches to public art and the built environment can unlock new ways of living contentedly in densely populated urban communities, how it can offer us new identities and a sense of belonging, and how it can stimulate economic and social activities, creating a place where people want to live, and want to stay. Many people are groping towards this insight, for instance in the search for mindfulness, and in the increasingly interest in measuring our happiness and quality of life as well as our so-called standard of living. Where such culture-led communities are established, low rent ghettoes are rapidly transformed
into chic and desirable neighbourhoods. This transformation can be seen in Hoxton and Hackney where artists played a crucial role in changing perceptions, and making these into places where high tech start-ups and fashionable coffee shops want to locate. This often results in such areas becoming gentrified and expensive, driving out the area’s original residents. But people very rarely draw the obvious conclusion that culture can improve and render more dynamic *all of our communities*, reconnecting people with their places in a way that will have an important social and economic impact.

8.4 Public art can be aspirational, meritocratic, creative and commercial. It potentially adds value in so many indirect ways that its direct economic benefits are the least part of it. Where you have a thriving community and active citizens the opportunities for entrepreneurial small businesses will proliferate rapidly. To state the obvious, business and business success naturally follow our human determinations as to what is most important to us. In an economy based on information such success is not going to be based on consumerism of the old sort but on shared experience and participation. The choices offered by new technology also suggest that businesses will need to be more value-driven. This is the domain of culture and the arts, and the expression of this new age in public art has the potential to symbolise and unlock new ways of living and of participating in the new digitally connected sharing economy.

8.5 Most importantly, it is a question of what kind of society we want to be. If we are to create a new democratic model which enjoys the support of its citizens, this must be based on our values, on private virtue and public participation, on tolerance and respect for human rights. We need to stimulate new creativity and new forms of economic activity based on these values if we are to avoid becoming a society of masters and slaves, or one which is environmentally unsustainable. This will involve redefining the purpose of work and the role of society in caring for its weaker members, and accommodating protest and opposition. Only a culturally vigorous and educated society will be able to adapt successfully to a revolutionary new era. Public art offers us a way to express or reassert our values, to champion a pluralistic and tolerant society, and to inspire new forms of public life. Championing the transformation of the built environment is about embracing the future and ensuing that we do not sleep-walk into tyranny, environmental degradation and inhumanity.

9. Strategy

9.1 This essay is calling for a more ambitious use of public art, which has the potential to be an important revitalising force. This will require a radical step-change in collective expectations and actions to improve standards within the built environment. It is not a call for more intervention by government or for more expenditure by government, but for a smarter and more creative approach by government. Strategically it is a matter of
recognising the sense of place and accepting that sustainable cities and ways of living are intimately connected with the built environment. It is also a matter of enabling a new approach to the built environment across government and of empowering local communities. Government needs to recognise the value of good design, the civic value of well-designed public spaces, streets and amenities, and the way they connect with the character and needs of existing communities.

9.2 In practical terms government needs to revolutionise the planning process. Imaginative and proactive planning is required, with thought being given in advance to the overall artistic integrity of a given project. Instead of being reactive, the planning system needs to think creatively about the future shape and form of our towns and cities, and the role that public art can play in reinvigorating our communities. Far from involving additional expenditure, this revolution in planning will be a very cost-effective way of developing more community-driven places. Time taken developing great plans and designs supported by local communities, and then implementing them over a longer period, will pay rich dividends when people start to get the communities they really want. We are calling on government to introduce an artistic audit for all planning decisions in order to empower this new approach. We also call on it to appoint a new Chief Place Maker to champion this new approach and encourage the development of a few key places and projects designed to show what can be achieved by bold new public art with a sense of place. We also have much to learn from great public art initiatives and sustainable models for urban living from around the world. The building blocks for this radical new approach are already available. We also call on the government to support and encourage the development of the Place Alliance, a voluntary network hosted by UCL, bringing together all those who support a new approach to public art and the built environment, and providing a vehicle for radical change.

9.3 It is not the role of government to mandate change, and top-down approaches to public art and the built environment are unlikely to be successful. But what it can do very effectively is to enable change, remove barriers to creativity, and encourage the radical action we are calling for. Indeed this important strategic change of emphasis in favour of sense of place, culture and creativity must be enabled by government. If obstacles are removed and change empowered by government, thousands of talented individuals, artists, designers, makers, architects, fabricators, planners, academics and technicians will do the rest. The revolution in approach by government we are calling for in this essay will result in a far-reaching transformation in our relationship with public space, and will leave a great legacy for future generations, determining the quality of our built environment, and influencing the quality of our civil society and democracy for the next hundred years.

10. Leadership
10.1 Friedrich Nietzsche (1844-1900) once said that if he could find 70 people who thought like him he would be able to change the world. The complete transformation in public art we are calling for requires champions and advocates prepared to articulate a bold new vision of a design-led future, embedded in our built environment. We are increasingly aware of the influence of ideas leadership, and of those prepared to advocate publicly for change. We know that such ideas can start small, working their way into small group and networks, starting to appear on public platforms and in publications, before suddenly achieving a critical mass and becoming accepted as nothing more than reasonable and obvious common sense.

10.2 This essay is a call for such leadership not only from architects, developers and planners, but also from artists, politicians, business people, environmentalists and active citizens. Leadership can spring from anywhere. It will often be empowered by a strong sense of place, and will play a vital part in overcoming the many bureaucratic and institutional obstacles to the transformation of our built environment. Great leadership wins hearts and minds, builds consensus, and overcomes practical difficulties. Stepping up into such a leadership role, whether in our profession, business or in our community, is the first manifestation of active citizenship.

10.3 The ideas about public art and the built environment contained in this essay are already out there. They have found their way into print and into public pronouncements by architects, planners, artists and landscape designers. They have even been manifested in a few pieces of bold and exciting public art. The old ways are widely recognised to be inadequate for the 21st century, and the urgent need for new thinking has been recognised. And yet the old methods for the creation of public art (or its complete neglect) are still the norm, and our urban landscape is still blighted by soulless developments and damaged by false materialist arguments. The time for a revolution in our thinking about public art has come. It is up to us to be the leaders of a new school of thinking and to express this new approach in a manifesto. It is up to us, professionals, artists, politicians or citizens, to go out and champion the new approach in our own town, in our own community. We need to try, to fail, and then to try again, until a new paradigm for great public art is established. We can succeed at putting soul in the city, and the time to start doing so is now.

2. ANNEX: Draft Manifesto for the Public Arts - The Arts, People and Place

Submitted by:
  Robert Powell, Associate Director
  Beam
2. ANNEX:

DRAFT MANIFESTO FOR THE PUBLIC ARTS

The Arts, People and Place

We are passionate about the importance of place in our society and committed to promoting the role of artists and the arts in putting culture at the heart of placemaking.

Why A Manifesto?

- The importance of place in our society is fundamental, yet our urban landscape and buildings are often marred by soulless developments.
- Culture is as important to successful place-making as business, housing, jobs, and transport, but is often seen as an optional extra.
- The arts are important to both people and place-making, but their role is misunderstood, undervalued, and marginalised.
- The arts, including the public arts, are important in the development of active citizenship, yet our education system fails to give them equal weight and provide access to them.
- Artists can contribute to all stages of the planning and design process, to public engagement, and to the animation of public space, but are not normally involved.
- Public art is often bland, disconnected from place, designed ‘by committee’, poorly executed, or ‘bolted on’ to existing designs.
- Artists’ creative vision is sometimes lost within mistaken notions of public participation, or briefs that over-emphasise social outcomes at the expense of artistic quality.
- Within the built environment and public realm management professions there are some who are unaware of, or even hostile to, the arts.
- There are also people who believe the arts, their making and enjoyment, are restricted to certain purposes, people, and contexts.

We Believe.....

- The consideration of culture through the public arts should be seen as a joyful obligation that is fundamental, not ornamental, to every significant initiative impacting the public realm.
- The public arts have the potential to help regenerate and revitalise all of our urban spaces, towns, and parks, and to play a vital role in stimulating a successful people-centred economy in the service of a democratic society.
- Artists can contribute creative thinking, design and placemaking skills; help engage people of all ages and backgrounds in discussing, understanding, planning, and designing the public realm; help animate and enhance a meaningful sense of place through their individual vision, public participation, permanent or temporary art, performance, and street arts.
The public arts should be defined as anything that artists can do, plan, instigate, design, produce, stimulate and contribute, working with citizens, communities and other professionals, in the context of the built environment and place. Like placemaking, the public arts are the concern of everyone --- citizens, institutions, agencies, the creative industries, property developers, community groups, and leaders, as well as politicians in national and local government.

We Are Calling For.....

...a renaissance of the public arts and creativity inspired by ideas, experimentation, learning and participation.

1. A step change in how our built environment and public spaces are regarded and in the knowledge and skills needed to making ordinary places better, with the arts at their core.
2. The public arts to be re-defined and practised in an imaginative, multi-artform, cross-disciplinary and participatory way, recognising the individual vision of artists within a dynamic mix of professionals and citizens.
4. The education system to recognize the value of giving young people participatory access to the public arts within a creative democratic education.
5. The inclusion of the public arts in the education and ongoing skills development of built environment professionals, engineers, public realm managers, and local authority officers and members.
6. A greater encouragement of the deployment and benefits of the arts and culture in the implementation of the National Planning Policy Framework.
7. The introduction of an Artistic and Cultural Audit in Local and Neighbourhood Plans, and within or alongside Design and Access statements in mid- and large-scale planning applications.
8. An innovative and more robust approach to the funding of the public arts, initiated by the sector with Arts Council England and other key organisations.
9. Government at all levels to play an enabling role through developing, funding and implementing effective policy that promotes the public arts through its own procurement system and as part of the overall context for placemaking.
10. A new gathering of 20 sector leaders --- artists, cultural and built environment professionals, educators, politicians, business people, and active citizens – to champion the role of the arts and artists nationally.

Pledge Your Support for this Manifesto
3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

The NPPF is a well drafted document that appears to contain every relevant consideration if read in the spirit of co-operation and goodwill. However, the exceptional measures that allow reasonable economic activity in the Green Belt (NPPF 89) - for sports, forestry, brownfield sites and 'limited' village infill are particularly vulnerable to developers attempting to stretch the limits of the definition in our area. For instance, to allow forestry or sports facilities in the garden...

Buildings and places: New and old

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

The role of government in this and every other issue is to provide a stable economic background for the population to thrive in. The supply of houses does not need addressing so much as homeowners’ investment in spare bedrooms. There is further intervention required to redress the position where homeowners are mortgaged and borrowed up to the maximum to buy the largest property they can possibly afford in order to enjoy the advantage of seemingly perpetual rise in property prices. When two spare bedrooms is the average there is a distribution problem.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

Get the underlying economics right and the buildings will follow. A decentralising tax would reduce the pressure on areas in the immediate hinterland of cities and boost areas in the countryside. That would provide a more reasonable transition between city and countryside and offer a better chance of preserving areas of outstanding natural beauty and conservation areas which will allow them to take advantage of rural tourism and education when they can.

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?
We are unable to conserve and enhance our historic assets in the face of relentless commercial exploitation of every possible loophole in the planning law to take the maximum advantage of the rising residential property market. Jam today philosophy threatens the heritage assets of our children.

**Skills and design**

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas? The skilful professional has only one aim - to get to London and work there for both the company of other skilful people and the training and rewards of being with the best. The surrounding areas are impoverished by the huge differential in potential. Some differential in skill will always be there but the economic imperative could be removed by taxing the city. Local authorities have neither the professional advancement nor excessive financial backing required to hire the skills that would balance those of London architects and specialists in planning law hired by developers.

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced? Relying on ethical standards in the professions when there is so much money at stake is not balanced. Although it is wrong for professionals to put themselves in a position where money is more important than standards, even men of goodwill may find the fear of your family missing out on the property bandwagon very great. Ethical standards cannot flourish outside a just and even-handed society.

**Financial measures**

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers? The financial press publish stories and letters about site value taxation more and more frequently. Taxing land values annually is a relatively simple measure adopted by Denmark and Italy to name two; increasing the cost of owning land in the city (where sites are most valuable) while reducing it in areas that do not produce enough surplus to pay tax. Lessen the gradient between the city and the countryside, reduce the incentives to hold better property than the householder needs and the problems of design and place-making become opportunities.

Lord Best and National Housing Federation – Oral Evidence (QQ52-63)

Members present
Baroness O’Cathain (Chairman)
Baroness Andrews
Baroness Finlay of Llandaff
Lord Inglewood
Earl of Lytton
Baroness Parminter
Baroness Rawlings
Baroness Whitaker
Lord Woolmer of Leeds
Baroness Young of Old Scone

Examination of Witnesses

Lord Best, former Chief Executive of the National Housing Federation, former Chief Executive of the Joseph Rowntree Foundation and Joseph Rowntree Housing Trust, and Kathleen Kelly, Assistant Director of Policy and Research, National Housing Federation

Q83 The Chairman:
Welcome to this evidence session of the Select Committee on National Policy for the Built Environment. You have in front of you a list of the interests that have been declared by members of the Committee. A transcript of the meeting will be taken and published on the Committee website. You will have the opportunity to make corrections to that transcript, where necessary. Could I begin, for the record, by asking each of you to briefly introduce yourselves to the Committee, please?

Lord Best: I am Richard Best. I have been involved in housing things for 45 years as either a chief executive or on the board of a housing association, so that is a special interest. I do have other interests outside the housing association world. I have been involved with the Local Government Association as its president for nine years. I chair the Council of the Property Ombudsman for the private sector and, here, I look after your Lordships’ All-Party Parliamentary Group on Housing and Care for Older People, which is a Parliamentary Group,
I should say, not just for your Lordships. But older people’s housing and care is my special concern.

**The Chairman**: That is why you thought of it in terms of the House of Lords, in terms of the age structure. Thank you very much indeed. Ms Kelly, are you Ms or Mrs?

**Kathleen Kelly**: Ms, just to be very modern about it. Hello, I am Kathleen Kelly. I am assistant director of policy and research at the National Housing Federation. Prior to that I worked at the Joseph Rowntree Foundation and before that in central government, at what is now the Department for Communities and Local Government.

I am really very pleased to be here today to represent our members. We have some 1,200 members and they provide homes for around 5 million people. What is really important to bear in mind is that our members made a really firm commitment to ending the housing crisis, and last year they built more than one in three of the new homes in England. They have an ambition to do much more, building on their really good record of increasing their output of new homes during the recession, when other providers had to really scale back on their delivery.

We are the most successful example of public and private partnerships in the UK. We contribute £14 billion a year to the British economy. We are very keen to share the ambitions of government to deliver more homes and to provide more opportunities to own your own home. As well as providing homes fit for the future, it is also important to recognise that our members provide a variety of services. They help people into work, they revitalise local economies and they stick with local communities and local economies over the long term. With the right conditions, our members tell us, they can continue to do more of that. They can build more, provide more opportunities for more people to rent and own, and continue to work on revitalising local economies.

**Q84 The Chairman**: Thank you very much indeed, both of you. I am asking the first question, which is: there is a degree of political consensus on the need for more housing but, in practice, housing completions rarely meet the targets that have been set. What in your view are the reasons for this? What are the roadblocks, in simple terms, Lord Best?

**Lord Best**: The overarching roadblock is the hope, indeed the expectation, that the private sector housebuilders will do the job for us. My core message is that the housebuilders are
never going to do very much more than half of all the housebuilding that we require every year. Over the last 30 years, they have averaged 123,000 homes a year. That is about half what we need. We might get them up to 60% of the homes that are required but, if we expect them to do 100%, we are going to go on and on being disappointed that we have not built enough homes at the end of the year. We used to have local authorities doing the other half. We took them out of the picture and we have not succeeded in replacing the loss that we experienced once the councils had gone. It is the other half; it is the 40% to 50% of housebuilding that fails us. We have not put it back again.

The housebuilders are doing fine. I saw the results this week for the Berkeley Group, which is actually going to become part of the FTSE 100 now. They make some very substantial profits. Redrow has its results out. The housebuilders are doing fine. They do not have to solve the housing problems of this country. That is not their remit. They have to be profitable and do well for their shareholders, and they are being profitable and doing well for their shareholders. They are not going to be the whole story, which is why we need these other players. We need to build them up, which is going to be my theme for the day.

The Chairman: Thank you, Lord Best. In fact, if it is so brilliant and Berkeley homes are doing so well—and I declare an interest, as I live in one of their houses—surely other people must say, “Gosh, look at that sector. They are doing so well. Why do we not go in and contribute to the building of the remaining half of the houses that we need?” Is there no addition to the whole sector, in terms of the players in it, or is it all in the hands of half a dozen or a dozen major builders?

Lord Best: Absolutely it is in the hands of the half a dozen to a dozen. The smaller housebuilders, the SME housebuilders, really have not come back after the recession. They took a nosedive. It has been very difficult for them to borrow money since then. Banks do not want to lend to people who may go bust. Property is a little iffy; they have been through the crash. They cannot borrow money; they have been written out of the script. We need to bring them back.

The Chairman: How?

Lord Best: We have schemes of guaranteeing their loans, which are absolutely vital, and government support for those SME builders. I am not going to pin my hopes, though, on that
being the whole solution. We are hopeful that the Self-build and Custom Housebuilding Act, as it now is—I took it through the House of Lords when it came from the Commons—will enable the SMEs and smaller housebuilders to do more with people building their own homes on small plots or working with smaller housebuilders to develop small sites, to their own specification. It is an excellent piece of legislation that is starting the process of trying to get the small builders back and trying to get people doing their own thing: self-build, not actually building it but commissioning local builders. But these things are not going to produce the big numbers that we require.

The Chairman: Are there skills problems? Do we have enough architects, quantity surveyors and people who could show some flair and start another building company?

Lord Best: We are desperately short of skills in all kinds of areas, not least the operatives on site, the actual people to build the homes. The industry is pretty hopeless. I chaired an inquiry with a colleague Nick Raynsford from the other House. We came up with the statistic that we are going to need 427,000 more people in the building industry in the next five years, and 7,200 apprenticeships completed their course last year. We are just not bringing them on. What we are doing is importing those wonderful Polish workers, of course. The Big Six have their recruitment offices in Poland and so on. It is great to see them here, but this is not good for local employment, and in the end it is self-defeating. We need to train our own. We need to bring on our own, so there needs to be apprenticeships and training, and that goes right through the industry. I repeat that I do not think we are going to get the private sector to do it all for us. We are going to need other players in this.

You were talking earlier about the garden cities and that movement. It is great, but again these are relatively small numbers. It is a really important little piece of the jigsaw, but these are relatively small numbers. My Self-build and Custom Housebuilding people are in relatively small numbers. We may be able to get the institutional investors into some renting, get this new-look private rented sector, get the insurance companies and the pension funds investing, and some developers are doing that. It is just starting. If we get 5,000 homes out of that pipeline in a year, we would be doing quite well. That is well worth nurturing. I think we come down to whether the councils will get cracking again. Is there any hope of that, and what can we get out of the housing associations?
Kathleen Kelly: There are three main reasons why enough homes do not get built, in addition to the prevailing economic climate. We need better access to land for new homes. If we had only 1% of the available land, we could meet housing need for 25 years, so it is more about how we bring land forward. Secondly, we need the right investment framework, so rather than a proliferation of different funds targeted at different issues, our members could actually lever in much more of their own investment, deliver economies of scale and scale up their delivery, if we had a strategic funding network focused on outcomes, rather than a proliferation of individual funding streams.

Lastly, it is important to get red tape right and reduce the amount of red tape, particularly that housing associations face. Particularly important in that is the way that we value homes. Housing associations have something like 1.2 million homes from local authorities, but the way they have to value those homes for borrowing purposes is very low, sometimes only 30% of the actual value of a home, whereas other associations are able to use a market value, subject to tenancy, which is more like 60% of the value of the existing home. You could change that at the stroke of a pen and it would release a lot more capacity. Even individual associations tell us that could release millions of pounds, so that could be a really useful way of delivering more capacity and levelling the playing field amongst all associations.

Equally, we need to modernise the allocation framework so that we can provide for a broader range of need in local areas, consider what the local housing market circumstances require and how to deliver that. Lastly, we would be really keen to work with government to provide a rent-setting framework that avoids all the confusion of the current system, and is actually fit for purpose and fit for the future, so that it can reflect not just local market circumstances, but actually customers’ needs too.

Q85 Baroness Finlay of Llandaff: I wanted to pick up on Lord Best’s comment about apprentices, and wonder what the Department for Education’s response has been to the shortage of young people coming out of school, going into all the building skills sector, and whether there has been a discussion about pulling that into the teenage years of education as well, in schools.

Lord Best: Absolutely, it is the 14 to 19 year-olds whom we have to capture. We need to grow our own workforce. We need to concentrate on that age group. There are good signs that
people recognise this. Not everyone is going to go off to university and all that. Apprenticeships, in a lot of industries now, are becoming really significant. The construction industry is lagging behind, I would say. There are one or two wonderful exemplars at the top of the industry, where you get real leadership, but the mass of the construction industry cannot be bothered to get into all that, trying to work with schools, trying to bring people on, trying to change the image.

It is not about working in the rain on a nasty building site any more. There is all kinds of stuff that goes on—draftsmen, people behind the scenes, people on site doing very exciting and interesting things. It is a modern and really rather brilliant industry, if only it would get its act together and bring on that next generation.

The Chairman: Should some emphasis be put on the people who run academies? For example, I am thinking of Lord Baker, who has his technological type academy and not one NEET has come away from those academies. It is a brilliant template. I do not know why it does not get much more coverage. Surely there would be a way of doing that. You see poor kids going into these academies, and you know that they are not academic and you know they are going to struggle, whereas if they found themselves at a lathe or something, they would just be terrific. The whole education thing does need encouraging, I would have thought.

Q86 Baroness Andrews: Kathleen and Richard, you both talked about the right conditions for the housing association industry to fulfil its potential, and you have identified many of the same things as our previous witnesses, for example land supply. That came out very strongly, but you also mentioned the right financial structures and the simplification of bureaucracies around funding investment, conditions to raise money, the renting situation, rent controls, and so on and so forth. Of those, which is the most important constraint? If we had to prioritise how we were going to liberate the housing association industry to fulfil its potential, which one should we prioritise?

Secondly, could you give us your frank assessment of the impact of the Government’s decision to move on the right to buy, in relation to housing associations, and what it will do to your members and their capacity to provide?

Kathleen Kelly: That is a very good question, and one of the tricky things about answering that is that these are interconnected pieces of the jigsaw puzzle. You need all the things in
place to make that happen. The top three things would really be the priority. If we can absolutely identify where land is available for housing and take a different approach to how we identify that, such as zoning to be clear about what housing type land can deliver and what the planning requirements are, so that people then compete on the quality of the development and not on the price of the land, that would be a really useful start, and the Government have already made some moves in that direction. There are more powers you could give there.

The case for a more strategic funding framework and capital investment in the longer term is made. It is anti-cyclical; it is counter-cyclical. Housing associations have been able to carry on building during the crash, which has meant that they could keep some more of the small suppliers and the small builders going. They provided 12,000 apprenticeships. They are keen to work with the local economy and invest in the development of the local labour market as well.

Also, the red tape makes a difference, and clearly it is very difficult at the moment to answer the impact of right to buy, because we do not have a very clear framework for the policy and what it means. What we do know is that the 1% rent reduction over four years is going to take £4 billion out of the housing association sector, which comes on top of ending rent convergence a year early. These are very challenging circumstances, but our members are clear that they can deliver more and they want to deliver more. If we have those three conditions right, around land investment and red tape, our largest developers are telling us that they could increase supply by 25% over this Parliament.

**Baroness Andrews:** There are huge constraints, are there not? They are absolutely systemic to your ability to do your business. What happens if, in the next five years, we cannot or we refuse to address those issues?

**Kathleen Kelly:** The housing association sector has a no-default record, which is very impressive. It has also been very resilient in the recession. Although we saw a 63% cut in capital grant in the 2010 spending review, housing associations increased their own housing supply by 22% during the crash. They are adaptable, they are flexible, they are innovative. They plan their business plans over 30 years, and they are working through at the moment the impact of the changes and getting revisions to the board.
They are still committed to ending the housing crisis within a generation and they still want to build more homes and to up their supply. What we ask are just the right conditions to enable us to really build at scale, because housing associations are the sector that has the capacity. They are at a take-off point where they can do much more, which is why we are keen to work with the Government to deliver that aspiration.

Kate’s suggestion that it would be good for all government departments and government policies to pull together around the same aims is very important, because at the moment there are some competing tensions on those, but our members are clear that they are here to deliver and they want to deliver. They are here for the long term for their local communities and to end the housing crisis.

Q87 Baroness Whitaker: Could I just explore a little more the failure of the construction industry to create its own workforce? When I used to work with the manufacturing sector, which was quite a while ago, the construction industry was by far the least enlightened, the most dangerous, the most badly organised and the most badly invested. This did not apply, on the whole, to the larger firms; it was more a feature of the medium and the small firms.

This dearth of a skilled workforce obviously affects public sector housebuilding as well as the private sector. I think it would be important for us to know what should be done to improve the construction industry’s approach to this. Is it a question of the structure of the industry? What in your view are the main reasons why it is so bad in this area? Obviously the university technical colleges are going to make a big difference—that is one of the reasons why they were developed—but that is a generation ahead. What can be done now?

Lord Best: You made a very good point, Baroness Whitaker, that the safety record of the industry used to be hopeless. It was a very unsafe place to work. That has been fixed. At the Olympic Games, which was the largest development that we have seen for ages, nobody was seriously injured on any of those building sites. It was a triumph. We look at what happens in some other countries and you realise how dangerous this can be.

How did the industry make that huge change? There was a summit of the captains of the industry. They sat around and they said, “This is going to be a priority. We are going to fix this”. Together they understand their relationship with the Department for Education and so on. They are the people who know what they want and they how to get there. They made it
happen. The central recommendation at the end of the report that Nick Raynsford and I produced was to have a summit. “Get your heads around this. You are the guys who can fix it. Do what you did for safety”, because they could repeat it. It is not rocket science.

Q88 Earl of Lytton: Chairman, quite a lot of what I was going to ask has been passed by and I really wonder whether we should not move on to another question. It would be interesting perhaps to hear Lord Best’s view of the blocks, particularly in the light of the housing association sector, according to the Chancellor, as we see from a press cutting, questioning whether it is doing what it was designed to do: a vehicle for building homes. If he thinks of it as a vehicle for building homes, could we start with whether you actually agree that that is structurally how it is organised?

Lord Best: I must say I was very disappointed with that. They were perhaps just off-the-cuff remarks from the Chancellor, but the housing associations are feeling a little unloved generally. They are feeling that people are coming at them. When I first came into this world, they had just under 100,000 homes and now they have two point something million. They have grown very big and that has been against all kinds of pressures and difficulties. They have done a fantastically important job and now they are feeling that people are against them.

It was earlier this week when the Chancellor said that most of the housing associations, the majority—because there are over 1,500 of them—are not developing at all. “What do we need them for?” They are not all about developing all the time. Some of the old almshouse trusts have not done anything since 1592, but good. What they are doing is looking after what they have. In fact, it has been government policy to confine the development to the larger players, because that has been the more economical and sensible way of doing development on scale, so it has been Government policy. The housing associations have actually exceeded the targets set for them by the Government’s agent, which is the Homes and Communities Agency. I think they are 11,000-odd homes ahead of the target set by government, so they have done pretty well. We should not knock them too hard.

They now face these various trials and tribulations. Their tenants have had the upsets of the so-called “bedroom tax” and those welfare things. They now have been told to reduce their rents by 1% each year in real terms for the next four years. This means that their income is
The right to buy could well deprive them of a lot of properties. We could talk at length about that.

We want to stop knocking the people who really do have the opportunity to grow, expand and solve this endless problem that we do not build enough homes. We are not going to get the housebuilders to do it. The housing associations are capable of gearing up and doing a good deal more. They need the resource. What has fuelled the growth from 100,000 to 2.2 million has not been charitable money or even voluntary effort, although we have had quite a bit of those things. It has been public investment. It is treating housing like railways, like HS2 or airports. Housing we need for the economy of the nation, as well as the wellbeing of the nation. We need to invest in it.

There has been a 63% cut—Kathleen will correct me—in the grant funding to housing associations over recent years. It is quite tough for them to keep up the development pipeline and it is not kind to knock them when they are struggling to achieve that. The first thing is to be more supportive of the housing associations, because we desperately need them. We have a big quango with lots of red tape. If people are worrying about their efficiency, and there are lots of key indicators of performance they have to run through, we do not need too much more breathing down their neck. They could do with a bit of liberating to get going. Let us not knock it; they are well regulated and have the capacity to grow, if not exponentially, a good deal more than they are at the moment. Let us give them a chance.

**Kathleen Kelly:** The thing that I would say in addition to that is that housing associations and the delivery of new homes provide a really good deal for the public investment that goes in. Housing associations have raised £76 billion in private investment. For every £1 of public investment that goes into delivering a new home, housing associations put in £6 of their own resources. They fund up to 85% of the cost of building a new home themselves.

I would support everything that Richard said, because associations are working together with government, in partnership with government, to deliver. It is important to see that as a relationship that can prosper in the right conditions and can really achieve the potential that the housing associations have to deliver more new homes.

**The Chairman:** You have certainly upped my knowledge on this, so thank you very much indeed. I will look at the papers with a more jaundiced eye in the future.
Q89 Baroness Young of Old Scone: We have heard a lot about the housing associations, but what is your view on whether the local government role should have a renaissance in social housebuilding? If so, what would need to be put in place for that to happen?

Lord Best: The problem with local authority housebuilding is with all the money they borrow, the 85% that did not come in grants for housing associations. If they borrow that same chunk of money themselves, it counts against the public sector net debt. It is public expenditure, which means that it adds to the deficit. None of us would want to see the deficit grow, and the Government are not keen to see local authorities borrowing money to do more. Therefore, there is a cap on what they can do. This is very inhibiting, because although lots of local authorities have now transferred all their council stock to housing associations or especially created new ones, and they do not have the capacity to do much, quite a few of them are up for it and ready to go. They have land, even on their own council estates. Those ghastly garages that have not seen a car for 30 years can be demolished and we can get bungalows for people under occupying full family houses round the corner to move in. All kinds of good things can happen. A lot of councils are up for it, but this inhibition on their borrowing really holds them back.

Can we change that? Can we remove that cap, that ceiling, on their borrowing without affecting the deficit? We could if we changed the definition that applies to public sector borrowing, and used the same one that most countries in the EU use, the OECD uses and the IMF uses. If you can classify it as trading, if you are getting a rental income back and you are repaying what you borrow, it is in a box and does not count as public expenditure because it is self-contained. You are getting revenue to repay the debt that you have taken out, so you are in the clear.

I went with a delegation from the LGA to see Danny Alexander and say, “Come on, can we not change this definition to be like other countries?” He gave me the proper Treasury reply: “We must not frighten the horses. The international banking community, if they see us changing definitions, will get very agitated. This is not good for the credit rating of the country”. I do not think it would create such a big fuss to change our definition and allow local authorities to borrow more.
I remember well when we were first talking about this definition, when housing associations were not regarded as public bodies and could borrow, and local authorities were not. I can remember the discussions, which had a good deal of politics about them. It was at a time when generally the nation was not keen on seeing a lot more council-house building. We were all fed up with ghastly tower blocks and monolithic estates. People did not want local authorities to have the resources then and the definition actually reflected a kind of political mood at the time. I think we could change it now without the international banking community getting too upset. Although local authorities are so out of practice that you will not get all that much out of them immediately, we could get a bigger pipeline, a sensible pipeline. They have the land resources that so often are the absolute essence of getting more homes built.

**Kathleen Kelly:** I would support what Lord Best has said. I would say that there are two really important things about the local authority role in housebuilding. One is that of course everybody can make a contribution to ending the housing crisis. If local authorities want to build, they should be enabled to build. The second is that we should not forget the really important strategic enabling role of local authorities in bringing development forward and in getting homes built in their area. We would like to see them have more powers to map land in their area and bring land forward, because that sort of role is really valuable in enabling the right homes to get built at the right prices, in the right places and, in reference to your earlier evidence session, in terms of parcelling up sites in the right way as well to make sure that they come forward effectively. Local authorities have two roles and we need to see them both as equally important.

**Baroness Young of Old Scone:** Can I have one more supplementary on that—a tiny little one? If you were asked to judge the local authorities that we have at the moment, what percentage of them are doing this strategic role of enabling and facilitating the rest of the market?

**Kathleen Kelly:** That is a very good question. I would not have the number to hand, because it is actually a responsibility that they all have. They have to develop local plans in order to identify what land is needed in their area. Capacity is very different across local authorities, and some are much more geared up and enabled to do that. If you think of an authority like Manchester, which is a combined authority and has a city deal, it has aligned all its priorities...
and is demonstrating a lot of leadership about what it wants to see in an area. Cambridge operates in a similar way, in terms of developing lots of strategic partnerships. There are examples of really good practice, and those authorities that do well at those things can be enabled to do more.

**The Chairman:** That is very interesting, because it is a mixed bag. Is there an overarching umbrella organisation of local authorities where you could put the boot in?

**Lord Best:** That might be a question for me. I have been president of the Local Government Association. Quite a bit of this is a planning question, rather than directly the housing departments at the district level, and so on. It is unitary authorities, metropolitan authorities, London boroughs and county-level planning. That probably brings us on to other planning issues.

I would say in answer to the question, “How many local authorities?”, that it is probably a minority that are taking an active role in seeing their area, what is needed in it and making darn sure that the housing associations and housebuilders are working together. That is, I am afraid, a minority sport. They feel very underresourced to me, very much the junior partner in a discussion. When you have a private developer sat there and a representative of the council sat there, very often there is quite an unequal negotiation going on. They feel an underresourced group.

**Q90 Baroness Andrews:** Can I press you both on the housing revenue account? I think this is really important. Is it not possible to raise the housing revenue account cap without bringing it on to the public account? That is my first question. Secondly, would you agree that the Government’s plans for right to buy, extended to the housing associations, would confuse the public status of the housing association and its funding, and are more likely to bring the housing association and its funding on to the public account, thereby increasing the notion of the national debt? My third question is a supplementary really: what has been the impact of the community infrastructure levy on housing supply? Has it made any positive difference or, indeed, has it made a negative difference?

**Lord Best:** We cannot get more out of the housing revenue account without affecting public expenditure, as definitions currently stand. We are trapped at the moment. We have to change the definition. The point that Baroness Andrews is making about the housing
associations is whether there is a point at which they would be treated like local authorities, with all their borrowing regarded as public expenditure. This is down to the ONS, the Office for National Statistics, which defines what is or is not a public body. At the moment, housing associations are regarded not as public but as private bodies, but you begin to worry when you see that their rents are controlled by government; there is a lot of regulation and red tape around what they do; and now there is the possibility, at any rate, that they will be told they must sell their properties to the occupiers at these discounts and they will be told what to do with the money.

At what point does one have to accept that they have become public bodies? That is something I am not at all in favour of. If we get to that point, then it is not just that their existing debt—they have about £64 billion of debt still outstanding—goes on to the national debt. That is not very good news if you are trying to reduce the national debt. All that private borrowing goes on there but, worse than that, the borrowing they want to do each year, about £4.5 billion of private borrowing that fuels what they do, would suddenly start counting as public expenditure—and, of course, the Chancellor would have to say, “Clamp down on this. We have to cap this as we do with local authorities”, and then the golden goose is well and truly shot.

**Baroness Andrews:** You must be very concerned about that.

**Lord Best:** I think it is a threat. The ONS is an independent body. People say that the Government are not going to let the ONS get away with that, but in fact the ONS has shown itself to be quite independent-minded. I think the danger is real.

**Baroness Andrews:** We had that debate about the status of the housing associations about 10 years ago. It was a hard debate and it was finally hard won. There is a real issue here for the housing associations, and I am interested in what you say.

**Kathleen Kelly:** If I take your second two points, there is clearly a risk that right to buy could be a reclassification risk for housing associations. All Lord Best’s points are true in that case. Our members tell us that you could do much more on a voluntary basis. We share the ambition to give people more opportunities to own and there may be more effective ways of doing that than through the framework, which might avoid those risks. Clearly, we are keen to work with government to talk about that.
Q91  Lord Inglewood: Can I go back to right at the beginning of the evidence, please? It struck me that if I was an avid free marketeer I would be puzzled by the pattern that Richard Best pointed to. Somewhere over a third of the housing requirement in this country seems to be unable to be met by private enterprise. That seems to be the case from the evidence. What nobody has suggested to any of us is why.

Kathleen Kelly: One thing that is really important to recognise is the difference in business model. Housing associations are there to serve their local communities, and that is based on a not-for-profit model where they do not have to pay out any dividends; they reinvest all that back into building new homes and the services they provide. That provides a different sort of model in terms of what they are trying to achieve, which means that housing associations are able to take different decisions.

We have talked a fair bit about the supply chain this morning. A lot of associations, for example, keep their management and maintenance internally and they develop apprenticeships, so that they can keep developing the local workforce. Those that build also use that as an opportunity to operate in that way. Some developers do some of those things too. Also, our members are active in local schools.

Lord Inglewood: You are saying what your members do, but were I to be an avid free marketeer I would say, “The private sector can deliver what you deliver. They would do it differently, but they would. They would be more efficient”. I want to know why it is that failure is taking place. It is a market failure.

Kathleen Kelly: I would not necessarily say that it is efficiency. It is to do with what you set out to achieve. For example, if you build a lot of new homes in a local area, you are likely to reduce prices. If your profit depends on prices, that might not be a sensible business choice. If you are a not-for-profit provider, then you tend to take decisions over the longer term and to think differently about how your return might play out.

For example, Home Group, in a recent joint venture with Gateshead and Galliford Try, have a mixed portfolio of what they are developing, because they are taking a very long-term view of the development, which enables them to do some lower-priced housing as well as higher-priced housing. The local authority has managed to put in the land on a deferred
payment basis, so that can move the development along more quickly. There is scope for more partnerships along those lines that would deliver everybody’s objectives.

**Lord Inglewood**: I am genuinely interested in this. Why can the private sector not enter into these partnerships with deferred payments and affordable housing conditions imposed on planning consents?

**Kathleen Kelly**: They can and they do.

**Lord Inglewood**: They do not particularly like it.

**Kathleen Kelly**: It is very much an individual decision for the organisation, given their particular goals. I would not say that none of them like it, but actually it is possible for them to do that and some of them will make that choice. It is their individual business choice and their board choice, rather than necessarily something that they would all choose to do.

**The Chairman**: If I understand the point that Lord Inglewood is making, and I hope I do, there is certainly a huge opportunity here for entrepreneurs to get involved.

**Lord Inglewood**: I am wondering. I do not know. I would like to know why there is this apparent black hole and I do not know the answer.

**Lord Best**: It is very difficult for entrepreneurs to break into this. The big players have access to large-scale borrowing, to the acquisition of sites and indeed to the acquisition of options on sites. We were hearing a bit about that in the previous session. They in effect have it sewn up pretty well, but you only go as fast as the market will take you in terms of what you build. I watch the developments in York. The developments stop if house prices are not going up. If, for the next lot you build, you are going to have to sell more cheaply than the ones you have just sold, you are not going to build them. You sit tight, wait and go at the speed of the market.

You are always working on the basis that the market must be driven up, but the market will not go upwards if we build houses everywhere, as Kate Barker has demonstrated. In the end, house prices will, at the very least, stabilise if we build enough houses. It is not in the interests of those who are doing perfectly well.

I think a lot of housebuilders do a very good job. In running housing associations, I know that what I never managed to do was to build exactly on budget, exactly on time. We always were pressurised, one way or another, to add some bells and whistles, and I would not say to give
in to pressures, but we would always do the right thing. At the end of it, we could never match the way that housebuilders could always produce the goods, on the button, for the price that they said at the beginning. They do their job, but they only go at the speed of the market and that is always leaving behind the 40% or whatever. That is how the market works: it does not do everything that could be done.

It is also the case that a lot of people are not able to buy on the open market. Of course they are not, and we have decided, collectively as a country, that if we are going to subsidise anybody it is probably best not to subsidise, if you can help it, those that are purely profit-making bodies if there are alternative providers who are there for the long term and are going to manage and look after the properties for years to come. We have chosen the housing associations as the bodies that we want to give subsidies to.

**Lord Inglewood:** Is it then fair to say that the basic proposition is that there is this part of the market for housing that cannot afford what the market would require to be paid to deliver it? Therefore, for social reasons we have decided that there is a need to subsidise somebody, somewhere, in order to achieve what we want. The vehicle through which we are doing that as a society is this particular sector.

**Kathleen Kelly:** That is a fair response, but we have to remember that not building enough is also a drain on the economy, not just for social purposes—there are very good financial reasons for choosing that route, too. It is not just about having a social purpose and providing homes, although that is crucial and is at the heart of our members’ core purpose; it is also helpful to the local economy. If you meet affordable housing need in full, that is £8 billion contribution to the economy in England, so there is a very good economic reason for doing it too.

**Baroness Rawlings:** I am a bit confused, because as you explained very clearly the housing association is reinvesting all its profits back into the housing association, so it is not having to give to shareholders or anything like the private sector. So why do they not have more money to build more houses? They obviously have some sort of charitable status as well, so there is some sort of advantage. I do not quite understand why they are not actually building where we need them so badly.
**Lord Best**: The process that you described is the way the system works. In the early years, they got loads of grant, so they created the new homes on the back of government making that possible. Then, because those properties all increased in value, they could borrow against the value of those properties to do the next lot of housing. But of course if you borrow 100% of the cost of doing it, you have a very big mortgage and your rents are going to be very high, so you need some subsidy to take the edge off those market rents for the rents that you charge. You are then constantly reinvesting. You are borrowing against the assets that you are creating.

That is how we have this incredible growth out of the housing associations: constant borrowing against the rising values that they have. If it was constant borrowing of 100% of what you need, with no injection of anything else, then the rents you would have to charge would be too high or the housing benefit bill would go through the roof. We still need the resource to take the edge off the full market impact of borrowing everything.

**Kathleen Kelly**: It is important to recognise that as part of that picture, housing associations have diversified, so they provide a lot of shared ownership. They provide homes with discounted sales, as well as rented houses at a variety of different rents. They have a very clear niche in helping people into low-cost home ownership.

**The Chairman**: They are probably also more risk averse than the big companies, because they probably have stacks of money in the bank anyway.

**Lord Best**: They are, you are right.

**Q92 Lord Woolmer of Leeds**: You talked at different times about the management of the built environment. One of the interests for this Committee is the quality of the built environment, place and all that. In the public sector and social sector housing, what are the principles of successful long-term management of the assets of the built environment that you own that contribute to the sense of quality for the people who live there? Is that a part of the remit to which you work, and, if it is, how is that followed through? What lessons are there for this Committee from what you have achieved, which might be sensible to take forward in the private sector?

**Kathleen Kelly**: One of the main differences about housing associations from many other organisations is that they do want to stay around for the long term. There are three key
principles that they adopt: design for the long term, managing places, and working with local communities for the long term. They are getting the design right of the wider environment, the development itself and the homes in there, so that they are fit not just for today but for tomorrow. Secondly, it is about providing good access to opportunities, whether that is employment, green space, places to meet or transport links. Thirdly, it is about providing for a wide variety of people, providing for the local community and including them in decisions about the design of places and about the delivery of new homes, as well as, in many cases, the running of some housing associations.

If I can give you an example, Regenda in Limehurst Village in Oldham has a 10-year vision to revitalise that local community. They have actually worked with partners, including residents and the local authority, to have a key role in shaping that 10-year vision. That includes what homes will be provided, what services will be delivered and what that whole community looks like. Limehurst has secured £5 million of new investment, with a further £12 million proposed over the next five years, so they really are keen to stay around for the longer term. That means you make different decisions. If you know you are going to be there in five, 10 or 20 years, or in many cases 100 or 150 years, you are very keen to get it right and to work with the people who are going to be living in those communities and working with you in those communities.

**Lord Best:** With Bournville village in Birmingham and the one that I inherited in York, the New Earswick village of the Joseph Rowntree Trust, these garden villages were the start of the idea that you look at a whole community together. You look at a place. You make a place. You think of all the things that are required for that. I have to tell you that New Earswick in York is still going strong, at 1,100-odd homes in this village, with the amenities that go with it. A garden village implies, rightly, that the landscaping and the environment are important, and there are facilities for people to meet together. There are things we cannot do nowadays; there is a very nice cricket pitch. We cannot afford those things any more, but the idea of having a masterplan, in which you look at all the elements of what will make life good, remains.

Rowntree is now doing a new garden village on the other side of York called Derwenthorpe. If you are planning any outings, I think that this is a pretty wonderful example. There is
combined heat and power. Nowadays, energy efficiency is very much at the core of these things. It has its little lake with ducks on it and some things that might look a bit superficial, but it also has high-quality housing, a mix of people, plenty of home ownership and plenty of renting as well, all mixed together. It is half way through being built.

The design does not have to be a pastiche. I am rather fond of Poundbury, but not everybody is. Derwenthorpe is not a pastiche of an ancient village; it is a modern new village, but it looks and feels great. It is about masterplanning the whole of the community as an entity. It has a jogging track round the outside, so people can have a jog in the morning. It has cycle paths across. You can walk to the school.

The Chairman: I think you sold it to us. I actually know somebody who lives in one of your villages.

Lord Woolmer of Leeds: Every witness we speak to can always come up with one or two excellent examples. I am concerned about the overwhelming majority of places. In the public sector and, as you said, the private sector, some dreadful places have been built. My question was really more fundamental than that. Are there any principles that have to be abided by within the housing association movement in new developments? What assessment do you make nationally of the extent to which the excellent examples are, in general, followed through? If we simply produce a report that gives some very special examples of excellence here, there and everywhere, it betrays the truth that faces most people. I am concerned by the extent to which you have some guidelines that have to be followed through—an assessment every three or five years of how this is being followed through. What happens on that side of things?

Kathleen Kelly: Housing associations are subject to different design standards for their homes, which tend to be better quality, although those have been changing over the years, it is fair to say. They are subject to that, but some of what is different is their ethos: staying with a development for the long term and staying with the community. In answer to your question about why more of it does not happen, there is clearly a housing crisis, which means that people are very conscious of the need to build more. There are also problems with the number of resources—local planners and local authorities—and there is a skills shortage there too. That can make it difficult for everybody to make the case effectively that you need
to have a masterplan for an area, and that actually the quality of what you build today matters very much, both today and tomorrow, not least for energy efficiency and the quality of the green spaces, as Richard mentioned, which support healthy living and more use of the outdoors.

That principle is hard to deliver when you are under pressure to deliver more and more, without recourse to those plans. There could be a much stronger and clearer vision about how you make local places the thriving and prosperous communities that we all want to see, but I would say that most people do aspire to those principles. It is just in the practice that they sometimes slip. Housing associations certainly have to have higher standards in the property they deliver, and they are very aware of the risk of getting it wrong, because they are there for the long term.

The Chairman: We are running out of time again, I am afraid. I am a very bad Chairman, but I was just wondering, Baroness Finlay, whether you want to ask your question, because it dovetails completely with what you have just been saying.

Q93 Baroness Finlay of Llandaff: Very briefly, because you have touched on the need for healthy communities, we know that we have an ageing population. We know loneliness is a big problem. Where are the levers that should or could come in to make sure that these splendid principles that you have outlined and best practice actually become the norm, rather than the exceptional best practice? At the moment, example is not enough.

Lord Best: You are linking, absolutely properly, housing and health. This is so important, particularly of course for older people: all that business of preventing accidents, preventing people from not being able to come out of hospital because the home will not receive them, readmissions to hospitals endlessly because of the problems of the home, and people being cold and miserable in the home. Health and housing are absolutely interlinked and we need to ensure structurally that people take note of that everywhere.

We now have the health and well-being boards up and down the country, which bring together local authorities and the health service. That is a critical point at which those two things can be talked about together. I see a shake of a head.

Baroness Finlay of Llandaff: They are not doing it. That is the problem.
Lord Best: Some are. It is the old story: some are and some are not. Where they are, they are showing what can be done. With the combined authorities, Manchester now being a great example, health is closer to local government. There are new opportunities to think about housing and about health in the same breath, because they work together. You save a fortune for the hospital, the health service and social care if you get the housing right, as we all know.

Kathleen Kelly: We know that poor housing costs the NHS £1.4 billion a year, and we are working very closely with Public Health England and the Department of Health to put housing at the centre stage of health decisions. We have done work with NHS boards on how you can use NHS land to reduce the pressure on services, such as providing reablement services to enable people to come out of hospital earlier and to prevent people from going into hospital. Housing associations are uniquely placed in that we know our residents very well. We know all the people that they are connected with, so actually our members do provide a lot of services.

The right strategic funding framework that is very clear about the outcomes it wants to achieve, and departments working together in that way, both nationally and in combined authorities, can deliver a lot of value and what is needed in a local area. Whether that is about the ageing population or mental health, a lot of the schemes that exist have real success in reducing people’s reliance on medication or their reliance on emergency services, like A&E at hospitals.

Baroness Finlay of Llandaff: Should we be requiring an assessment of those factors in all planning?

Lord Best: Absolutely, they come together. That is such an important point.

Q94 The Chairman: Can I ask a question that Lady Andrews, who had to go off to another meeting, would have asked? I do not want a reply, but I would be very grateful if you could scribble down a few words on it. Do housing associations involve their residents in the management of homes and surrounding areas? Piggybacking on that is even getting discussion groups going with them. That makes them feel wanted, and they would have very good ideas on the very points about health and maintenance—the point about people coming
out of hospital and even having something like a rota of visitors and people looking after them. It does seem the right way to do it. I have hogged that question. I am sorry about that. It has been a fascinating session. Thank you very much indeed. I am sure there are lots of things that you will think about, as soon as you are out of that door. You are probably thinking about them now, but could we ask you to think about them and let us know? If you were in my position, what do you think I should really be thinking about? On that happy note, I say have a very good weekend and thank you very much.

10 September 2015
When CABE was set up in 1999 it was a clear statement by the Government of the time that it wished to promote better standards of design in the built environment. There has been a debate about its effectiveness, but the decision to withdraw government funding in 2010 was also seen by many in the development industry as a clear statement of Government policy priorities, especially as the savings were tiny.

The impact of CABE in its early days under John Rouse and Stuart Lipton was significant. It did generate debate and its design reviews did carry weight and were taken seriously. They were also welcomed by many developers and their architects as an opportunity for feedback and debate that led to tangible design improvements.

I would not advocate re-establishing CABE, but I would strongly urge the Select Committee to give consideration to the establishment of a successor body that can give advice to Government and act as a focus for:

1. A continuing constructive debate about how design quality of buildings and places can be improved.
2. A client body for commissioning independent research on current specific issues.
3. A national design review system that oversees and ensures best practice in regional and local panels and would be the natural home of national large scale reviews, for example HS2. It should also have the role of disseminating the key lessons that are emerging from design review and, in exceptional circumstances, the right of call in. Its own design reviews should be a material consideration in planning decision making.
4. Act as the design advisor to Government ministers and their departments.

Such an organisation should be small and strategic and under the funding of a single Government Department.

Examination of Witnesses

Q29 The Chairman: Good morning and welcome to this evidence session of the Select Committee on National Policy for the Built Environment. It is very kind of you to give up your time, and I am sure we will have a very interesting discussion. We have certainly read all about the Bishop Review and the Farrell Review.

You have in front of you a list of the interests that have been declared by the Members of the Committee. A transcript of the meeting will be taken and published on the Committee website. You will have the opportunity to make corrections to that transcript where necessary. You cannot change the thing, but you can make just factual corrections. Could I begin by asking each of you to briefly introduce yourselves to the Committee, please? We will start, with Professor Bishop, alphabetically.

Professor Bishop: Peter Bishop, Professor of Urban Design at the Bartlett School of Architecture, University College London. I am also a director at Allies and Morrison Architects. I was previously deputy chief executive of the London Development Agency, Director of
Design for London, and a planning director in a number of large inner-London authorities, and I am also the author of the Bishop Review.

Max Farrell: I am Max Farrell, a partner at Farrells architect planners practice internationally. Recently I was project leader for the Farrell Review of Architecture and the Built Environment.

The Chairman: Thank you very much. I am going to ask the first question. You have copies of the questions there. What has the response from the Government been to the recommendations of the Farrell Review? How engaged have Ministers and civil servants been in delivering its ideas? Is more action required? I am sure you will say yes to the last one. Obviously we are very interested in that, but we have read what the immediate reaction was and it seemed to be that the Government were going fairly slowly. Just what has happened since then?

Max Farrell: Thank you. The first thing I would like to say is what an excellent thing I think it is to have this Select Committee. We are all extremely pleased and very hopeful about the impact that it can make. One of the things that we set out to do with the review is to try to cut across all the different silos to do some joining up. The built environment is so complex with all the different organisations and institutions involved. Hopefully this can have the same sort of impact.

We published the review just over a year ago, and our initial response was one of slight disappointment that there had not been a formal response from the Government when it was a government-commissioned review, but also after all the extensive consultation that had taken place throughout the country over a long period of time. We also understood that the Minister, Ed Vaizey, who had commissioned the review—and who was personally extremely involved and still is—felt that a number of recommendations were aimed at departments other than his department, in particular at DCLG, where we talked a lot about the planning system and the relationship between planning and architecture. So at the time it did not seem entirely appropriate for him; I do not think he felt in a position to make a formal statement.

Now that there has been a change and architecture is with a new Minister and a new department, it might be an opportune time for a statement about either the Farrell Review or the state of play with the built environment and place quality.
The final thing I would say in response to that question is it is great to see Matthew Carmona here. I only just discovered outside in the corridor that he has joined the group. We see the Place Alliance as an incredibly important organisation, or collective if you like, that will help carry on all the work that we initiated in the review, in the sense that it is a collaborative enterprise that does not have its own particular agenda. It is more about, as I said at the beginning, joining up, sharing resources, sharing research, lobbying collectively, and taking collective responsibility for place quality and the built environment. So if the Government were to make a statement or give support for anything, I would almost prefer that to be for the Place Alliance as the body that will take this forward.

The Chairman: Of course, our specialist adviser is now the chairman of it, which is even better. Max Farrell: That is excellent news, yes.

The Chairman: I can assure you that all of us are aware of the cross-cutting needed and that will come out through the evidence session, I am sure. Thank you very much. Professor Bishop?

Professor Bishop: There is not much I can add to that, really. I would not in any way play down the difficulties the Government will have in responding to something like the Farrell Review. One of the difficulties we had in carrying out the review was that there was no single point of focus. Design in the built environment is something that moves across most government departments. Effectively, for me the central point of it is how Government exercise leadership consistently to say that this is important: it is not just important at the moment, and not just next year; it is something that has continuity in policy over quite a long period of time to establish a firm platform of expectation as to how we promote high-quality design. It is not something that can be divorced from economic growth or housing or infrastructure or climate change. It has to be absolutely embedded in it.

I think that the key challenge for Government from reviews like the Farrell Review is how they respond collectively and consistently across departments. Having worked in government for a lot of my career, I know just how difficult that in fact is.

The Chairman: Yes. But, Professor Bishop, is there not another point? You also have to ensure that it works with the developers and all the other players. What is the response from the industry? Government, we know, have been slightly dilatory, but they have allowed us to go
ahead with this Committee, do not forget. What has been the response from the other players? I hate using that word “stakeholders”. What actions could help to encourage developers to embrace the conclusions of the Farrell Review and your review also?

**Professor Bishop:** That is an extremely difficult question to answer. I suspect a theme from the session this morning will be that there is no single industry, first of all. There is a significant difference between the commercial development industry and house building, for example, and engineering and infrastructure. Within those sectors there is a huge difference of response between certain organisations and others. Like any sector of the industry, there are good and bad organisations, and people who strive to produce something that is better than the average and people who are quite happy to make do. Through the course of the Farrell Review and through the course of the Bishop Review there was a general willingness to engage in that conversation. I think that is the key thing—a genuine willingness from most people to try to produce something good, if they could, if the circumstances were right. There are always rogue organisations who will probably just try to make do.

I think the key thing is to try to pull the average up. You can always get exemplary design. As a nation, we do have some of the top design firms, not just in architecture but some top design firms in the world. It is how you get the average up. It is the average that affects most people’s general lives, the communities and the environments that they live in.

**The Chairman:** It is the same in every industry, any group; Government likewise.

**Professor Bishop:** Absolutely.

**Q30 Baroness Whitaker:** Leading on to the other leg of implementation, the Farrell Review put forward quite a lot about the local authorities. What about the response in the town halls?

**Professor Bishop:** I think town halls are under a lot of pressure. That is not a particularly controversial thing to say. Most people will probably recognise that is the case. Certainly when I did my review four years ago—and I still feel quite strongly about this—local government has an absolutely critical role to play if we are going to get good design in the physical environment. It has three roles. It has a role as regulator, and that is very important. It might sound a bit unfashionable but regulation is quite important if it is applied correctly and sensitively in promoting good design. It has a role as client, and that is another area where
there has been a significant loss of expertise at the local area. It has a proactive role in trying to carry out placemaking and producing good environments.

Over the course of my career, 40 years, I have seen a huge change to the way in which local government is structured. The one thing that is particularly damaging is that local government over the last 15 or 20 years has lost a lot of talented people. In the 1970s, remarkably, it was almost the career of choice for any bright graduate coming out of architectural school. That has largely disappeared. There are some local authorities, some of the big metropolitans and the other cities and some of the London boroughs, who are still maintaining good design resources, good design expertise, and are producing extremely good results on the ground, both in terms of regulation and placemaking. But there has been an alarming stripping out of talent in design at the local level.

Secondly, there has always been the perennial problem of training local politicians up to a level where they understand the difference between design quality and personal taste, and how you can promote good design and have aspirations that are demanding and challenging for their local areas. I think there has been a steady loss across the board, and that is quite damaging. Through my own practice, we do a lot of work on training packages for local councils, and it is great when we do but it really is the tip of the iceberg.

**Baroness Whitaker:** Sorry, I should have clarified. I meant the response of the town halls to the *[Farrell Review]*.

**Professor Bishop:** I am sorry.

**Baroness Whitaker:** All the things you have said are extremely interesting. I am very glad to hear them and we shall find them useful, but I wondered, moving on, how the town halls have responded.

**Max Farrell:** I think it has been varied. Where there has been a positive response we have seen already that it has been making a difference. It is making a difference in that local authorities and local government are recognising that it is not entirely down to them and there are lots of other people involved who can make a difference. Initiatives like setting up urban rooms, for example, are now one of the great success stories of the review. We found out yesterday about another one near our office, which makes 18, I think, across the country. They have been set up through partnerships between local authorities, institutions like RIBA
but also, and quite fundamentally important, the universities as well. We had very interesting conversations recently in Newcastle with the chief executive of the council, the vice-chancellor of the university and the head of RIBA Enterprises, which is based there, all about the idea of having an urban room so that the onus does not fall entirely on one or the other—that they can collectively do something that will make a difference.

The idea of the urban room is very closely linked to the idea of proactive planning. As Peter said, everyone is very aware of what the problems are and where the shortfalls are in resourcing and skills within local authorities. What we tried to do in the review was identify solutions to that. Part of the problem with the lack of proactive planning is the way that we communicate planning and architecture to the wider public and how readily they can relate to it and get engaged with it. What a tremendous difference it makes when they do.

We have seen with neighbourhood planning that it can make an incredible difference to the way that people think about new development and new housing. If they are involved at the beginning and they can say, “If we have 50 houses, we could have a new library or new sports facilities”, it is a completely different way of looking at new development, rather than waiting for a planning application to be made and then preparing for a fight. It is choosing to say yes very early on, but yes with a number of conditions.

I think developers are supportive of that. They like the certainty, and they know that if they put their resources upfront as well, in terms of engaging with the community, having a wider master plan, thinking about the town and not just their site, then they do not have to spend the money and resources later on in having that fight, which tends to involve planning consultants, lawyers, going to inquiries and appeals and so on. It is just a different way of going about things, which I think is more of a culture change than a change to any particular policy.

**The Chairman:** So the default position is negative, but in fact what you are saying is that if there was trust, you could change the world.

**Max Farrell:** Yes, absolutely, or at least this country.

**The Chairman:** It is not just the built environment.

**Q31 Baroness Andrews:** Good morning. I have a couple of related questions. One starts with Peter and the reference that you made, Professor Bishop, to leadership and the need for
consistency. Given there have been changes between DCMS and DCLG now and you have said how difficult you think Government will find it to implement a better system of placemaking, to use the shorthand, who do you think is the champion now in Government for you and for all this? Where does it sit, and where is the capacity within central government and the conviction to make this happen?

Following that and finally, given the spread of issues that you address, both in the Farrell Report and your own report, that are related to the curriculum, the skills agenda, the proactive planning—a very wide range of interrelated issues—what are you most worried is not going to be addressed? If you get a statement from Government, what will it mean? What will it not want to address?

Max Farrell: I think it goes back to one of the things that Peter was talking about earlier on. The built environment is so disaggregated and a number of different departments and agencies are involved, so it is difficult to have leadership in one particular individual, but I think there are key departments. We did a diagram in the review about where the built environment has sat and how it has been moved around and spliced and diced. At the moment I think it sits across five departments.

Obviously the Minister for Housing and Planning, and now the Architecture Minister, has an important role to play, but equally the Department for Transport. I think a lot of big decisions that have a huge impact on places are transport-related. They are about roads, rail and airports, and quite often urban planning or placemaking are not central to those debates at all. Quite often the rail operators do not think in that way, and it is more about delivering a station on time and on budget than what impact the station has on the city and how it can create a new place. We know from projects like Old Oak Common, now Euston, that having that dialogue and shared objective and putting placemaking at the forefront, rather than as an afterthought to argue about, is a hugely important thing.

Professor Bishop: I would be very reluctant to advise on how Government should structure themselves on this, but I will have a go. I think that, first of all, there has to be a voice, and there has to be a strong voice. With a certain amount of trepidation, I think that probably has to be in Cabinet, because if you are looking at issues around infrastructure, airports, High Speed 2 and housing numbers, that is where the debate happens. Again, with a certain
amount of trepidation, because I am not an expert in this at all, I suspect the voice of the Treasury is extremely strong in these kinds of debates and discussions. There needs to be a counter-voice to try to balance that—understanding the pressures, the expediency of money and timescales against producing something that is of quality, long lasting, durable and has extremely effective lifetime costs. Sometimes it can be beautiful as well, which would be quite a nice gain to have.

So I think there has to be a voice and that voice has to be backed up by a small resource. When I was at the London Development Agency, I had endless discussions about how many architects London needed, but we never had as many architects as we had people dealing with contract compliance and, therefore, it was always a matter of political choice. Design teams can be very small, very agile and very cost effective, but I think that to have an effective voice at Cabinet level that person would need a resource. Whether that sits in DCLG or DCMS or anywhere else is less important, as long as you also have behind that a simple but clear structure to make sure that when key decisions are made, design is seriously considered and weighed up against all the other criteria the Government have to decide upon.

Baroness Andrews: I understand that there is no official now in DCLG with responsibility for design. So when you talk about resource, we are talking about a complete absence of resource within the key department that is now dealing with design and planning and housing. Am I correct in that?

Professor Bishop: As far as I am aware—well, Max?

Max Farrell: One of our recommendations was for the Government to appoint a chief architect. We said that there was a gap—that there is a chief planner at one end of the spectrum and a chief construction adviser at the other, but no champion for the part in the middle, about design, who is advising all the different departments and ensuring consistency in the way the Government approach these things.

What happened since was quite interesting, because one of the first things that Brandon Lewis suggested when he took up his new role was to have a design panel within Government and on that panel to have the institutions, but also for him to chair it and to have some private sector representatives as well. That panel initially looked at the starter homes and developed and designed templates for starter homes. I do not see any reason why that same model could
not be applied to housing more widely, or even other types of government buildings, schools, hospitals, where it is about getting the best quality for the best value, rather than just all about cost.

The Chairman: Lord Freeman, you have explained to us previously what you feel about it.

Lord Freeman: There is a ministerial committee, I think headed by Greg Clark. That committee, which in theory should be looking at the built environment, is listed number 16. It is the last in terms of the entire list of ministerial committees. First of all, do you think that his department is the right department for us to question the Secretary of State on and, if not, who else?

Max Farrell: We met Greg Clark during the review process, before he took up his current role, and he was very supportive. One of the things we talked about in the review was the need for planning to be place-based and at city, town and village level, rather than perhaps other scales. The move towards devolution and decentralisation is an important one in terms of planning and how we plan our towns and cities.

I also think local leadership is just as important as national leadership. In Bristol, for example, the mayor, who happens to be an architect, has made a huge difference because he has thought about placemaking and put that at the centre of a lot of his policymaking across a number of different areas, whether it is health or education. I would think Greg Clark, the Secretary of State at DCLG, is probably the right person, because integrating planning, housing, and architecture is a very important thing.

The Chairman: They have all been silos.

Q32 Baroness Finlay of Llandaff: I think some parts of my question may have already been answered, but it is really to Professor Bishop. When you recommended that the Commission for Architecture and the Built Environment become part of the Design Council Cabe, you also recommended engagement with Government. We have already had bits about the hole that is there. We have also heard in evidence about a lack of policy evidence being available centrally anyway. Could you comment on the research that may be needed and whether the DCLG and BIS should be undertaking this, driving it, requesting it or commissioning it, and whether it is happening at all in practice?
Professor Bishop: With respect, I did not recommend the merger of CABE and the Design Council.

Baroness Finlay of Llandaff: I am sorry.

Professor Bishop: It happened, and I was brought in to try to come up with a way that it could work. I think one of the sad things that has happened since that merger has been the loss of CABE’s function in terms of, first of all, being a conduit to import best practice, not just from the UK but from overseas, and to disseminate it, and to produce research and publications. The good news is that CABE still exists; that element of CABE’s work has been lost. There is a paucity of work in terms of research and design in the built environment. Unfortunately, a lot of it is anecdotal; a lot of it has to rest on case studies. The essential question that one always comes back to—which much does good design cost and what is the long-term value—is still largely unanswered. There have been various pieces of research, but it is a relatively thin field in terms of research, and I think it would be really quite important to carry out very focused research into that area. There is also the area of particular typologies of housing and infrastructure, where there is a real shortage of long-term research on the performance of buildings. Similarly, there is a real shortage of data and information about how places are being put together. Certainly, working in practice, a lot of the work we access is purely off the top of our heads; it is anecdotal; it is case studies we know of.

With CABE having disappeared, what has been lost is, first, an organisation you can go to that either holds the information or can commission it, and secondly, an independent organisation that can either be asked by Government to carry out research or, possibly more importantly, to be the client on behalf of Government to carry out the research. Both of those are rather large gaps that I would advocate should be addressed.

Baroness Finlay of Llandaff: Has that gap been taken over by university departments at all? Are there any long-term registers of innovative design whereby other departments within the university have linked to look at the population effect as well as the duration of the actual project?

Professor Bishop: My colleague from UCL is sitting here. A lot of research is being carried out by university departments in planning and architecture in the built environment. I would say that it is not necessarily easy to access or focused, and it is not necessarily commissioned and
driven by the key issues the Government need to address. A lot of it follows the research interests of the individuals and the particular departments they belong to. When I carried out the review—and I suspect it is probably still the case—there was a lack of a real focus from Government on the key issues where research would be very useful. There are issues around how we provide decent housing in quantity; in London there are issues around tall buildings and skyline; there are issues around the green belt; there are issues around sustainable energy in the countryside. You can continue to name the key points where really hard research would be extremely valuable, but I am not aware there is any process whereby that debate happens within Government and departments make decisions together about commissioning that.

The Chairman: Is there any chance that an application to the European Commission would yield fruit here? There is lots of money rushing around in Brussels for research and development. In fact, another Committee of this House looked at the idea of research and innovation and it covered everything from medicine to—but building and architecture was not involved, as I recall. It may be that that it is an outlet. I am just suggesting that people should think about it.

Q33 Baroness Whitaker: You did touch on this, Professor Bishop, but just for the record: do you take it that it is important to have research on what design saves as well as what it costs? We have to look now at the long term as well as the short term. There is also the issue that the benefits of good design might well accrue to another aspect of public responsibility, that is to say crime reduction or better health. These things are not encapsulated in research stimulated by one government department, but they would all be long-term savings. Do you think that that is an important area? That is the main question, but also, what about the Building Research Establishment? Before it was privatised, it used to do some of this. Is there scope for it not to have to earn its living quite so much and to do this kind of thing?

Professor Bishop: The simple answer is, yes, there is a need for this and we do have organisations—the Building Research Establishment and obviously universities—that could carry out this type of research. Something that did come up when I did my review, which I found quite extraordinary, was that speaking to house builders, I could not find anyone at all who ever went back and looked
at their developments after two years of completion. Most never went back and looked at them. There are no data tracking the quality of the specification, the environmental or long-term running costs of those houses, or indeed the design quality, or on value. Therefore, you have a complete vacuum in which people are designing and commissioning volume house building, for a start.

On housing, again, anecdotally, I am afraid, because a lot of this is anecdotal, if you look around London you can see some of the housing built in the 1970s—Camden’s architectural department, Alexandra Road, for example, now listed; Lillington Gardens in Westminster; the Odhams building estate in Covent Garden—where we have done it well. These are buildings and houses with high values and that will probably still be here in 100 or 150 years’ time. We have since demolished an awful lot of the stuff we did badly. Therefore, anecdotally, it is rather clear that good design, if you look at lifetime costs, saves you a huge amount of money. Having some hard research to back up these anecdotes would make the debate a lot easier, especially in terms of persuading Government to put the resources—relatively small resources—and the focus into promoting good long-term design.

The Chairman: It is a case of commoditising, if there is such a word, housing like they used to do in the grocery sector: “pile it high and sell it cheap” and not think about the long-term implications.

Baroness Andrews: I have an example, in fact, Chair. In about 2008, DCLG looked at the cost of a lifetime home that was built to the highest standards, was fully flexible and could enable people to age in place. This, of course, turned out to be more expensive than the ordinary home, which you outlive because you cannot manoeuvre around it when you are older. There was a distinct cost to it. You referred to the Treasury; this is precisely the sort of argument you used with the Treasury. The house builders, of course, immediately said, “We will put up the price of housing”. You are talking in your reports about everyday housing, everyday planning and so on, and this is absolutely fundamental to everyday. To my knowledge, that research has never been followed up or applied. It is a precise example of the gap in the system that fails to follow through on that sort of information.
Baroness Rawlings: You were saying how they have stripped out the research department in various planning authorities and that CABE was closed from the research point of view. Where did all those research people go, because they must still be around?

Max Farrell: I would like to pick up on that point in a sort of roundabout way. It goes back to the current state of research. It is important to point out that the idea of the Place Alliance is to collectively pool all the different research reports and initiatives that are going on. It is just as much about awareness of what research there is as it is about commissioning research. What we discovered during the review process was that there is quite a significant amount going on; it is just that there is no one central place where it is all easily accessible. To have the Place Alliance as a hub where you can go to access—there is research being done all the time by the institutions, by the TCPA.

Just to pick up on Lady Andrews’ point about housing and being able to understand why poor products are accepted and sold, there is a piece of research that was done recently on home performance labelling that we thought was very interesting. It was initiated by the Housing Forum, but it is not widely known about. The idea of it, as we talked about in the Farrell Review, was to influence consumers in terms of what they expect and for that to then have a greater impact on the house builders. It is interesting that Barratts are now supporting this home performance labelling. Essentially, it challenges our current system of valuing property, which is incredibly crude. We value houses by the number of bedrooms and floor area, so design quality does not come into it. This is a website that can measure space, daylight, sunlight, storage and access to green space; it is a much more sophisticated way of valuing property. I think that that would have probably a bigger impact on house builders than this regulatory “carrot and stick” approach.

Baroness Finlay of Llandaff: Just to follow on with that, if you are being the repository for research that has happened and therefore generating new ideas, is anybody doing the equivalent of TripAdvisor for people who are buying these new homes and new construction? You assess your holidays; you are asked, when you go into healthcare, to assess your healthcare. The biggest expenditure you will make will be on your home, and yet where is the consumer able to feed back?
Max Farrell: Absolutely. That is a massive opportunity and something that is inevitable, I think. It is happening in the rental sector, where you now get feedback on landlords but also on tenants. That is becoming more widely accessible and making a difference.

Baroness Finlay of Llandaff: Should Place be doing that?

Max Farrell: The Place Alliance?

Baroness Finlay of Llandaff: Yes, Place Alliance. Should you set it up? Should you start it?

Max Farrell: I do not see why not.

Q34 Earl of Lytton: Just a comment on that last exchange, which was particularly interesting because, of course, if you go on to some of these holiday home websites, UK holiday homes, you will find more qualitative information than you would get from a house builder.

How widespread do you both consider the design review process to be at present? What is it dependent on? Is it factor of scale, is it individuals, or is it to do with investor input or lack of input, as the case may be? What are the outcomes from these reviews on the development process and its quality? In other words, is it effective?

Professor Bishop: Perhaps if go first on that. I am a big fan of design review. Design review engages in a broad conversation and a challenge. It is also a very cheap process. There has been a lot of discussion about how much it costs, but a design review will cost between £3,000 and £5,000. That is less than 1% of the consultant fees you will pay in bringing a reasonably sized development up to planning. In percentage terms, it is very small. It is non-binding and, therefore, it is purely there for advice. When you have good local authorities and good developers, they do value it. They value it because it allows a challenge and a discussion to happen that allows a scheme to develop at the right time.

Since CABE became part of the Design Council and effectively lost its unique and privileged role as the principal adviser to Government, design review has, first, grown—I believe there is more design review happening across the country, which is good—and, secondly, it has devolved, which is good. However, it has become very patchy and it is voluntary. Therefore, if a local authority is powerful enough and prepared to insist that a scheme go to design review, it probably will. Poor developers will almost certainly resist that; good developers will be very happy for that as part of a constructive process. The design review, being patchy, has also become quite competitive. You have a set of organisations, including CABE, competing
for a very constrained and constricted market. Finally, whereas most design review panels that have been set up locally are extremely good and are doing an extremely good job, I do not believe the quality is as good as the far larger and more professional ones that were run by CABE in the first place.

In my own experience, a project that goes to design review almost certainly raises questions and comes out better. I would advocate that there are times when there should almost be a call-in: the schemes are so important that they should be almost required to go to design review. In the Bishop Review, I did say that there should be a presumption that anything that is procured through public contract using public money should go through design review to set the example and the conditions for it.

Max Farrell: I agree with Peter. I think design review is a very successful and valuable process. I would argue that it is not applied widely enough and it is quite limited in its scope, because the current state of affairs is that the majority of design review takes place for new buildings that are coming through the planning process. In this country 80% of the built environment that we will have in the year 2050 already exists, so only 20% of it will be new. Of that 20%, only a very small percentage will go through the planning process. In the public realm, changes to high streets and parks do not go through the planning process.

I would argue that we need what we call place reviews of existing places, not just new buildings, which in a way are easy to focus on. Who is looking at housing estates? Who is looking at mega hospitals? I would argue that these places have a much bigger impact on a much greater number of people’s lives than a new museum or a new office building. The good thing about design review or place review, whatever you want to call it, is that professionals are happy to give up their time, either at cost or for no money, to do it. It is a good way of public and private working together for the greater good for a low cost, and I would say it should be applied more widely.

Q35 Lord Freeman: This is a follow-up question and I suspect I know how you are going to answer it, but let us see. Does there need to be a greater emphasis in the national planning policy framework on design generally but also on design reviews?

Max Farrell: It would be great if there was support for or reference to the idea of place reviews, because it is a different concept. I do not think they would necessarily need to
replace design reviews because design reviews play an important role and are very valuable for individual developments. Looking more widely, I notice that CABE does have what they are calling a place review panel to look at Oxford and what its needs are, what the transport problems are, and thinking about those things at the very early stages, which will then help inform developers who are bringing forward applications for individual sites. If there was some support for it within the national planning policy, that would be a good thing in my view.

Professor Bishop: Could I just come in on the back of that question? First of all, I think the National Planning Policy Framework is a really good document. What it has done, which I think is remarkable, is invited planning to come back into the debate about design quality in the built environment. I absolutely applaud it for doing that. It has some powerful statements suggesting that planning authorities can turn down applications on design and can use exceptional design to override some other considerations. That is absolutely wonderful. I think what has happened is you have had a very positive drift in the policy framework, which has moved completely away from the funding of the infrastructure to support it. To me, that is the crux of the problem we are facing.

Baroness Whitaker: I share your view, Professor Bishop, about the merits of the NPPF. My question is: have you any confidence that it is read across or translated down? I have in front of me the national networks national policy statement, which I would say is inadequate about design. It talks about aesthetics being a desirable consideration; there is no idea in it that good design is integral to the good functioning of a highway or similar. Do you have experience of this? Am I right that it is not read across?

Professor Bishop: I would share your view on this. There is a gap between the lead given in national policy and the application on the ground, both in terms of national infrastructure projects and how it is applied locally. Partly, the stripping out of expertise, capability and capacity at local level has been very serious. I think an awful lot of local authorities, which in theory have considerable power to intervene to promote good design, have become extremely timid even in wishing to enter that kind of debate and lack the expertise in doing so.

Q36 Baroness Whitaker: Thank you. If we could move on to the subject that Professor Bishop touched on, both the Bishop Review and the Farrell Review identify a shortfall in skills
among key decision-makers in the planning process. That is not just officials; it is also the elected politicians. Those who have been around development have also noticed it. What impact has this shortfall had on the built environment and, more importantly perhaps, do you have the impression that Government realise that there is this big gap, and what ought to be done to bring back the visionary planners? You mentioned the 1970s; I am thinking more of the 1940s and the 1950s. Where are those people? How can we get them back, or their replacements or their descendants?

Max Farrell: You are absolutely right. That is a critical part of it and the solution to this is not a silver bullet; it is multi-faceted. Design literacy and design awareness within local councils are key for elected councillors but also for highway engineers, for example, who make very important decisions that have a profound impact on our urban environment. I would point you to papers written by people following the review, whom we called champions of particular issues. There was one written by Sue Vincent, a councillor at Camden who was the deputy leader there, on ways in which we can introduce design literacy and training to elected councillors in the same way that they receive training on financial and legal matters, because it is so important and because the decisions they make have a legacy that lasts for decades.

The Chairman: Is that paper available?

Max Farrell: It is, yes. On the Farrell Review website, on the home page, there are about 12 papers. There is the one that I have just mentioned by Sue Vincent, but there is another paper, which is very relevant to what Peter was talking about, about skills and talent within local authorities, which was written by Finn Williams who is currently at the GLA and was at Croydon. We pointed to Croydon as a good example of where placemaking is a central focus within the local authority, and I think that was partly due to the leadership of Jon Rouse, who was a member of the Urban Task Force. Finn has come up with an idea for a social enterprise that is a bit like Teach First. He has called it Plan First but also Public Service. The idea is to attract the best talent into public sector planning departments, which do not have the same reputation or perception as the private sector. I think Finn himself is an exception to the rule. He could have gone to any leading architectural practice; he went to Croydon and now he has gone to the GLA. He is saying: why can we not fast track recruitment? Why can we not make it more exciting and show that it is not just about development control—that it is about
visionary thinking, about placemaking—and attract the right kind of skills into local authorities?

**Professor Bishop:** Certainly in my own experience you can carry out training for elected councillors. I do not know if this is true—I was told this in China and I have not been able to check it—but apparently Chinese city leaders are required to attend Tongji University every year for a training course in how to be a city mayor. I was told that it was four weeks a year. Now, I have not checked that. It seems remarkable but it is almost believable.

**The Chairman:** It sounds a bit like the continuous professional development we have in this country for other things, but not for design and architecture. We could easily piggyback on that with CPD programmes.

**Professor Bishop:** Certainly having a centre of excellence that does provide training packages—it is about raising expectations and having a few core skills to ask the right questions. In my own experience, what tends to happen—and Max has mentioned the question of Croydon—is that you do get certain boroughs, metropolitan authorities and district authorities where you get the very good coincidence of a leader, a political leader or the chair of a committee, who is absolutely committed, with a chief officer or senior officer, and they work together. We have seen it in Westminster and in Southwark when the Tate Modern was produced, and when it happens you do raise the internal skill level of that authority. Attracting people either as full-time staff or as long-term advisers could be quite a powerful way of raising design standards at a local level.

The last point I would make is that longevity is very important. I am slightly concerned about using the case of Leeds but John Thorp, the civic architect of Leeds, was there for 25 years and he did a fantastic job in keeping the continuity of thinking about how that city could develop. You need those kinds of timescales in a city.

**The Chairman:** That is an interesting point. Thank you.

**Q37 Baroness Rawlings:** The Farrell Review emphasised the need to consider heritage of current buildings. I have to agree with you—and this has come out in your last answer, too—about the necessity of a strong voice, resources and leadership, wherever it is. If you get really good leadership, it does not matter which field you are in, it should work well. What are your views of the new housing and commercial developments over the last, say, 30 years? What
Professor Peter Bishop and Farrells – Oral Evidence (QQ29-40)

percentage of the designs today do you think have heritage values for the decades to come, having mentioned the importance of the longevity of the buildings?

*Max Farrell*: We have quite a mature and sophisticated approach to heritage in this country, which is often the envy of the world. The rest of the world looks at us as having got our act together when it comes to valuing heritage, but I think there is still more to be done. The value of heritage is not just for the more easily analysed areas like tourism, for example, or even placemaking, but also in terms of sustainability. The fact is that existing buildings are a resource. We have limited land and our building stock can and should be looked at to be adapted and refurbished as a first point of call. Quite often, that is not the case.

There are certain things that have a dramatic effect on that. For example, the VAT on refurbishment and retrofits, whereas there is no VAT on new build, completely flies in the face of encouraging refurbishment. There is also the lack of architectural training when it comes to skills for refurbishment and retrofitting. There are a number of different things that we talked about in the review that could move us even further forward in valuing and making the most of the value of heritage in this country.

*Professor Bishop*: I am sorry, I am going to give a slightly different view here. It is far more pessimistic, I am afraid. We do produce some extraordinary new buildings in this country. On the prime sites, under the spotlight, commercially in particular, our cultural buildings and some of our housing stands with the very best in the world. That is a very small percentage of what we are building. I fear that the default is normally mediocrity and I would advocate a simple test: that you stand almost anywhere in any town outside the centre of London or the major historic cities, turn slowly through 360 degrees and ask yourself if you can see anything that is not mediocre. Most of what you see—

*The Chairman*: Anything that is mediocre?

*Professor Bishop*: That is not mediocre. Most of what you will see has probably been built in the last 25 to 30 years.

*Baroness Rawlings*: You are talking about contemporary?

*Professor Bishop*: Yes, in effect.

*Baroness Rawlings*: The last 30 years? You are not talking about 300 years ago?
Professor Bishop: No. In a lot of the home counties, in particular provincial towns and the suburbs, what you see is largely 25 or 30 years old or less and, generally speaking, of quite extraordinarily poor quality, and uncoordinated as well. The question is: will we be listing what this generation is building? Yes, we will be listing some of the prime buildings but an awful lot of what we are building, unlike the Victorians and the Georgians, we will not be listing.

Baroness Rawlings: Would you put this down to cost-cutting, or just lack of talent in architects?

Professor Bishop: Not lack of talent. We have the talent in this country. Our schools are producing some of the best graduates in the world and we have some of the best practices in the world. That assumes that people are using architects, for a start, and an awful lot of developments now are not using architects, or start by using architects but do not end up using the architects. A lot of it is down to short-term expediency and, I have to say, lack of will. Again, this might be slightly unfashionable, but having strong planning regulation that is capable and resourced to engage in a positive debate about design is going to address the people who are prepared to build it, sell on and never look at it again. That is what we are doing over a large amount of our new build, I am afraid.

Max Farrell: I am sorry, I think I misunderstood your question so I gave the wrong answer to it. I am sorry about that.

The Chairman: Do you agree with Professor Bishop?

Max Farrell: I do, and I think it is very hit and miss. What we do not do is we do not learn from where things have worked well and we do not have a consistent approach to the way we plan towns and cities. Even within towns and cities, within London the political boundaries are not the same as the place boundaries. Very often, we have projects that are divided between two boroughs that have very different ideas about heights of buildings and affordable housing rates and so it is hard, under those circumstances, for the focus to be about design quality, because quite often the focus is about all the other things that are open to negotiation. One of the key things that we called for in the Farrell Review was more proactive planning, to have a more consistent approach to things like affordable housing levels, shape, form and
even materials of buildings, so that people know and agree in advance that that is the right way to go.

Q38 Baroness Andrews: I am going to bundle this up into my proper question. It picks up on what you have both said and goes back to what you said, Professor Bishop, about the National Planning Policy Framework. I agree with you: I think it is an excellent document after a lot of hard work and a lot of negotiation with all the expertise available to the department. It was a good outcome. But in that department there is clearly a tension between protecting the historic environment, the natural environment, landscapes and so on, and the pressure for development, and since the NPPF was published, that pressure has intensified. Do you think that is making the situation better or worse? At the same time, we have lost our special planning capacities. My original question was: are we doing well enough at placemaking? But it seems to me the answer, if I may anticipate, is no, and these may be factors that make it more difficult now to do as well as we can in terms of placemaking.

Professor Bishop: I said earlier that one of the key judges of success of any organisation is how it does most of its work. How high is the average? Most organisations can do one or two brilliant things but good organisations do everything rather well. That is the kind of problem we are facing. As a nation, we do conservation rather well. We are one of the leading countries in the world in terms of conserving our built environment. We do that very well.

There is a rather strange thing underneath all of this, around the British planning system: it is a pretty unique way of dealing with planning. It is bespoke. We deal with every application on its merits and every application can potentially be negotiated, and that places a huge onus on the planner. There is little doubt that good planners normally are the ones with an awful lot of experience behind them. In the 25 years I did planning, I was probably better at the end than when I started. You learn and you amass that experience. That is very important for building a long-term capability.

As far as placemaking is concerned, I have to tell you it is not a phrase I particularly like. It implies something a bit like cooking, a bit like a recipe: you can follow a recipe and produce a good place. Good places are made by people who are passionate and engaged, and can broker broad agreements between stakeholders. There is one thing that local authorities have lost, and quite early in the process. From the 1980s and 1990s onwards, as local authorities had to
fall back on core business, plan-making and development control became the core business in planning departments. The really interesting stuff, the stuff that can make a fundamental difference to how you shape and mould a place over time, has been lost. The Farrell Review did come up with a whole series of ways in which that could be compensated for, but I think that underneath that you still need a point, a leader locally, who can rally the forces around a vision, have the stake to see it through over the long term and fight very hard to make it happen.

**Baroness Andrews:** If I may, I will follow that up briefly. You are both quoting isolated examples of where good things are happening. Bristol is obvious because George Ferguson is both charismatic and expert, but he is unique, I think. There are a handful of places where you seem to think that good placemaking is within capacity. What do we have to do in order to learn the lessons? Leadership is clearly key but we cannot replicate good leaders. We have to have something inside the systems that makes it more or less likely that this happens. It obviously is an issue of the curriculum of young planners, too. I take your point about placemaking, but it seems to me that placemaking is at least a more generous description than planning and is less likely to turn people off from the questions, challenges and possibilities.

**Max Farrell:** I would absolutely agree. I would even argue that it is important for the curriculum of school children just as much as it is for planners. In this country, it is incredible that we are not taught about the built environment when it affects so many different things. We looked at whether or not it should be a subject in its own right and we thought that that did not make sense because you could just as easily teach the built environment through maths, history, geography or physics, and it engages children. One of the most popular computer games is Minecraft, which is basically about placemaking. Making a connection to your house, your street and your neighbourhood and how that affects climate change would be incredibly powerful. I think that would then create more people who are interested in being civic champions, taking up a leadership role, asking why things are the way they are and so on. I think it starts much earlier.

**Professor Bishop:** If I could make a quick further comment on that, I want to go back to the role of Government. Government consistently saying that design is important, and putting
that into practice in everything they do and commission over a long period, will shift the
nature of the debate. Without wishing to be too blunt about it, the present debate around
housing is around numbers. You hear very few statements saying, “Yes, of course we need a
lot more housing but that has to be of high, durable quality”. That bit is always missing. For
as long as that is always missing, the message that comes down is that design is not that
important. It is number 16 on the list of priorities in terms of committees.

**Q39 Lord Clement-Jones:** I think you have pretty much answered this, at least by implication,
throughout the answers that you have given to the questions, but it would be quite useful to
get it on the record, particularly in light of your views about what might be done. It is this
whole question of the local plan value. As you know, we have had Ruth Stanier and Steve
Quartermain here giving evidence to us and they said that they thought that local plans did
have a positive impact and this led to an increased number of houses being approved. What
is your view of the work of local authorities in developing and adopting local plans? I can see
that it is coloured by the hollowing out of expertise point that you have made and so on. Do
you think they are sufficiently able to address and promote design standards, given what you
have said about the quality of our current housing and so on?

**Professor Bishop:** My view is quite personal on this. It may not be representative of other
people in my field. I think local plan-making might have resulted in more housing being built.
I would not question what Steve Quartermain said. I think that it is an incredibly cumbersome
process to go through and not one that is likely to inspire many people to participate or get
excited. The very nature of local plan-making, with its procedures and legal requirements,
tends to make it a very cautious process, normally carried through by very cautious people,
and at the end of the day what local plans quite often fail to say is: what can this place be? It
misses the key point. Having been involved in very small local design exercises, I know that
you can achieve an awful lot more in two or three weeks by getting people together around
a table, having a debate and drawing and sketching and asking those kinds of questions,
instead of the rather cumbersome processes of producing a local plan. If we could rethink
how local plans are constructed, we could probably free up some resources to apply to the
more creative process of asking the question: how do we create brilliant places in which we
can live and work?
**Lord Clement-Jones:** Can you do that in a context where you do not have a concrete proposal? I know you said that the problem is that every application is dealt with on its merits, but can you have a discussion that is not quite theoretical but certainly looking to the future, where you have a hypothetical development taking place?

**Professor Bishop:** Yes, I think you can. At the end of the day you will have to back it up with something that carries material weight in the planning process, but I would still hold to my answer that when you look at local plan-making—and I know that DCLG has spent a lot of time trying to simplify and streamline it—it is a heavy-handed process that often misses the key points that local people want to engage in.

**Lord Clement-Jones:** Which bit of the process is the cumbersome part, compared with what you are suggesting?

**Professor Bishop:** It is taking it through the various stages through to adoption—as simple as that.

**Lord Clement-Jones:** Does that not have a danger involved in it? A few local people get involved and it is basically the voice of the most active. You push it through and you do not have to go through the process, and yet it is adopted as your design standard.

**Professor Bishop:** With all respect, that probably happens a lot under the present process.

**Lord Clement-Jones:** Yes. Do you have a different—

**Max Farrell:** I would just add that I think a local plan is probably not enough. It is symptomatic of the whole system being reactive. It is setting out a number of policies but then it is waiting for the private sector to bring forward an application, assess it on that basis, and then get into negotiations and quite often do something different or adapt accordingly. What it does not do is set out a vision and a master plan for an area that would facilitate that process and be much more proactive. That is what we have said there should be more of. The planning system has gone from one where, in the 1950s and 1960s, it was entirely the public sector doing all the planning. But I think people then lost faith with all the social housing and the motorways, and now it has swung completely the other way, whereby it is entirely waiting for the private sector to do the spatial planning. There needs to be a middle ground where the two work together.
Lord Clement-Jones: Just to coin your phrase, we need a proactive master plan as opposed to a reactive local plan?

Max Farrell: Yes.

Lord Clement-Jones: We have to work out how to get from A to B without much local expertise or the hollowing out of local expertise.

Max Farrell: I think you can do that with the private sector as well, with place review panels. They do that in other countries. They are getting together to talk and then test and then engage with the public about ideas, what their needs are and how they can be accommodated, without relying on landowners and developers to try to make those solutions for them.

I would just say one other thing, which is that the difference between a local plan and having a vision or a master plan is that they are communicated in completely different ways. Anyone who has gone on to a council website and tried to read a local plan knows it is very hard to get an understanding, especially for the layperson, of what it means for their town or their village. If you walk into an urban room and you have a model in front of you and you have some drawings, that is a completely different way of understanding. It is instant. You do not need reams and reams of planning—

Lord Clement-Jones: It has to be accessible as well?

Max Farrell: Absolutely.

Professor Bishop: If I could just comment very quickly on that. Local plans need to focus on what we want you to do, as opposed to what we do not want you to do. Planning is defensive because of precedent and because of the pressure it is under. If we can focus on what we want to happen, you are better off constructing a narrative and doing drawings. That is the difference—drawings and narratives that communicate. Then, planning has an absolutely key role: to broker between the local community and the stakeholders, put people together and to try to get the alignment so things can happen. That is a very different approach to planning. Some people are doing it, but that is quite different from the local planning processes that tend to work against it.

Lord Clement-Jones: We will have to try to capture that, clearly.

The Chairman: That is right. That is very interesting.
Q40 Baroness Parminter: Part of the process of visioning for the local plans, not from above but from below, is obviously the neighbourhood planning level, and you talked a little bit about that earlier. Is there any clear evidence that there are sufficient resources going into that process to make that deliverable? It can be done and it is being done quite well where you are getting local communities engaging with other relevant stakeholders. It feeds into the local plan and it is obviously on a statutory footing if it is accepted. There are places that are doing it well and there are other places where I have heard there is insufficient money to make it a robust and, as you made quite clear, a visioning process that local people can engage with. Do you have any sense of whether there are sufficient resources; is it working; is it too soon to say?

Professor Bishop: Again, what is happening is patchy and there are some good examples where communities are coming together very powerfully. There is a quite important issue here about the nature of communities that are far more poorly resourced than others. There will always be communities, certainly in my experience in planning and development, that are extremely able, capable, well-resourced and have the right people, and who will always put up a fight. That is brilliant. When you work with those communities, it is fantastic. There is energy. It is incredibly challenging and sometimes quite daunting but you normally get a far better result.

Against that, you have a far greater number of areas where those resources do not exist, or are extremely unfocused when they do. Something that local planning or placemaking can do is to provide a focus to try to rally those other communities around becoming engaged. A lot of the work we did at Design for London in places like Barking, Dalston and other town centres, in Tottenham, was to try to provide a point where we could actually bring people together, put a small resource in to get that debate going and then hopefully leave behind us a community that felt more engaged, more capable and more able to sustain that, to put up their own fight, get their own point of view into the debate and try to get a better result out of placemaking or out of a particular development proposal. That is a very big gap. Unless we address it, we will have a polarisation whereby the nice areas will get nicer and the worse areas will get worse.

The Chairman: Those with the strongest voices.
Professor Bishop: Yes.

The Chairman: On that note we must end, unfortunately. We could go on for ever. I am sure you have a lot of ideas that you would like us to take on board as well. Would you be prepared to send us whatever ideas you have subsequently, by whatever method, email and so on? You will have all the details on the website. That would be very good. I have to say that it has been a brilliant session and thank you both very much for coming.

22 July 2015
Dear Sirs

I have been requested to write to you on behalf of Boughton Parish Council.

The Parish Council understands that you are requesting evidence for a Select Committee on National Policy for the Built Environment and the Parish Council wish to make particular comment on question 12 which is particularly relevant to parish and town councils.

*How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?*

Buckton Fields, Northampton is a perfect example of how, it is believed, the major house builders manipulate the planning system to their own advantage and, or, maximise the premise that the Government wants to see development, therefore, the planning system is there to enable it rather than to give the public a real voice. Similarly, the way the boundaries have been drawn enforcing the residents of Northampton North to look all the way to their District Council in Daventry makes a ridicule of local representation.

It is felt that little account is taken of comments from local residents in relation to design and construction and how new build relates to the local area and open countryside.

Often, when dealing with new large developments, guidance and advice is required along the way and parish councils incur costs in legal fees that would be better used elsewhere.

We believe that no matter how well you know the Parish Councillor, the local MP or the Chief Executive of the Local Authority, Planning Department or Highways Department, decisions are made by the Authorities according to their own requirements, they either have no money to spend, and therefore, nothing can be done, or they have some money to be spend (within certain time scales) and that money will be spent regardless of any consultation process which is perfunctory at best.

Yours faithfully

Jayne Bunting
Clerk to the Council & RFO

06 October 2015
Dear Sir/Madam

Select Committee on National Policy for the Built Environment - submit written evidence

The Parish Council would like to thank you for the opportunity to submit evidence.

Community Involvement and Community Impact questions 11 and 12.

1. Landscaping conditions. Often not put in place or maintained by developers so the end result is not what was agreed and is often sufficiently less than what was promised. A pleasant and green local environment has proven health and community benefits.

2. LPA do not have to enforce planning conditions so community feel short changed.

3. PCs and the community are effectively ignored and LPAs take only a local and not holistic view. True sustainable development constantly seems to be over looked resulting in development where principle services or highway infrastructure are unable to cope and where small scale improvements and investment provided by S106 do not fully mitigate the additional development. Local schools and medical services are unable to cope with current needs let alone with a further influx of residents.

4. Local Traffic Authority. In this parish council’s experience the LTA does not take a holistic view on the knock-on effect of major developments elsewhere on the local highway network. Section 106 payments are often identified for the immediate area e.g. improving a roundabout however this only moves the problem further down the road. Some roads, even with improvements are unable to take any more traffic.

5. Planning Inspectorate public inquiry being away from the affected area even though there are local venues. In the spirit of Localism the LPA/Planning Inspectorate should be obliged to consult the lowest tier of government on the proposed venue for a hearing.

Other comments.

6. Agricultural and green barrier land is seemingly under constant threat of development without sufficient consideration to the impact of a nation being able to feed itself as well as the general health of having a green lung.

7. Developer’s primary focus is cost and profit capability and this does not generally reflect the need for smaller units for first time buyers and for people trying to downgrade. Well
placed development generally flats, close to local facilities and public transport links with adequate (preferable) secure underground parking and green spaces is more sustainable than large houses. A recent application within this parish was for 144 units (mainly flats) but once planning permission was obtained the application was changed to 77 dwellings with more houses being built because this was more profitable.

8. The emphasis for planners is to facilitate development and this is potentially a primary reason why communities, developers and planners are constantly clashing. Without a good common-sense approach to ensure the right types of property are built in the right location this situation will not change.

Yours faithfully

Pauline Bowdery
Clerk to Boxley Parish Council

05 October 2015
This evidence addresses a number of Questions posed in the Call for Written Evidence (Questions 1, 3, 4, 5, 6, and 7), primarily around the theme of planning for new housing. The evidence is based on an accumulation of research evidence gained through a number of research projects supported by the Engineering and Physical Sciences Research Council (EPSRC, specifically the ‘CityForm’ and ‘SNACC’ consortium projects), the Joseph Rowntree Foundation, and the former National Housing and Planning Advice Unit, among others.

Q.1 (Are decisions that shape England’s built environment taken at the right administrative level?)

While it is right that local authorities play a key role in local planning, that role should be performed in a context which ensures that the essential interests of the nation and of wider neighbouring localities and regions are reflected. The present English planning system fails this latter requirement, because it has abolished the former regional planning machinery and left these interests only haphazardly catered for through the arrangements for National Infrastructure, the ad hoc/responsive interventions of planning inspectors, and ill-defined, untested and still-localised ‘duty to cooperate’.

Evidence from our and other research on the operation of housing markets, demographic processes of migration and household formation shows clearly that there are strong connections between local areas, particularly at sub-regional scale (within so-called ‘housing market areas’ or ‘travel to work areas’), and indeed significant connections between what are treated administratively as separate regions (notably London and the rest of southern England). In other words, under-provision of housing in some areas will impact adversely on other areas, in terms of migration flows, house prices, rents, affordability problems and unmet housing needs. These effects will also have an impact on the performance of the economy, as for example key workers find it difficult to obtain suitable housing, particularly housing to buy.

Specific evidence can be cited to show that, given patterns of public attitudes towards new housing, a predictable outcome of the move to ‘Localism’ in determining Local Plans was a reduction of planned levels of new housing in the areas of higher need and demand (South East of England, and wider South), with some (ineffective) increase in lower demand areas.

---

(remote and northern areas)\textsuperscript{7}. Actual changes in local plans following this policy change conformed to this prediction. Furthermore, evidence from modelling the housing market at sub-regional level shows that, in general, the benefits of increasing supply in terms of improved affordability are enhanced if surrounding areas increase supply as well. In the particular, and important, case of London, the surrounding 'Home Counties’ area can make a potentially larger contribution to alleviating the pressure in London than can London itself, particularly if one takes a realistic view about acceptable densities and quality of life\textsuperscript{8}.

**Q.3 (Does the NPPF provide sufficient policy guidance?)**

The biggest weakness of NPPF is the lack of a spatial perspective (see below). On housing requirements, the Practice Guidance looks sound on paper but is unambitious and in practice unreliable and capable of being manipulated to justify inadequate plans. There is undue reliance on household projections, which are increasingly unstable, unreliable and lacking in credibility\textsuperscript{9}, and no attempt at forward forecasting of market outcomes – in contrast for example with the Chancellor’s ‘Fiscal Framework’ which is built around forecasts. Current practice examples highlight the resulting problems, including quite inappropriate judgements about the scale of housing supply adjustment which should be made in response to adverse ‘market signals’\textsuperscript{10}.

**Q.4 (Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?)**

The short answer to the first question is clearly ‘yes’. The effects of introducing a spatial element must be to some extent speculative, and will depend on the form and process adopted, although one can gain some clues from existing practice in Scotland.

The central dilemma of regional/spatial planning is to balance the perceived imperatives of economic growth and international competitiveness with the desire to spread prosperity, reduce inequalities in economic outcomes, stabilise declining areas and foster a spirit of inclusion for the remoter places. We would speculate that an explicit spatial strategy would recognise that the ‘super-region’ comprising London plus the ‘Greater South East’ is vital to the overall economic performance of GB plc, and would support facilitating the growth of

\textsuperscript{8} See Bramley & Watkins (2015), Note 1.

\textsuperscript{9} This critique of household projections is developed in conference presentations to the British Society for Population studies, particularly Bramley, G. & Watkins, D. (2014) ‘A sub-regional housing market model for England with endogenous migration and household formation: its role in assessing the adequacy of planned new housing’ BHPS Conference, Winchester, Sept 2014, Special Session on Demographic projections and Forecasts, and also in Bramley & Watkins (2015), Note 1.

\textsuperscript{10} Inadequate response to market signals, as well as questionable household projections, feature in the case of Bristol-West of England, discussed in Bramley (2015), Note 10.
employment and housing in key city-regions within that overall frame, including appropriate new settlement/garden city/urban extension elements. For these areas, more housing is a key element. Beyond that, there would be a desire to promote similar growth points in the more peripheral and northern regions; for these areas, infrastructure, land reclamation and regeneration might be higher priorities. Infrastructure priorities would be (hopefully) shaped through this spatial strategy process.

**Q.5 (Optimal Timescale for Planning?)**

In the 1990s and early 2000s you could certainly say that planning timescales had got too short in the UK. Typical structure and local plans had a 15 year time horizon, but by the time they were approved they had ten or less years to run. Within such a time horizon, it is difficult to bring large scale new sites forward and get housing completed and sold and new communities established. This was convenient for local politicians, who thereby avoided having to make potentially controversial decisions which would upset comfortable local voters. ‘Planning’ became opportunistic, grabbing ‘windfall’ sites resulting from factory closures and the like, rather than thinking about the best shape for future city regions. This approach was reinforced by the excessive emphasis in planning policy guidance (recently reinforced) on ‘brownfield’ redevelopment.

In other countries, where city and regional authorities and state governments take planning for growth more seriously, ‘urban growth boundaries’ are often set with a longer time horizon of 20-25 years or more.

The current conventional time horizon for Local Plans is 20 years. This is the minimum for that purpose. For regional and national spatial planning, where the role is strongly connected to infrastructure requirements, a longer timescale is needed (of the order of 40 years). This is similarly the case in relation to aspects of environmental sustainability, including both mitigation and adaptation to climate change. The function of planning to such time horizons is not to prescribe an infallible blueprint or trajectory – it is rather to test the resilience of urban settlements, economies and infrastructure to a range of conditions which may prevail. For example, the SNACC project we participated in highlighted the significant risks of overheating arising within typical suburban housing areas in southern England within that timescale.

**Q.6 (What role should Government play in addressing issues of housing supply?)**

---

The current system in England is confused and contradictory. The ‘Localism’ emphasis post-2011 directly contradicts the emphasis in NPPF, reiterated in *Fixing the Foundations* 13, on meeting housing need and demand in full. The negative effects of the former on planned housing supply in high growth potential regions was predictable, predicted and realised14. We have already argued for a robust government-led approach on spatial planning (Q.3-Q.4 above). However, policy commitments made in 2015, particularly the emphasis on maintaining (rather than reviewing and redrawing) Green Belts, confound the problems.

While clearly housing supply has suffered disproportionately in the financial crisis and recession of 2008-12, our research supports the view that four issues hold back housing supply in the longer term: (1) not enough land allocated through planning in high demand south of England; (2) lack of funding and assured provision of necessary infrastructure to support new/expanded communities; (3) the conventional speculative housebuilding model is not responsive enough (the ‘pushing string’ problem)15; (4) quite a lot of the housing required should be ‘affordable’ (including social renting), but the funding and mechanisms to deliver this are inadequate.

To address issue (1), government should formalize the sub-regional collaboration of local authorities on a housing market area/TTWA basis16, including imposing arrangements where local agreement is lacking. Key elements of planning strategy including housing numbers and locations for major growth should be determined at this level, with statutory backing. There is a case for absorbing Local Enterprise Partnerships within these structures. Where there are significant housing numbers and market issues which spill over even these sub-regional areas, notably as between London and the Greater South East, the Government should reach a view, in consultation with the GLA/Mayor, about the balance of housing numbers to be allocated as between the GLA area and the GSE, and between the sub-regional planning areas within the GSE.

To address issues (2) and (3), local authorities or LA-led land development agencies in growth areas should have powers to acquire development land (with reserve CPO power) at existing use value plus a fixed premium, with the possibility of sharing ‘equity’ in the ultimate development profit, after meeting all infrastructural and planning obligation costs, with the original landowner. They should use such powers and land to auction sites under

14 See Matthews et al (2014) (Note 2) for evidence on public sentiment and Bramley & Watkins 2015 (Note 1) for evidence on the impact on output and affordability.
licence to wider range of potential housebuilders with conditions on mix, price range, and delivery dates, with freeholds conveyed to the final purchasers\textsuperscript{17}.

To address issue (4), local authorities should have their powers to apply s.106 planning agreements for affordable housing re-emphasized, and not watered down or sidestepped as in some recent government initiatives. Relevant to both issues (2) and (4), ‘viability assessments’ relating to planning obligations should be undertaken according to a standard format with routine market information inputs updated, with a maximum profit margin (e.g. 15%), and these should be published.

\textbf{Q.7 (How do we develop built environments which are sustainable and resilient?)}

Our research has a bearing on two particular aspects of this question, each of which is quite important.

Firstly, there is the issue of the density and form of future housing development, which is bound up with planning and location. There is a view in some quarters that the right way forward for housing supply in England is to build mainly or exclusively on brownfield sites within the existing urban areas, and probably mainly in the form of higher density (flatted) housing rather than houses with gardens at ground level (implying medium density or less). Some equate such an urban vision with ‘sustainability’, but our research shows clearly that such a single-minded focus on urban compaction will not support sustainability in important respects, including social, environmental and economic, and will not meet the range of people’s preferences and promote maximum wellbeing and happiness. Whether measured in terms of people’s ‘willingness to pay’ preferences (as in house price models) or in terms of people’s satisfaction with different aspects of their social and community life, high density living does not score well, although it does offer acknowledged advantages in terms of accessibility to services and opportunities\textsuperscript{18}. Even from an ecological perspective, in terms of biodiversity and wildlife, suburban environments (with their gardens and greenspaces) score better than the average agricultural land ‘protected’ in Green Belts.

Secondly, a key challenge in mitigating carbon emissions and climate change is to increase the energy efficiency of housing. Government has effectively scrapped targets for ‘zero carbon’ new build homes, creating uncertainty for the market\textsuperscript{19}. However, the largest

\textsuperscript{19} While the retreat from zero carbon homes as a regulatory target is perhaps an understandable response to the recession and undersupply of housing, it contributes to uncertainty which itself may harm supply chains, as emphasized in \url{http://www.ukgbc.org/press-centre/press-releases/over-200-businesses-urge-chancellor-reconsider-scraping-zero-carbon}.
challenge here is with the existing housing stock. Since most of this is owned by private individuals, the keys are to raise awareness, to motivate and to facilitate individual investment in energy-saving improvements to the homes and their systems. The Government’s current headline programme, the Green Deal, has been a conspicuous flop, with funding now withdrawn, so there is clearly a need for renewed attention to this issue.

Our research within the SNACC project showed clear evidence, from statistical modelling on the best available dataset, that even in the mid-late 2000s house prices/values did reflect the energy performance characteristics of the home, allowing properly for all the other known influences. Secondly, it showed clearly that people’s actual energy consumption and bills also reflected those energy efficiency features of the home. At that time we found annual savings in energy bills of £400 pa for homes with basic, commonly applied energy efficiency measures, equivalent of £8-10,000 in capital terms. We also found, consistently, that homes with those efficiency features commanded prices about £8-10,000 higher. With the subsequent rise in both energy and house prices, these figures would now be considerably higher.

Thus it should be possible to motivate home-owners to invest in at least the more cost-effective measures, on the basis that they will get a return on their investment through both lower bills and higher values. We would expect the effects on housing values to become larger and firmer over time as (a) the effects of higher energy costs work their way through and (b) awareness grows, partly through the influence of Energy Performance Certificates and their role in the house transaction process. Regulation of mortgage lending through the Financial Conduct Authority could further encourage such awareness and motivation, by reflecting expected energy costs in the ‘affordability’ criteria applied to borrowers.

Additional measures may be needed, however, to make such improvements happen in the private rented sector, to ensure that any financing deals promoted are value for money, and to curb the nuisance and abuse exhibited by some of the home improvement industry that has grown up around this area.

06 October 2015

---

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

Response from Cllr Alan Mawer, of Braunston Parish Council (Northamptonshire)

I believe communities are readily able to engage. In particular the system of establishing a Neighbourhood Plan allows for significant engagement.

I consider the following to be barriers to greater public engagement:

- The complexity of a multi-layered system. Many people do not have the capacity or time to become aware of who has responsibility for different planning decisions.

- The reduced circulation of local newspapers and the widening of the methods of communication and receiving news also present a challenge in communicating news of a forthcoming planning decision to those who will be affected and may wish to respond.

- The greater resources available to large organisations enable them to use the planning system in ways that are to their advantage. An example might be the new warehouse on the edge of Daventry. They did not apply for the size of building they eventually wanted and had the resources to apply for a relatively small addition that may not have been allowed of the full size had been mentioned originally.

Issues could be addressed by using a leaflet drop and by including clear explanations of implications and sustainability issues.

Response from Cllr Abigail Campbell, of Braunston Parish Council (Northamptonshire)

The current planning system is fairly combative and generally limited in terms of meaningful public engagement. Much more strategic work with the cultural and creative sector could transform the means by which local communities can influence and inform the development of the built environment (see Nesta’s Creative Councils work, or the Arts Council funded project Safe House (http://www.metro-boulot-dodo.com/safe-house.html)).

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

Response from Cllr Abigail Campbell, of Braunston Parish Council (Northamptonshire)
Current use of the historic environment appears fairly conservative and defensive. A more energetic, imaginative response to the historic environment is needed. Growth and heritage need not be antithetical.

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

Response from Cllr Abigail Campbell, of Braunston Parish Council (Northamptonshire)

I’m aware there is a national shortage of planners – our local planning authority has found it difficult to recruit staff – and I am sure that cuts to local government and pay freezes must have something to do with this.

In our District there is a lot of emphasis on and investment in construction, but much less on design and architecture, and heritage and culture. Cuts in F.E. funding, and increasing pressures on the arts and humanities at school and in higher education make it more difficult to achieve a holistic understanding of the built environment.

06 October 2015
Submission: on behalf of Brington Parish Council, Northamptonshire

Author: Ben Thornely, Chairman, Brington Parish Council

Comment: Brington Parish Council would be happy to discuss the examples provided in this response in more detail with the Committee.

The House of Lords has established a Select Committee to consider ‘the development and implementation of national policy for the built environment’.

Questions

Policymaking, integration and coordination

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

- Decisions should be taken at a local level, informed by robust national policy, supported by detailed practice guidance which leaves no ambiguity – the use of case studies will avoid this.
- Clear and robust national policy sets the strategic approach to the built environment, with practical practice guidance enabling local interpretation – potentially dividing this into urban and rural policy approaches to suit both environments.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

- It could be improved, as the approaches can be in conflict, e.g. housing need versus the need to protect the undeveloped rural areas or biodiversity.
- Better integration between organisations could assist e.g. The assets held by organisations such as the Homes and Communities Agency could be looked at in terms of providing multi benefits to assist other organisations achieve their goals such as the Environment Agency and Local Authorities. For example, this could see housing (required by the LA) developed alongside reduced flood risk and increased biodiversity (desired by the EA).

National policy for planning and the built environment

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural
environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

- The NPPF can sometimes be open to interpretation – it should be more prescriptive in parts. For example, the requirement for Sustainable Development – this is poorly defined and open to interpretation by all parties – developers, Local Authorities, individuals.
- PPS25 used to be accompanied by a detailed practice guide which enables far greater detail to be provided – NPPF could benefit from a similar (of somewhat more rationalised) approach.
- Greater emphasis on different development approaches to urban and rural areas would be of benefit, to distinguish between the very different requirements of such communities.
- As a rural Parish, we would like to see emphasis on sustainable development being development which is proposed in keeping with the scale and nature of the existing development within the community.
- Community consultation and the right of the community to have its voice heard (in support or objection to a proposal) is also very important and should not be underestimated.

4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

- Potentially Yes – a spatial element would enable interpretation of national policy. For example, it would enable a clear distinction between rural and urban areas and the appropriateness (or otherwise) of certain development types/scale/nature.
- Introducing a special element would enable growth to progress in accordance with the particular requirements of an area, enabling protection of certain aspect of the environment (e.g. Historically important buildings/areas, environmentally sensitive receptors etc)

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

- Planning ahead is important, subject to flexibility to adapt plans given changing evidence/information/growth delivery etc

Buildings and places: New and old

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?
National policy can hinder growth, particularly in rural areas. For example, in Daventry District, the local authority has recently announced that it has met its 5 year housing land supply need, predominantly as a result of large urban extensions in and around Daventry town. As a result Daventry District Council has recently refused a very modest proposal for new housing (circa 8 units) within Great Brington – a rural parish – despite the Parish Council fully supporting the proposals which were in keeping with the scale and nature of the site, and had been influenced over a three year period of community engagement by the very responsible developer.

The result is that there will be no new housing, including affordable housing, provided in the community in the foreseeable future – against the wishes of the community and as a direct result of DDC’s approach and judgement.

See DDC’s planning search page: https://www.daventrydc.gov.uk/living/planning-and-building-control/search-comment-planning/

Application reference: DA/2015/0364

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

- Provide a clear definition of ‘sustainable development’ – it is currently open to interpretation by all parties
- Resilience, e.g. to flooding, should be a requirement of the planning process to ensure communities are not put at risk
- Climate change must be factored into proposals now, and higher building standard required – this would not cost more but rather push down the cost of provision, as in the case of green subsidies being cut to green energy – the effect is to reduce the price of provision of the energy sources/equipment.
- Far bigger incentives should be provided to focus development of brownfield sites – this will reinvigorate use of these areas and help resolve legacy environmental issues e.g. contamination. This could be provided by business rate reductions, LAs keeping the income locally etc.

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

- A more pragmatic approach to historic assets should be taken to ensure that they remain functional, usable and acceptable in the modern world whilst ensuring that the main historic features are retained. There is often a very negative approach to the redevelopment of historic buildings which would benefit from new and improved construction techniques and methods making them more inclusive places.

Skills and design
9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

- The application recently determined by Daventry District Council (ref: DA/2015/0364) shows how growth is not being considered in a holistic manner – the modest proposal is for a mixture of circa 8 units of mixed market housing and affordable housing on land that has previously been developed, within the centre of the village. The local authority has decided they regard this as important open land and the views of the conservation officer have been given more weight than the views of the Parish Council, who unanimously support the proposal on behalf of the community.
- This calls into question the approach taken as well as the skills utilised in determining this application.
- Bodies such as Parish Councils, representing the views of the local community, should have the right to ‘call in’ decisions that are contrary to the community view, for further reconsideration by the likes of the planning inspectorate.

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

- Higher code level requirements in terms of the Code for Sustainable Homes
- Clearer national definition of ‘Sustainable Development’

**Community involvement and community impact**

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

- More emphasis should be placed on community engagement throughout the planning process where a community has strong views about development. This should not be a method by which to prevent development but to ensure that schemes meet community aspirations. The current Neighbourhood Plan process, which would enable this, is too long and expensive a process for smaller communities to engage in. Where communities do have input it should carry significant weight in the determination of applications.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?
• The example given above (Daventry District Council Ref: DA/2015/0364) is an example where community engagement in the decision making process has been substantively undermined by the Local Authority.

• Recognising the potential impact of the proposal on the community, when it first emerged three years ago, Brington Parish Council proactively sought to engage the developer and the land owner in constructive community engagement via a series of community meetings. This had the effect of evolving the design to be far more in keeping with the scale and nature of the location.

• The developer and land owner really engaged with the community and should be recognised for this constructive approach. We have had other developers who have come to one PC meeting and then claimed they have undertaken community engagement – this is a very cynical approach to community engagement.

• Conversely the LA has not been supportive of this level of community engagement – indeed the PC was advised by the LA not to engage in discussions with the developer!

• Consequently, the PC’s voice was not represented accurately by the LA in the report for members – see the attached letter from Brington PC to DDC Planning Committee, copying in the local Member of Parliament, raising our concerns.

• Many hours of constructive working with the developer to amend their scheme to address concerns raised by the community (before reaching a scheme which was fully supported by the PC) have thus been wasted.

• Clearer national guidance on meaningful community engagement would help.

Financial measures

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

• Incentives for developers to provide higher design standards e.g. higher code levels for houses under the Codes for Sustainable homes.

• This would also lead to reduce energy requirements, thereby reducing the impacts of climate change, increasing resilience etc.

Examination of Witnesses
Guy Bransby, Lead Director, Planning and Development, Jones Lang LaSalle, Richard Lemon, Associate Director, Planning, CBRE, and Adrian Penfold, Head of Planning, British Land

Q41 The Chairman: Welcome, Mr Bransby, Mr Lemon and Mr Penfold to this evidence session of the Select Committee on National Policy for the Built Environment. You have in front of you a list of the interests that have been declared by members of the Committee. A transcript of the meeting will be taken and published on the Committee website. You will have the opportunity to make corrections to that transcript where necessary. For the interests of the record and for our transcriber, could I begin by asking each one of you to briefly introduce yourselves to the Committee please, starting with Mr Bransby?

Guy Bransby: My name is Guy Bransby. I am lead director of the planning and development team at the private sector consultancy Jones Lang LaSalle.

Richard Lemon: Good morning, my Lord Chairman. My name is Richard Lemon. I am an associate director in the planning team at CBRE, an international real estate firm.

Adrian Penfold: Good morning. I am Adrian Penfold. I am head of planning at British Land. I was also previously a chief planner in local government, and I should declare that I am a non-executive chairman of Design South East, which is a charity promoting design quality in the built environment.

The Chairman: That is interesting: a charity on the built environment. How does it link in with, say, government? Is it for lobbying?
Adrian Penfold: No, it does not do any lobbying. It works with local government, local communities and developers promoting design quality, so it supports local government, mainly, through design review, in-house support and working sessions.

Q42 The Chairman: Thank you very much. I am going to ask the first question. What are the main constraints on the ability of the planning and development industry to grow? To what extent will recent and proposed national policy reforms help to address such constraints?

Guy Bransby: My Lord Chairman, I have a number of points that I would like to make. If it is okay, I will work through them one by one. If you would like more detail, I can obviously focus on those. I think I have identified 10 potential constraints on growth, but I will do so in one sentence for each. The first is the level of local authority resources and expertise to deal with planning applications, which have been hit further by recent cuts. Linked to that is the ability of the profession to attract young people through university to study and to want to practise. The third point is the impact of both, which is the time the system takes to deal with planning matters at all levels of governance. My fourth point, again, is related; we have a planning system that often relies on the appeal process to get to a decision, and the Planning Inspectorate also has issues with resourcing, in my opinion. Fifthly, the emphasis on localism, the involvement of local people, the development of local frameworks and how that marries up with the agenda to drive growth is a challenge, the two potentially exclusive of one another.

The next point is about the ability to bring judicial review against planning decisions. The thresholds, in my opinion, are set too low. The next couple of points relate to planning policy constantly changing and evolving, which leads to some uncertainty. This in turn links to my next point, which is that planning policy often seeks to be all things to all people and to cover potentially too many circumstances; it needs to focus in.

Penultimately, the planning system is inevitably a democracy driven by politics, and that can influence decision-making at a local level. Finally, the planning applications themselves are often overburdened by superfluous information, in my opinion, and there needs to be a tightening up on what a planning application comprises and what is truly necessary.

The Chairman: That is certainly a very comprehensive list. We have skirted around all of them and got evidence on them. That seems to be a very comprehensive fundamental list of things
that are going wrong and which we need to address. I will not ask you which is the most important, because that is silly; they are equally important. But we are going to be dealing with a lot of these in the course of the questions, for example on education and the issue of trying to encourage people from universities. Do you have a question on that, Lady Parminter?

**Baroness Parminter:** It is for the next session.

**The Chairman:** That is right. We have a lot to go through, but we have not heard the point about judicial review before. It would be very useful if you can expand on that briefly at this stage, or send us something if you have anything on that. As soon as you said it, I thought, “Gosh, yes. This is one we have not heard about yet”. Would you like to give us a few words on this now?

**Guy Bransby:** Yes, my Lord Chairman. I am very happy to send information in response, and I am conscious that I have not answered the second part of your question, which I will do in a minute. On judicial review, the cost threshold to bring a judicial review challenge was recently changed and is now at a cost of £5,000, which is a level low enough not to discourage people from bringing judicial review or, to put it another way, is actually encouraging more judicial review challenges to come forward. Second to that, the criteria on which the judge assesses judicial review at the first stage are fairly flexible and fairly loose, so a lot of judicial review challenges are proceeding to stage two, to the high courts.

**Baroness Parminter:** On that specific point about judicial review, how do you feel about the fact that local people do not have the right of appeal against a developer if a plan comes forward that is contrary to the local plan? Do you think there would be less judicial review if the Government accepted such a right of appeal at the beginning of the process?

**Guy Bransby:** I am not sure that is true. In fact, we have done a bit of work looking at the Irish planning system, which, as I understand it, does have the ability for local people to appeal decision-making. It has not solved this issue.

**Baroness Parminter:** Is that against a local plan, or is it a broader right?

**Guy Bransby:** It is a broader right.

**Baroness Parminter:** I am talking about plans that go against local plans, so it is not an exact parallel.
Guy Bransby: We can follow up with some more work on that.

Baroness Parminter: That would be helpful.

Guy Bransby: That is an interesting point.

The Chairman: I would not like to take a lead from the Irish thing. If you go out of Dublin, it is completely littered with half-built estates, but there we go.

Lord Inglewood: Can I just ask for a point of clarification, please? Is your concern about judicial review’s scope, or are you basically saying that there should not be any at all?

Guy Bransby: I am comfortable with the right of judicial review. It is more the scope and the thresholds that apply to the ability to bring one. I put it to you that there are some superfluous judicial review challenges, which are driven by non-planning interests.

The Chairman: Yes, I can imagine.

Adrian Penfold: Can I just add on the judicial review point, because I have direct experience of this, that the issue is about the length of time it takes to deal with a judicial review. We had one on a small extension to a shopping centre two years ago. It took 15 months to go through the process. It was arguable, but the judge did not agree with the case at every stage. Once it had gone through all the appeal stages, it had taken 15 months, and it got to the point where the project was no longer one that we wanted to do. We decided that we would do something different, so it had a significant impact.

The Chairman: Mr Lemon, do you have anything on judicial review?

Richard Lemon: Not on judicial review, no, but I will come back to some wider points in a minute, if I may.

The Chairman: What is your list of constraints? Then I will come to Mr Penfold.

Richard Lemon: I would certainly endorse all the points made by Mr Bransby, first of all. On the point about the constant stream of planning reform, coupled with that are the difficulties that we have with the uncertainty that causes and the lack of clarity from the Government on whether, for example, the office to residential permitted development right was to be extended. That was hanging in the air for many months and left many of our clients all at sea. Related to the point about resources in local planning authorities is expertise. There are very many fantastic planners in local authorities. In fact, the majority are, but there are also some who, when you go and see them for a discussion prior to submitting a planning application,
the advice one gets is frankly rather limited and rather woolly. One leaves without any clear steer as to whether or not we are engaging in a scheme that has a prospect of going forward and, if so, what the key issues are on which we need to engage. It is absolutely vital that we get that clear advice from every local authority on every occasion.

**The Chairman:** Is there a scheduled time for you making the application and getting the result, or at least an answer, from them? Are there delaying tactics, or do you get some people who say, “Yes, that is fine”, and you get it back in a couple of weeks?

**Richard Lemon:** No. Typically there is an arrangement whereby there is a formal pre-application process, and one submits a series of papers, documents and some initial plans, and then you have a meeting. It is at that meeting or in the follow-up advice that you are not necessarily given the clear steer that you need in order to proceed and take forward your scheme with any certainty and to engage in what you and the local authority think are the key issues.

**The Chairman:** So what you really want is efficiency and clarity.

**Richard Lemon:** Absolutely, and to engage on a professional level: two professionals talking to one another who are not that reluctant to stick their neck out, albeit that we all know that it is ultimately the decision of the members. Nevertheless, we are professional to professional, and we ought to have that sensible, constructive discussion.

**The Chairman:** Thank you. That is very useful. Mr Penfold, what are your constraints?

**Adrian Penfold:** That was a pretty exhaustive list from Mr Bransby. I can add one to the list. On the development management points that have just been touched on by Mr Lemon, in our experience the problems are at the pre-application stage. It is that engagement with the professionals. There is more and more financial pressure on local planning authorities and a loss of resources in planning departments. For some local authorities, it is quite an easy cut to make compared to other departments, so those pre-application discussions get more and more difficult. There is also the post-consent stage of getting the approvals on conditions that you need once you have the actual permission to go ahead, so there are things you need to get approved before the development can actually start, and that can sometimes take some time. Section 106 can take some time. The judicial review point has already been touched on.
My one additional point, which is a very large point to throw into this particular pool as a pebble, is the financing of infrastructure. A lot of communities, councils and developers are very concerned about going ahead with development without the proper infrastructure being put in place. For communities, it removes or undermines the confidence that this development is going to be acceptable—that it is going to have the transport, education and infrastructure that is needed. Particularly on the large strategic developments, which tend to be the ones I get involved in, that is a big issue.

**Q43 Baroness Whitaker:** On this point about the pre-application delays, in your judgment is it because of any deficiency in the capacity or the general orientation of planning officers, or is it because they do not know what the planning committee is going to do, because perhaps the members are not particularly au fait with what really matters?

**Adrian Penfold:** It is both. The worst authorities are the ones where the relationship between the officers and the members of the committee is poor. On some occasions, it seems that the members of the committee are not interested in what the officers have to say at all. That is obviously very unhelpful.

**Baroness Whitaker:** That needs attention as well, does it?

**Adrian Penfold:** I think so. The best experience is where that relationship is good, but also where you have quality officers. I agree with Mr Lemon that plenty of local planning authorities have very good officers, and you can have that discussion at a professional level about what is needed and what in your application needs to change. It is very rare that we will put in an application or go into a pre-application, when what we submit is exactly the same as what we put into the pre-application. They nearly always change.

**Baroness Whitaker:** Are your difficulties more with the officials or the committee?

**Adrian Penfold:** At the moment, it seems to be more with the committees, but I am worried about the reducing resources in planning departments.

**The Chairman:** Can I just ask a supplementary on that particular point? Do these people who are elected by local members, local people, who have never had any planning before or know anything about building, construction or anything, have teach-ins? Do they have a programme? Will everybody be given an aide-memoire or something like that?
Adrian Penfold: It is varied. As an ex-chief planner, in my planning committee I provided training for them. When I look back on it, it was nowhere near enough. We should have done a lot more, but it varies across the country.

Guy Bransby: I might just add that I am aware that a lot of planning committee members who are elected, and who quite often do not have planning and property experience, are now undergoing training programmes, often offered by people in the private sector or planning solicitors, but it is not compulsory and it is not countrywide. That is something that I would advocate.

Richard Lemon: Let us not forget that it is in the interest of local planning authorities to make sure the members understand the system. If they refuse a planning application on grounds that are not reasonable planning grounds, it will leave them at risk of cost during the appeal.

Lord Inglewood: In the old days, if you wanted to open a pub you had to get planning permission and you had to get a licence from the local magistrates. It seems to me that you can make the case, perhaps, that it would be better for planning applications and development control functions to be determined by panels of people appointed like magistrates, rather than local authority members. What would you think about that?

The Chairman: That is an interesting idea. Magistrates are usually very intensely interested people.

Guy Bransby: There is a tangential point, which is interesting, which is that officers at planning authorities of course are the professionals who are trained, who work on things with the applicant for a number of months. They have the ability to offer decisions via delegated powers, so it does not actually have to go in front of a committee. As soon as there is an objection to any proposal, be it a pub or something bigger, it automatically has to go in front of a committee. I might recommend extension of officer delegated powers as a process as a way to address your point.

Baroness Parminter: Chairman, could I just ask Mr Bransby to confirm that he is in favour of democracy in local planning applications? In his 10 points, he said that democracy and localism were both problems, but he did not say that he actually supported them. I would like it on the record that you support democracy in the planning system, as an essential part of the difficult job in planning of competing demands.
Guy Bransby: For the record, I absolutely support democracy in the planning system. It is the tenet of the planning system that we have in this country, which has been copied by other countries around the world. I did not say it at the beginning, but I am also ex-local authority, so I have experience being in both different roles.

Baroness Parminter: Good, I think that is important for you, as well as for us.

Q44 Lord Freeman: Good morning. My question relates to what happens after planning permission and then failure to deliver. The formal question is: what are the main reasons why the granting of planning permission does not always translate into new housing delivery? Is there a case for the compulsory registration of land acquired for housebuilding—in other words, in order to prevent alternative use or no use?

Guy Bransby: My Lord Chairman, would you like me to start again? I also have a few points, which I will just run through very quickly, not as many as 10 this time, I hasten to add. In no particular order, the parties obtaining planning permission are frequently not the developer themselves, so it might be the landowner or it might be another party interest that will not actually deliver the development. That is a natural state of affairs, whereby the developer does not achieve the planning permission.

Mr Penfold has already made my second point, but it is about the time it takes to discharge the large number of conditions on any planning permission, which can take time. My third point is a broader one, which is that a lot of delivery, particularly of housing, is market-driven. There are obviously market circumstances that are both local and national that will drive that. My penultimate point is a broader one as well, which is that there are wider economic factors, be they the cost of materials or the unavailability of labour, which will dictate housebuilding rates. Finally, another broader point is that, since we have entered recession and then come out of it, the number of housebuilders and developers able to actually deliver big housing schemes has reduced, in my opinion, because a lot of the smaller and medium-sized developers, housebuilders and construction companies unfortunately went out of business. There is a mixture of points there that are both planning-related and broader market-related. The registration of land is a good idea in principle, but I would probably need to understand it a little bit better. The devil would inevitably be in the detail. As a principle, if it involves
zoning of land or permission in principle on brownfield land, it is a welcome addition, but, as I say, the devil will be in the detail.

**Richard Lemon:** I think Mr Bransby has stolen my thunder again.

**The Chairman:** Next time round, I will ask you to come first.

**Richard Lemon:** On the point that Mr Bransby makes about delivery being market-driven, of course housebuilders do not want to flood the market with products on day one, so there will be a drip-feed of product to the market, otherwise the price will fall. Inevitably, it is not all going to be built the day after commission. Incidentally, it is worth considering whether or not other housing products might better serve the market here, so it is not just homes for private sale or market sales but homes in the private rented sector, for example. That might help boost delivery, but there is not a great deal of encouragement for that sector at the moment from central government. It is talked about as a broadly good thing, but at this stage there is no great incentive for it, so that might be something to look at.

**The Chairman:** We can mention that to the Minister and see what he says.

**Richard Lemon:** Thank you. On the point about the compulsory registration of land acquired for housebuilding, I am not entirely sure where it would get you and what benefit it would have. Moreover, I am not sure how it would be workable. A site might well have been pretty obviously bought for housing if it is by one of the major volume housebuilders, but if it has been bought by anybody else, then who knows what their intentions are for it? Is it housing, is it a mix of uses, or is it something else entirely? I am not sure where it would get you. Nor am I sure that it would be practical.

**Adrian Penfold:** It is an interesting question. I read Kate Barker’s response to the same question when you talked to her, and she talked about absorption rates and the idea that only 100 dwellings per year could be released from any single site. We are not housebuilders, although we do build residential and we do build what we get planning permission for. I do not think we ever get planning permission and then do not build it. That is not our business, but it sounds broadly right. That point about tenure mix is absolutely right. I will give you an example of a development in Southwark. I understand you visited Southwark.

**The Chairman:** Yes we did and we were very impressed.
Adrian Penfold: We are working with Southwark Council on a scheme at Canada Water, where we own the shopping centre and 45 acres of adjacent land, for something like 3,000 dwellings. Certainly our plan is to provide some of that as built to rent. Obviously some of it would be social housing as well. There is a mix of tenures there and we can build those different tenures out alongside each other, which should mean—and will mean, I believe—that we can get well beyond 100 units per year. Certainly our plans would be well in excess of that. I think that is an important point to mention.

Savills produced a very interesting research note on sites getting planning permission and then not being built out. If you have not seen it, I would recommend it to you. It seemed to show that in the areas of highest demand, what gets planning permission does get built out. They looked at three-year averages of consents against housing starts. I will just look at my notes here. In South Bucks and Woking, for example, there were five times as many starts on site as there were planning permissions granted in those three years. Other examples were Merton, four times; Elmbridge and Watford, three times; and interestingly in Newcastle, there were four times as many starts as granted planning permissions. Again, it seems as though the picture is varied. It is dangerous to come away with one picture or idea that covers the whole country. That is not what is going on in the whole country, although it is certainly going on in parts of the country.

Q45 Earl of Lytton: Good morning, gentlemen. As you probably know, I am a chartered surveyor. I wanted to unpick one thing that has puzzled me, and that is the alternatives and whether you have lots of small sites and a dispersed approach to dealing with housing numbers and the five-year land supply as opposed to the strategic large sites. Now, we have already had before the Committee issues to do with the cost of infrastructure and stuff like that, but some housebuilders are saying to me that the only way you are going to get the numbers up is by having lots of little sites, because that will give the choice and enable the sort of build-out rates to be delivered in practice. Is that the situation in reality? Do the strategic sites essentially always have a constrained build-out rate, because that locality can only really expect to deliver a certain proportion every year? Is that the issue?

Guy Bransby: I am happy to take this question. The answer probably lies in both, actually. There is a combination of strategic site delivery and indeed delivery through smaller sites. I
have sympathy with the view expressed by others who have come to see you; it has been my experience as well. It leads on to a recommendation that I was going to put to you that the local planning authorities, which know their boroughs better than anyone, maybe with the support of the private sector, should be encouraged to identify where those small sites are. Spending time in the borough where I live, there are plenty of vacant brownfield underutilised sites that seem ripe for delivering small pockets of housing, but there is no central database that audits where those are and what their potential is. That would be a recommendation of mine. A couple of local authorities I am aware of do have such a record of sites that are then promoted through the planning system, but that is very rare.

The Chairman: Can you give us any idea of which local authorities do it right?

Guy Bransby: I am happy to. It is near where I live, so I can refer to the London Borough of Wandsworth. It has something called a site-specific allocations document, where the officers of Wandsworth Council have been around, walked the streets, identified the sites and then allocated those for future development. That is a good example that I can refer you to.

The Chairman: That is very useful. Thank you very much. Do you think that is particularly important in London or for the rest of the country? Sometimes we are a bit metro-centred. Do you think there are any other local authorities in Nether Stowey or wherever that would have this idea?

Guy Bransby: My view is yes, that is right. I understand that you visited Birmingham as well, which is an example of a city that has done wonderful things to regenerate and grow, and to deliver housing and commercial space. Yes, I think it is more than just a London idea. It could be countrywide.

Richard Lemon: I should add, if I may, that most local authorities do or should have a site allocations document as part of their local plan. The difficulty is that many have found it so difficult to get their basic strategy in place that they have not yet got round to doing a site allocations document.

The Chairman: Are they guarding it because it is personal to them and they do not want anybody else to come along and make a bid for a site?

Richard Lemon: No, I do not think so.

The Chairman: Good, so it is open knowledge.
Richard Lemon: Absolutely. I am certain that in some cases the smaller sites do not get picked up because they are perhaps too small. That ought to be something that local authorities are looking at a great deal more. In the borough in which I live there are a number of sites that are probably in a variety of ownerships. If somebody, the local authority or another party, could assemble those sites, which are currently very low densities, with a mix of fish and chip shops and a car showroom, all one-storey, five minutes’ walk from a station where there is a train every four minutes, you would think that that really had to be a site for some decent housing development. As I say, if they are in multiple ownership, it makes it fairly unattractive to a developer. Along the way, someone has to get involved and pull those sites together.

Adrian Penfold: A lot of those sites are owned by public sector bodies as well. There is a huge opportunity there. That again relates to the resourcing and skills within those public sector bodies and whether they have people who can bring forward those sites.

The Chairman: They would just say, “Well, what about that site there?”. It is local knowledge.

Adrian Penfold: Exactly. If they have some expertise in that area, that is very helpful. The other advantage with smaller sites is that they can be taken up by smaller businesses. What we are seeing in housebuilding is an increased focus on smaller and smaller numbers of major housebuilders providing most of the housing. There is a need to try to encourage the SMEs, which are presently just going out of business. The NHBC had a figure of 400 builder SMEs having gone out of business in the last year. It would be good if some of those smaller sites could be given to smaller builders to bring forward housing development.

Guy Bransby: Am I allowed to add, my Lord Chairman, that I think those smaller sites are being missed? The in-fill sites and the smaller parcels of land are being missed. The strategic allocations and the medium-sized sites are being picked up; it is the smaller plots that are being missed.

The Chairman: That is very interesting, because big oaks out of small acorns grow. I am sure that is true. That is very interesting. Who is next? Lord Inglewood.

Q46 Lord Inglewood: On this topic, you have a planning register that shows you the planning consents on land. We know that. We have a land register, which is working towards providing a cadastral survey for the whole country, so you can combine the two together. If you have some sort of allocation document produced by the local authority, combined ultimately with
the power of CPO, if it is in the interests of planning to do, if you have owners who for some reason or another do not want to proceed and the project would be in the public interest—bearing in mind that one of the general characteristics of developing land is that you end up richer than when you started—is there really any need for anything more?

Richard Lemon: Do you mean in terms of larger strategic allocations?

Lord Inglewood: Registers and all that. If you want to find out who owns a bit of land, in reality it is not that difficult.

Richard Lemon: No, you go to the Land Registry.

Lord Inglewood: You go to the Land Registry. If you want to know if it has planning consent on it, you look at the planning register. If you want to know whether it has potential, you either look at whether an allocation document has been produced or you talk to the planning officer, so is there a need for any further registers in this area?

Guy Bransby: My view is that there probably is to pull all of that together. I can see a case for establishing who owns the land or whether it has the ability to come forward for development, but the piece that is missing is what land use and scale of building would be appropriate and what the wider community benefits should be both for the local authority and for the local people. That piece is missing for me. I gave the example of Wandsworth earlier. It has produced a document that makes very clear the land use, the height, the scale and the benefits that must accrue from any development on that piece of land.

Lord Inglewood: Is that not something that the planning authority should be doing now? Therefore, there is no need to introduce statutory registers or any other sort of register. You just need them to get on and do what they are meant to be doing.

Guy Bransby: They should, but this is where I am very sympathetic to local authorities.

Lord Inglewood: I do not dispute that. That may be a separate issue of resourcing or whatever; it is not an issue of the way the system would work if it was working as a well lubricated machine.

Adrian Penfold: I agree with that, and I am part of a government expert group looking at local plans at the moment. We are due to report in February, and I am sure that is one of the things that we will be thinking about. The land that is included on the strategic housing land assessment, which is a very important part of the plan-making process, tends to exclude the
very small sites. It starts from five houses and up or half a hectare and up, so some of the smaller sites can get missed.

Lord Inglewood: Mr Bransby’s point about his local authority’s work was that they will pick that up.

Adrian Penfold: The Wandsworth model sounds really interesting and may be something that we, as part of our group on the local plan side, ought to be looking at. I will take that away.

Baroness Whitaker: Should we have a word about viability?

The Chairman: That is the next question.

Q47 Lord Inglewood: The question that I was allocated to put is about assessing viability. Once you have the consent and everything, you then actually have to deliver as a developer and assess all kinds of aspects, which will probably be different in each site, which will then enable you to take a decision in detail about the financial worth of going ahead with a particular project. Are there any particular changes in the way that the system works that would enable you to achieve that either more accurately or quickly than at present? There is an awful lot of negotiating with various people that has to go on.

Adrian Penfold: There are two points to that, really. One is the way that viability is used in the planning system. It is increasingly used. When I started as a planner, “viability” was not a word that was used, but now it cuts across most or a lot of the planning work that we do, for example on affordable housing, on CIL and on heritage issues. It is becoming increasingly important, and I have some concerns about that.

For developers, and I work for a development company, viability is obviously an important part of the work that we do, working out whether we actually want to invest in something or build something, or not. That is not just a snapshot on value for us; it is a broad view that we would take on a range of issues on the market, the economy, where we are in the cycle, and what interest rates, values and rents are likely to do. On all those things, we will have a strategic company view and what sort of returns we would expect in order for us to invest. The sorts of returns we would expect might not be the same as the sorts of returns that somebody else would expect, so we look at all those things.

What planning could do to make that easier involves certainty. The more certainty we get about what we are likely to be able to build, and the quicker we get it, and how quickly we
are likely to be able to get planning permission, the easier it is, because a lot of this is really about predicting the future, if you think about it. The longer ahead you need to predict the future, the more difficult it gets. Speed and certainty are the two points.

On the point about the use of viability and viability assessments in the planning system, I get increasingly worried. There is a lot of cynicism and mistrust out there among local communities and members of planning committees about the way viability is used to argue about levels of affordable housing, for example, which should be provided on any particular site attached to any particular planning permission. There is this idea that developers are coming in with an assessment that is not really their true viability assessment but something that tries to argue the value down. The way it works encourages game-playing on both sides. Developers probably do that, and on the other side local authorities are putting pressure on their advisers to argue the value up for more affordable housing. It is the nature of the British planning system.

Lord Inglewood: Is this tension inherent in the system of arrangements that we have, and can you do nothing about it structurally? We just have to live with it.

Adrian Penfold: No, I do not think we do have to live with it. If you think about it, what we are trying to do is work out a level of tax or social value that is going to come from a particular development. We increasingly use viability assessments to do that. How much affordable housing? How much contribution to whatever it is—how much CIL would need to be paid? There are other ways in which you could tax. CIL in itself is another way. We do not actually apply the viability assessment on a site-by-site level; we apply it across the area, and the developer or investor comes in and knows how much CIL will need to be paid in order for that development to go ahead, so it gives you a level of certainty.

The other concern I have about all this, which applies to CIL—and this can get quite tricky—is that that payment has to come upfront. How many taxes do we know where you pay the tax collector in advance of actually having earnt any money? If the income tax inspector came to you and said, “I think you are going to earn £70,000 a year for the next three years”—

Lord Inglewood: That is what he does.

Adrian Penfold: Does he? You pay on what you earn.

Lord Inglewood: You pay on what you earned last year for next year, but I take your point.
Adrian Penfold: Perhaps, but I think it would be better, if we could, to tax profit rather than expectation of profit. If that is not possible, then it would be better to do it on an area-wide basis than on a site-by-site basis. That would be my view, largely because it is beginning to bring the planning system almost into disrepute. People do not trust it, and that is not a good thing for any of us.

Lord Inglewood: There is a lot of gaming in the system by all kinds of people.

Adrian Penfold: Absolutely, there is gaming.

Guy Bransby: I have a couple of suggestions as well, which I hope address the question. I have three ideas and maybe one debating point. As Mr Penfold has said, they all come down to the fact that you have this system where you have an applicant trying to agree a position with the local authority, and the two might not necessarily be trying to get to the same endpoint. They are driven by different things. The way the process works at the moment is that the applicant produces a viability report, which is sent to the local authority, which then reviews it independently, and they try to reach agreement. My three ideas are that, first, the local authority and the applicant could appoint a single viability consultant who is briefed by both parties, is independent and comes to an independent view, rather than the two parties paying for their own viability consultant to produce their own work, which is then discussed and hopefully agreement reached. That would be one suggestion; you have a body of independent viability consultants who represent both sides.

My second suggestion is that there should be an agreed principles methodology for producing viability assessments, which does not currently exist. Again, to give you the example of Wandsworth, because that is where I am, Wandsworth has a one-page methodology statement on agreeing principles for viability, so you know where you are starting from and you do not have to have debates about what the benchmark value should be, how you apply yields, and so on and so forth. I would suggest that a national agreed methodology for viability might be a good idea.

Lord Inglewood: Can I ask you who would agree it?

Guy Bransby: That is a good question. The RICS has guidelines, which are a good starting point, which people in my profession will use. That may be the suggestion there. My third idea is that these viability discussions can sometimes take a long time, particularly if the two parties
cannot reach agreement, so I would advocate an objective of agreeing a position within a set timescale. It must be agreed within 28 working days or similar, and, if not, there might be some sort of independent arbitration process that deals with it, because these can be long-winded open-ended discussions.

**Lord Inglewood:** Are we getting back to your previous comment about judicial review?

**Guy Bransby:** We might be. I do not know if we have the time—and, if we do not, please let me know—but I did want to touch on the point of overage clauses that sit within viability. Would that be helpful?

**The Chairman:** Could you send us a note on that? I am very conscious of the fact that I am not giving enough time to various people. For example, Mr Lemon, do you have anything to say on this particular issue?

**Richard Lemon:** Funnily enough, I took some advice from colleagues who specialise in affordable housing viability assessments yesterday, and they made exactly the same suggestions as Mr Bransby on a set of guidelines on which everyone can cluster and agree. Whether these guidelines are RICS guidelines, government guidelines or RICS guidelines endorsed by government, I am not sure, but as long as everyone is working to roughly the same template and they agree about whatever they are using existing-use values, benchmark land values or whatever they might be, that has to be a sensible way forward.

**The Chairman:** Is there a history of having guidelines in this sector? No, because there is no central trade association.

**Baroness Parminter:** Yes, because, as mentioned, they each have their own determination of what the return would be. That would be part of the package.

**Guy Bransby:** It is only the RICS, I understand.

**Q48 Earl of Lytton:** I would just say on that last bit that we had a paper sent to us that rather suggests that the profit margin on development ought to be 15%. That was the figure that was suggested. If these gentlemen are writing to us, I would really like their thoughts on whether a 15% margin is realistic and practical. Do not bother to answer now, because I am going to ask the question that I told the Chairman I wanted to ask.

I touch on things that are possibly related to social prejudice here, so I tread slightly carefully. The question relates to the affordable housing element incorporated within developments.
We have gone away from the old thing where they used to be put on mass housing estates and they were over there somewhere. They have now all dispersed around the thing. Is this universally regarded by housebuilders as a satisfactory arrangement, and whether it is or not, does that sit behind the Government’s idea of moving towards starter homes, where it will effectively be a sale of the freehold at a discounted figure, rather than affordable housing at a discounted rent, as I understand it? I wonder if I can have your comments.

**Richard Lemon**: On the point about affordable housing being secured through the planning process, it is something that developers have come to live with, although they accept that it is right and proper that in some way they make some provision for affordable housing. As Mr Penfold mentioned earlier—forgive me, Mr Penfold, if I am putting words in your mouth, and correct me if I am—it is almost a negotiable tax on the grounds of a one-liner in the National Planning Policy Framework about creating mixed and balanced communities. We must always remember that this must always sit in the context of creating mixed and balanced communities. It is something that developers are accustomed to and they accept that it is almost certainly here to stay.

On the point about starter homes, I of course support the Government’s desire to get people on to the housing ladder, but I am concerned that the measure as proposed will simply squeeze affordable housing, by which I mean intermediate products, as well as the social rented sector. If developers are being asked to subsidise starter homes as their number one priority, something else will inevitably get squeezed. A lot of infrastructure is already provided for by CIL, which is already non-negotiable, so that only leaves affordable housing to squeeze. That will inevitably be where the pain is felt.

**Baroness Whitaker**: I have a quick question and a case in point. I do not know if it was Mr Penfold’s development or not, but when we went to Southwark Council, they told us that the affordable housing proportion had been driven down. My recollection is that it was down to 25%. I just wondered what the considerations were that enabled it to be driven down if it was not your development.

**Adrian Penfold**: It was not my development. The development that we are doing is actually a joint venture with Southwark Council.

**Baroness Whitaker**: What is the proportion of yours?
Adrian Penfold: Thirty-five per cent, and that is consistent policy, working very closely with the council. What brings it down to 25% is that viability discussion we have just been having.

Baroness Whitaker: What considerations would make that the case?

Adrian Penfold: Basically the developer would say, “If we have to provide 35% affordable housing, we will not be able to afford to do this development”. That is the argument that is being made.

Guy Bransby: May I just add that it also comes back to the other question about acceptable levels of profit? That is the nub of the discussion, and whether that should be 15%, 17.5% or 20%.

Adrian Penfold: It comes down to other issues as well. We can get very technical here if we are not careful, but often the viability assessment issue is about the existing value of the site that you work off. There is quite a detailed technical argument about whether you work off what is called an existing-use value or a market value. That becomes quite important in those discussions, as do all sorts of other things. They are very complicated discussions, which is why there is such a problem with them.

Q49 Lord Inglewood: Standing back from the detail, this approach has evolved over the last 20 or 30 years. Are we as a nation better or worse off as a result of it having happened? In the old days, it was much more free market. Things happened more quickly. More houses may have been built. Is this clogging up the system or is it adding value to it?

Adrian Penfold: What do you mean by “this”?

Lord Inglewood: The whole thing: the viability assessment together with all this other haggling and negotiating.

Adrian Penfold: I will be clear: I do not think providing affordable housing is clogging up the system.

Lord Inglewood: No, but it gets more complicated than that, does it not?

Adrian Penfold: The viability approach does make things take longer. As I have said, people do not understand how you get to that 25%. Exactly that question is asked and people do not understand it.

Lord Inglewood: My question to you is whether this approach adds or detracts value, from a national overall perspective, for development in this country.
**Adrian Penfold**: My view would be that it detracts value, because it is so complicated, and there should be an easier, simpler way of doing it.

**Lord Inglewood**: Is that the view of the other two of you?

**Guy Bransby**: That is right, but inevitably it depends on where you are coming from.

**Lord Inglewood**: Of course it does. Everything is site-specific.

**Guy Bransby**: I meant more whether you are a resident or a developer.

**Lord Inglewood**: Yes, but it is also site-specific.

**Guy Bransby**: It is site-specific, yes.

**Lord Inglewood**: We have to stand above all this and try to take an overview.

**Adrian Penfold**: Can I just come back? I do not think it is a question of free market or not free market. We all accept that development should pay for infrastructure and for social goods. That was an argument 15 or 20 years ago, but it is no longer an argument. We have all absolutely accepted that. The question is how you do it: what is the best way of doing it?

**Guy Bransby**: I agree.

**Q50 Baroness Whitaker**: I would like to go to the broader question of place-making as a whole. I was interested in Mr Penfold’s design quality charity. How important are design considerations in development schemes, and where does design, by which I mean place-making—the whole place, not just an attractive something or other—rank in the priorities? How prominent is place-making in your thinking and how can it be encouraged? I also noted what Mr Penfold said about the infrastructure having to be in place. We have not talked about employment, but it is possible to have housing to such an extent that it annihilates all the workplaces in an area. Can you give us some thoughts on that, please?

**Adrian Penfold**: The answer to your first question is that place-making is crucial to our business. You just have to go to our website to see. You will land on a page that talks about place-making being at the heart of our business. Our investment strategy is focused on place-making, so we invest in places and we believe that we have skills in making and in improving places, and that by doing so we can create value—for our shareholders, which is obviously very important to us, but also for the wider community.

**Baroness Whitaker**: For the record, could you list the elements of place-making, because we often tend to ignore some of them? What are the key things?
Adrian Penfold: Probably at the heart of it sits the public realm, the places which the buildings sit around. The buildings are important, but the public realm—the squares, the streets—is even more important. Part of what goes to making those streets is what sits on the frontages of those streets: the retail, the cafés, the bars and those sorts of uses. It is also quite important how you activate those places and spaces. For example, we have a lot of farmers’ markets now. We are probably one of the biggest landlords of farmers’ markets in the country, because a lot of our places have farmers’ markets to make those places interesting to people. A mix of uses is also important, which you touched on: the mix between residential, different tenures of residential and the employment space. If you just have employment space, it can become a very sterile space in the evenings and at the weekends. If it is just residential, you tend not to get the level of activity at ground level that you would get if you had employment.

Baroness Whitaker: What about transport?

Adrian Penfold: Transport is absolutely key to the work that we do. We tend to be very involved with the transport providers of a place. When I talk about places, what am I talking about? I am talking about Broadgate. We own and manage Broadgate. A large part of Paddington is ours. Regent’s Place is a big estate up in Camden, on the Euston Road next to Warren Street Tube. Canada Water is the development in Southwark that I talked about. For all those, transport is key, and we will get involved proactively with the transport providers and the local authorities in improving transport. At Regent’s Place we spent a very large sum of money on improving the ability to walk from Warren Street Tube station on the south side of Euston Road to Regent’s Place, which is on the north side of Euston Road.

Baroness Whitaker: How can that approach be encouraged? What you say happens here and there, but it is not the norm.

Adrian Penfold: It is not the norm. British Land is not the only company that believes in this and thinks that this is a way of creating value. If you look back over the centuries, you will see great estates in London: the Grosvenor Estate, the Portman Estate, even the Crown Estate. It is their model that we are adopting in some senses.

How can you encourage people to get more involved in that? The housebuilder model is a different model. It is, “We will invest and then move on to the next investment”. Build to rent can have an impact on that, because when you build something in order to rent it out to
people, the long-term management of that place becomes of interest to the developer and the owner, so the two can come together quite nicely, which is one of the reasons why we are looking at Canada Water. Inevitably, it will not be the business model that everybody adopts. It is much easier for me. We are a FTSE 100 company; we can think a bit more long-term than some others.

**Baroness Whitaker**: It is a long-term/short-term thing too.

**Adrian Penfold**: It is long-term/short-term. We have owned the Regent’s Place development that I talked about for 30 years, and managed it for 30 years. That is a long-term commitment.

**Richard Lemon**: I wonder if I might add to that. It is also about local authorities understanding the importance of place. I have done a lot of supporting information for planning applications, where we have been looking to provide retail uses, leisure uses, food and drink, restaurants and cafés and so on, in major new developments, making the case that they are so important to creating a genuine place in these new developments.

**Baroness Whitaker**: Do the local authorities appear to you to get the point?

**Richard Lemon**: They did. We may come to town centres later, but quite rightly planning policy directs new retail, leisure, and café and restaurant uses to town centres, so that is the first port of call for a planning officer. I have been playing the role of saying, “Yes, that is absolutely right, but you also need those uses in this development as well”, not on a massive scale perhaps. It depends on the circumstance, but it is about explaining to them how important these uses are going to be in contributing to that sense of place.

**Baroness Whitaker**: Do you find yourself, the developer, explaining to the local authority, which is responsible for the whole place, how they ought to be thinking?

**Richard Lemon**: Yes, absolutely. It is partly the developer’s role, partly our role as planning consultants and partly that of other consultants. Yes, you are absolutely right that we need to tell that story to local authorities, but we also need to give them almost the excuse so that when it gets to planning committee and the planning policy says, “No, you should not have retail or leisure floor space here”, they have a reason to say that actually there are particular circumstances here and we must have these additional uses in this development.

**Guy Bransby**: I have one quick point, please. I think design is important. After the principle of the development, it is probably the most important thing when it comes to schemes, because
it is subjective, emotive and important to people. There are some excellent examples of local planning authorities doing really good things with regards to place-making, and I can think of an example in the south-west of the country—and I am happy to send you details—where they actually submit place-making plans with the planning application and, as part of that, a green infrastructure plan. As Mr Penfold was saying, this is not just about how buildings hit the ground, the transport and the landscaping; this actually sets out the greening, the biodiversity and where the water features will go in any scheme. I am happy to provide that.

**The Chairman:** That would be really helpful. And trees?

**Guy Bransby:** Absolutely. The green infrastructure plan covers all that.

**Lord Inglewood:** I just wanted to ask, in purely vulgar commercial terms, how important the difference between a well-made place and a poorly made place is to a scheme.

**Adrian Penfold:** I can give you an example. We looked back at that Regent’s Place development, which I spoke about, which we have owned for 30 years, to see what has happened to values. I am talking mainly about office rents, but also about residential. The values there have increased at twice the rate of the increase in the West End, and that is because we have made a place rather than just built a building.

**The Chairman:** Of course what we cannot quantify is the effect on the human beings who actually work, live and walk through these spaces.

**Adrian Penfold:** We looked at that as well. The area around our estate, which is mainly Camden council housing, is in the top 1% of areas in London where deprivation has gone down in the same period. I must not over-talk this, because it is something I have been involved in and I am very proud of, but everybody seems to be winning there.

**The Chairman:** Have any articles been published about that? I ask because we have a member of the Committee, Baroness Finlay, who unfortunately cannot be here today, who is very determined that we take into account the effect on human beings, mental health problems and physical health problems.

**Adrian Penfold:** We worked with the Royal Society of Arts and the New Economics Foundation and produced, early this year or late last year, a document looking back at those 30 years. That is where the figures I have just given you have come from, and I am happy to send you some copies of that.
Baroness Whitaker: I have one brief follow-up, if I may. It is about the design quality charity. Local authorities can obviously choose to use its services or not. How do you and how could the country get them to use that kind of thing more? It is obviously not appropriate for mandatory requirements, but it sounds like a really useful thing. How many use it now?

Adrian Penfold: I do not know. We could probably find that figure. I will see what I can find on that. The NPPF has been helpful, because it has a specific reference to design review, and a lot of local authorities are taking that very seriously.

Baroness Whitaker: They use you.

Adrian Penfold: They use us and there is the design alliance across the country. You have heard evidence from David Waterhouse from CABE, which does similar sorts of work, so there is cross-country coverage of design review. We are seeing a pattern developing that is quite interesting and positive: towns are working with CABE, with us or other members of the design alliance to provide a panel that can look at a number of different schemes. They are working with a design review body, rather than setting it up. Generally setting up your own design review body is more difficult. I looked at this when I was in local government. If you can work with somebody like Design South East, CABE or other members of the design alliance, as a local authority, that is a positive way of doing it.

Q51 Baroness Parminter: I would like to tease out a bit more about the revitalisation of town centres and high streets. Mr Penfold, you have already said quite a lot on this, so perhaps we could hear from Mr Lemon, because you mentioned that this is something you wanted to come back to.

Richard Lemon: Yes, certainly. I am sure the Committee is well aware that the general thrust of planning policy for the last 15 or 20 years now has been to direct new retail and leisure development towards town centres. I think that is an established principle and one that most people support, but we are seeing a changing context in which the retail world is operating now and people are gravitating towards the largest town centres and the smallest town centres. The largest ones are for their comparison goods shopping, their clothes and shoes. They spend a day there, maybe have something to eat as well and go to the cinema. At the other end of the scale they do their day-to-day shopping, but the town centres in the middle are the ones that are being squeezed and are now looking for a role. My view is that this is
going to have to be guided by local authorities and the main landowners in those centres to identify their future role. How do they reinvent themselves so that they are fit for purpose and meet a genuine need? There may be a slightly bitter pill to swallow, which is for those centres to consolidate in some places, so that the fringes, the straggly ends of some of these centres, are converted to residential. As I say, some careful thinking needs to be done about those centres in the middle.

On a more practical level, again you will no doubt be aware that the Government have, in recent years, introduced a number of new permitted development rights allowing the change of use of certain units to other uses. For example, we have seen a new permitted development right allowing the change of use from A1 shops to A2 financial services, which includes banks. That is a very welcome move. The likes of Metro Bank operate some very large glassy buildings that are open seven days a week and throughout the day. They really generate footfall in a town centre. If town-centre vitality and viability is about generating footfall, getting people into their centres and using the facilities, that is certainly a good move.

Some of the other changes have been slightly smaller-scale. Frankly, they are not particularly useful. They are limited to very small floor spaces, so we are really just talking about very small-scale shops. All this has been done through legislation, through permitted development rights. It would have been easier, and it could still be done, to add a single sentence to the NPPF that simply says that local authorities should not resist the change of use of units in certain parts of the town centre—outside the primary shopping area, for example. This comes back to the point earlier about people wanting to spend more on eating out, and so on and so forth. There is a real resistance to opening up restaurants in some places, when actually they are playing a key role in the health of our town centres. There have been some useful initiatives so far, but there is more to do. A slightly less prescriptive and rigid approach is required by local authorities in some cases, which may take some changes to national policy in order to drive it.

**Guy Bransby:** I have another view, or would you like to move on?

**The Chairman:** No. How many points do you have this time?

**Guy Bransby:** I will make it two. The first is making the high streets physically attractive to people, so I am talking about landscaping, public realm, decent, affordable, accessible public
transport, making them clean, secure and safe. All that should be funded either through the community infrastructure levy or through planning gain associated with planning schemes. That is about the physical.

The second point is more about planning and policy and builds on Mr Lemon’s point. I do think that our town centres should become more diverse. Planning should be more flexible on the uses it allows. I have come across a lot of policies that restrict the introduction of restaurants, bars or types of retail to town centres. I think we should do the opposite and make it more flexible, because that is how places become active, vibrant and attractive. Those are my two points.

Adrian Penfold: The one point that I would make is the impact of the internet. It is worth thinking about that. I had a look at the figures, and something like 4.7% of all shopping in 2008 was on the internet. Now it is nearly 12% and is projected to go to 18% by 2020. That is having an impact. I also had a look at Experian’s latest figures projecting a growth in floor space for retail. It is projecting a 13% growth of floor space in retail over the next 10 years, so there is scope for new retail in town centres. We as a company are investing in town centres at the moment.

The Chairman: How strong is that knowledge that there is scope for increasing town centres? I was thinking the other way round—about these big out-of-town areas and even town centres, which always seem to have a John Lewis at one end and something or other at the other. Most people now think that they cannot park their car. They are also becoming much more aware that digital skills are an essential part of their toolbox, so to speak. A lot of this stuff is going to close.

Adrian Penfold: We are the biggest retail landlord in the UK, so this is quite an important issue for us. We are finding that actually there is a synergy between the internet and physical retailing. A lot of the people who are shopping on the internet are also visiting our shopping centres, but they will not visit our shopping centres unless they are nice places to be. Our strategy at the moment is very much about investing in the basics. Investing in car parking is important, you are right, but investing in loos, for example, is also critical, as is investing in the training of our retail shop assistants in the way they greet people and work with people as they arrive to do their shopping to make it a pleasant experience for people. When you do
that, our belief—and we have some proof of this from the studies that we do—is that footfall can be held up and can increase. The internet is not all doom and gloom.

Q52 Lord Inglewood: My cynical friends tell me that people go to the shopping centre, look at the goods and then buy them across the internet, because they are cheaper. Is your footfall turning into money taken?

Adrian Penfold: Some people are doing that, but click and collect is an important phenomenon. People are going to collect something that they have clicked on, and while they are collecting what they have clicked on they will look at and buy other things. Interestingly, even when they are returning something that they have had delivered, and they return them because they do not want to hang about and send them back through the post, they return them to the shop at the shopping centre and also look in other shops and buy. We reckon, when we look at the internet and physical shopping, that there are 10 different ways in which people shop now. I have them, but you will not want them, having had Mr Bransby’s 10 points. I will not give you the 10.

The Chairman: All these points have been very useful.

Adrian Penfold: Indeed, but perhaps this is another one I can follow up to give you the 10. Only one of them is actually to click and deliver at home, and that is it. The other nine all touch on physical retailing in one form or another.

Richard Lemon: My Lord Chairman, if I may respond to your question earlier about out-of-town retailing, you are quite right that people increasingly like to shop out of town. In order to respond, town centres have to make sure that they offer what out of town offers, which is plentiful free parking. The town centres must provide the sites for large-format units where people can go and shop and know they will have the size of trousers, dress or whatever it is they are looking for. In order to push that over the edge, it comes back to this place point. It is about going and enjoying your experience as a shopper. I think Mr Penfold made that point a moment ago.

The Chairman: Mr Penfold, how many psychologists do you employ?

Adrian Penfold: We do not employ any psychologists, but we have been working with a Canadian company called Happy City. If you get a chance, have a look at Happy City. I think it has a website. It looks at the psychology of shoppers and people in town centres.
The Chairman: I think it is a very important point. Thank you very much. Lord Woolmer.

Lord Woolmer of Leeds: Given the time and that this is a huge topic, do you want me to ask it?

The Chairman: Give it to them and see if they can agree to send us some information.

Q53 Lord Woolmer of Leeds: You have touched on some trends, looking into your crystal ball, but apart from the internet and so on, what other trends affecting property markets and sustainability will have the largest impact on the built environment? Do you think national policymakers and local authorities have this kind of time horizon, as well as the immediate?

The Chairman: There are a few more lists coming.

Adrian Penfold: I am afraid I have a list. I have seven actually, but I will go through them very quickly. Technology and the internet is a big one, but there is also 3D printing, for example. I noticed Professor Worthington is here, who will probably know about this than I do. I am told that in China they can produce 10 3D blocks in 24 hours. The only problem is that they cannot produce the roofs for these buildings, but they can produce the building. It is one to keep an eye on. From our perspective, the key one is still globalisation and the global movement of capital around the world, from which obviously London and the UK more generally are benefiting at the moment, but that can change. It is very much something to keep an eye on. Some of the drivers by the Government relate to devolution, for example. Devolution is an important theme for planning, and we are looking at it very carefully in our local plan work to see what it might have to offer. We have touched on sustainability and place. Climate change is a huge issue, as is an ageing population and what that means for the sorts of developments that we build and the sorts of places that we manage. Finally, there is the growth of London. There is just huge growth going on in London, and the question is how we accommodate that and provide the infrastructure. How well government is doing and how capable it is of dealing with all those things is probably another session and a half, is it not?

The Chairman: It is probably more than that. Thank you, Mr Penfold. Mr Lemon and then Mr Bransby.

Richard Lemon: I will pick up three points very quickly, if I may. Call them trends, call them challenges, or whatever you like, but I picked up three. The first is the continuing and overwhelming need for new homes, which we must deliver, and we are not getting to grips
with that. The second is the future of our town centres. How do the secondary ones I mentioned earlier reinvent themselves? Thirdly, how do we deliver the necessary infrastructure? Are we getting to grips with that? We are still not quite delivering enough homes, by all accounts. We are getting there in town centres, but there is more to do. On infrastructure, some of the recent moves have been welcome. It is worth picking up on or giving some credit to the Mayor of London and the GLA on their infrastructure 2050 document, which tried to look a bit further ahead, not just until the end of this mayoral term but well into the future. There are signs that things are being done, but there is far more to do, I think.

Guy Bransby: I will make my four points, but I am happy to make a submission to cover the detail, given the time.

The Chairman: That is very kind, thank you.

Guy Bransby: The topic headings are release of green belt land for new housing and whether that is something that we feel can be supported and is appropriate. That is the first one.

Baroness Parminter: That is not a trend, that is your proposed solution, but carry on.

Guy Bransby: It is not, actually. I am happy to make a submission on that point, if you would welcome it, but it is not my personal view. The second point I was going to make was about energy performance and the need for carbon reduction, which touches on some of the sustainability points that we have made. The third is climate change, which Mr Penfold has touched on that, but more than that it is about subsidies, increased taxation and scrapping things like the Green Deal improvement funds. A lot of decisions are being made by government that are changing that landscape, which addresses the second part of your question. The final point goes back to where we started. I touched on, but did not explain very well, the difference between conflicting demands of localism and growth. My personal view is that both are incredibly important. There needs to be democracy in the planning system. Local people need to be involved, but how that marries up with the agenda to drive decision-making, growth and investment is something we still need to tackle.

The Chairman: In our very first session we heard about BANANA, which is “build absolutely nothing anywhere near anything”. It is the new word for nimbyism, I am told. This localism is a big question. As you can see, I think we have bitten off more than we can chew, but we were
given the remit. Your contribution, from all three of you today, has been terrific. Thank you very much indeed. If you wake up in the middle of the night and think, “Oh, we should have said that”, you know where to find us. We would be very grateful. Thank you.

19 November 2015
1. The British Property Federation (BPF) is the voice of property in the UK, representing companies owning, managing and investing in real estate. This includes a broad range of businesses – commercial property owners, developers, the financial institutions and pension funds, corporate landlords, local private landlords – as well as all those professions that support the industry.

2. We welcome the opportunity to respond to the Select Committee’s inquiry on National Policy for the Built Environment. In the interests of brevity this response provides headline observations, a more detailed response can be provided.

Q1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

3. It is crucial that decisions are made at the correct administrative and geographical level, with neighbourhood plans being consistent with strategy decided at local authority level. Decisions at the national level should therefore focus on setting the broad policy framework.

Q2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

4. Whilst great strides in coordination have been made, our interactions with Government departments suggest that improvements could still be made to encourage a more joined up approach.

5. For example, the National Planning Policy Framework (NPPF) currently gives the same weight to all designated heritage assets (including Registered Parks & Gardens, battle fields, World Heritage Sites) but this is not reflected in legislation, which protects only those under the Planning (Listed Buildings and Conservation Areas) Act 1990.

Q3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?
6. The Communities and Local Government Select Committee report published in December 2014 identified many of the challenges that arise from the operation of the NPPF. We welcomed the report and the recommendation that the NPPF should not be dismantled but merely subject to some small amendments. It was also seen as crucial that a proper evidence base be established in order to make the right changes in the future.

Q4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

7. While the government is clear that planning is largely a decision for local authorities, there are difficulties in planning strategic nationally-important infrastructure without any broad brush national spatial policy.

8. We welcome the recently-announced creation of a National Infrastructure Commission, and we hope to see swift decisions over important projects to ensure clarity and certainty for investors.

Q5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

9. To help with boosting the supply of housing, the NPPF requires local planning authorities to identify and keep up-to-date a deliverable five year housing land supply. It seems, however, that this is a somewhat arbitrary figure.

10. Those involved in the development of planning and built environment policy should be encouraged to look outside the length of a parliamentary term. Development is not instantaneous, and the effects of policy change can take time to be seen in practice.

Q6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

11. Housing delivery takes place within a local context and therefore is not totally within the control of central Government. We represent the Build-to-Rent sector, which has taken time to reach a critical mass, but is making good progress at adding to housing supply, with 18,000 units in the London development pipeline alone. Whilst central Government has been very supportive at reshaping planning guidance to reflect this new phenomenon of pension fund investment in large-scale rental housing, it has
taken time to inform and educate local planners and politicians about this sector. No blame is being ascribed, but it shows that innovation in the housing sector is slow, because there are so many participants who have been brought up over the past 30 years on a model of building for sale with an affordable housing requirement.

12. The other significant challenge the sector faces is ensuring there is an up-to-date local plan in place. Decent investors do not want to foist unwanted development on communities, but to work within a framework where the local community is welcoming of development and clear about its needs and intentions. We welcome the latest initiatives for central Government to intervene where local plans are not put in place by early 2017, and the expert panel set up by the Housing and Planning Minister to look at speeding up the local plan process.

13. Some of the most innovative housing delivery we see is where our members work in partnership with local government through joint ventures and other structures, where public land is invested as part of the structure. They can offer local councils valuable income and control of their public land rather than outright sale to the highest bidder for that land, but many councils remain nervous of best value rules and we believe there needs to be clearer guidance on what is allowable.

Q7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

14. There is a pre-existing commitment within European Union legislation for new buildings to be ‘nearly zero energy’ by 2021 by virtue of the Energy Performance of Buildings Directive Recast. The same Directive mandates energy efficiency standards for major renovation of existing buildings. While the withdrawal of the zero carbon target by the Government was in our view misguided, there remains this imperative and it is vital that the Government and industry work in concert to examine how it can be delivered.

15. The overall policy framework which seeks to mitigate energy consumption and emissions associated with the occupation of existing non-domestic buildings has evolved incrementally, and we believe that there is scope for rationalisation of the policy framework without detriment to the headline objectives of carbon reduction, energy efficiency and green growth:

- There currently exists no agreed framework for the collection and expression of energy and carbon performance among Government policies – the differing
frameworks used to collect data pursuant to Greenhouse Gas Reporting, the Energy Savings Opportunity Scheme, Energy Performance Certificates and the Carbon Reduction Commitment Energy Efficiency Scheme could be better harmonised to reduce nugatory costs upon property owners and occupiers;

- **Clear signposting of policy trajectory** to the owners and users of non-domestic buildings should be given in order to provide investment certainty to owners and occupiers (with a compelling case for upwards revision set via the Green Construction Board Low Carbon Routemap);

- **The distribution of policy instruments throughout the building lifecycle from planning to demolition is uneven** – there is currently a lack of policies designed to stimulate energy efficiency and carbon reduction in and around building transactions. When properties are vacant, there are greater opportunities for renovation and retrofit than when properties are occupied;

- **Standard setting** - the Government intends to mandate a minimum energy performance rating of E on letting non-domestic buildings by 2018, and a consultation is expected shortly on the detail of how this policy will work in practice, but we urge due consideration as to the future trajectory for these minimum standards. If it is the intention to ratchet up standards over time, then this should be done so via a regulatory escalator. The rationale being that property owners and occupiers will be better able to understand the risk profile attached to their ownership or occupation of property and react accordingly when considering capital expenditure (e.g. around major refurbishment).

- **There is a need for stronger Government/industry dialogue on the development of new policies** – such a dialogue can provide insights as to the effectiveness of policies, a view on market conditions, advice on minimisation of policy overlap and identify triggers and nudges which can be capitalised upon. We support an ongoing role for the Green Construction Board in this regard.

Q8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

16. Using the historic environment as an asset, and giving it new life, has been one of the cornerstones of the economic and social revival of our towns and cities.

17. For developers, there must be a clear economic argument for why heritage assets should be incorporated into a scheme. Developers need certainty and clarity, but there are often risks and costs not associated with modern buildings: running and maintenance costs may be higher than for comparable modern buildings, and work
to listed buildings can be more complex meaning consultants and contractors are more expensive.

18. That this deters some is frustrating, as there is significant added value to be found from including assets in regeneration schemes: Colliers research in 2011 showed that listed commercial and office property generated a higher level of total return than their non-listed counterparts for three, five, ten and thirty year time periods.

19. Over-protection risks deterring investment and development, and it is not just the developer who loses out: there are clearly associated economic benefits to the local area that are put at risk. Examples such as the regeneration of Kings Cross and St Peter’s Square in Manchester show how heritage can form a vital part of a regeneration scheme.

20. Local planning authorities often lack the required resources to understand how heritage assets can be sensitively incorporated into development, and many in the sector itself have been slow to recognise the benefits of such development.

21. With resources also being squeezed in all heritage bodies, the required knowledge of what should be listed, and why, could be limited.

Q9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

22. Successive skills reviews (e.g. Egan, Latham) have identified that periodic downturns in the construction sector lead to the flight of skilled and semi-skilled workers away from the industry. Such reviews were largely predicated on the likely numbers of workers for traditional trades, but fewer estimates have been made in light of future technology change and the advent of relatively new techniques such as Building Information Modelling, which will require less parochial work practices on the part of individual professions and more integrated supply chains.

23. Still less has been done to assess the contribution of economic migration to the construction sector in the UK. Government policy toward such economic migration needs to take account of skills shortages, particularly given the Government’s focus on construction as an agent of recovery.
24. Finally, the onset of new methods of construction, such as 3D printing and new materials as well as the onset of more complex building services are likely to lead to a heavier emphasis on the role of building services engineers and engineering. The recently announced low cost loans for masters degrees were subject-agnostic, for understandable reasons, but more needs to be done to incentivise entrants to these disciplines in order to ensure that we have the requisite skills to build buildings that are energy efficient and low carbon, and responsive to their occupiers’ needs.

Q10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

25. Designing a high-quality place where people want to work, live and enjoy their time should be at the heart of development. While it may be helpful for government or bodies such as the Design Council to set the tone of this, it is important that the detail is developed at a local level, allowing communities the opportunity to work with developers on what suits their specific area.

26. Recent appeal decisions where permission has been refused for otherwise acceptable developments solely on design grounds has shown the importance of high quality design.

Q11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

27. The effect of the built environment on those living and working in the area is of fundamental importance. Developers and investors often have an interest in an area which stretches beyond the immediate future, and involving people who will be affected by any scheme is crucial to secure its long-term sustainability and success.

28. There is significant research on the benefits of encouraging activity through the design of the built environment, from active office buildings to public realm which encourages walking and cycling. Examples of this are now becoming the norm in many developments, such as hiding escalators behind staircases in public buildings or pedestrianising streets.

Q12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?
29. For developers engaging in the large-scale regeneration of an area, fully engaging with the community at a very early stage is vital, as it allows those living and working in the area to shape the place-making and have a sense of ownership over the changes. However, difficulties remain, particularly in reaching those who traditionally do not engage and particularly younger people or those in deprived areas.

30. It is important to note that while engagement and place-making should be a key part of any development, the level of engagement should be proportionate to the scale of development. Those involved in a major regeneration scheme should undoubtedly be more involved in the community than those working on a single building. People could better be involved here through shaping the local plan, but many do not engage in that process.

31. Engaging at the earliest stages of development by visiting schools, local community groups, etc. and using games and models to engage with people and gauge their views is extremely useful, and is a method used by many BPF members.

32. There are innovative methods of engagement: the ‘Yes Plan’ developed by Newcastle University is a toolkit for engaging with the younger community, youth groups, and schools in planning and development matters. While it has not yet been used widely, it has been entered into the RTPI North East awards.

33. Local authorities can also contribute to this by ensuring relevant local planning policy and guidance is up-to-date and has public support will mean prospective developers are fully aware of local concerns and priorities from the outset.

Q13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

34. Investors in the build to rent market will have a greater interest in high quality place making as they typically look to retain their investments for the longer term. As such, removing the tax barriers to investment in this market could encourage better design and place making by the private sector – as well as contribute significantly to the Government’s housing targets. For example, reducing the rate of VAT on residential repairs and maintenance would make investment in the private rented sector more attractive. This change would enable large scale players in the professional private rented sector to compete on a more level playing field on the price they can pay for land.
35. The riskiest phase of a new build to rent asset is the development/construction phase. As such, finding the finance for this period is often very difficult – even though there would be plenty of investors interested in the end product. In order to incentivise the development of new built to rent assets, the government could look at options to help mitigate the risks of construction. For example, government could consider an income guarantee during the construction phase of new build to rent developments, which would be repaid once the development is complete.

36. The Government could explore options to increase demand among buy-to-let retail investors for new homes. There is currently significant demand from individual buy-to-let investors for existing housing – if this investment could be diverted to new housing, it would directly contribute to the county’s housing stock. For example, a CGT taper relief could be available for investment in a new build property. Alternatively, allowing a full tax deduction for interest costs could incentivise investors.

Comments on National Policy for the Built Environment – Lords Select Committee

Q1, Notwithstanding the rhetoric around localism, there has been an increasing centralisation of planning control through DCLG through the de-regulation agenda which has seen a dramatic broadening of permitted development. This serves to reduce planning control over development at a local level undermining Local Planning Authorities' and interested stakeholders' ability to manage development in their areas. National policy makers should concentrate on national issues and high level policy setting, but how this is implemented should remain in the hands of council planning departments and be subject to the normal democratic processes as now.

Q2, High level co-ordination does appear lacking, particularly given the apparent dominance of the Treasury over the DCLG planning and DCMS heritage remits. The recent move of heritage to the DCLG remit should hopefully enable planning and heritage decision making and policy setting to be more coherent and complimentary.

Q3, The NPPF does not provide sufficient policy guidance in a number of areas including design, heritage and viability. Hence other guidance in the National Planning Policy Guidance is now having to be significantly expanded to deal with this. The ability to balance public benefits against disbenefits in the NPPF when considering heritage impacts and to allow harm to heritage assets where 'public benefits' are considered to accrue is one example of where greater clarity is needed on what are public benefits. There is also far too much emphasis on viability in the NPPF which is being manipulated by the development industry to avoid providing the necessary affordable housing and infrastructure payments that new developments require. Such arguments are also used to justify greater densities and harm to heritage assets than would have been considered before. The established planning considerations need to be re-emphasised in their importance.

Q4, A spatial planning perspective is required at national level to guide more clearly where growth can be more easily accommodated, which can in turn guide infrastructure, jobs, housing and services. This is needed to create a more balanced economy across the country rather than seeing the South East and London overheat and the cities in the north see the collapse of their housing markets through lack of demand.

Q5, When planning significant infrastructure and long term housing need a 15 year planning timeframe is sensible. However, development plan reviews should occur at least every 3-5
years as part of the plan, monitor and manage approach, to ensure that they are kept up to date in the interim.

Q6, To increase housing supply the Government should halt the de-regulation agenda through permitted development relaxations as this is only serving to raise land values and create conversions of poor housing quality. These measures also make no contribution to affordable housing undermining the requirement to create mixed and balanced communities. Government should also reduce the emphasis on viability in the NPPF which is undermining the delivery of affordable housing and raising land prices for landowners and returns to developers beyond a reasonable profit level. There is still a lot of land banking occurring where developers are sitting on land with planning permission and not building, or drip feeding their stock into the market to ensure that prices continue to rise. Delivery should be encouraged by charging a higher level of CIL where implementation of a planning permission has not occurred within 3 years.

Q7, To build sustainable developments we should see the built heritage as an asset to economic growth and not a hinderance as it sometimes appears to be viewed. This should be emphasised more clearly through national policy drawing on the excellent research and examples from bodies such as Historic England. VAT exemptions should also be granted for conversions of existing building considered to be of heritage value to encourage their re-use.

Q8, See answer to 7 above.

Q9, There is an increasing crisis developing in the fields of planning, conservation and design given the unprecedented squeeze on public sector funding which is leading to dramatic reductions in staff in councils and other public sector bodies. This is already leading to a huge reduction in capacity to deliver the sustainable growth this country needs and to create the successful places where people can live, work and visit.

Q10, High quality design and placemaking is being undermined by the cuts mentioned in Q9 above and the over reliance on a 'developers' agenda' where viability arguments are being manipulated to trump all other issues.

Q11, national policy should be clearer in requiring true consultation earlier in the process, rather than the tokenistic notification that is still too commonplace on schemes large and small.

Q12, for effective community consultation there needs to be concerted efforts to build capacity and expertise in the community so they can engage in the process and be on a more level playing field with other stakeholders and participants. The broadening of permitted development and the move towards Permissions in Principle on brownfield sites will only serve to exclude communities from key states of the planning process and opportunities to positively influence outcomes.
Q13, See comments above regarding reducing the reliance developers can place on viability arguments which is undermining design and place making principles. Examples of good practice should be emphasised more clearly in national guidance.

Tony Banfield - Chair of Bromley Civic Society - 6th October 2015
Dr Tim Brown, De Montfort University – Written Evidence (BEN0088)

Summary

- Better co-ordination is required at both national and local levels. In relation to the former, a spatial plan that brings together existing commitments would be a useful starting point.
- At the local level, strategic policy making at city region / sub-regional levels that reflects the realities of local housing and labour markets is required.
- There is a strong case for an independent in-depth review of green belt policy – the results of which would feed into the national planning policy framework.
- Boosting housing supply requires a multiplicity of measures as out-of-date local plans and poor development control performance are only a small part of the issue.
- Local authorities should be encouraged and supported financially to re-engineer their facilitating / enabling role in promoting development.
- This will necessitate building capacity in terms of real estate & development viability skills as well as those covering design.
- Community-led housing development (e.g. community land trusts) should be even more strongly supported so that there is a scaling up of outputs.
- The provision of affordable housing requires some form of subsidy.
- There are a number of

1. Introduction

1.1. This evidence submission focusses primarily on housing supply. It, therefore, addresses, in particular, the questions on policymaking, buildings & places, community involvement & community impact and financial measures.

1.2. The author was previously Director of the Centre for Comparative Housing Research at De Montfort University and has been involved in a number of studies on lesson learning from other countries on boosting housing supply. These have included a relatively recent project funded by the Economic & Social Research Council on boosting housing supply using low income housing tax credits that are widely utilised in France and the USA.

2. Policymaking, integration and co-ordination

2.1. There are two issues – national government co-ordination (and see sections two & five) and the geography of policy making at the sub-national level.
2.2. In terms of co-ordination at the national level, it is not clear to outside organisations including the public how co-ordination is achieved where there are inevitable overlaps between departments. For example, in the case of rural housing supply, responsibilities overlap between the Department for Communities & Local Government (DCLG) and the Department for Environment, Food & Rural Affairs. This is compounded by the presence of government agencies such as the Homes & Communities Agency (HCA), National Parks Authorities etc. A relatively straightforward solution would be for the Cabinet Office to have website guidance on how these overlaps are dealt with.

2.3. An increasingly important and linked issue is the role and power of the Treasury. For instance, the devolution and city region / sub-region debate is led by the Treasury but involves strategic housing and planning policies. The current assessment of the 38 devolution bids by the Treasury focuses on enhancing economic productivity. However a significant number of the bids have planning and housing ‘asks’ that have been discussed with the DCLG but do not appear to meet Treasury criteria. Again, clarity is needed from the centre.

2.4. The devolution debate also raises the issue of ‘what is the most appropriate geographical scale for housing and planning strategies?’ There is no straightforward solution as housing and labour markets no longer reflect the current realities of local government boundaries either individually or in city regions and sub-regions. The way forward is that adjacent councils must co-ordinate their strategies and work in partnership. In some cases, this might result in formal sub-regional strategies. An interesting initiative is that authorities in the West of England (i.e. the Bristol City Region) are producing a joint spatial strategy. But in such situations the issues of accountability and transparency need to be addressed. In other cases, a strategy based on a single council area could remain appropriate. But it would require robust co-ordination with adjoining areas. The example of Coventry and Warwickshire illustrates the challenges. The lack of land in the city and a tightly drawn green belt requires Coventry’s housing needs to be met, in part, in adjacent districts. However, there are on-going planning issues with at least one local plan being withdrawn because of ineffective co-ordination and co-operation.

2.5. In addition, there is a strong case for the design of neighbourhood plans where extensive change is likely e.g. major new housing development on greenfield or brownfield sites and large scale housing regeneration projects. Of course, it might be argued that there is a danger of an overload of plans and strategies. However, evidence from Western European countries indicates that the successful development of new housing areas and the regeneration of older areas requires co-ordinated sub-regional plans and neighbourhood strategies. Swedish cities such as
Malmo and Gothenberg are illustrative of this type of approach for successful policy making.

3. **National policy for planning and the built environment**

3.1. Reference has already been made to the need for much more effective co-ordination and co-operation between councils. This requirement in the national planning policy framework (NPPF) is simply not strong enough. It must be strengthened and initiatives, such as joint spatial strategies, should be highlighted as potential good practice.

3.2. A long standing and highly contentious in housing and planning is green belt policy. Many reports from a housing supply perspective have argued for the release of some green belt land to boost housing supply. There has, however, been widespread popular support for the protection of green belts since the 1950s with it being frequently claimed that it is one of principles and successes of town and country planning in this country. Nevertheless, there has been research since the 1960s that parts of the green belt are far from ‘green’ e.g. poorly managed and underused farm land, unauthorised tipping, vacant and derelict buildings etc. There is this a strong case to have an independent review of the role of green belts. This should include consideration of (i) land allocation swaps between the green belt and other countryside sites, (ii) stronger protection of green wedges and open space within the built-up area of town and cities, (iii) consideration of the designation of ‘white land’ i.e. sites that should be developed in the medium-long term but will remain in their existing uses for, say, the next decade\(^{22}\) and (iv) effective management of land designated as green belt.

3.3. This links to the bigger issue of the need for a spatial plan for England. Research by the University of Manchester for the Royal Town Planning Institute through the ‘map for England’ initiative has shown that there were over 100 national policy plans that had to be pulled together to produce a single national spatial strategy.

4. **Buildings and places: New and old**

\(^{22}\) White land was a key feature of local plans in the 1960s and early 1970s and functioned as a zone / area between the green belt boundary and land allocated for residential and commercial uses. By the end of the 1970s this land had been developed so the green belt boundary was often also the boundary of the built up area.
4.1. Boosting housing supply is a fundamental challenge. There is consensus that we need to build 250,000 new homes per year in England and of these approximately 100,000 should be affordable. The reality is that we are delivering 50% of the overall total. There are many small scale government initiatives with, at least, 20 currently in operation. This has created its own problem of ‘initiatives’ with new modest schemes emerging at every Autumn Statement, Budget and Spending Review.

4.2. Planning is frequently seen as impediment to housing supply through the lack of up-to-date local plans and slow and inappropriate development control decision making. The Government has, thus, emphasised though its policies on planning performance measures that it wishes to see local plans in place as soon as possible and quicker development control decisions.

4.3. However, the reality is much more complex. Reference has already been made to green belt policy as a constraint on development. To this can be added many further issues such as (i) attitudes and strategies of land owners who may wish to maximise the sale of land by releasing it to builders only at the top of the market, (ii) some housing developers who build out sites over an extended period so as to maximise the return on each house sale and (iii) lack of funding (see below) for affordable housing.

4.4. A further consideration is the quality of the built environment. There have been a number of comparative studies that have highlighted that new housing areas in some other Western European countries are of a much higher quality than in this country. It is, therefore, imperative that there is a refocus on not only numbers but also on sustainable communities.

4.5. There is, thus, no single magic bullet solution to boost housing supply. A range of measures are needed such as speeding up the commissioning process on the release of public land. The pilot scheme announced earlier this year by the Treasury and the HCA for Northstowe in Cambridgeshire is an interesting approach. It involves the HCA in directly procuring housing rather than selling land to a developer. There are similar schemes being developed at a local level e.g. Birmingham Municipal Housing Trust which is a City Council initiative to boost affordable housing supply and is now the largest provider of new homes in the area.

4.6. From a planning perspective, no one would argue against each local authority having an up-to-date local plan or making effective development control decisions (assuming, of course, that councils have the resources in a period of austerity to staff their planning departments appropriately). But there has to be an acknowledgement

---

23 See, for example,
that a balance has to be achieved between boosting housing supply and other aims and objectives such as protecting the countryside. Thus, these ‘planning reforms’ will not necessarily lead to more homes being built.

4.7. A further but hugely neglected aspect of planning at the local level is facilitating / enabling the implementation of local plan policies. Activities include (i) the use of compulsory purchase orders to resolve land ownership issues, (ii) preparation of planning briefs (including design briefs) for large and complex sites to guide developers and (iii) master planning for areas where there is to be major new developments or regeneration projects. These activities (and the skills underpinning them) have generally been lost since the 1980s. Yet there are an essential part of the development process for housing and indeed for other uses.

5. Skills and design

5.1. The lack of capacity in councils to produce local plans, make effective development control decisions and facilitate developments stems, in part, from the impact of austerity policies on local government. There are, however, ways in which this can be addressed. They include (i) sharing skills between councils – for example, there are an increasing number of district councils that share staff with expertise in real estate and development viability so as to be able to negotiate planning agreements, (ii) partnering with developers on projects that enable the planning expertise of councils to be shared with those development and funding skills available in the private sector.

5.2. In terms of design skills, the Farrell Review in 2013 commissioned by the Department for Culture, Media and Sport discussed many opportune ideas. It is, thus, disappointing that there is relatively little reference to this material on the Department for Communities and Local Government website pages on planning.

6. Community involvement and community impact

6.1. There is a wealth of material and a long history of debate, discussion and practical measures on community involvement in the planning process that started with the Skeffington Report on public participation in 1969. One aspect that is sometimes underplayed is direct provision by communities themselves.

6.2. From a housing supply perspective, there are many grassroots initiatives in cities, towns and villages to provide affordable housing. They include community land trusts, custom-build/self-build schemes and co-operatives. Although these are usually small-scale, they frequently have a galvanising effect on strengthening local communities. This sometimes results in further activities such as neighbourhood
planning etc. Although there is a paucity of in-depth research on their scale and geography, some areas appear to be particularly strong. For instance, community land trusts are concentrated especially in Devon & Cornwall and Cumbria. In urban areas, there are many initiatives in Bristol e.g. an urban community land trust, a self-build scheme and a project to convert empty office buildings into homes.

6.3. Nevertheless, these types of schemes have remained small scale and highly localised. If they could be scaled up, they would make a much more significant contribution to tackling the housing crisis (as well as enhancing community involvement). In each case, lessons could be learnt from other countries. Community land trusts are much more significant in parts of the USA with rural examples in Vermont having a stock size of over 1,000 units. Housing co-operatives are much more common in Scandinavian countries. Large self-build schemes exist in parts of the Netherlands e.g. Almere.

7. Financial measures

7.1. Boosting affordable housing supply requires some form of subsidy. This can take many forms such as provision of land at less than market price, grants and/or loans, cross-subsidisation between schemes etc. For many schemes, there will be a number of different subsidies to make a project viable. For instance, a project might involve free land, grant from the HCA and a sum of money from a commuted sum negotiated as part of a planning agreement. Bringing all these elements together is a complex activity.

7.2. At the same time, private sector developments on difficult brownfield sites may require subsidy as can new types of development where there is no track record of performance e.g. the recent push to attract institutional investment into new build private rental schemes.

7.3. Therefore, there is no straightforward simple solution to funding housing provision especially affordable housing. Nevertheless, there are opportunities to explore new ideas. These include (i) the use of social and community investment tax relief to support community initiatives such as self-build, (ii) lesson learning from low income housing tax credit schemes in the USA and France24 and (iii) local housing companies. The latter are joint partnerships between a local authority, a financial institution and a builder to deliver a range of types of housing. It normally involves a council putting land into the company at less than market price. There are at least 50

councils in England either that have or are in the process of establishing this type of delivery vehicle.

05 October 2015
Building & Engineering Services Association – Written Evidence (BEN0134)

Introduction:

The Building & Engineering Services Association is the UK’s leading trade association for building services engineering contractors, representing the interests of over 1,370 firms active in the design, installation, commissioning and maintenance of heating, ventilating, air conditioning, refrigeration and electrical products and equipment.

We welcome the setting up of the Lords committee on National Policy for the Built Environment and are pleased to submit our response for consideration. We would be delighted to have the opportunity to give oral evidence.

A. Policymaking, integration and coordination

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

National policymakers currently set standards and regulations for buildings, which are added to through local planning requirements. This leads to layers of regulation and policies such as the requirement for onsite energy generation, which can lead to perverse results notably biomass boilers in cities and heat pump installations in social housing projects with access to the gas network – actually creating higher emissions and higher energy bills for occupants.

A more imaginative and pioneering role in shaping the built environment could be taken by setting minimum environmental standards that developers would need to adhere to when submitting applications for planning permission.

In line with this, B&ES would like government to take a more holistic approach to planning and building regulations; we would like to see regulations that are more focused on actual performance, more sympathetic to local people affected by building work (eg. in terms of the impacts of noise and poor air quality) and which are less prescriptive.

This would provide the greater flexibility necessary for the construction supply chain to innovate and also put more focus on the end product, which is delivering a building with the intended carbon, energy saving, and wellbeing benefits.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?
Overall we feel that coordination across departments is less than ideal. For example, DECC, DCLG and the DEFRA can often have responsibility for different aspects of policy, but appear to work in silos. On a positive note, B&ES is encouraged by the current Bonfield Review of energy efficiency in domestic properties, looking at issues from a cross-departmental perspective. This is a model for future initiatives.

We also welcome the ECC select committee’s current inquiry into home energy efficiency and demand reduction.

B. National policy for planning and the built environment

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

B&ES does not have a view.

4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

B&ES does not have a view.

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

It is impossible to give a substantive answer on what the optimum timescale might be – 10, 20 or 40 years – because of the impact of climate change and rapidly changing worldwide societal and economic circumstances. A vivid example is the current European migrant crisis; the rapidity of which could not have been predicted. Most experts were anticipating a slower migration resulting from climate change and, therefore, our planning is already out of step.

C. Buildings and places: New and old

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

B&ES does not have a view.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be
able to adapt to changing needs and circumstance in the years to come? How can the best use of existing housing stock and built environment assets be made?

The government should consider a change of direction on building regulation that sets a performance standard for the completed building, encourages innovation and discourages the current ‘tick box’ approach that undermines the original design.

A recent UK Green Building Council report indicated that, on average, building energy use is 200% over design intent – while Carbon Buzz\(^1\) statistics indicate that buildings consume between 1.5 and 2.5 times their predicted values.

This is a consequence of the frequent failure of all involved in the construction process (architects, builders and the myriad of contractors and consultants) to actually build and deliver what has been designed and agreed at the planning stage.

The process of ‘value engineering’ is a euphemism for cost-cutting and means that, in most construction projects, there are usually a number of minor deviations from the original building specification. These minor changes mount up and the aggregate impact is the large performance gap between design intent and finished, operating building. This collectively results in the building not being able to deliver the benefits that were committed to when the original planning application was submitted and approved.

For example, building designs require the increased use of integrated systems as they become more complex; yet the fragmented supply chain delivers products assembled at the lowest price and often in complete ignorance of the overall design intent. The result is often a building that is a facsimile of the design produced for planning consent. It may look the same as in the original design, but in performance terms is a long way from what was first promised and approved.

This issue is compounded by the lack of checking and enforcement by Building Control authorities. The planning and building regulations drive a culture where checking effectively ends when planning permission is granted. There is little or no focus on what is built. Also, when none of the stakeholders in the construction process picks up the energy bill, because of the nature of the developer / landlord / tenant relationship, there is no financial incentive to meet the design intent.

Therefore, a better approach than that of the current building regulations would be to specify the building performance based on a value of energy use (w/m\(^2\)) and the equivalent carbon usage. This would allow designers to innovate rather than tick boxes against design criteria.

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

B&ES does not have a view.
D. Skills and design

9. Do the professions involved in this area have the skills to consider adequately the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

The construction industry is struggling to maintain the correct skills levels and is working hard, with support from government, to ensure that the skill base is maintained and developed through various training and learning initiatives. The current initiatives around high quality apprenticeships and trailblazers and University Technical Colleges are good examples of this.

However, local authorities do not have the requisite skills and certainly do not have anywhere near adequate resources. We feel there is a particular issue with Building Control (around the checking and enforcement of Building Regulations), where developers can contract out these services. This means that the contracted companies often have a vested interest in maintaining a commercial arrangement with the applicant to gain repeat work.

10. Are we using the right tools and techniques to promote high quality design and place-making at the national level? How could national leadership on these matters be enhanced?

No we are not. However, the increasing commitment towards Building Information Modeling (BIM)\(^2\) can help ensure that high quality design is consistently delivered.

Apart from the problem of ‘value engineering’ the other is ‘build and design’ where developers, keen to get the project started, break ground before the design is completed. The result is that the design is always chasing the build programme and poor decisions and lengthy delays result, particularly where budget pressures influence decisions.

This could be solved in two ways:

1) Planning authorities could approve the scheme, so giving the developer certainty, but refuse the applicant the right to start work until a design has been properly developed. That design would be verified by an independent professional appointed and paid for by the developer.

2) The construction professional could also be responsible for the building’s efficacy and fitness for purpose on completion.

These innovations would reduce the amount of time spent on site, reduce disruption to neighbours (the costs suffered by affected businesses are never calculated) and, in turn, present the industry in a more favourable light, which would also help with future recruitment.
The availability of BIM, which offers the prospect of more thoroughly designed, better planned projects, has the potential to turn this vision into reality.

The current poor across-the-board performance of the construction industry is illustrated in the latest key performance indicators compiled by the CITB, Constructing Excellence and BIS against targets that were set under the Construction 2025 industrial strategy published in 2013. Only 45 per cent of schemes were delivered on time or earlier; and only 69 per cent of overall projects were delivered on cost or better.

The median profit margin on construction projects before interest and tax was 2.8 per cent, illustrating the financial pressures inherent on developers and constructors to cut corners. This accounts for many of the problems within the supply chain including, crucially, cash flow when sub-contractors are paid late (or not at all) by those further up the chain looking to maximise profits. This, inevitably, has a knock-on impact on quality and delivery.

E. Community involvement and community impact

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

No they do not. Here I should like to share a recent personal experience of ‘having construction done to me’ (and my neighbours).

The project to which I refer involved the £8.6m refurbishment a council-owned facility consisting of swimming pools and a sports centre – which happens to be located next to the block of flats in which I live in London.

It was undertaken by a chartered builder – a member of the National Federation of Builders; registered with Constructionline, Exor and CHAS – so should not be considered a ‘cowboy’ outfit. However, the way the project was ‘managed’ is symptomatic of the construction industry’s principal ills.

From my first floor window, I had a grandstand view of the building site, which I can only describe as chaotic – and the result of inadequate contract planning, incompetent co-ordination and indicative of a lack of a professional and coherent approach to design. It was evident from the planning application that insufficient design had been carried out before work started on site.

The (inevitable) result was a build-and-design project that ran months late, and was seriously over budget, evidenced by the lodging of a revised planning application, the reason for which was given as ‘value engineering’.
The residents were subjected to dust, noise and disruption for twice as long as programmed and on completion continued to suffer noise and pollution issues from the installed plant, caused by fundamental design flaws, that have yet to be resolved, some six months after completion.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

People can often feel that the environment around them changes without their views being taken into consideration. Projects increasingly appear to pass through the planning process with little apparent regard for citizens’ comments and ignoring residents or action groups who opposed them. The granting of planning permission for the contentious ‘Garden Bridge’ project, proposed for central London, is a very good example.

We commend to the committee an article on this subject in Architects Journal of 24th August 2015, by Will Jennings; the organiser of a contest seeking rival ideas to Heatherwick Studios’ Garden Bridge proposals:

http://www.architectsjournal.co.uk/comment/jennings-people-are-tired-of-being-duped-by-developers/8688025.article?blocktitle=Comment-&-analysis&contentID=14299

In the example affecting my property, a revised planning application was lodged in November 2014 requesting a relaxation of the noise levels. 11 months later this has still not been either approved or rejected by the Council, who incidentally own the building in question, yet the residents have been subjected to the increased noise levels throughout this period.

These noise levels are 200% higher than the requirement set in the original planning permission and well above World Health Organisation (WHO) health limits. Had the author of this response not been a mechanical services contractor, who understood the issues and commissioned an independent acoustic report to prove the discrepancy, this application would probably have been waived through.

Is it any wonder that many feel disenfranchised by the planning process?

F. Financial measures

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

Developers, as the people ultimately responsible for ensuring that the resulting building delivers on what was originally specified, submit planning applications. Yet so often the reality falls significantly short of what was promised – buildings are completed late and with
poor performance. When this happens, there is no comeback on the developer from the planning authority.

In fact in most cases, the planning authority won’t have inspected the building and therefore won’t be aware of any shortcomings.

The macro impact of the performance gap seems to have been lost. If the average building uses 200% more energy than the developer said it would then we need to generate more electricity, supply more gas and oil. This means the UK will be forced to build more power stations to compensate and that comes at a considerable cost to the tax payer.

A social contract is formed between the electorate/tax payer and the developer when a planning permission is approved. The developer promises to construct the building in accordance with the planning application or seek to change the application.

It seems that too many people in the process are taking this promise at face value and accept that it has been met without checking the detail. How else do we explain the performance gap and the long list of disappointed building owners?

ADDENDUM: Press report; September 2015
LABC President attacks DCLG’s lack of concern for consumers and council taxpayers
Outgoing LABC President Peter Keates called on the government to tackle increasing building control costs suffered by local authorities and property owners.

He noted that over the past 10 years the Department for Communities and Local Government (DCLG) had gradually failed to maintain a coherent building control system despite calls for such a system by business users.

Keates, who is Head of Building Control at Central Bedfordshire Council, described the gradual unravelling of the building control system - an unintended consequence of the way
competition was introduced. Private sector inspectors unilaterally using ‘building regulations opt-outs’, among other inconsistencies, means that local authorities have to notify the public of which parts of the Building Regulations the private sector isn’t covering. This is creating a confused mess and leaving building owners at risk, he said. It also increases cost burdens on local authorities and creates additional costs for property owners who have to undertake regularisations when they realise they haven’t fulfilled their building regulation responsibilities.

Similarly, Peter referred to the dumping of additional notifications into local authorities without arranging either a central repository or the right to charge the private sector originators. He said this was unfair on council tax payers and increases costs on building control teams who need to reduce overheads.

“It seems to us that the government is losing the thread and making it impossible to run a holistic building control system,” he added. “This has nothing to do with new regulations or new burdens. In fact, it’s the opposite. By creating more loopholes and muddling the system, DCLG’s actions mean that property owners get less out of the system and end up paying more. It’s a slipshod way to maintain a regulated system and the reputational backlash will be bad for everyone.”

06 October 2015
SELECT COMMITTEE ON NATIONAL POLICY FOR THE BUILT ENVIRONMENT:

Dr Kerry Burton and Dr Richard Newman

Department of Geography and Environmental Management, University of the West of England (UWE), Bristol

The response outlined below primarily addresses Question 12, however we also provide a short response to Question 9.

Q 12: How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?:

AUTHOR SUMMARY AND BACKGROUND:
[1] Dr Richard Newman (Civil Engineer) and Dr Kerry Burton (Geographer) are based at UWE and undertake research into urban sustainability and transitions to more sustainable urban water management, with their key focus on urban flood risk management. In July 2015 they hosted an agenda setting workshop on the future of urban water and strategies for flood risk management for water management practitioners and academics. Their previous research into urban flood risk management, and the outcomes from the workshop provide the basis for the following evidence. The co-authors are affiliated to the Centre for Flood, Communities and Resilience at UWE, but put forward this evidence as personal researchers not on behalf of the research centre. A list of used references is provided at the end.

EVIDENCE SUMMARY:
[2] Policy makers have acknowledged the need to re-think urban flood risk management. The Living with Water: Report into flood resilience of the future states that 5.2 million homes are at risk of flooding, with a water infrastructure (supply and drainage) that cannot cope with environmental demands (House of Commons 2015). Echoing the findings of the Pitt report (2008), it places an emphasis on increased public understanding of flooding, increased public participation in responding to vulnerability, and the need for localised solutions. In particular, moves toward sustainable systems for flood mitigation and water capture, such as Sustainable Urban Drainage Systems (SUDS) and non-structural responses such as flood education. Water management practitioners also responded to the floods of 2013/14, with fifteen of the nation’s leading landscape, water, and environmental management bodies calling for ‘urgent action’ on urban water management; to ‘rethink and plan both the natural environment and the built
environment of our towns and cities to make them more resilient...This must be coherent and adaptable to local circumstances, to allow it to be rolled out countrywide’ (Landscape Institute).

[3] Our research establishes that a key area of concern within many urban built environments is flood risk and surface water damage. Current problems exist within governance, implementation, and expertise. There is an urgency for urban flood risk needs to be addressed through context sensitive approaches that involve a higher level of stake-holder engagement and increased expertise in non-structural solutions and sustainable urban drainage systems (SUDS) highlighting the need for capacity building through social learning across both public and professional spheres to be taken seriously (see Newman 2011, Ashley et al 2011). Too much emphasis is placed upon technical solutions (including SUDS), with little accounting for their suitability to the social and ecological context. Community level responses to flood risk (and surface water) management tend to be more successful where there is a high level of stake-holder ownership; by which we mean, access to professional knowledge, inclusion of local/lay expertise and knowledge, involvement within decision making.

[4] There is very little scope within current practice to engage with the psychological barriers to change and adaptation which are experienced by communities facing the risk and/ or aftermath of flooding. Emotional, affective, and embodied responses, such as place attachment, can be powerful in shaping reactions to vulnerability, sometimes challenging prevailing techno-managerial and economic rationalities and mobilising ‘counter-support’ through high profile media and social media attention (see Sandover 2014) or shaping transformative material responses. This was illustrated during the flooding on the Somerset levels in 2014, particularly the widespread support from the grass-roots campaign group FLAG (Flooding on the Levels Action Group), whose calls for dredging, prompted an additional £10M government funding to Defra’s flood defence budget for the region despite contestation by hydrologists and engineers. As New Civil Engineer (NCE 2015) explains, “it was a very interesting time...we basically watched as the Prime Minister tore up 20 years of flood risk management (FRM) policy for the Somerset Levels in an instant”. This occurred in a well-established context of uncertainty over the technical and ecological efficacy of dredging (Scrase and Sheate 2005, NCE 2014).

[5] We argue that community participation in the co-constitution of their local environment is an everyday occurrence; however the majority of community participation around water and flood management is indirect (outside of formal participatory processes). Understanding expertise as knowledge that is dispersed through both lay and formal networks can help to bring more contextual understandings into discussions, aid community ownership of projects and reduce tensions through co-production, which in turn will deliver community ownership of the project, the problem and solutions.
[6] In addressing the urgency to transition toward context appropriate FRM that includes the participation of a context appropriate range of stakeholders, there is also a need to re-consider how participation and public engagement have been framed and practiced. Crucially, this includes a need to investigate the under-acknowledged barriers (psychological and processual) that prevent people from fully engaging with localised vulnerability and change. Here, we acknowledge the need to take both material and non-material considerations into account, in considering the urban not just as the built environment, but as the ‘product of distinct place-based relationships; specific geographies, social milieux and inhabitants’ (Greenfield 2013). In considering flooding as an event that is both public and private, we examine individual and community responses to flood vulnerability in order to understand the impact of these on the ability to adapt to changing environmental conditions. In gaining a better understanding of the role of human values, concerns, and relationships as shaping responses to vulnerability, more context sensitive flood risk and water management strategies can be adopted. Context sensitivity that takes account of social, ecological and technological complexities can better counter the entrapment within prevailing normative flood management frames that have failed to adapt to changing conditions and, in turn be more responsive to change; more context-centric.

[7] More progressive urban water/flood management schemes outside of the UK have involved a higher level of public participation. A number of successful urban water management projects in the USA have adopted principles of common management, where communities are given more control and ownership over decision-making and management of schemes (Grant 2012).

Q 9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?:

[8] The response to this question focuses on an over-reliance of technocratic ‘expertise’ within the arena of urban flood risk management. Reducing flood risk in urban and suburban catchments using flood defences is rarely appropriate, creating a driver for a shift of emphasis in suburban flood management. Sustainable Drainage Systems (SuDS) in suburban catchments can provide multiple benefits including sustainability and liveability but this local approach to managing flood risk requires engagement with a wider group of stakeholders than is currently typical including community groups and initiatives, urban designers and landscape architects, planners, civil contingencies, etc this list is not exhaustive. This type of engagement requires a wider set of skills than ‘technical’ professions such as engineering typically possess. The Institution of Civil Engineers and the Royal Academy of Engineering recognise this skills deficit (ICE (2014),
Lucas et al (2014), NCE (2013)). More focus is required on training both professionals in accessing and communicating and exchanging information with communities to access lay knowledge, but also on encouraging communities to engaging is awareness raising and capacity building of themselves. We anticipate that engaging communities in the design process will engender greater buy-in to schemes by promoting the positive benefits that SuDS can lend to the build environment, leading to more context appropriate designs.

This document is structured as a set of replies to your questionnaire and the answers are numbered accordingly. I have confined my replies to areas where my own or my council’s experiences are clear and relevant. I have occasionally generated “common sense opinions” base on local contacts and conversations over the years.

My overall intention is to show what is happening at “ground level”.

1) Correct administrative level. No! Local knowledge and wishes are profoundly undervalued at higher levels of administration, although high-level problems appear to be broadly understood at lower levels.

2) Coordination is poor. Sustainability is not just a magic word, although commonly used as such. It and other policies cannot be properly considered without clear, pre-existing, technical policies followed by factual assessment of individual cases.

3) NPPF seems to be heavily biased towards housing development regardless of local issues, opinions or of true sustainability.

4) Spatial policy, as for all policies, should be managed at the lowest administrative level capable of handling the technicalities. The lower the level, the more fine-grained should be the detail addressed. “Can’t be done” is an acceptable answer, if evidenced.

5) Time frame for policies. A human lifetime is about eighty years. The working life of a house is at least the same. So—eighty years!

6, 7, 8) I suggest maximum delegation of decisions to the lowest local levels.

9, 10) I suggest local ad hoc recruitment of necessary skills and opinions.

11) I suggest obtain, and use, local opinion at the lowest addressable levels.

12) Communities feel that their opinions are not invited and if offered, even with good reasons, are not listened to.

13) Improved fiscal or financial measures. The market, and hence the current value of land for housing, is highly artificial, being driven almost entirely by planning constraints and decisions. If all housing developments of more than one or two houses were on leased land the landowner could receive an attractive annual rent and the cost of the houses would be bricks and mortar only—possibly half what is now paid.

Cambridge Centre for Housing & Planning Research – Written Evidence (BEN0109)

Submission From:
Professor Michael Oxley, Director, Cambridge Centre for Housing and Planning Research (CCHPR), Department of Land Economy, University of Cambridge.

1. Introduction

1.1 This submission focuses on two questions from the call for written evidence:

**Question 6:** What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system? And

**Question 13:** Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

1.2 The focus of this submission connects with the emphasis of the activities of the Cambridge Centre for Housing and Planning Research (CCHPR), which has over 25 years of experience in producing world class policy related research on many aspects of housing and planning. An overview of our previous and current work is available on our website: http://www.cchpr.landecon.cam.ac.uk

2. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

2.1 Government should seek to promote additional house building by all forms of house builders. This includes building for social as well as market sector housing. Thus additional building by housing associations and local authorities as well as by private developers is essential. Government has a role in prioritising increased house building as a policy objective, incentivising production and coordinating the national provision of land, infrastructure and house building. This can be done in ways that are compatible with a large degree of devolution of detailed decisions and which support local democracy. There is a large body of evidence that suggests that whilst land use planning reforms that increase the supply of land for house building have an important role to play in promoting increased house building, changes in the planning system alone will not be sufficient. A wide range of other changes are needed to encourage all forms of house builders to do more.

2.3 Changes in land use planning that promote more house building have been an important aspect of the work of CCHPR. This has included a broad range of topics including learning from how planning works in other countries, the role of section 106, CIL, and planning constraints. Some examples of this evidence base are given below:

More information on all of these is available from the CCHPR website: http://www.cchpr.landecon.cam.ac.uk

3. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?
One option that might be considered is the use of a form of Low Income Tax Credits as used to promote investment in low income housing in the USA. LIHTCs, which have been in operation since 1986, are income-related investment incentives. Developers are able to obtain these subsidies if dwellings are occupied by households whose incomes are low with respect to local median levels. LIHTC support is a federal scheme operated through the Internal Revenue Service (IRS). The Federal Government allocates annual quotas (based on population levels) to each state. Each state allocates their quotas according to a qualified allocation plan (QAP). The QAPs enable each state to prioritise funding for locally important issues (for example, new build or improving existing stock, urban or rural areas). The tax credits last for ten years and projects are required to meet the particular project’s low income requirements for a 15-year initial "compliance period" and a subsequent 15-year "extended use period". Rather than using government to fund, build and manages affordable housing, LIHTCs are used by the federal government to stimulate the private and non-profit sectors into partnership arrangements targeted at providing subsidised housing for specific income groups LIHTCs have helped to build, renovate or conserve more than 2.5 million affordable housing units. The system accounts for 90% of all current affordable housing provision in the USA.

More information is available at

Oxley et al (2014) Boosting the supply of affordable rented housing: learning from other countries, ESRC Project http://www.esrc.ac.uk/my-esrc/grants/ES.K007564.1/read

CHHPR has also made a short film on boosting housing supply which features LIHTCs: http://www.cchpr.landecon.cam.ac.uk/Projects/Start-Year/2014/Promoting-policy-change-to-boost-the-supply-of-affordable-housing/Affordable-Housing-Film

There are further ideas on “financial measures potentially available which would help to address current issues of housing and land supply” in the studies indentified in section 2 above.

Michael Oxley

06 October 2015
Response to the House of Lords Committee on a National Policy for the Built Environment’s Call for Written Evidence on ‘the development and implementation of national policy for the built environment’

Prepared and submitted by Simon Pitkeathley, Chief Executive of Camden Town Unlimited
6 October 2015

1. Camden Town Unlimited (‘CTU’) welcomes the opportunity to respond to this consultation and would like to focus its response on the impact that recent changes to the UK’s planning policy landscape have had on businesses in built-up, urban areas.

2. CTU is a Business Improvement District (BID) elected by its local business members and works to make Camden a better place to live, shop and visit. For that reason the built environment of Camden and its surroundings are a key priority.

3. This paper responds directly to the themes raised in the Committee’s Call for Written Evidence, specifically those relating to community involvement and community impact. The view held by CTU – both by its leadership team and its members – is that business in Camden has suffered from major changes to the planning regime in recent years. This response therefore focuses on the questions, stated below, raised in paragraphs 11 and 12 of the Committee’s Call for Written Evidence.

Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it?

4. Many small and medium-sized business owners collectively form Camden’s creative hub; an area featuring world famous markets and an iconic high street. Its entrepreneurial, start-up culture has meant Camden is home to a number of London’s leading-edge companies. Many of these firms are tenants and have relied on the affordable, well located office space in Camden’s business district, similar to the situation in other commercial hotspots of the capital.

5. These firms’ ability to do business has been impacted by the Government’s amendment of the Town and Country Planning (General Permitted Development) (England) Order. This allowed developers to convert office space to homes without the need for planning permission. This permitted development right (PDR) was extended for a three year period until March 2016. As that date approaches, however, there is now a very real prospect of an extension of expedited permissions and the removal of what were exempted areas (including London’s Central Activities Zone) – without a formal application – on a permanent basis.
6. Though well intentioned, this policy has been devastating for many small businesses which have been turfed out of neighbourhoods by landlords eager to convert property into more lucrative residential space. According to data collected by London Councils, 834,000 square meters of office space have been lost since the introduction of PDR; an indicator that the policy is throttling the operations of small businesses within the capital.

7. The impact on the fabric of Camden’s built environment has therefore been significant in the instance of office-to-residential PDR. Camden has thrived as a workplace to architects, tech start-ups, designers and artists because it offers an iconic location at the centre of a creative business district, well-served by good transport and infrastructure. Yet we have seen that it is often more lucrative for a private landlord to convert creative workspace in London’s key business clusters into high-value flats.

8. As the local BID, Camden Town Unlimited has been cognisant of how unique, open plan work places help young entrepreneurs thrive. Our own Collective spaces have underscored this principle – with some housing up to 500 employees, including many local entrepreneurs – in shared offices in and around the high street and Camden’s culturally-significant buildings. Carlow House was a particular example where the Collective initiative had been a great success, with employees estimated to be spending on average £70-£80 a week in the local area, supporting other local firms in the process. The building itself has now been emptied with the businesses moved on to make way for residential development.

9. CTU therefore believes that Camden presents a strong case study that highlights how reforms to the planning application process have had an adverse impact on the local built environment, in terms of stymying entrepreneurial growth and changing the shape of an iconic and creative economic hub. Going forward, and as an organisation representing a number of SMEs located outside of the Central Activities Zone, CTU is keen to see national policy focused on exempting all of Greater London from office-to-residential PDR. This is the best way to safeguard against potential job losses and ensure an appropriate business-residential balance in London’s neighbourhoods.

How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work?

10. It is the responsibility of BIDs, such as CTU, to represent the views of the firms that they are elected by. This often means that the CTU team is required to engage with national policy makers and other stakeholders in order to put its message across. In the context of planning reforms, CTU has spearheaded a campaign on behalf of all of the BIDs operating in the capital against the proposed extension of office-to-residential PDR. This saw the drafting and delivery of a joint letter to the Chancellor of the Exchequer (signed by 38 of the aforementioned BID teams) and engaged with Parliamentarians.
representing various political parties, along with other Ministers in HM Treasury and the Department for Business, Innovation & Skills.

11. Individual business members, who are more often than not commercial tenants themselves, therefore rely on BIDs to put their case to Government. Yet despite establishing an ongoing dialogue with Government, CTU still represents a number of concerned SMEs which remain in the dark about the detail of the anticipated extension of office-to-residential PDR. Even still, Ministers have not issued a formal response to the consultation covering the planning reforms, opened by DCLG back in summer 2013. In this respect, communities have been able to engage constructively have not received an answer to their concerns. CTU will continue to make this case, and is encouraged by the work of the House of Lords Select Committee on the Built Environment for the opportunity that its Call for Evidence has presented in allowing us to put across these anxieties.

Simon Pitkeathley
Chief Executive

06 October 2015
Memorandum of evidence by the Campaign to Protect Rural England (CPRE) to the inquiry by the House of Lords Select Committee

Organisational views submitted by Paul Miner, Planning Campaign Manager

Introduction and summary

1. The Campaign to Protect Rural England (CPRE) welcomes the opportunity to submit evidence to this inquiry. We are a registered charity with over 60,000 members and a branch in every English county. We are a strong supporter of the planning system as a tool for helping us to use land efficiently in order to provide new development, while also protecting and improving the countryside, and enabling public involvement in these issues.

2. We have focused this submission on particular areas where we have taken an interest in recent years:

   We do not believe that the National Planning Policy Framework (NPPF) or the Planning Practice Guidance (PPG), even when taken together, offer sufficient guidance on planning, development and protection of the built and natural environment. Both the NPPF and PPG promote a short term, narrow approach of releasing more land for housebuilding in locations attractive to large scale housebuilding companies, and offer little in the way of a long term strategy for providing more new housing while making efficient use of land and protecting our countryside assets. (paragraphs 4-6)

   The Government has committed to protect the Green Belt. Since the establishment of the national Green Belt policy in 1955, Green Belts have been a long-established part of a strategy to prevent England’s largest or most historic urban areas from sprawling and encourage regeneration of previously developed land within those areas. CPRE is greatly concerned, however, that the overall short-termist approach of the NPPF is leading to a gradual and unnecessary erosion of the Green Belt through Local Plan reviews. (paragraphs 7-12)

   We can do much to both meet housing need and safeguard our land resource by developing the majority of new housing on brownfield (previously developed) land, the supply of which is renewable and far from drying up. The Government has committed to a range of welcome initiatives to help redevelop suitable brownfield sites. Again, however, a short-termist approach to planning threatens to undermine these initiatives. In particular, the proposed new register of brownfield sites may only include large brownfield sites that big
housebuilders consider to be immediately ‘deliverable’; this would lead to large amounts of brownfield potential being left untapped. (paragraphs 28-30)

The Government’s introduction of neighbourhood planning is a welcome step towards more effective community engagement in planning. In several cases, however, local neighbourhood planning initiatives have been frustrated or undermined by developers looking to promote large housing sites against local wishes. CPRE believes that neighbourhood planning bodies and parish councils should be given a limited right of appeal, to prevent speculative housing applications in situations where neighbourhood plans are in preparation or adopted. (paragraphs 37-8)

Questions

Policymaking, integration and coordination

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

3. For decades, decisions have not been made at the right level, and different aspects of development need to be considered at different levels to be effective, taking into account the principle of subsidiarity. While we support neighbourhood planning, we always need to be mindful of the demands it places on the sustained enthusiasm and commitment of people who are largely volunteers - this is a fragile resource, particularly if their efforts are frustrated by a lack of control over speculative development, or by the actions of higher tiers of decision-making. On the whole, district councils have been proved to be too small to be able to participate effectively in the proper strategic planning of wider areas, and many are also too small to be able to retain specialist skills and resources necessary to understand the proper functioning of their areas (including skills in demography, economic development, ecology, built and natural heritage, energy, etc.) to the detriment of their ability to plan properly. The formation of combined authorities to address strategic planning and economic development issues currently being pursued under the devolution agenda is potentially a better solution than the top-down imposition of the old regions that were often remote from communities and their cultural associations with places. But the current scatter-gun approach to powers and responsibilities could lead to a governance structure that is very difficult to navigate for communities and for investors; devolution does need to be considered more carefully. In particular the new devolved structures need to take explicit account of the complex relationship between urban and rural areas.
2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

4. CPRE is currently unconvinced that planning policy is well co-ordinated between Government departments. In particular, Defra aims on food and farming, and on landscape and environmental protection appear to be sidelined in the implementation of DCLG planning policy in the rush for new housebuilding at all costs. This is despite the NPPF appearing to give significant weight to such issues – apart from the protection of soils, on which it is very weak.

5. Also, the Committee will be aware that the Government’s current programme of devolution deals is leading to combined authorities or other groupings of local authorities taking on more powers to plan strategically and co-ordinate housing growth with transport investment. CPRE is concerned that the new devolved arrangements should result in bodies that are both open to public involvement, and skilled in issues such as urban design and environmental assessment. The Greater Manchester combined authority has shown what results such an approach should lead to by consulting (in late 2015) on the evidence base for a draft spatial framework, and the CPRE regional group has responded to this consultation.

National policy for planning and the built environment

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

6. We do not believe that the National Planning Policy Framework (NPPF) or the Planning Practice Guidance (PPG), even when taken together, offer sufficient guidance on reconciling planning, development and protection of the built and natural environment. Both the NPPF and PPG promote a short term, narrow approach of releasing more land for housebuilding in locations attractive to large scale housebuilding companies, and offer little in the way of a long term strategy for providing more new housing, or making efficient use of land and protecting our countryside assets.
7. The Government has repeatedly committed to protecting the Green Belt. Since the establishment of the national Green Belt policy in 1955, Green Belts have been an established part of a strategy to protect farmland and woodland, prevent England’s largest or most historic urban areas from sprawling, and encourage regeneration of previously developed land within those and other areas. International comparisons suggest that without the strong protection Green Belts offer against many forms of development, much more farmland and woods would be consumed by urban sprawl, especially around large cities. Yet with the increasing global pressures from climate change and population growth, our farmland and woodlands will become more valuable in future, not less. The calls for more development in the Green Belt assume that this land is only valuable if built on, an assumption that is fundamentally flawed. The Green Belt is needed now more than ever.

8. Around two-thirds of Green Belt is in agricultural use, and so also provides, at a minimum, an intrinsic sense of well-being for people by providing views of an open landscape. The permanent protection of the land from most forms of development, particularly housing, has safeguarded and enabled the further provision of a range of environmental benefits including a particular concentration of local nature reserves, public rights of way, and broadleaf or mixed woodland. CPRE is greatly concerned, however, that the overall short-termist approach of the NPPF is leading to a gradual and unnecessary erosion of the Green Belt through Local Plan reviews.

9. The Prime Minister stated before the general election that ‘Development on Green Belt is at its lowest rate since modern records began 25 years ago.’ This is unlikely to remain true for much longer. Research carried out in June 2015 on behalf of BBC Radio 4’s File on 4 programme by Glenigan, a leading provider of construction data, found a sharp increase in the number of houses securing full planning approval in the Green Belt. In 2009/10, 2,258 homes were approved. In 2013/2014, the number had risen to 5,607. By the following year, 2014/2015, it had more than doubled to 11,977.

---

10. CPRE analysis has found that Local Plans are proposing more than 226,000 houses on the Green Belt. As proposals in Local Plans are at an earlier stage in the pipeline than full planning approval, the vast majority, if not all, of these houses will be in addition to the figures mentioned by Glenigan. Ministers have taken action to address some of the most unnecessary Local Plan proposals. The Government now needs to act on the national imperative to protect the Green Belt by making clear that Green Belt land should only be developed in truly exceptional cases, and that economic growth does not in itself justify an ‘exceptional case’.

11. CPRE has noted that the Committee has already taken oral evidence on the issue of Green Belt from other sources. We are deeply concerned that a range of developers, economists and think tanks have made calls for a major weakening of Green Belt policy in recent months, based on often highly questionable evidence about both the value of the Green Belt in its current largely undeveloped form, and the gains that would result from developing it as housing27.

12. More woodlands and wetland in the Green Belt could also play a highly significant role in enabling the recovery of nature and adaptation to climate change in urban areas, as the Government’s Natural Capital Committee has also pointed out28. In April 2015, leading environmental economist and Chair of the NCC, Dieter Helm, published a paper which also seeks to challenge many of the arguments for Green Belt deregulation put forward by developers and other economists.29 As Helm argues, where the quality of Green Belt land is poor, the solution is to improve it. For example, the Community Forests initiative has turned more than 20,000 hectares of often degraded Green Belt land into woodland or other natural habitats since 1990.

13. We would be keen to discuss these issues further with the Committee.

4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning

---

Campaign to Protect Rural England (CPRE) – Written Evidence (BEN0084)

and built environment policy be looking?

14. Ministers are already formulating a spatial perspective to national policy in their agreement of Growth Deals in the early part of 2015, and currently through assessment of bids for further devolved powers over housing (mentioned above). But this is neither explicit nor transparent, and for the most part protection and improvement of the natural environment have been considered fleetingly if at all. The lack of a long term strategy for land management, in particular, is meaning that we are not taking sufficient steps to address the decline in biodiversity within the natural environment.

15. CPRE believes that there is a strong case for introducing a spatial framework for land use policy in England. A more explicitly spatial element to national policy would enable Parliament and civil society groups such as CPRE to better consider progress on rebalancing both the economy and the balance of growth between regions, reducing pressure on the South East and making progress towards the ‘Northern Powerhouse’. This would allow better use of resources, for example more use of both brownfield sites and existing capacity in airports outside the South East in preference to a new runway.

16. CPRE commends the broad methodological approach taken by the Government Office for Science in its Foresight Land Use Futures project30. CPRE had input to this study, which reported in February 2010, although we did not endorse all of its conclusions. The approach taken, however, was broadly sensible: it had an integrated analysis of land use looking at agriculture and forestry as well as expected trends in housing and development of the built environment, over a 50 year horizon.

Buildings and places: New and old

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

17. New homes are most efficiently provided through the plan-led system. This is the best means we have of ensuring that development decisions are based on democratic and transparent policies, and that environmental, social and economic needs are met. Local

---

plans are taking longer to produce, primarily because of issues around deciding housing numbers. Unclear national guidance on how to assess housing ‘need’ and the requirement to meet that need in full are creating difficult decisions for local authorities. The result is that environmental constraints are given little weight compared to meeting arbitrary, inflated growth targets. Setting high housing targets will not mean those targets will be met. It simply provides developers with a selection of sites to choose from and only the most profitable, usually green field sites, will be developed. CPRE has commissioned consultants to prepare research into housing need methodologies and issues that they are causing. This research will be ready by the end of October and we are keen to share this with the Committee as soon as it is available.

18. A proper plan-led system should also give confidence to all investors - not just housebuilders - as well as communities, thereby helping to reduce local opposition to schemes and speed up delivery. The current system undermines this principle by allowing the five year land supply rule to render local policies on housing void. A 2014 CPRE report found that 72% of appeal decisions for housing developments on green field sites were approved when a local authority could not prove they had a five year land supply31.

19. Greater capacity, diversity and competition would ensure more of an emphasis from housebuilders on quality and design. In order to help more small and medium size builders enter, or re-enter, the industry we suggest that more could be done through the NPPF and local plans to prioritise the allocation of smaller sites for development. Consideration should also be given to amending the NPPF to require local authorities to allocate land specifically for self- and custom-build housing. This could be through a requirement that any sites allocated for a development of more than 20 houses should include a proportion of the site being allocated and available for self- or custom-build.

20. If the Committee is to promote ways in which a sustainable uplift in housing delivery is to be achieved they must advocate the changes necessary to enable local authorities to become significant providers of social housing once again. In doing so, however, they should be clear that homes being provided by local authorities should be in addition to, not instead of, those affordable houses provided by housing associations.

31 CPRE, Targeting the Countryside, September 2014.
21. It is also essential that increasing housing output is not considered in isolation from the provision of services, employment sites, retail, leisure, education and other social facilities. In order to boost housing numbers in a sustainable way, that meets defined needs, recognition should be given to the importance of the location of these houses and where and how future residents will do their grocery shopping or send their children to school. This is why the plan-led system, which seeks to consider all of these issues in the round, while operating in the wider public interest, is so important.

22. The Productivity Plan announced a number of measures aimed at speeding up housing delivery. CPRE welcome the Government’s recognition that the local plan process is taking too long. As of the end of August 2015 only 27% of local planning authorities had a post-NPPF local plan in place. However, it is not clear how the Secretary of State intervening in the production of local plans will actually speed up the process or how the views of local communities will be safeguarded.

23. The Productivity Plan also proposes extensions to the existing performance regimes. CPRE believes that the Government’s emphasis on the time taken to process planning applications, to the exclusion of other important considerations, is both insufficient and unhelpful as the basis for an analysis of performance within the planning system.

24. We believe that ‘quality’ of decision making is best measured by rates of local plan adoption and progress towards the achievement of key planning outcomes and objectives, such as the re-use of brownfield sites and maintenance or improvement of the natural environment. An oversight of the rates at which local planning authorities approve applications that are departures from their development plan should also form part of any quality assessment.

25. Both the Starter Homes initiative and extension of Right to Buy to housing associations are likely to lead to a reduction in the construction of new homes, especially of rural affordable homes. Communities and landowners in rural areas are supportive of new housing when it meets a local need. Both of these measures, however, will mean that there is no guarantee that housing association homes or Starter Homes will remain available to meet local needs in perpetuity. Landowners will be reluctant to sell land for housing which, within a few years, will be available at full market rate. The local community will also have
no incentive to support the development of houses which will likely end up in the hands of commuters or as a second home.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

26. CPRE welcomes the pledges of the Government, following the 2015 general election, to introduce (i) a new statutory register of brownfield sites; and (ii) a new brownfield regeneration fund worth up to £1 billion. In 2014 we commissioned the University of the West of England to compile and analyse evidence submitted to the National Land Use Database of Previously Developed Land, but not published by Government, which showed that there is enough brownfield land suitable for at least 975,000 homes. Our report also demonstrated that brownfield land is not a finite resource. The supply of brownfield sites is constantly being replenished, and usually, many more homes can be delivered on a brownfield site than an equivalent area of greenfield land. Government land use change statistics show that, in every year since 2004, we have consistently built an average 50% or more houses on brownfield sites than on equivalent areas of greenfield.

27. CPRE has continued concerns that the NPPF does not sufficiently encourage brownfield redevelopment. There is no policy requiring that brownfield sites in an area should be reused before greenfield, and local authorities in areas such as Cheshire East and North East Lincolnshire have been prevented by Planning Inspectors from insisting on such an approach at the local level. Following the conclusion of City Deals, CPRE has seen encouraging signs that a number of the bids submitted up to September 2015 by local authorities for further devolution in areas such as Cheshire, Hampshire, the West of England

(or the former county of Avon) and West Yorkshire are bidding for further powers and/or resources to help bring brownfield sites back into use. A brownfield first planning policy would help such initiatives go further by encouraging housebuilders and lenders to do more to provide supporting finance, rather than to divert this into competing greenfield development.

28. We are also concerned that the Government may seriously undermine its welcome new pledges by linking the proposed new register with further deregulation of the planning system. There are particular concerns that the new ‘permission in principle’ route proposed in the Productivity Plan may short circuit the Local Plan process, and create additional cost burdens for already stretched local planning authorities.

29. CPRE also has concerns that the proposed new register could significantly underestimate the potential of brownfield land. It is essential that the register is backed by policy and guidance that encourages local authorities to proactively seek out redevelopment opportunities on existing developed land which is currently in use, but could be used more intensively, and does not yet have planning permission. Such an ‘urban capacity’ approach worked well in the 2000s and continues to work well in London, but in the rest of England local planning authorities largely depend on sites being nominated by potential developers.

Skills and design

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

30. The UK has a very good skills base in the built environment, one that is world renowned. But local government institutions have comparatively little (and reducing) resources to use them, whereas investors and developers have almost unlimited resources by comparison. This leads to a power imbalance that is detrimental to local democracy as well as to the natural environment, as the agenda for local planning policy is increasingly dominated by accommodating housing numbers.
31. Local planning authorities and communities should be given the right to reject development proposals that do not meet their aspirations, and national government, through their executive agencies, such as the Planning Inspectorate, as well as statutory consultees and advisory bodies, such as Historic England and Design Council CABE, should support councils and communities in demanding better quality development.

32. CPRE would commend the use of design panels and reviews as an excellent means to deliver a multidisciplinary approach. We have been involved, for example, in the Visual Impact Provision Stakeholder Advisory Group, formed by National Grid with the objective of reducing the impact of high voltage overhead lines in National Parks and Areas of Outstanding Natural Beauty, and to this end deciding on individual schemes where this objective could be best achieved.

Community involvement and community impact

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

33. Tranquillity is a central part of why the countryside matters deeply to so many people and the reason many want to spend time there, and CPRE’s work on tranquillity can be used to help identify areas of the countryside that can be used as a resource to help people minimise or avoid negative impacts of land use such as excessive noise and light pollution or visual intrusion. The Government first acknowledged tranquillity as a special quality of the countryside in 2000. Since then it has been recognised by bodies such as the Civil Aviation Authority in its Future Airspace Strategy, High Speed Two Ltd, and Natural England, as well as many National Parks and Areas of Outstanding Natural Beauty (AONBs). In 2012, tranquillity gained recognition in national planning policy for the first time. The NPPF now encourages local authorities to identify and protect areas that are valued by the public for their tranquillity.

34. In May 2015 CPRE surveyed local planning authorities to find whether they had a tranquillity policy in place, for how long and if it was due to the NPPF. The key findings highlight the need for the Government to issue more clarifying guidance and monitor the
take up of the policy in the NPPF. Two fifths (29 of 69) of planning authorities or AONBs had a policy and most (four fifths) were in AONB Management Plans or National Park Local Plans- designated landscapes with higher protection and generally higher levels of tranquillity. Most of these have had policies in place for five or more years, and do not reflect the more recent policy in the NPPF. Of local authorities covering urban and rural areas outside of ‘designated’ landscapes or the wider countryside, relatively few (one in seven) have tranquillity policies in their Local Plans. A small number – four - had developed an entirely new policy due to the NPPF and four others had adapted theirs to comply with the NPPF35.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

35. CPRE strongly supports the planning law principle of a plan-led system of managing development. (See response to Question 6 above.) We have therefore welcomed the Government’s policy, stated in the NPPF, of seeking to get Local Plans in place in all local authorities across the country; as well as recent statements36 by both the new Secretary of State Greg Clark and Housing and Planning Minister Brandon Lewis that have sought to encourage further progress. But in our view the preparation of Local Plans is being actively hindered by the lack of clarity around the NPPF policies on housing land supply, leading to constant disputes between developers and planning authorities. Principally for this reason, the rate at which local authorities are getting finalised (sound or adopted) plans is now significantly slower than the two year period prior to the NPPF coming into force37. Planning Inspectorate figures show that 27% of local authorities do not have a post-2004 Local Plan in place, and fewer still have had a plan adopted or ruled ‘sound’ since the NPPF came into force.

36. The Government’s introduction of neighbourhood planning, below Local Plans but capable of having the same or greater weight than Local Plan policies, is a welcome step towards more effective community engagement in planning. Progress in the actual making of neighbourhood plans (as distinct from the designation of neighbourhood areas) has

however been much slower than officials originally hoped\textsuperscript{38}, and CPRE believes that much of this is due to either (i) the lack of up to date Local Plans in many areas, or (ii) direct challenges by developers, or both. In several cases, neighbourhood planning initiatives have been frustrated or undermined by developers looking to promote large housing sites against local wishes, but encouraged by policies in the NPPF. Since May 2015 CPRE has only been able to find one instance in which Greg Clark has intervened in and directly refused a planning appeal for a proposal which would compromise a draft neighbourhood plan.

37. CPRE believes that neighbourhood planning bodies and parish councils should be given a limited right of appeal, to prevent speculative housing applications in situations where neighbourhood plans are in preparation or adopted. We believe that such a mechanism would be rarely used in practice, but would be an active incentive to developers to help bring more neighbourhood plans forward.

Financial measures

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

38. At present, the New Homes Bonus scheme is the most significant financial incentive used by Government to encourage local authorities to release more land for housebuilding. CPRE believes that it should be substantially reformed, because in its present form it has the damaging outcome of encouraging local authorities to permit or accept poor quality new development, without having had a chance to plan properly for it. The scheme has been widely criticised, including by both the National Audit Office in March 2013 and the House of Commons Public Accounts Committee in October 2013. In July 2014 an investigation by the Financial Times highlighted that the scheme had served in effect to redistribute public funding away from areas in the Midlands and the North in need of regeneration, to areas of London and southern England\textsuperscript{41}.

\textsuperscript{38} Based on a comparison with the figures provided in DCLG: Localism Bill: neighbourhood plans and community right to build Impact assessment, January 2011, p.14 and figures on current take up published at https://www.gov.uk/government/collections/notes-on-neighbourhood-planning.
39. We believe therefore that the New Homes Bonus should be substantially recast. Some elements of the current scheme are valuable: in particular those which support bringing empty homes back into use. In other cases, the scheme should explicitly support the successful delivery of schemes in a development plan (local plan or neighbourhood plan) or local development order that is either adopted or at examination. This would retain the focus on rewarding an increase in housebuilding, as the New Homes Bonus originally intended. It would also be more likely to reward well planned, good quality development that is supported by the local community. The scheme could also be used to encourage the granting of planning permissions on brownfield sites.

40. One other potential barrier to the promotion of custom-build (see Question 6 above) at the moment is that zero-rated VAT, which is normally applied to labour and materials for new build houses, does not apply. This anomaly needs to be addressed if we are to promote a more diverse housing supply sector. Alongside this, CPRE has long opposed the differentiation between VAT on materials and labour for new build houses compared with the refurbishment of existing homes. But as custom build is about providing new build properties, this seems to be a particularly significant barrier to this approach becoming more of a prominent part of the housing delivery sector, as in other countries such as France and Germany.

Examination of Witnesses

Dr Hugh Ellis, Head of Policy, Town and Country Planning Association, and Paul Miner, Planning Campaign Manager, Campaign to Protect Rural England

Q54 The Chairman: Good morning and thank you very much for giving up your time to come and see us. You know that we have been doing this campaign, or at least this inquiry, since July. You have in front of you a list of the interests that have been declared by members of the Committee. A transcript of the meeting will be taken and published on the Committee’s website and you will have the opportunity to make corrections to that transcript where necessary. Could I begin by asking each of you to introduce yourself briefly? This is for the record, because everything is being broadcast, and for the help of the transcribers, who will want to know who is speaking.

Dr Ellis: My name is Hugh Ellis and I am Head of Policy at the Town and Country Planning Association.

Paul Miner: My name is Paul Miner, I am Planning Campaign Manager at the Campaign to Protect Rural England. I am also a chartered town planner and fellow of the Royal Geographical Society.
The Chairman: Thank you very much indeed. You have copies of the questions. I am going to ask the first question. How could the National Planning Policy Framework be reformed to improve its effectiveness? We will take it in alphabetical order: Dr Ellis.

Dr Ellis: It would need fundamental reform. The NPPF does not provide the framework to deliver the kind of high-quality communities that the TCPA has the aspiration to deliver. This is partly not because of its individual content, some of which is actually very positive; it is also about the weight given to that content in planning. It is particularly to do with a couple of very powerful clauses, the viability test being one of them and the presumption in favour of the developer perhaps being the other.

There is a really important question about whether or not the Government’s outward commitment to place-making is matched by a comprehensive structure for town planning in this country and by a comprehensive set of policies. In our view, it absolutely is not. Place-making in England is certainly in its poorest state since the 1947 town planning settlement. That settlement was extremely important, embodying as it did all the learning that had gone before and setting a framework for extremely ambitious high-quality development. We are not delivering that framework at the moment, so, certainly from the TCPA’s point of view, we would like to see a fundamental change to policy that really emphasises not simply numbers and quantity, but critical issues around the complexity of place-making.

The Chairman: That is very interesting. Does that mean there has been no progress at all since 1947?

Dr Ellis: It means that the 1947 system created tremendous ambition as a settlement around town planning, with everything from national parks right through to a strong concern with the built environment. Broadly speaking, that settlement has been undermined and, compared to other European countries, certainly in relation to design, we have not achieved what they have managed to achieve. That is measured precisely in the reduction in standards. We have lost a tremendous number of critical standards from the built environment. Those standards were absolutely important; they started with Parker Morris but you could go on and end with zero carbon. The abandonment of key place-making standards in the built
environment has been an absolutely distinctive feature of English planning, certainly over the last 10 years.

**Lord Inglewood**: Chairman, could he tell us which ones he recommends we look at?

**Dr Ellis**: I would start with Parker Morris. That was an attempt, for example, to set important space standards, and I would reflect on the kind of space standards being delivered in London—for example, accommodation with flats of 10, 12 or 13 square metres being delivered. Parker Morris was an attempt, not perfect by any means, to try to set a bench floor below which the performance of the built environment should not fall, and it was abolished in 1980.

Since that time, we have had a variety of different ways of dealing with space standards and other kinds of standards, culminating most recently in the Government’s building standards review. That is really worth looking at, because it sets a set of standards for the built environment that is not a national minimum. All those standards are a menu that local governments can choose from, but each standard has to pass through the viability test, which is being used to strip out local plan policy on built environment standards, because the private sector can argue convincingly that it cannot afford to include them. The outcome of that for the kind of built environment we are shaping is a lower level of performance, which has important implications for health, wellbeing and the future of communities and place-making.

**Q55 The Chairman**: That is very interesting, and also very disturbing. You said that other European countries started off in 1947 at the same sort of level—at least, that is the implication—and they have built on and improved their standards. Is there any published evidence to that extent, other than the eyes, when we go and look?

**Dr Ellis**: That is important. Certainly from the TCPA’s point of view, we spend a lot of time in Europe and there is a mass of academic and practice work from the Netherlands, in places like Almere, or from Germany, in places like Freiburg and Hamburg—all sorts of places that have delivered and surpassed our cutting edge. It is important that the town planning inheritance in Britain is the inheritance of Ruskin and Morris. It was extraordinarily ambitious and extraordinarily high-performing, and we have lost that edge, certainly compared to Germany. Perhaps the clearest example is the housing performance standards of the
Germans; certainly, their ability to build Huf houses and zero-carbon homes is quite extraordinary.

**Paul Miner**: The CPRE has always seen the planning system as hugely important to addressing some of the most fundamental questions that this country faces, in particular how we make best use of land, which is a very restricted resource in countries as small as England or the wider UK with such large populations. We need a long-term approach to how we address issues such as how we build the housing that we need, while protecting our valued and increasingly important natural environment.

Our concerns with the National Planning Policy Framework have always been that it is far too short-termist. It privileges getting a five-year supply of deliverable housing sites above everything else, and it does not really think about where these housing sites should be best located or how they might be delivered best over time to get better places, in the fashion that we have been talking about.

Also, planning, for us, is hugely important in protecting our natural environment resources, and there is very little in the NPPF about how we might get a better natural environment through things like promoting landscape-scale conservation or the recovery of nature. It encourages local authorities to address those issues, but the encouragement is very weak.

We have seen time and again with the plans that are coming forward that the overriding main issue has always been how we get these short-term housing sites.

**The Chairman**: If we just look at the question I asked you—how the National Planning Policy Framework could be reformed to improve its effectiveness—what two things would each of you want at the top of your list?

**Paul Miner**: From our perspective, the NPPF needs to give more encouragement to the local plans and to set a clear lead, such that large-scale speculative planning proposals for housing that are not in accordance with local plans should generally be refused. That would enable local authorities to put more resources into plan-making and developers to work more constructively to get local plans into place. We would also like to see stronger protection for the green belt. The Government should largely maintain existing policy, but they need to be clearer when exceptions to policy are and are not acceptable.
**The Chairman:** We will be coming to the green belt, but that is very helpful, thank you. Dr Ellis, what two things would you like to see?

**Dr Ellis:** A fundamental but perhaps more minor one is that the NPPF needs to reflect the place of town planning and spatial planning at the heart of the creation of a civilised society. So far, we have had reform driven by the idea that planning is anti-competitive and that planning is somehow a brake on innovation of design. All these things are not evidenced and they have been hugely destructive to the creation of long-term sustainable place. The NPPF must recognise and create a line that establishes planning as a truly creative enterprise, as much technical as artistic, so ambition needs to come back into planning.

Secondly, the viability test is the critical issue. It is economically illiterate, if that is the right phrase, in the sense that it creates an economic frame for development that ignores the fact that creating, for example, lifetime homes that do not have to result in large costs to adapt buildings for people perhaps in later life is important. Those policies and requirements are being struck down using the viability test, because it simply focuses on the needs of landowners and developers in the short term. That needs to change.

**Baroness Andrews:** I was just going to ask whether we could have a note on the viability test. Mr Ellis has exemplified it in relation to lifetime homes, which is extremely important, but you can also exemplify it in relation to the things you have been saying in your evidence about zero carbon, design and so on. We have discussed it in the Committee in relation to our volume of housebuilding, but we have not drilled down into the general impacts, so I thought that might be useful.

**The Chairman:** It would be very useful indeed if you can do that for us.

**Dr Ellis:** Yes, certainly.

**Baroness Young of Old Scone:** If you are going to give a note, could you also list, as Lord Inglewood asked, the building standards that you believe have gone in the recent past—perhaps not 40 years ago but in the last 10 years?

**The Chairman:** Cutting corners, yes; quite.

**Q56 Baroness Whitaker:** One of the things we have lost is a national spatial standard. We have had a bit of discussion about that. The Government evidence was very clear that it was
not needed, but I would like to ask both Dr Ellis and Mr Miner how a spatial framework for land use policy in England could help to develop built environment policy objectives. Do we need one for that purpose?

**Dr Ellis:** We absolutely do. Nothing could be clearer. We are one of the very few advanced economies that have neither comprehensive national planning nor regional planning. It is very important to say, by the way, that this argument gets bogged down in people saying you are implying some kind of Stalinist end-state vision, but nothing could be further from the truth. The process of planning is about the messy business of trying to mediate change. Having some sense of engagement with that change at a national level simply reflects functional geography, and geography is something that is absent from public policy at the moment, in the most extraordinary way.

As a quick example, and there are many, High Speed 2 was a railway without a plan. It is the idea of the potential demographic opportunities. Whether you think the railway is a good idea or not is a separate issue, but, if you are going to have it, the idea that you would then link that to a series of critical developments that could deal with demographic change in England seems sensible, yet that was absent.

There is absolutely no doubt that the kinds of challenges that play out at a regional and national tier, particularly climate change, demographic change and transport, are critical in a small nation. A national plan would not tell people what to do. It would set out the evidence very clearly—if you like, a laboratory of spatial evidence—at a national level, and then it would perhaps set out strategic areas of growth and it would be relatively light-touch. That is the model that other nations use. That then supports the work of local action, does it not? The terrible tragedy for England is that it cannot have a sensible debate about national and local. Both things have to happen effectively to have an effective and efficient economy, and an inclusive society.

**Paul Miner:** Ministers are already doing some form of national planning, but they are not doing it in a way that is perhaps as accessible or transparent as it could be. For example, the recent round of city deals that have been agreed all have some kind of planning implication in terms of schemes that Ministers have said they will support, but we need to see that
delivered in a more transparent and accessible way that also looks at opportunities to improve the natural environment. It is very much focused on short-term economic growth projects and much less on how we can manage our environment in the longer term for public benefit.

When we talk about a national plan, Government departments have done this kind of work before. If you take the national policy statements created since the Planning Act 2008, there is one on nuclear power which actually says where in the country new nuclear power stations will go, so the Government can do it, but it is a question of their being prepared to be open and honest with the country about the choices we face in terms of land. As Hugh rightly pointed out, we need to have a better geographical understanding of the pressures we face. If you look at the UK and England in a wider international context, we are a country that is probably better placed than many others in the world to deal with the pressures of climate change, for example, because we are in the northern hemisphere. We have seen recently through growing immigration that the UK is a desirable place to live and people want to come here, so we need to think about how we can best manage demographic change and other issues in the longer term if we are to avoid some huge pressures coming up unforeseen to bite us in the long run.

I would pick up in particular on evidence given by one of the people who previously came to this Committee: Mark Tewdwr-Jones, who was involved in the Foresight Land Use Futures project. Some of the points he made were incredibly valuable, and the approach taken by the Foresight study was sound. We did not necessarily agree with all its conclusions, but the approach it took was a very good one and it is a great shame that the issues it raised and the points it made have been buried. That work could be very beneficially dusted off and brought back into the public limelight.

**Q57 Lord Inglewood:** I begin by pointing out that I am a member of the advisory panel of the Friends of the Lake District, which you will know is the Cumbrian branch of the CPRE. I would like to ask each one of you—I think you have already intimated what your reply is likely to be—whether you think the plan-led system for development planning is fit for purpose. Following on from that—and concisely, please—are there any particular changes you would like to see?
I would also like to go back to the earlier question: are there any other countries, bearing in mind that nothing is exactly comparable, which you think point our country in a better direction?

Dr Ellis: The quick answer is that the plan-led system is critical, but it is not fit for purpose. It is very important that, in legal terms, England has never had a plan-led system compared to European-style systems, for example. It has always had this element of discretion, which is a very important part of the process of the 1947 settlement.

I have to preface my comments by saying that we are at an extraordinary time. The Housing and Planning Bill will transform local plans, so the question framed here has to be in the context of the Government’s introduction of zonal planning. Zonal planning is a radical change, and Clauses 102 and 103 of that Bill mean that future local plans in England will be of an entirely different character. Attempts that are passing around to say that this is an evolution of English planning are really quite wrong. Zonal planning plays out in the United States in a particular form. Its implications there for social and racial segregation have been enormous. It has been challenged in the Supreme Court on the basis of its outward use for racist motives in American cities, so there is an enormous issue about how zonal planning plays out. However, zonal planning in European countries can be very positive. There is something here that perhaps we could use as a model.

The core of it, certainly from communities’ points of view, is that it is very difficult to understand why plans are made and ignored. That is a great difficulty for the planning system and something that brings planning into disrepute. We have to grapple with this critical issue of whether we have a plan-led system or not, if plans are going to be overturned in the way Paul has described. The appeal success rate on major housing is up at 50%, which is historically unprecedented; it has never been that high in the post-war period—it reached about 43% in 1986-87—so we have an appeal-led system, truth be told.

The Chairman: We heard about that before and I understand why it arose.

Dr Ellis: In that sense, there is a need for a fundamental look at the plan-led system.

Lord Inglewood: Have you a clear idea of your own of what you, as an individual who has knowledge and considerable expertise in this area, would do?
**Dr Ellis**: Yes, I would go straight to the Dutch system. Although the Dutch system is currently being deregulated, which is a lesson they are learning from us, it has a combination of elements and cultures and is a very strongly public-sector-led planning process. The private sector, of course, is the developer still, but that sets plans. If you want to change—the success of Almere and those places is having a very strong progressive plan. People buy into that plan and the plan is then delivered through development corporations and other mechanisms through the public sector. That was the framework; of course, they got that framework from us. That was the framework we created in the first 20 years post-war, and the Dutch said, “That looks very effective. We will copy that”. In some senses, we are just borrowing our learning back.

**Paul Miner**: It seems to me that we are moving towards a zoning system but, if we are to do that, then we must properly manage that and make sure that local authorities have the proper amount of time to adjust to a new zoning system. Some of the measures in the Housing and Planning Bill—for example, the proposal for a new permission in principle—are going to have a huge effect on how local plans operate. In future, local plans are going to have to go into a lot more detail about how individual development schemes are brought forward, the absolute number of houses, how they are designed and the supporting infrastructure. That will need to be properly managed. There are only one or two local authorities—Cherwell in Oxfordshire, for example—that currently have local plans that could in any way be described as following a zoning approach.

Yes, it matters hugely what kind of zoning approach you take. In Germany and the Netherlands, zoning works well, encouraging custom builders to come forward very quickly with new developments that look very good. But, regarding the American system, Hugh made the point about entrenching racial segregation and there are big problems in terms of urban sprawl as well. The kind of zoning that has been entrenched in America has encouraged a particular model of very low-density housing development, and there are serious dangers if we started going down that road in this country. We are seen as a leader across the world in preventing urban sprawl.
Baroness Andrews: I want to try to roll up my two supplementaries, Lord Chairman. First of all, I want to take you back to the spatial thing, Dr Ellis. How can we reintroduce a spatial element back into planning? What would be the process? Would we be talking about reintroducing the regional spatial strategies, or about taking the duty to co-operate and adding something extra? What do you think has been the impact of the absence of a spatial strategy on the power of developers to drive their plans through the system by appeal, as it were? My other question is not really related; it is to do with the Housing and Planning Bill and what you are saying about the march of deregulation. To what extent is that Bill going to exacerbate the failure of the planning system, because deregulation has simply gone too far to guarantee any standards of quality and spatial proportion, shall we say?

Dr Ellis: In reverse order and as quickly as possible, the proposition behind the deregulation of planning is that you unleash a private sector tiger that will build enough housing at a high standard. The extraordinary thing about the deregulation of planning is that, up until March 2015, in that calendar year, we approved 261,000 new units of housing through planning, and the private sector on its own, without housing association support, built 112,000, and starts are declining.

The interesting thing about the European model is, if we could take the ideology out of this, we would have a dreamy scenario. When I talk to the Germans about the debate in planning in England, they say, “We see planning as a toolbox. We take tools out of the box and we use them to create places. You see the toolbox as intrinsically bad before you have opened it”. The debate on planning and place-making needs to go back to where it was when the 1947 system was there. Four eminent lawyers, establishment figures, solved the problems of how you manage land democratically, and the 1947 system was born. Those principles, by and large, should remain.

Deregulation is not the answer, because the built environment is so special. Land is such a special commodity. Housing is also a special public good. All these things mean that the character of building places has always been unique; it has been unique for 4,000 years and it remains unique as an enterprise. It should be one of the great enterprises of a civilised society. The deregulation of the built environment will not help the Government’s objectives
in building more homes. In our view, it certainly is building a quality of home that is substandard. Gardens are not heresy—it would be quite nice to have some for people. The same is true for space standards and important design standards. This debate is heading in one direction and it is the wrong direction.

Yes, of course the end of regional spatial planning was politically expedient, but it was intellectual vandalism. Regional planning contained data and data are not intrinsically bad or political; they are simply data. What we needed there was a way of reflecting that. Now, the duty to co-operate can never be made to work. It is fundamentally a process of getting people to speak to each other and demonstrating that they have spoken to each other. That is not a proxy for strategic planning.

I will just give one final quick example, which could make our lives so much easier. Everyone thinks the new towns programme was a big programme imposed on local communities. It turns out that Milton Keynes was a locally led development. Buckinghamshire County Council made a judgment in the early 1960s that they did not want urban sprawl in all their villages. They wanted to concentrate a housing growth problem and deal with it strategically. The duty to co-operate cannot let you do that. In terms of what this nation needs, where there are 20 district councils and 18 of them might be constrained, the logic surely has to be for sustainable development. This is what regional planning did. You decide on strategic growth areas, as a well-service of infrastructure, that do not have the impacts on the natural environment that Paul described, and you develop places along those lines.

Baroness Andrews: Does this need legislation?

Dr Ellis: No, the legislation is all there. In fact, the legislation for the new towns programme, the New Towns Act, which we are suggesting needs to be updated, is still very powerful. The issue is that people do not want to use it because they think it is about central imposition, but, actually, the programme was locally led, in part.

Baroness Andrews: It could be done by leadership and practice incentives by Government.

Dr Ellis: It could be done, yes. It does not require a new law. It requires a new understanding and a new culture to see the meeting of housing needs, not in whole—I am not suggesting all of it is met like that, because places need to grow more evenly—but there is a very powerful
case for meeting some of the major housing need through strategic new highly sustainable communities. That is an idea we pioneered and it is an idea, interestingly, that we have turned our back on. Bicester/Cherwell is an example, obviously, and then you have Ebbsfleet, which I am slightly more dubious about. There are issues about how we get strategic growth happening. The tools are with us; the issue is much more about whether we care to use them.

**Paul Miner:** There is no doubt that the way regional strategies were abolished had the kinds of effects Baroness Andrews was highlighting in her question. Many local authorities across the country put a lot of work into regional plans. Although they are often characterised as top-down plans, in fact, conferences of local authorities put these plans together. Many local authorities relied on regional plans to give them the kinds of strategic policies they needed. I do not think many people are suggesting that we return to the old model of regional planning; also, Ministers realise that they need to bring strategic planning back. In many cases, we are seeing with the city deals that local authorities are being specifically encouraged to have some kind of formal arrangement for doing a strategic plan. Greater Manchester, for example, is now producing a joint spatial plan. We think that is an encouraging sign, because you need to do planning at that level.

What particularly concerned us about the way the regional plans were abolished was that it was done in a way that did not allow local authorities to retain the policies or the evidence they needed. Also, it got rid, in practice, of the brownfield-first approach that we had in national policy during the 2000s. When the regional plans were in place, they looked to concentrate development on brownfield sites within the major conurbations but, since the NPPF has come into force, local authorities have had to work out what their own housing need is and then meet it in full within their own area. The way that has been done in practice has caused huge problems, because there is no clear agreed method for assessing housing need or deciding what objectively assessed need is. We are going to produce further evidence on this shortly, which we would be very happy to share with the Committee, but it has caused huge problems for local plan-making and we need government to be clearer about how housing need should be met and give more encouragement to local planning again and, in particular, strategic plans.
The Chairman: Anything you have that you think would enlighten us would be very useful. I know we are making a rod for our own backs; we have a huge amount of evidence already, but we still have to try to do this well.

Q59 Lord Inglewood: Mr Ellis, you said that we have an appeal-led planning system. Do you think this is the absolute antithesis of a democratic planning system? Invariably or very frequently, you have councillors who take decisions at development control level or plans that have been put together with public consultation. We are then seeing the wider system saying, “Actually, we do not want to do it the way you want to do it. We want to do it the way the system wants to do it”. As you yourself said, planning is an art and it is also a technique. It is not random. How do you see the relationship between the appeals end of it and the democratic input interfacing?

Dr Ellis: It is very troubling. Zonal planning on a European scale removes that tension, because it genuinely is a plan-led system. There is no doubt that is why the Dutch system has those advantages. High levels of appeal traditionally bring the system into disrepute. It also raises this question again, which is fascinating but unresolved, of how much power we want to give communities over their future. The appeal system really brings that into focus. There is an insufficient amount of public policy time devoted to resolving that problem. The last full investigation of people and planning was in 1968—the Skeffington report. It is extraordinary that no government since that time have set anything up, neighbourhood planning aside, which is not a full solution to the problem you describe; it is a separate problem. We have not worked out how much power we want to give communities.

For us as an organisation primarily focused on providing a decent home for people, we want local communities to face their responsibilities for providing people with a home, but you have to have a system for doing that, it seems to us, that retains that democratic element. People will reference the Chinese system of planning and always say it is much more effective than ours, but it is the wrong exam question, surely. We are trying to plan democratically, which is eminently more complex.

Lord Inglewood: If you have extreme nimbyism, you have to somehow counterbalance it with an appeals system, do you not?
Dr Ellis: You absolutely do. The difficulty we have is that that process is not worked out. One of the reasons why there is a relationship between those appeals and why regional planning was such a good idea was precisely that issues of major growth could be resolved strategically. What is happening now is a fragmentation. Each district has to consume its own smoke, in housing terms. You could argue that that is a good thing and what responsible communities should do, but it fails to understand that places are very different. Where they are heavily constrained by designations or not having proper services, for example, then plainly a strategic response would be better. It would be much better to resolve it through Milton Keynes than through 1,000 appeal decisions. So there is a strong relationship between having a logical narrative for town planning and reducing the amount of appeal; but that fundamental issue about people and planning being at the heart of it really needs some attention in policy terms.

Paul Miner: If I can add to Hugh’s points, this problem with appeal-led development is a very serious one. In our written evidence, we highlighted that in about 72% of cases, a local authority could not demonstrate a five-year supply of deliverable sites and appeals were granted. There is another effect on local democracy, which is blatantly financial, because local authorities having to defend their position for appeals is hugely expensive. To give one example, Cheshire West and Chester Council recently published a cabinet committee report that showed that they had spent about £1 million defending themselves in losing planning appeals. That is money that could be far better spent on forward planning and setting visionary aspirations for where housing should go and how the environment should be protected within that district. Many local authorities see what is happening in these other cases and often throw in the towel and just grant permission for substandard, poor quality or inappropriate development, because they do not feel confident defending their position at appeal.

Q60 The Chairman: I would just like to ask if you are going to deal with skills or people’s ambitions to become planners. Has there been a dearth of planning? How is it that, in 1947, things were great and there were good planners, and there are no planners now? Is it just that they are all so frustrated?
Dr Ellis: There is a massive demoralisation in the planning service; it is true. We really need to transform that. Planning education needs to be transformed. You cannot expect the young enthusiastic people I meet all the time in planning schools to stay in planning when there is such a weight of criticism, most of it unfounded, loaded on to the profession. I am not interested in defending planners per se. It has to be about outcomes and what we actually produce but, if you want visionaries to get back into town planning, we have to make sure that we all agree that planning can be a visionary activity. I would stress that issue. I know it is an unpopular one, but planning was about art. If you look at development plans from the 1950s, they always begin with a piece of Tolstoy and are brilliantly illustrated. It is interesting that it would be inconceivable now for a local development plan to say, “We have aspirations for people’s wider welfare, wider artistic ambition or cultural ambition”. These documents are likely to put you to sleep within 20 minutes, because that visionary element has been ironed out of them and that is a great shame.

The Chairman: I am breaking my own rules on not interrupting, but you have not made any reference to local areas that have a completely different culture. The people in South Yorkshire, for instance, would not thank you for the stuff from Lancaster or whatever, so you have to take that into consideration too. It is the local history.

Dr Ellis: The original local plans had a remit to strongly reflect, in their opening chapter, that kind of context. It is true that one of the great flaws of the National Planning Policy Framework is it has no recognition of the diversity of place that exists in England. It is extraordinary when people talk about planning being a barrier. Certainly in my own patch, in the North Derbyshire coalfield, we have been trying to plan for almost anything of any kind, for ever. There is no barrier to development. There is an extraordinarily strong sense of wanting to develop brownfield sites; what there is not, is the supporting infrastructure and supporting regional plan.

Baroness Finlay of Llandaff: I was wondering, from the way you are talking about this, how we can get an assessment of the impact on the health of the community, on living and on biodiversity, and an assessment of the wider impact of decisions. The effects on health and
biodiversity go much further than a narrow geographical site. How do we get that impact assessment in the system?

**Dr Ellis:** I will say a quick word about health. There has been a transformation in the last five years, from Public Health England working, certainly with the TCPA, on producing guidance for local authorities on the connection between the built environment and health. It is extraordinary that we had apparently forgotten that connection, since planning had partly emanated from a health background. There is now the most extraordinary set of very real evidence about how the built environment affects people.

The NPPF mentioned green infrastructure just once and removed and abolished the guidance without any replacement, as a result of this review of guidance that was on Natural England’s website. There is now an active conversation going on with DCLG about whether we can get some guidance back on green infrastructure. Green infrastructure has a multi-functional impact on flood risk, wellbeing, people’s health, recreation, obesity and all these issues. The difficulty about getting health impact assessments formally into this process is that they should be there and, for some major developments, they are there. Now we have devolved public health back into local authorities, we hope for a more fruitful relationship between planning and public health, but the cultural gap between the two professions is very big. Planners are constantly saying, “We do not have time for that. We are just going to do the very bare minimum”.

One of the most important reviews under way at the moment into the local plan is the ministerial review of the local plan process. In our evidence to that, we made it absolutely clear that they must not use that review process as a way of making planning more stupid. Plans do not have to be long, but they have to have a complete set of policies to understand how people work, particularly in relation to public health.

**Paul Miner:** On the biodiversity point, picking up on what was said about the local plan review, what gives us particular cause for concern about that is that many people have argued over a long time that local plans are too long, they take far too long to prepare and they have far too many detailed policies. When you drill down into it, a lot of these so-called far too long and detailed policies are actually well established policies that do not involve too much of local
authorities’ effort in reviewing and updating. They are policies, for example, such as the protection of local wildlife sites and policies that show what the landscape character of an area is and how it should be best protected. It is vitally important that we keep those policies in the future and that, when we talk about local plan preparation, we do not get too hung up about how long plans are, because how long a plan is may not be that related to how much effort goes into preparing it.

I would also refer back to my earlier point that, since the NPPF has come into force and probably before that as well, to be fair, there has been this overriding obsession with meeting housing targets, to the exclusion of the other valuable functions that planning performs. Biodiversity and landscape are good examples of that. I know that later you will be coming on to the green belt but, if you look at the green belt reviews that have been carried out in this country, they nearly always focus on what sites could be released from the green belt for development. They do not really look at how you can achieve a policy that is in the NPPF—paragraph 81, I think—which says that local authorities should plan positively for the beneficial use of the green belt. In many if not most green belt reviews, you will find few examples of local authorities thinking, “We could probably plant more trees there or extend a local wildlife site here”, or something like that. That illustrates the kinds of problems we are facing.

The Chairman: It is an afterthought.

Paul Miner: Yes.

Q61 Baroness Parminter: For the record, I ought to declare that I was previously Chief Executive of the CPRE. In the evidence submitted by both of you, you cite how much you welcome the introduction of neighbourhood planning, but seem to suggest that there are opportunities to make it work better. Could you be specific about how that could be achieved?

Paul Miner: There are two points to make here. One is that, certainly from CPRE’s perspective and I think TCPA as well, we have strongly welcomed neighbourhood planning. We think it can be a very beneficial means of getting communities more involved in planning and getting more people skilled in the process as well, by making it more open to involvement at the local
level. We have seen a very positive development in terms of the number of neighbourhoods that have designated themselves for the purpose of making neighbourhood plans. There are probably about 1,200 across the country, which is broadly in line with what the department was expecting.

But the department has probably underestimated the amount of skill and effort that is needed to get a neighbourhood plan through the various processes, from consultation to examination to adoption. We have about 100 neighbourhood plans that have passed through examination, and 57 that have been adopted or made. In some cases, that is due to the fact that there are insufficient local plans in an area that give neighbourhoods a context within which to work, but there have also been a lot of cases where we have had this problem with appeal-led development, where developers have been looking to frustrate neighbourhood plans by getting in speculative proposals ahead of the local plan and causing a huge amount of controversy and opposition in the local community, who would prefer to see different sites developed.

What we think needs to be done is that, on the one hand, the Government could encourage local authorities to support neighbourhood plans more. There are some measures in the Housing and Planning Bill that might possibly help, but they need further scrutiny to make sure they are doing that. We also think that communities should be given the right of appeal, where they are well advanced in producing a neighbourhood plan, to resist these kinds of speculative proposals that we have been seeing in many parts of the country. That way, not only can they be confident in producing a neighbourhood plan that it will not be trumped, but it would also encourage developers to put some of their resources into supporting neighbourhood planning too. As we have seen over recent years, there is a growing inequality of resources between the public and private sectors in planning. Currently, the private sector holds most of the resources, but they should be encouraged more than they currently are to use them for constructive ends and to work with communities, rather than trying to foist development upon them.

Dr Ellis: I would only add that, in respect of our concerns about how socially inclusive they are, you cannot argue with the scale of implementation but, in our experience, it is mostly
people like me who participate in neighbourhood plans. There is nothing wrong with that, I guess, but it is extremely worrying in complex urban environments, particularly when neighbourhood forums, which are not accountable, in urban areas are making plans. There is insufficient targeting of resources. The department, essentially, does not target resources in relation to those silent voices who find it very difficult to participate in the planning process. Neighbourhood planning should have been a real tool to make that happen. The fact that neighbourhood plans will be allocating sites and that those sites will benefit from automatic planning permission will transform the nature of neighbourhood planning, and I am not sure that it will help, because it will create an additional burden on the neighbourhood plan and it will potentially invite a lot more controversy. It is not necessarily a wrong proposal but, certainly in urban areas, neighbourhood planning is not enough. It does not solve that people and planning problem. It would be great, for example, to see positive and creative measures concerning how people could be involved in local plans and wider regional and national planning.

Q62 Baroness Andrews: You just said something really important, Mr Miner, about the inequality of resources available to the public and private sectors, because that has implications for everything. I have two very short questions. First, is the ministerial review of local plans going to include a review of neighbourhood planning and neighbourhood plans as well? My second question relates to the Housing and Planning Bill. You have touched on the deregulation that may follow from that Bill. Will that impact on neighbourhood plans too, and to what effect? What will the Housing and Planning Bill do for neighbourhood planning? Can you unpack that a bit for us?

Paul Miner: I will say a couple of things briefly. As I understand it, neighbourhood planning is specifically outside the terms of reference of the local plan review, but, in practice, I think they will have to look at it to some degree.

Baroness Andrews: Do you know the timetable for that review?

Paul Miner: It should publish fairly quickly. The deadline for the call for evidence was the beginning of this week, I think, or the end of last week.

Baroness Andrews: It is an internal Government CLG review.
Paul Miner: Yes, it is.

The Chairman: How long do they normally take?

Baroness Andrews: Often, the CLG has gone outside for chairs, but it sounds as if they are doing this rather quickly. Is this prompted by the general anxiety about the low number of starts, et cetera? It is a housing-driven review.

Paul Miner: The main anxiety is that it has taken longer for local plans to get in place than Ministers perhaps said they thought it would, in the past, and there still is no comprehensive local plan coverage across the country. There are some figures in our evidence, but we can send the Committee further information on that, if needed.

Baroness Andrews: Have you given evidence on how local plans can be speeded up? You have already said that the suite of documents that goes into a local plan does not have to be altered. You can still have your sustainability plans, your environmental protection plans and so on.

The Chairman: Where is the call for evidence? Is it on a website?

Paul Miner: It is on the gov.uk website, yes, and we would be happy to share our submission to the local plan review with the Committee.

The Chairman: That would be very useful. Thank you very much.

Dr Ellis: On the Bill and deregulation, it is very important that the Bill, which introduces this very radical zonal planning system, was not subject to a White Paper, so we cannot understand it. It is impossible to understand what is being proposed, because it is a Treasury proposal implemented by DCLG which is not worked through in a way that we can fully understand.

One very important point is that the Bill sits in a wider context of deregulation, particularly permitted development. Permitted development means that local plans and neighbourhood plans are intrinsically less powerful, because we are removing controls that they previously dealt with and it is absolutely not an exaggeration to say that, in places like London, we have lost control of the urban environment. The transfer of a building from office use to residential is perfectly legitimate, so long as it has planning permission and has gone through the process. It can now happen with no consideration for child play space, no contribution for education
and no contribution for 100 other place-making issues, because the prior approval process considers only three things. That may be very powerful for growth, although that is debateable—the evidence is not so clearly there for that—but it is potentially leading to the kinds of places that really are the slums of the future.

**Baroness Andrews:** Again it is housing-driven. Change of use has been primarily designed to release things like retail space for housing. All I am saying is that a lot of these things that have perverse consequences, which are to do with this rather subtle bit of planning, are going to have catastrophic effects on place-making. They will certainly be intensified if you have zonal planning with a permitted development. It essentially means you have ghettos without sufficient infrastructure. Am I right about that?

**Dr Ellis:** That is right. The critical unresolved issue with zonal planning is where you locate the place-making quality standards. You have to give permission in principle in the plan. This negates the whole basis of the fact that detail and principle in planning are intimately related. How is it possible to give permission for something in principle, without understanding its detailed design or flood risk mitigation or sustainable urban drainage or proportion of social housing? I could go on. It misunderstands the intellectual process of making planning decisions and it is certainly not like the Dutch system, by the way. It is certainly not that.

**Paul Miner:** As we understand it, many of the changes in the Housing and Planning Bill are directed towards requiring local authorities to support neighbourhood forums through the process, whereas at the moment neighbourhood planning is purely discretionary. It has been suggested by some that some local authorities are preventing neighbourhood plans coming forward. We are not sure how well founded that is, but it may well be influencing some of the proposals in the housing Bill. To go back to what I said earlier, the far more significant reason why many neighbourhood plans are struggling is gaps in local planning coverage.

**Q63 Lord Clement-Jones:** So far, you have both been agreeing quite heavily on most issues. I want to come on to something I think you might disagree on, which is the whole issue of brownfield development and housing, and whether or not it should be encouraged and prioritised for housing. The context, to some degree, is the fact that we have heard evidence that there has been over-reliance on large strategic sites, which can limit the potential output
for housing. It therefore may be better to concentrate on some of the small sites. It is part of that same debate, I suspect, but do you think that housing needs can be met through brownfield development? What policy changes are needed to ensure that the supply potential of brownfield land is developed?

**Paul Miner:** We believe that there is a strong case for a brownfield-first approach in national policy, and it goes back to what we were asked about at the beginning—about changes to the NPPF. That would be one of our leading changes, too. It is not just about the large sites; it is also about the small sites. One of the problems that we have been seeing since the NPPF came into force is that local authorities are not being encouraged to identify the smallest sites. In their strategic housing land availability assessments, they are generally encouraged to focus on sites of 10 dwellings or over but, if they did more work to identify the small sites, not only would they pick up on a large reservoir of brownfield potential; they would also be encouraging small and medium-sized housebuilders back into the market a bit more, by making available the kinds of sites they can thrive on.

When we talk about brownfield-first, it is important to remember that it is in terms not just of planning but of prioritising Government investment. We should not underestimate the amount of support the Government are putting into encouraging new development, especially in the northern regions. We can send the Committee a bit of further information that we picked up about the amount of new housing stock in the north-west, for example, which is actually being funded by some kind of public subsidy through the Homes and Communities Agency or others.

We have seen some good statements by Ministers about looking to get brownfield sites through the system, but it is important that the Government are backing up those words with financial support. Some brownfield sites are being supported through city deals, but a lot of what we would say is unnecessary greenfield development is being supported as well. We need a clearer approach from Ministers so that, when they are working on devolution with local authorities, when they are supporting the delivery of new housing, they are taking all the opportunities they can to use brownfield sites, because it is not just about providing
housing; it is also about a range of public benefits that, in many cases, could include getting rid of an environmental nuisance, like a contaminated site.

**Lord Clement-Jones**: Of course, they have made certain proposals that encourage brownfield sites, including something you probably would not approve of: permission in principle. How far do you go as a Government in encouraging the use of those brownfield sites?

**Paul Miner**: We think that the Government are right to encourage more brownfield development, but it is important to remember that it is not just about housing. If we are going to build the kinds of communities that people want to live in in the future, it cannot just be a narrow, single focus on housing development. That is part of the problem with increasing these permitted development rights from office to residential, for example. It is just leading to houses in a place that could have much better development if there were more of a mix of uses.

We would support what the Government are doing on brownfield but, on the permission in principle issue, there are some serious potential problems that need to be looked at. We need to make sure that these developments are properly planned for and are in the right places, because the relationship between permission in principle and local plans is not clear enough at the moment. We are concerned that it could be used to short-circuit the local plan process.

I have one further point, if I may. There is also the suggestion that permission in principle could be granted for sites on the Government’s proposed new brownfield register. We strongly support a register of brownfield sites, because we showed in the recent report that there was no clear understanding of how much brownfield land is available across the country. This register will help with that, but the register is part of the evidence for local planning. It is not enough in itself for a site to be on the register and then just to be given automatic permission. There needs to be a proper local plan process as well to make sure that we are getting the right development in the right places.

**Dr Ellis**: This is just very complicated. Developing brownfield sites has to be a priority. The planning system has been pretty good at it. The question whether there is any planning problem with the development of brownfield sites is very dubious, in terms of whether there is any evidence at all that planning has been a problem. There is certainly not in any of the
local authorities that I have ever talked to or worked in, in the north of England. There has always been a desperate priority to develop brownfield sites and the problems of development have been technical—such as remediation—and they have been about investment.

Brownfield is part of the solution, but the wider enterprise of place-making means that such sites are not always the right place to develop. Sometimes they are important for biodiversity and sometimes they are unsuitable for housing in other means. Whether they can meet the whole housing need currently presented to us we are quite sceptical about. After all, even with the great suppressed demand in terms of household formation—because people cannot afford to form households—some 230,000 to 240,000 households are still forming each year. We are going to publish some new research on that next week. Those figures create an enormous challenge for us.

Finally, we have also reached a point in planning and development—this is one of those conversations that CPRE and TCPA will no doubt go on having for the next 100 years—whereby it is possible to develop sites, green and brownfield, at much higher levels of biodiversity and design quality than the existing use, sometimes even when that is intensive agriculture.

**Baroness Andrews**: And density.

**Dr Ellis**: Density—absolutely right. This is a wider issue, is it not? There is a sense that development has been problematised, and the reason is that we have been very poor at it. When people say, “Shall we have some new housing development?”, they picture an extremely poor quality built environment.

If you ask the people who live in Letchworth, which is arguably the finest design concept we have ever developed in this country, they are very happy living there. The master plan for that site did not fell one tree, and that was in 1903. The sense that we can build extraordinary places that can deliver net benefits to nature and also to human wellbeing is a vision that was at the heart and beginning of the planning movement.

**Lord Inglewood**: Can we afford it in the round?

**Dr Ellis**: Letchworth paid for itself.
Lord Inglewood: That was middle-class people.

Dr Ellis: No, Letchworth is still 35% social housing. I am not suggesting that there are not lots of middle-class people living there, but there is a significant contribution.

Lord Inglewood: The good stuff tends to cost, and this is one of the problems.

Dr Ellis: There is something very important there. Letchworth has a self-funding model. The garden city model, which I know we may not talk about, was so important because it did something that the planning system and European planning systems do. It captures a proportion of the increase in land values, pays down debts and reinvests. Letchworth Garden City funds its three philosophy societies, its theatre, its cinema and a health centre out of a fund created in 1903, based on its ownership of the commercial estate. This is a John Lewis town, if you like. That is the shorthand. The mutualisation of key assets in the town means not only can we build to extraordinarily high standards, but we can self-finance it. The first 10 new towns, although they had design issues, were incredibly profitable. They were so profitable, they lent money to other public utilities.

Lord Clement-Jones: Can I take it from that that you are therefore not convinced, either, by the small site versus large site argument? You are arguing for development on a very big scale.

Dr Ellis: Actually, I am arguing for a programme of all of it. What we do not do is “big”. Big is not necessarily intrinsically bad, is what I am arguing. Sometimes it can be the most sustainable option. I am curious about why our conversation—not here but in the wider sense—is so polarised. Surely in some places it will be about developing existing villages but, in the Milton Keynes example, it was about Buckinghamshire remaining Buckinghamshire and also producing an extremely economically successful and socially successful place, strategically. It is that bit that we seem incapable of examining at the moment.

Baroness Finlay of Llandaff: Just linking to all that, I am wondering whether the areas that a planning group is responsible for are large enough now to allow that type of broad consideration to develop infrastructure that can pay for itself, or are they too small and therefore acting in silos?
**Dr Ellis:** They are too small at the moment. Paul has talked about the devolution agenda and what that might do. One or two combined authorities have asked for development corporation powers, because you need a development corporation to capture those land values. That is the critical mechanism for doing that, so that requires a new planning tool. That is what the New Towns Act did so brilliantly well.

On how you work this out and where they go, yes, that gets back to the geographic question—that in the south-east of England, where pressures are greatest, you need Government to co-ordinate, facilitate and mediate a conversation about where strategic growth will go. If you do not want to do that, you will get multiple fragmented housing development which is poorly serviced, has inadequate infrastructure and sets a problem. We have done this before in this country. It sets a problem that you then have to spend 100 years trying to resolve.

**Q64 Baroness Young of Old Scone:** This is the reverse side of what you have just been talking about, which is the green belt thing. It has done its stuff in many ways, but is now a bit creaky in terms of piecemeal nibbling. Do we need a new policy for the green belt, in order to reshape it for a modern set of purposes, including this broader-scale strategic development perspective?

**Paul Miner:** We think that green belt policy still works well. The fundamental principles of green belt policy are sound and they should be kept. It is important to remember that, when green belts were first established in national policy, back in 1955, they were part of a wider sub-national city region approach to working out how the development of a city should take place, and they were usually accompanied by a strategy for regeneration within the inner cities and the building of garden cities and, by that time, new towns around places like London, Liverpool and Manchester.

We are pleased that the Government have restated their commitment to the green belt, but the policy has been put under pressure through death by a thousand cuts in local plan reviews across the country, because there has not been a proper strategic approach to working out where housing need is best met. We are seeing increasing calls to change the policy and to allow much more development, and we think those calls are misconceived, because they underestimate the true value of the green belt to society.
For example, the Adam Smith Institute reckoned that the value of the green belt to society was about £889 per hectare. It based that value on a study, in 1992, of a few fields near Chester, but green belts also surround places like London and Manchester. They are of huge value to urban communities in those areas. The work of the Natural Capital Committee, and in particular its Chair, Dieter Helm, has shown how much more value there is to the green belt—not only its possible biodiversity value, but its value to the public in terms of being able to see an agricultural landscape.

Also, we have seen many claims that you could do a lot to meet this country’s housing need by building a million homes on just 1% or 2% of the green belt, but that is massively overstating the benefits of that approach. If you built in the way they are suggesting, you would be building dormitory suburbs. You would not be building proper new places; you would be building stuff tacked on to the edge of train stations. That would lead to a lot of urban sprawl, in many cases, because there are very few, if any, train stations in the green belt around London that do not already have some development around one side or the other. By building on the remaining bit of undeveloped land near the train station, you would be completely defeating the purpose of green belt.

We need the green belt as a tool to prevent urban sprawl, more than ever. We have seen studies by UN-Habitat and the European Commission that show that urban sprawl is one of the most pressing problems facing the world today. It is most pressing in the areas around big towns and cities, which in England are protected by green belt policy. That is the particular value of it and that is why it is not fanciful to say that, if we did not have the green belt around London, it would sprawl for 50 miles beyond its centre like Los Angeles does.

Dr Ellis: From our point of view, the green belt remains extremely important. Again, I would just like to point to the complexities of green belt policy. The green belt is a very successful policy and should be retained, but it plays out very differently across England. The case to retain London’s green belt is very powerful, and the original idea of building highly sustainable new places beyond London’s green belt still seems to be extremely important, but the gap between Nottingham and Derby is a few hundred yards. There, the issue is urban containment and definition. That is very important. Oxford is a freestanding community.
There are highly controversial plans at the moment to think about reviewing Oxford’s green belt, but the issues are very different there. Again, it is very difficult to come up with a one-size-fits-all review of green belt. I would say that, in London’s case, it is critical to things like urban cooling and climate change—issues that have not really been properly considered. I would say that we are very positive, though. The original concept for green belt 100 years ago was as a very active resource for local food production, local energy and much greater access for people. The idea that urban populations need to have contact with nature and should not have to travel too far to do that relates very closely now to the issues around the health evidence.

Finally, there is this piece of heresy that we have accepted completely that we will focus the entire demographic future of England on the development of London and the south-east. Liverpool has lost 50% of its population. Liverpool was engineered for a million people in 1938 and now has a population of 400,000. Immediately post-war, Belfast had 440,000 people. Now it has a population of 220,000.

The Chairman: That is a bit different.

Dr Ellis: It is, but all I would point out is that there is opportunity in other parts of the United Kingdom and other parts of England, which seems to us to be important to examine before we accept solely focusing on the south-east.

Q65 Baroness Rawlings: I was going to ask about garden cities and new cities, but you have explained it so clearly with 1903 and Letchworth. Following on from what Lord Inglewood said, basically in 1903 the country was very wealthy at that time. It was thriving. Milton Keynes developed and was successful. What I was not sure about—perhaps you could expand on this—was the point about 1947, which was after the war when money was scarce. In the 1950s and 1960s, money was quite scarce. There were horrors built in that period—massive concrete high-rise buildings that were really not very successful—and a massive amount of old buildings were just pulled down willy-nilly. There was the division of cities like Sheffield and a few others. It was not so wonderful then, and today rather successful developments have taken place around the country. I just wonder what your views are. I would be fascinated to hear.
Dr Ellis: It is a very good set of questions about what planning got wrong, and we have to be honest about that. The new towns programme post-war mostly did not include that kind of high-rise commitment. Interestingly, at the time the TCPA argued its heart out against the high-rise modernist move and lost that argument. We deployed Ruskin and they deployed Le Corbusier and we lost. The social consequences of that were very important. The garden city design ethic was very much a vernacular design, a humanist design in its broadest sense, and we forgot that; we decided to put that down. I would dearly love the architectural profession to take some of the responsibility for that, as well as town planning, because they bear it as well.

There is no doubt that—probably more than anything else, whether fairly or not—it was high-rise modernism that discredited the practice and ambition of town planning, because people associated it with being top-down, lacking any sense of human value and all those issues, which was tragic given where it comes from and what the core values are. The new towns programme is interesting. They struggled with a shortage of materials, for example, so they used a lot of concrete. There was a desperate housing shortage, so there is a sense of expediency about it, but it is worth pointing out that we built 34 places in 20 years that house 2.8 million people. Some of those places, economically and socially, remain very successful.

The difficulty was—and this is heart-breaking—they were all financially viable until the forced repayment of loans in 1980. In 1980, the Treasury insisted on the early repayment of the 60-year loans that had founded the new towns movement. Some of those assets have ended up with the HCA. The HCA still owns assets that were paid down. The new towns programme had to pay the penalty clauses for early repayment, even though they did not want to pay the loans back early. If the programme had continued and run its course, new towns would have had an economic model like Letchworth. They would have had an asset value. It seems to me that, rather than this being some sort of very strange and radical idea, this is really a very English, mutualised approach to building places but, because they do not have that asset value, they all age at the same time and they cannot reinvest in themselves. All of the built environment in new towns now needs a lot of work. It was all built in that 20-year period.
One final thing that is very important, though, is the car culture. Milton Keynes reflected the lesson from America and the fashion to build cities based on the private car. That proved to be a very short-lived idea in design terms, but with massive consequences for cities. Probably no other single design element has done more damage to UK cities than the urban motorway. It is extraordinarily socially divisive; it is environmentally damaging. Now, of course, we face this extraordinary process. The gap between ripping up our trams and trying to redeploy them was about 18 to 20 years—it was that short-sighted. When you pulled up the roads in Sheffield to relay the tram tracks, the old tram tracks were still there. That tells you something very important about this nation: we invented planning, we invented long-term vision and then seemed determined not to plan at the right spatial scale, to forget the visionary sense of it and to be completely obsessed with short-term cycles.

**The Chairman:** That is absolutely right. It reminds us of the thing we were reminded of in Birmingham—the concrete collar around the centre and the damage that did to the centre of Birmingham.

Thank you so much. It has been an absolutely fascinating session and we are very grateful to both of you. If you think that we are going off down quite the wrong track and you have some more suggestions for us, we would be more than willing to accept them and very grateful for them. Thank you.
Response from the Kent Branch of the Campaign to Protect Rural England.

CPRE Kent is the Kent Branch of the Campaign to Protect Rural England which is part of the national CPRE charity. Throughout Kent we represent 2,783 individual members, 189 Parish Councils and 40 local amenity groups and civic societies. We are glad to have the opportunity to offer our evidence to this Select Committee.

1. GENERAL.
   Our comments relate primarily to Question 3 insofar as National Policy, at least from a Kent perspective, is often perceived to be formulated or applied without regard to the full impact of housing development on the county’s already severely depleted water resources. There are also questions to be raised with respect to the inroads made on our remaining productive farmland.

2. WATER RESOURCES.

2.1. Potable water supplies to domestic and commercial premises are managed by reference to Water Resource Management Plans (WRMP) formulated by the water companies on the basis of short term (5 year) and long term (25 year) population and household forecasts. All of the four companies operating in Kent face a progressive decrease in the balance of supply vs demand, with continuing pressure on levels of service. This condition was recognised by the Environment Agency in their assessment of July 2013 which classified these and other companies in the south east as “Seriously Stressed”, a measure of the magnitude of the current deficit. And it has added further momentum to the compulsory metering programme as a key demand management measure.

2.2. It is recognised, however, that the full range of demand management and water efficiency options will not match the predicted deficit, and provision will have to be made for substantial capital investment in new sources of supply at some stage in the medium term. OFWAT, the industry regulator, will almost certainly challenge any capital schemes likely to incur what they would regard as excessive increases in charges to consumers. But unless the deficit is addressed, we must expect a further decrease in levels of service. To judge from past performance, most water companies would not be able to deliver their expected supply of water under the sort of drought conditions we can expect about once every 10 years. There have, of course, been new network connections to improve operational flexibility and facilitate inter-company transfers, but we have the lessons from relatively recent long droughts such as 2004-2007 which had wide impact, simultaneously affecting a number of neighbouring supply zones, thereby largely negating the effectiveness of mutual transfer arrangements.
2.3. The special circumstances of Kent, with its existing deficit and the prospect of an increasing impact of climate change, would seem to make this county particularly vulnerable to the additional demands that must come with further housing development. By way of example, South East Water, which serves approximately 800,000 customers in Kent, have forecast a peak period deficit of 25ML/day by 2025 and 55ML/day by 2040. This takes account of:

- a forecast 1% per annum population growth and corresponding housing requirement in line with DCLG, Local Authority and ONS estimates, and
- Continuing impact of climate change, with increasing rates of evapotranspiration losses.

However no allowance has been made for:

- increases in the migration component of population growth (expected to be relatively high in Kent)
- mid-term decreases in water company deployable drought output resulting from reductions in authorised abstraction imposed by EA in accordance with European Directives to restore sustainable abstraction and improve river and groundwater quality. Additional sources of supply will therefore need to be identified in the next WRMP period. Quantities have yet to be confirmed but could exceed 20ML/day
- a potential increase in demand arising from shale gas/oil exploration and development in Kent, comprising supplies for high pressure fracking operations and any loss of public supply capacity which could result from pollution of groundwater sources (which in Kent support 70 to 90% of the total demand).

These three components will add significantly to the out-turn deficit which could, in consequence, exceed 80ML/day.

2.4 No figures are to hand for the other 3 companies operating in Kent and Medway but the SEW WRMP can be taken as a fair representation of the overall supply/demand picture for Kent. Of the options for addressing the deficit, most are essentially short-term with an emphasis on demand management and water efficiency. As to any new sources of supply, some of the groundwater development schemes are speculative and not likely to achieve the anticipated net increase in deployable drought output.

2.5 Water companies are not statutory consultees but nonetheless have an obligation to provide a supply, irrespective of the state of resources in their supply areas. South East Water make the point in their draft WRMP 2014 that:

“Additional measures to manage demand for water and developing new water resources are still required for all zones throughout the lifetime of the plan.” Furthermore they make the

---

42 Non technical summary page16, para 3.4  
43 Ibid, page 23
very telling point that “many of the longer term water resource solutions ... have long lead-in times and are potentially complex operations that carry a degree of planning and deliverability risk”.

2.6. This prompts the conclusion, from an NPPF perspective, that for Kent the only manageable component of the supply/demand deficit would seem to be housing growth. Unless this is more closely controlled, we will have to be reconciled to a progressive decrease in drought resilience and a corresponding down-grading of public supply levels of service.

3. LAND UPTAKE.
3.1 We are no longer immune from the increasing pressures on the world’s food production capacity. Britain has become heavily dependent on imports to fill the shortfall in our own agricultural output, which continues to grow with the advance of house building onto productive farmland. Approximately 70% of UK land is used for agriculture but we currently import 60% of all our food requirements (including 85% of our fresh fruit and vegetables).

3.2 Much of these imports are from countries now experiencing strong economic growth, and an increasing proportion of their exported produce will be diverted to home consumption. Some of these countries are also becoming major importers and competing with Britain for a wide range of high value produce, pushing up prices. The acceleration of global food demand has also resulted in increased use of water for irrigation in tropical regions, resulting in the progressive depletion of river and groundwater resources, with corresponding stress on rural communities; a process exacerbated by desertification and forest clearance. World food production can no longer keep pace with demand and we must expect to see commensurate increases in global prices.

3.3 This could be the spur for the UK to increase home production of food, but our options in this respect will decrease further with the encroachment of housing development onto productive farmland and grazing. The greatest pressures are in the south east, and Kent is particularly vulnerable with development targets for the county totalling approximately 140,000 households. This is equivalent, assuming plan densities of 25 dwellings/ha, to a land-take of at least 5,600 ha. If we take the total area of Kent’s productive farmland (including grazing) to be 100,000 ha (i.e. 25% of the county area) the planned land-take of 5,600 ha would therefore represent a potential loss approaching 6%; a considerable sacrifice, given the recommendation by the Government Chief Scientific Advisor that UK food production will need to be double that of current levels by 2040.

4. CONCLUSIONS: A NEW STRATEGY?
The combined challenges facing the sustainable use of our best and most versatile agricultural land and water resources call for a radical shift in the principles underpinning planning strategy, making the safeguarding of these resources a key factor in determining national policy for the built environment.
Questions & Answers

Policymaking, integration and coordination

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

There needs to be transparent and accountable national, sub-regional, local and neighbourhood planning. Currently we do not have this.

Despite the Localism Act 2011, too many decisions are being made by central Government and the planning inspectorate. This is largely due to the inadequacy of the NPPF as an exposition of government policy, resulting in unpredictability in decision-taking and consequential distrust of the planning system. See below.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

There needs to be improvement in the coordination of national, sub-regional, local and neighbourhood planning so there is spatial coherence in plan-making and decision-taking. We need integrated connectivity between geographically related settlements. We ask, for example, “Why cannot Oxenholme to Windermere be like Munstertal in the Black Forest, Germany?” and “Why can’t the Ribble Valley be like Dornach, Switzerland?” There is also need for coherence in regulation to protect the environment; for example, we have had recent experience of the worrying gaps in planning and environmental regulation in regard to shale gas developments and the disposal of hazardous waste by landfill.

National policy for planning and the built environment

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

No it does not. The NPPF is frustrating desirable outcomes for the development of the built environment and is particularly deficient in facilitating the production of local plans because of the malign influence of the 5-year housing land supply rule (5YHLS rule) as defined in paragraphs 47
and 49 and qualifying Note 11 of the NPPF. Savills\(^{44}\) show 222 of 293 LAs did not have a post-NPPF adopted local plan in place. Considerable delay is caused at the examination stage because inspectors are taking the view that housing numbers estimated by LPAs are too low.

Ministerial Statements encouraging the preferential use of brownfield land and the preservation of Best and Most Versatile (BMV) agricultural land are rendered meaningless by the omission from the NPPF and the PG of any provision for the sequential allocation of land for housing.

In relation to Green Belt land, the Planning Practice Guidance (PG), while it makes provision for the exclusion of Green Belt land from the Strategic Housing Land Availability Assessment, it makes no comparable allowance when estimating the housing requirement/target (Objectively Assessed Need subject to policy-on). In consequence, it becomes progressively more difficult for LPAs to satisfy the 5YHLS rule which is a necessary condition for a sound local plan; this is because, as LPAs grant planning consents which are not implemented within the 5-year limit, the available land supply is progressively eroded.

For this reason, CPRE Lancashire urges that the NPPF and the PG make it clear that assessing the housing requirement/target is a two stage process (ref. Gallagher Homes [2014] EWHC1283 (Admin)). Nathaniel Lichfield & Partners\(^{45}\) also evidence that inspectors responsible for examining local plans are now neglecting the second stage, so that the housing requirement/target is actually Objectively Assessed Need subject to policy-off, rather than to policy-on as required for implantation of the second stage. In 2015, 71% of local plans that were adopted made provision for more houses than was required by the DCLG sub-national household projections. Because of this over estimation of houses, restricted land (e.g. Green Belt) is being released for housing without due regard to the protections afforded to Green Belt land by the NPPF, the PG and Ministerial Statements.

The result is the needless loss to future generations of natural habitats and their flora, fauna, beautiful rural landscapes and precious high quality farmland, while depressed urban areas remain neglected and without the provision of new or refurbished housing accommodation of the right size and tenure as identified in the Strategic Housing Market Assessment and embodied in a well-considered, community approved, local plan. Anecdotal evidence\(^{46}\) is that there is no longer a market in brownfield land in Lancashire due to the market being saturated by planning consents for greenfield sites. This is a problem for public sector organisations with land holding interests, particularly in Lancashire where there is in excess of 5,000 hectares of vacant brownfield land\(^{47}\).

\(^{44}\) Comments from a surveyor who represents public sector organisations in Lancashire
\(^{45}\) CPRE, 2014 From Wasted Space to Living Spaces: The availability of brownfield land for housing development in England
\(^{46}\) Brundtland Report, Our Common Future, 1987
A contributory reason why this undesirable result is happening is that the NPPF is unclear about the definition of its central concept namely ‘sustainable’ development. Unhelpfully, the NPPF states that sustainable development is development conforming to the policies of the NPPF taken as a whole - in our view this is a circular statement and therefore meaningless. In the preamble to the NPPF, reference is made to Resolution 42/187 of the United Nations General Assembly definition of sustainable development, but the fundamental principle embodied in the resolution is not reflected in the policies of the NPPF itself. As a priority, we believe that the NPPF should be clear on its definition of sustainable development (after all, it is the only kind of development with which the NPPF is concerned) and we ask that it is based on the Brundtland Commission Report 48 in combination with the three roles of development, namely economic, social and environmental. Since the introduction of the NPPF, CPRE Lancashire would be hard pressed to find a single application that has been refused due to the site being located in an unsustainable position, in the sense that access to essential amenities such as shopping, schools and health care was totally dependent on the use of the car.

LPAs can cannot build houses - they can only allocate suitable land for housing, and grant planning permission for sustainable development. This is because LPAs cannot raise finance to build houses themselves, yet the criterion for LA-compliance with the 5YHLS rule is based on the number of houses completed within 5-year time limit. Present policies mean that large developers have an incentive to acquire substantial land banks, a) because it enhances the book value of their assets, and b) they are able to control the supply of housing at a rate to maintain the premium selling price and hence the highest return on their investment. The system favors large developers and has all but squeezed out smaller developers and builders needed for the development of the very many small sites (many of them brownfield) which are of no interest to the large developers.

These are not new considerations. Historically high rates of housebuilding have only been achieved when LAs have been able to build houses by borrowing against their own assets.

On the assumption that the Government will not change the 5YHLS rule, CPRE Lancashire advocates measures that will inhibit land banking, viz.

1) An LPA, in determining a planning application, should be able to take into account the record of housing completions of an applicant with a significant number of extant planning permissions for the same housing-market area (as was the case with PPS3 2006: Housing).

2) As an incentive to developers to build out housing permissions within the 5-year period, failure to do so should incur a financial penalty, e.g. the payment of the council tax and possibly the New Homes Bonus in respect of each house yet to be completed.

3) A developers should have the right to surrender a planning permission so that the land involved can be restored to the housing land supply and thereby become available to another developer.

48 Shelter, July 2014 Missed opportunity: Changes to public investment in housing
CPRE Lancashire believes the following factors are more important than others.

National planning policy ought to ensure a sequential development of land to ensure brownfield land is routinely brought back into use and recycled rather than remaining in an under-used, or worse, in a vacant and neglected condition. Greenfield development ought to be an easier option. CPRE Lancashire welcomes the announcement that a Brownfield Package will provide funding and powers to unlock the potential of some brownfield sites, but it is in reality modest in scale and the ambition for brownfield must be more fully enshrined in policy if it is to be successful.

4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

See answer to Q2 concerning the need for a comprehensive spatial perspective.

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

National planning policy should plan for 50 years ahead, but local planning needs to be more medium terms for 25 to 30 years.

Buildings and places: New and old

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

The Government should consider the recommendations of the Rural Affordable Housing Review49 and stop ‘Right to Buy’ as a priority. The selling off of public sector housing is exacerbating the affordable housing shortage.

Powers for LAs to deliver houses is important. LAs should be able to build houses if this is the measure on which their performance is assessed. This includes being empowered to borrow money to build houses, for sale or long term management by housing associations. A Shelter50 report shows had public investment in housing been maintained, England could have built one million more homes than it actually has.

Changes to Compulsory Purchase Law are required in order that LPAs can acquire brownfield sites (contaminated or land-banked) to unlock potential (remove constraints,

---

49 National Audit Office Report 2014, The impact of funding reductions on local authorities
prepare for development, sell with outline planning permission, planning gain to be reinvested to unlock further brownfield). Owners could be given the opportunity to develop sites prior to CPOs being progressed. Former owners should not to benefit from CPO enabled development.

7. **How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?**

   Development should not be permitted in the flood plain.

We advocate ‘Smart Growth’ based on good urban design, sound town planning and sustainable development principles and recognition of importance of interdependent transport networks to ensure public transport and sustainable modes, such as cycling and walking, are a realistic option for commuting and other activities.

8. **To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?**

   Refurbishment and modernization of older housing stock of architectural merit or merely sound construction is far preferable to demolition; it is environmentally sustainable and helps protect not only the historic fabric but also the social integrity of areas like Salford’s Seedley and Langworthy.

   In the evaluation of LPA performance on net-housing supply, houses brought back into use should be counted as a credit, not as a debit as happens at present (cf. 5YHLS rule).

**Skills and design**

9. **Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?**

   LPAs are under resourced and are suffering disproportionately as a result of the reduction of government support to LPAs. The role played by LPAs is too important for this to continue.

10. **Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?**

---

There is much consideration of housing quantity, but not enough concerning suitability and quality.

**Community involvement and community impact**

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

See answer to Q1 concerning mistrust of the planning system.

Communities when engaged need to see evidence that their concerns have been addressed, and, where appropriate, community opposition should be a material consideration of sufficient weight to warrant refusal of an application.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

Communities need transparency and accountability in the planning system. When the consultation for an application includes a recognised holiday period, the period should be extended by a fortnight.

**Financial measures**

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

Refer to answers to Q6 concerning ability of LAs to borrow money to build houses, and to Q9 concerning the poor resourcing of planning departments.

05 October 2015
Maidstone District Committee

Response to the Select Committee on National policy for the built environment

Q 1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

Response: Decisions on overall needs are currently taken at District level, which is too low, particularly on housing targets where build rates can fluctuate wildly as estates come on stream, erroneously affecting projections for future needs. County level can be more strategic, and is much more satisfactory. National policy should play a greater role in getting the balance right between housing, infrastructure, green spaces and ensuring brownfield first.

Q 2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

Response: Greater recognition that the English countryside is one of the country’s greatest assets would help. Also a reduction of the significance of the economic aspects and the Treasury inputs which can overwhelm the other considerations in place-making.

Q 3. Does the NPPF provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are there some factors within the NPPF more important than others? If so, what should be prioritised and why?

Response: All “needs” are based only on projections, which produces the bizarre result that the more a District builds the greater its “need” becomes, and if build rates are reduced or delayed then “need” reduces. This is where requirements across Counties rather than Districts would help to smooth out unnecessary fluctuations. The need for a District to have identify a five year supply of land, which is not well defined, distorts the planning process as it seems to be taken as a “free-for-all” by developers where it is not seen to be met. Brownfield first needs to be emphasised.
Q 4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

Response: We are unaware of any spatial policy. One should be developed to reduce the north/south divide and the current London-centric situation.

Q 5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

Response: We believe that ten years is a realistic working maximum.

Q 6. What role should the Government play in seeking to address the current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

Response: Interventions such as permitting redundant offices to be converted to residential, more freedom to extend existing dwellings (including upwards) are helpful. Limiting the time for developers to start building properly after gaining planning permission, such as three years, would help.

Q 7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in years to come? How can the best use of existing housing stock and built environment assets be made?

Response: Both sustainability and resilience ultimately mean that the quality of life and wellbeing of people are recognised as being the most important aspects of development, and therefore all facilities are required to be built alongside housing, including green spaces.

Q 8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

Response: All development should be grounded around the historic environment to ensure social well-being. Greater protection is needed.
Q 9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

Response: Planners generally do not plan, they respond to planning requests. Developers put forward plans only where they have acquired options or have bought land, which may be far from the most suitable places. Surveyors and architects work to the requirements of developers. Planning needs to change to being more constructive and include local well-being as a basis for decisions.

Q 10. Are we using the right tools and techniques to promote high quality design and “place-making” at the national level? How could national leadership on these matters be enhanced?

Response: More detailed character assessments required to be carried out to serve as guidelines.

Q 11. Do those involved in delivering and managing our built environment, including decision makers and developers, take sufficient account of the way in which the built environment affects those that live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

Response; certainly not – planners need to have much more responsibility for assessing the effects on the well-being of the current population with new developments. It should be an explicit item in their job descriptions, which it appears not to be at present.

Q 12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

Response: As in Q11 above, planners need improved job descriptions, and have consultations made compulsory. Pre-application consultations must be made public rather than the cosy private discussions that currently occur, which seem to result often in the planner taking some “ownership” of proposals.
Q 13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

Response; Developers should be restricted from land banking with development potential. Planning approvals should require genuine start-up within three years. Ways of offsetting any extra costs in developing brownfield sites should be explored. Self-build schemes should be encouraged.

03 October 2015
Canterbury Society – Written Evidence (BEN0107)

1.1 In presenting our evidence we have aimed to answer the questions which the Select Committee listed in the Call for Written Evidence. So our responses below are set out following each numbered question. We have not sought to answer all the questions listed by the Select Committee but only those where the Canterbury Society has relevant experience, highlighting our key points with a bold font.

1.2 The Canterbury Society is the city’s leading civic society, bringing together a diverse group of local people with a shared sense of civic pride and an interest in improving the built environment and the quality of life of local residents. The Society comments regularly on planning applications, is engaged in consultations over the Local Plan, works to enhance the built environment and has produced its own Vision for the Future of Canterbury. It is a founder member of Civic Voice, the national body for civic societies in England, with 275 civic societies representing 75,000 individual members. Representatives of the Canterbury Society would be happy to appear before the Select Committee if that would be helpful.

**Question 3.** Does the NPPF provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so what should be prioritised and why?

3.1 Paragraphs 6 to 10 of the NPPF define sustainable development as “a balance between the economic, social, and environmental roles of development” and states that these roles cannot be carried out in isolation from each other. Specifically paragraph 10 states that: “Plans and decisions need to take local circumstances into account, so that they respond to the different opportunities for achieving sustainable development in different areas.”

3.2 Our experience in Canterbury is that central government places undue pressure on local authorities to give the utmost priority to economic considerations, and to downgrade social and environmental impacts. Central government policy makers seem to take the view that sanctioning development, regardless of local circumstances, will feed through to a better quality of life. This is a questionable hypothesis to say the least. In our view local planning authorities and the communities they represent should be allowed to decide for themselves, within a broad framework, how best to interpret the requirements of the NPPF in a way that recognises local opportunities and constraints.

3.3 This cannot be achieved without meaningful participation by the local community in the Local Plan process at a much earlier stage than is presently the case; we refer again to this issue in our response to Q12 of the List of Questions.

**Question 4.** Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?
4.1 The second of these two questions implies that the answer to the first question is already known! The NPPF is certainly lacking specific references to spatial objectives but much of the content is of an implicitly spatial nature – as is inherent in planning. In the Local Plan (LP) for the Canterbury District there was almost no explicit spatial strategy. The problem here is that there is a conflict between having a spatial plan that attempts to optimise location versus the NPPF demands which simply state that a LP must be “sound”. To be sound is effectively saying that the content of the Plan must be must be “passable” or “adequate”. To achieve these rather minimal aims means that optimum spatial considerations can be ignored, as indeed can the optimisation of any element of the LP. There is thus no compulsion to be cognisant of spatial perspectives.

4.2 In the case of the Canterbury District LP there was no compulsion to undertake proper, spatially variable, traffic/transport analyses, though this would seem to be an essential spatial element in planning. Canterbury suffers from severe traffic congestion round its small medieval core. The LP proposes 4000 new homes located in one quadrant of the city, meaning that the current levels of congestion will be significantly exacerbated.

4.3 However, strategic housing and employment land allocations across the whole district were selected solely on the perceived deliverability of large greenfield sites. The limited traffic modelling that was undertaken indicated that these sites would again result in increased traffic congestion but this was ignored by the PINS inspectorate.

4.4 We would propose that a strong spatial element must be explicitly stated in the NPPF and that it should be compulsory for planning authorities to optimise locations for built developments.

**Question 5.** Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

5.1 There is no optimum timescale for planning our future built environment – this depends upon the facet of the built environment being examined. For example, a new high speed train link needs a very long term time span compared with smaller scale planning provision. We believe that a 10 year time span is to be preferred, but with an important review at year 5. In order to ease pressure on local authorities, perhaps there could be overlapping tranches of planning for development in process, so that they were not occupying the same 10 year periods. For instance, employment land considerations could form an individual tranche, housing a separate one, the natural environment a third, and so on. A main advantage of this would be to ease the huge pressure felt by local planning authorities under the present 10 year LP cycle. Clearly smaller scale Examinations in Public could take place for each tranche. A well-managed Planning Department could readily integrate the work on various tranches where required. Contingency arrangements would need to be in place for when “emergency” planning is required.
Question 6  What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

6.1 There are several ways in which the government could intervene to address current issues of housing supply. Chief among these would be the initiation of a programme for the building of affordable housing by local councils or housing associations. This would require central government support, as it did in the past when the country was faced with a shortage of housing which people could afford.

6.2 Action on empty homes could also help. There are many empty houses which could be renovated to provide decent homes. Some valuable work has already been done, but we would hope that the work of the Empty Homes Agency will be supported and extended. One problem is that VAT is charged on housing repairs, but not on the building of new homes. The effect of this is to increase the incentive to build from scratch, as opposed to repairing existing stock.

6.3 The incentive to let empty houses lie vacant is increased by the reduction of council tax in many areas. In order to increase the use of such homes, council tax should always be levied on empty properties.

6.4 Inequality of income and wealth has led to a situation where some people can afford to own two or three homes while others cannot afford a home at all. Some of these second/third homes are in areas of acute housing need, such as London. Others are in rural areas where average incomes are low and housing costs have risen. It might be hard to devise a system for charging higher council tax on such second homes, but if this could be done it would go some way to redress the current housing crisis in these areas.

6.5 Action on housing supply should focus on building more affordable housing, bringing empty homes into use and limiting second homes in areas of housing need.

Question 7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

7.1 In order to be both sustainable and resilient the built environment needs to achieve high qualitative standards. For too long new housing stock has been mass produced to standards that, compared to most of western Europe, are of very poor quality. Here quality is represented by materials used, quality of workmanship, density of dwellings, and the amount of open space and “natural” planting of shrubs and trees. Estates have tended to be both sprawling and lacking in variety or any conception of “attractiveness“.
7.2 It is easy to think in Canterbury of several developments that were so shoddily built that after just a few years they have deteriorated so badly that one almost suspects that builders or developers are constructing with a view to built-in obsolescence. The buildings we have in mind will be virtual “slums” within a few decades. Developers and local authorities must adopt much higher design standards and insist that these are adhered too. Too often we see development briefs that paint a glossy picture of what is to be built, but which turn out to be “mirages” dreamed up to draw us in.

7.3 Higher design standards also require that qualitative energy efficiency standards are built into all new dwellings (and other buildings). Some planning authorities, such as Woking Borough Council, already insist that new dwellings are built to what used to be Level 6. This ensures real sustainability in terms of impact on the environment. We deplore the fact that the government has withdrawn the Code for Sustainable new homes, except for legacy cases. Additionally, it would be immensely beneficial if the retrofitting of older buildings with enhanced insulation, plus efficient heating, plumbing and lighting, became obligatory. This could be achieved via the aid of grants, or interest free loans to be repaid over a suitable time scale, and this investment would have a strong positive effect on the local economy.

7.4 Creating sustainable dwellings depends on local authorities being able to enforce high standards in the energy efficiency of new buildings and to encourage the more efficient insulation of existing dwellings.

Question 8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

8.1 The heritage based tourist economy directly accounts for at least £5 billion and 134,000 jobs across the UK (Oxford Economics, 2013). However, in a place like Canterbury heritage plays an even more important role, attracting some two million tourists and being part of the reason why around 37,000 students choose to study in the city. Despite this, the historic environment often seems to be neglected, with priority given to new developments and short term commercial interests.

8.2 Civic societies in a number of historic cathedral cities have become increasingly concerned about the tension between the conservation of the historic fabric of the city and the current drive for growth. Many of these cities are threatened with over-large developments, which endanger the very qualities which make them so attractive. This concern has led to some excellent research (Green Balance 2014) and to the setting up the Civic Voice Historic Cathedral Cities Alliance, which will be launched at the Civic Voice annual conference at the end of October 2015.
8.3 The value of heritage means that protecting and conserving the historic built environment is vital. The following specific changes would demonstrate the government’s real commitment to heritage and quality of place:

a. Urge local authorities to ensure they have the necessary expertise in conservation and that councillors understand the value of heritage
b. Require every local authority to produce a Place Improvement Strategy
c. Strengthen policy to support collaborative community planning for major developments and local plans
d. Enable local authorities to control use classes and permitted development rights to meet local need

8.4 Addressing these issues does not have to be at the expense of economic growth. On the contrary the measures we are proposing would protect and enhance the historic framework and bring about a revival of our towns and cities, making development more acceptable to local people, rebalancing the economy, unlocking the potential of heritage and helping places retain graduates and attract visitors and investors.

8.5 Research has shown that the most important factor affecting attention to the historic environment is the cultural approach of the local authority. It is vital to impress upon local authorities the importance of protecting the historic built environment to enhance the quality of life and prosperity of towns and cities.

**Question 9.** Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc) have the skills adequately to consider the built environment in a holistic manner? How do we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

9.1 We consider that the issues raised in question 9 are very relevant to the poor quality outcomes that can be seen in our built environment today.

9.2 Our experience in Canterbury is that the local authority planning department has lost much of its expertise over the last 5 years or so, especially in the areas of conservation, enforcement and tree preservation. The reductions in central government funding have forced local authorities to severely downgrade the number and quality of the staff they can engage in planning, shaping and managing the built environment. Planning has now become largely a matter of numbers and meeting targets rather than quality of outcomes. Central government policy is focused on economic growth and speed of decision making and whilst the NPPF makes reference to the necessity of good design local authorities no longer seem to have the resources to implement these parts of the NPPF. This pursuit of economic growth above all other considerations has resulted in the abandonment of any holistic approach to the planning of the built environment in our towns and cities.
9.3 There is no shortage nationally of skills amongst planners, architects and engineers but these are now to be found mainly in the private sector. In the private sector these skills are employed first and foremost to deliver profits and shareholder value. A holistic approach to the delivery of quality in the built environment is low down the order of priorities. Central government needs to ensure that local authorities have sufficient financial resources to enable them to deliver quality as well as quantity as the NPPF envisages.

9.4 Not only is there a lack of skills available to local authorities from amongst their officials but there is an equally noticeable lack of any appreciation for the quality of the built environment amongst elected council members. We have observed in Canterbury that in the absence of any expertise themselves, councillors often rely on officer recommendations to cover their own skills deficits. For the reason given above this is a highly unsatisfactory state of affairs as neither officers or elected members have the skill sets to deal with these important issues.

9.5 It is important to give local authorities the necessary resources to deliver the requirements set out in Chapter 7 of the NPPF and to provide proper training for elected members, many of whom have never heard of the NPPF.

**Question 10** Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

10.1 Chapter 7 of the NPPF (56-68) Requiring Good Design states: “The Government attaches great importance to the design of the built environment. Good design is a key aspect of sustainable development, is indivisible from good planning, and should contribute positively to making places better for people.”

10.2 The Canterbury Society considers that the issues raised in question 10 are at the heart of so many poor quality design outcomes that can be seen in our towns and cities. Local authority planning departments have lost much of their design expertise over the last 5 years or so. The reductions in central government funding have forced local authorities to severely downgrade the number and quality of the staff that they can engage in assessing design. This, coupled with the relentless pursuit of economic considerations above all others has resulted in almost complete disregard for design issues in the consideration of planning applications. These two factors taken together account for a noticeable reduction in examples of good quality design.

10.3 This is particularly noticeable in a small historic city such as Canterbury where we have seen recently seen controversial planning applications nodded through at committee despite considerable public concern about the design issues. In one particular case, where the local authority were both property owner and planning authority, officers overrode design problems in favour of short term financial gain, despite the proposal being in an important conservation area within the city walls and close to the Cathedral Precincts. At
the planning committee meeting most members criticised the design then proceeded to
grant consent. In this particular case, it was clear that elected members, on their own
admission, had no expertise on design in the built environment and were unaware of the
guidance in the NPPF.

10.4 We would recommend that in the case of Local Plan allocations and large scale
development proposals, or where the quality of design is a matter of public concern,
planning authorities should be required to undertake an Independent Design Review and
to have regard to the recommendations of the design review panel, as set out in
Paragraph 62 of the NPPF. It would also be good to adopt design standards such as the
Greater London Housing Design Guide.

Question 11. Do those involved in delivering and managing our built environment, including
decision-makers and developers, take sufficient account of the way in which the built
environment affects those who live and work within it? How could we improve consideration
of the impacts of the built environment upon the mental and physical health of users, and
upon behaviours within communities?

11.1 It has been striking to see how little consideration of health issues there is in the Local
Plans currently being prepared by local authorities. The quality of the built environment
impacts on health in a variety of ways. Air pollution is responsible for much morbidity, in
the form of chest and lung disease, and for increased mortality. Poor housing impacts on
health and welfare, while those who are homeless have a much reduced expectation of life.

11.2 Now that Public Health has been moved into local authorities there is a real possibility
that these sorts of health inequalities could be ameliorated.

11.3 We would urge central government to ensure that local authorities see the public
health input as crucial to the development of Local Plans.

Question 12. How effectively are communities able to engage with the process of decision
making that shapes the built environment in which they live and work? Are there any
barriers to effective public engagement and, if so, how might they be addressed? Page 3 of 4

12.1 Currently there are many barriers to public engagement with the processes which
shape the built environment. Many civic societies, including the Canterbury Society, have
experience of a pattern of community engagement which essentially involves consultation
after, rather than before, decisions are made.

12.2 Typically local authority officers work on a given issue, produce a draft report, discuss
it with elected members – and then invite the public to comment on the draft report.
Comments then come in from interested members of the public. However, by this stage so
much work has gone into the report that all those involved are very reluctant to make any
serious changes. The result is that those members of the public who did engage see that
their comments have had little impact on what is finally proposed. The end result of such ‘public consultation’ is public disillusionment.

12.3 We would suggest that councils be urged to, ‘Consult on the question and not the answer’. That is to say, consultation should take place at the time when the issue is still being discussed, questions are still open and solutions to problems have not yet been firmed up.

**Question 13** Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are their financial or other mechanisms that would encourage better design and place making by private sector developers?

13.1 The quality of the built environment is not just about the design of buildings but whether the built environment we create adds to the quality of life for the people who live and work in it. Those who create our built environment need to develop this wider vision rather than a narrow view based solely on financial considerations. Creating built environments that communities enjoy and value is well within the skill sets of those concerned but more often than not finance is an obstacle to providing the holistic solutions that communities need. These might include social infrastructure such as schools, medical centres, community buildings, parks, playing fields community woodland and so on.

13.2 When a local authority grants planning permission for residential development on previously undeveloped land the value of the land can increase anywhere from around £8,000 an acre to £1.5m to £2m per acre or more in the south east of England outside London. This increase, though subject to general taxation, is released to the landowner, whilst the future liability to support the new communities that are created is left with the local authority. In a free market economy the competition for land with planning permission keeps land values and house prices high and this acts as a constraint on the quality of the built environment.

If a fair proportion of the increase in land value were captured and managed locally for the benefit of improving the built environment and the quality of life for local communities this could produce a step change in the quality of our built environments.

13.3 Trying to capture land value in the past through such mechanisms as Development Land Tax have failed but if we are to address the challenges that we currently face to create better quality built environments then we need to introduce policies into the NPPF which enable local authorities and the communities they serve to capture locally a fair proportion of the increase in land value. This can be used to secure some of the wider built environment policies in the NPPF.
13.4 The Select Committee might consider recommending that a Royal Commission be set up to investigate how a proportion of the large increases in land values created from the granting of planning permissions can be captured to improve the built environment.

13.5 The reform of council tax is long over-due. At present this is a highly regressive tax, in that poorer households pay a higher proportion of their income than richer ones. The bandings have not been revised since 1991, despite the enormous rise in the value of property. The result is that those living in a house worth £5 million can pay the same council tax as those in a house worth a tenth as much.

13.6 Extending the bandings for council tax, so increasing the council tax paid for larger houses, and charging council tax on empty houses, could provide more income for hard-pressed local authorities. This in turn would enable them to do more to enhance the built environment.

05 October 2015
1. About Care & Repair England

1.1. Care & Repair England is an independent charitable organisation set up in 1986 which aims to improve older people’s housing. Its vision is that all older people have decent living conditions in a home of their own choosing. It innovates, develops, promotes and supports practical housing initiatives and the related policy and practice which enable older people to live independently in their own homes for as long as they choose, particularly for older people living in poor or unsuitable private sector housing.

2. The focus of Care & Repair England’s evidence

2.1. The focus of this evidence is the failure to take account of the 'demographic revolution' underway in England in the fields related to shaping the built environment - planning, architecture, building regulation and control. We would draw the Committee's attention to the headline conclusion of the House of Lords 'Ready for Ageing?' report (2013):

"The UK population is ageing rapidly, but we have concluded that the Government and our society are woefully underprepared. Longer lives can be a great benefit, but there has been a collective failure to address the implications and without urgent action this great boon could turn into a series of miserable crises."

2.2. Our central argument is that there is a critical need to shape a built environment to support positive, active ageing and that failure to do so will result in costs to society eg through higher health and social care costs.

2.3. We note that the aspiration of the vast majority of older people is to live safely and independently at home for as long as possible, usually in general/ mainstream housing. People wish to remaining socially engaged, to get out and about in their neighbourhoods, stay involved with family, friends and the wider community. The shape of the built environment is critical to achieving that aspiration.

2.4. The design, quality and suitability of homes and the wider built environment in enabling safe, healthy ageing is of paramount importance in terms of public expenditure as well as individuals’ quality of life. There is a causal, quantifiable relationship between housing conditions and many of the most common chronic &
acute health conditions. Failure to plan a built environment for an ageing population thus has a direct impact on the NHS.

2.5. Housing conditions have a significant and quantifiable effect on health. The Building Research Establishment quantifies the costs to the NHS of specific aspects of poor housing as over £1.3b pa. Many of the chronic health conditions experienced by older people have a causal link to, or are exacerbated by, particular housing conditions. This housing/health link becomes more important with age, as people become more prone to trips and falls and more susceptible to cold or damp related health conditions.
3. Questions posed by the Committee: *Policymaking, integration and coordination*

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

3. (Q1) No, they are not.
   (Q2) Policy is not co-ordinated and there are particularly weak links between housing/planning and health, the latter bearing the consequences of a poor built environment.

   National minimum housing standards are necessary to create an all-ages accessible, inclusive built environment that supports inclusion and healthy active ageing at home. As a starting point this would require all new homes to be built to a new minimum set of design standards. These would build on those originally created as 'Lifetime Homes Standards' and also apply the large international evidence base (eg WHO) concerning health and the built environment.

   3.1. Only 4% of UK homes meet even the basic accessibility standard (*Level access, flush threshold, wide doors & circulation space, WC at entrance level*). This is in stark contrast to the growing number of people with restricted mobility and whose lives would be transformed by accessible buildings.

   3.2. The English Longitudinal Study of Ageing [ELSA Wave 6] reported that 46% of women and 36% of men aged 75-79yrs received help with mobility (defined in terms of activities of daily living - washing, dressing, preparing a meal etc). This rises to 71 & 55 for those over 80yrs. Most of these activities can be made easier through home adaptations / built environment modification.

   3.3. The legal obligations under the Disability Discrimination Act to make the public/commercial built environment accessible has made a very significant difference. Whilst the Lifetime Homes Standards' (LTHS) obligations previously placed upon social housing providers [under Code for Sustainable Homes] and requirements for all new homes in London, has result in the building of more homes which meet LTHS, this will now cease outside London.

   3.4. Exhorting the building industry to apply such standards without legal obligation has resulted in no discernible level of adoption - rather the reverse as ever smaller, and increasingly un-adaptable homes are built.
3.5. In a competitive market place leaving each individual local authority to make the case for a higher design standard in their locality is both wasteful in terms of duplication and also unrealistic in areas outside London and the Southeast where land is at a premium and where local authorities are competing to attract builders of new homes.

4. Questions posed re: National policy for planning and the built environment

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

4.1. (Q3, 4,5) There needs to be a specific requirement in the NPPF for all planning decisions to specifically address population ageing and to make homes and neighbourhoods healthy places for all ages, setting minimum space and design standards for domestic dwellings.

4.2. At the current rate of replacement, homes would have to last many hundreds of years, hence anyone involved in shaping the built environment need to be tasked with making homes as flexible as possible, rather than the current 'niche' build/market segmentation which presumes that people will move home each time they reach a new phase of life (eg, form life partnerships, have children, grow older) rather than being able to live in a home long term in a future shape of society that we can only begin to guess.

5. Questions posed: Buildings and places: New and old

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?
8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

5.1. Please note points made in (4) above re key role of government in setting housing standards, taking the long view concerning resilience to change/ sustainability, creating flexible places.

5.2. With regard to making best use of the existing housing stock/ built environment assets, there needs to be a fresh look at the role of government in stock maintenance, addressing disrepair and area regeneration. This issue has fallen totally off the policy radar in recent years, but this disconnection brings risk of stock decline.

6. **Questions posed: Community involvement and community impact**

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

6.1. The primary driver for those involved in shaping the built environment today, particularly the building of homes, is profitability. There are decreasing government controls over the quality and standards of the built environment, particularly housing, with regard to addressing mental and physical health of future occupants, especially with regard to the ageing of the population and there is a lack of vision about creating positive, sustainable, mixed communities for all ages. Hence we build amongst the smallest homes in Europe, which are poorly adapted to ageing in both size and construction, particularly at the 'lower' end of the market.

6.2. A significant body of international knowledge and research about creating, designing and building healthy, inclusive, flexible places is not utilised.

7. **Financial measures**

Q13 Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

7.1. The current major programme of disposal of public land offers a unique opportunity to lock in considerations of long term social gain from any planned building on
public land disposed of. Unfortunately, the primary driver for the programme is to secure the greatest immediate financial return (ie the highest price) with no consideration of long term consequences.

7.2. With regard to 'encouraging' better design & place making, nearly two decades of exhorting the private sector to do so without regulation eg. lifetime homes standards, has resulted in minimal take up - it is only when a standard becomes mandatory that we see widespread application. In commercial terms this makes absolute sense.

7.3. We are also told anecdotally that unless there is a 'level playing field' when it comes to setting local standards for new homes, areas outside London/ SE which have to work very hard to attract builders will not feel able to set higher local standards if the response of developers is likely to be to go to another locality where such standards are not required.

8. **In summary the Committee is asked to consider:**

1. The importance of creating a built environment that supports healthy ageing at a time of unprecedented demographic change.

2. The link between the quality of the built environment and the long term costs to the state of housing/ built environment that is low quality, fails to support health and well being, noting that improved national, mandatory standards bring corresponding health/ social care gains.

*05 October 2015*
Are there any further measures – such as financial incentives or initiatives, and changes to national planning policy – which might help to encourage greater provision of suitable housing?

1. We would suggest that a 'carrot and stick' approach is required to bring about significant changes to the built environment to make it both healthy and older age friendly.

2. More than a decade of exhorting leading players (builders, designers, planners etc) to build homes that are inclusive, accessible and healthy has resulted in minimal discernible improvements.

3. The sea change in making the wider built environment accessible came about as a result of the Disability Discrimination Act, and the application of Lifetime Homes Standards came about primarily in social rented housing where it was a requirement through the Code for Sustainable Homes, whereas it was applied across the board in London where it became a minimum standard requirement for all new homes across the capital.

4. Only nationally set, legally required, enforceable Building Regulations would create a set of minimum standards that all builders have to apply. Only national standards would create a level playing field for all home building in all locations. As most major national builders of domestic dwellings use a 'pattern book' approach, this would have the benefit of creating a nationally applicable minimum 'pattern' that they could apply in all locations.

5. This national approach is also necessary as it creates a level playing field for local authorities, particularly those who have to work hard to attract developers to their area. As things currently stand in areas which are considered less attractive for new housing
development there is a perverse incentive to drive down standards / requirements. As one local authority in the north put it, ‘If we set Lifetime Homes Standards for all new homes in [yy] the developers will just go over the boundary and build in [xx authority] where they don't set that standard’.

6. Even if the current system for setting local accessibility standards of residential buildings is retained, there is an urgent need to change the assessment criteria so that social gain in the longer term becomes central to the analysis, rather than profitability for builders.

7. Changes to National Planning Policy Framework which go beyond and strengthen the current limited mention of creating healthy places to live, backed up by specific Guidance - possibly Public Health England supported - would help to create a new national vision for a healthy wider built environment, which encompasses housing and neighbourhoods.

8. Likewise, specific requirements in the NPPF to create a built environment which supports independent and healthy later life, rather than the general clause concerning addressing demographic change, would be an important addition and strengthen the drivers for change.

9. Large scale disposal of public land is being undertaken by the Homes and Communities Agency. We would put the case that social gain related conditions should be attached to such disposals in order to make best use of this national resource to create healthy places to live, thereby generating long term social gain eg reduced healthcare costs (currently the priority is to maximise income receipts).

10. At a local level, the role of the Director of Public Health and Health and Well Being Boards could be enhanced with regard to having oversight and powers over of planning proposals and standards of new build homes. This would need to be resourced but Public Health England is well placed, with access to a strong international evidence base for such an approach.

11. Local Government clearly plays a critical role in shaping local homes and neighbourhoods. However, with current funding constraints there are significant local issues with regard to powers and capacity to enforce even the current local building standards and planning. National government needs to work with the LGA and others to consider how they can support implementation and improve the national framework for planning and enforcement.

12. Taking the long view, there needs to be a change to the training of planners, designers, architects which embeds consideration of health and wellbeing and the connections to the built environment, alongside the implications of population ageing and creating inclusive places, as a core part of basic training in all of these professions.
13. On the 'carrot' side of the equation raising the profile of the benefits of creating healthy, older age friendly homes and neighbourhoods a national competition, maybe a partnership between Dept of Health, DCLG and the LGA, to highlight good places to grow old would be one approach. There could be sub-categories such as shaping neighbourhoods, visionary planning policy, building inclusive, healthy new homes and wider regeneration.

14. This could build on and extend the current NHS England & Public Health England supported initiative to drive the creation of Healthy New Towns and extend the remit to address population ageing and improvements to current towns, cities and villages.

15. However, we would reiterate the point that small scale, isolated examples of good practice, whilst useful, are unlikely to drive major change at a national scale unless backed up with a strong, national government backed vision and mandatory requirements.

Examination of Witnesses

Ms Sue Adams OBE, Chief Executive, Care & Repair England and Mr Paul Gamble, Chief Executive, Habinteg

Q66 The Chairman: Good morning. Welcome to this evidence session of the Select Committee on the National Policy for the Built Environment. You have in front of you a list of the interests that have been declared by members of the Committee. A transcript of the meeting will be taken and published on the Committee website. You will have the opportunity to make corrections to that transcript, where necessary. Could I begin by asking each of you to briefly introduce yourselves to the Committee, please?

Sue Adams: My name is Sue Adams. I am the chief executive of the charity Care & Repair England, and I chair the Housing and Ageing Alliance.

Paul Gamble: I am Paul Gamble. I am chief executive of Habinteg Housing Association, which, in the context of today’s meeting, has been the steward and developer of the Lifetime Homes standard and the wheelchair housing design guide.

Q67 The Chairman: Thank you very much. We are looking forward to a very interesting session. We are keen to have good evidence on ageing, disability and housing because this has been fairly seminal to the whole outlook that we hope to improve with our report, when we produce it in March. We are very glad to have you here.
The first question is, what are the main built environment challenges faced by the ageing population, and how well co-ordinated is the response to these challenges at the national level? Also, what are your ideas on what is likely to happen in the next 30 years—not year by year, but where are we likely to end up?

**Sue Adams**: The built environment roughly divides into the external built environment and the personal—the housing built environment. We have seen strides made in the commercial and public environments through the Disability Discrimination Act, which was not an Act with improvements specifically directed at an ageing population, but because older people are more likely to have mobility problems, reduced vision, reduced hearing—sadly, all the things that tend to come with age—the external built environment improvements have been very beneficial to that ageing population. What we have not seen are any major improvements to the personal housing stock. Currently, we have a housing stock where only 4% of the housing contains the four basic accessibility criteria.

**The Chairman**: What was the percentage?

**Sue Adams**: Four per cent.

**The Chairman**: I did not know whether it was 4% or 44%.

**Sue Adams**: Sadly not. Very often, we think ageing is a minority issue when it comes to the built environment, but a third of all households are already occupied by a head of household who is over 65, and that is going to grow. To actually create a built environment for ageing is a majority issue; it is not a small minority issue.

The other big issue around the challenges is that it is not just about having the right number of boxes for people with particular disabilities and physical limitations; it is about creating spaces that are visitable, where people can be included. It is about having a built environment where you can go and stay with your daughter when you are not very well, visit your friends and help to look after each other. The really big challenge for an ageing population is to create spaces where people remain less isolated, can still be socially engaged and involved, and can look after themselves. As much as we might hope that we will be in the minority who stay incredibly fit and well until we are 90 or 100, we know from the data from the *English Longitudinal Study on Ageing* that around half of people have problems. It is different for men and women, and changes over time, but you already have around half of people who have
problems with mobility and the activities of daily living. That has huge implications for the built environment. I very much agree with the Ready for Ageing report by Lord Filkin, which said that our society is woefully underprepared. It certainly strikes us that the built environment is woefully underprepared, particularly the housing environment. What you are doing is incredibly important because it gives an opportunity to say, “We want to create a world which is a healthy place to age”.

Without going on too long, and taking up too much time, a key connection around the built environment and ageing is, sadly, as we age we are more likely to have health problems and long-term health conditions. There is a very solid evidence base on the connection between the commonest long-term health conditions of later life and the quality of the built environment, particularly the housing environment. The headline figure people always pick out is the cost of falls to the NHS, and the clear connection there. You can actually identify the cost of falls and the risks in people’s homes: steps, stairs, baths, bathrooms. It goes beyond that: COPD, respiratory complaints, heart attack, stroke. So there is a direct cost to the public purse, through the health service, of having a built environment that is not suitable for ageing. That is a really big issue.

The Chairman: I am sure it is. I know countless examples of that where I live. You are concentrating on housing, and the built environment is not just housing. I am also very aware of elderly people who are fearful of going outside their own door because of hazards such as roads and pavements. They seem to think that they will trip on something. Is enough attention paid to that aspect of the built environment? It is part of the infrastructure, but the infrastructure is really the built environment.

Sue Adams: I totally agree. I thought I would start with the home and the built environment. I started by saying there had been improvements to level access and transport systems through the disability legislation, but it still needs to go beyond that so that we create lifetime neighbourhoods. Care & Repair England works very closely with older people’s groups and forums around the country, because they are people who are experts by the experience of being old. We have some great pioneers, like the Elders Council of Newcastle, which has done age-friendly audits. We know the things that can be done to the built environment, and they are quite simple. It largely boils down to pavements, seats, lighting. Instead of seeing this as
the information being there about what makes the wider built environment good for ageing—we have known that for more than a decade—it would be so welcome to see the impetus to actually implement those changes, which has been lacking.

The Chairman: Where do you think that impetus should be focused?

Sue Adams: Planning. We need national standards. I have not seen the exhortations that this would be a good thing to do result in any physical, concrete changes.

The Chairman: Thank you very much indeed. That has been most useful. Have you anything to add to that?

Paul Gamble: I think Sue has covered most of it. The key issue is that the existing housing stock is clearly not fit for purpose, and that is made worse by the replacement rates of housing. Kate Barker did a review some years ago which suggested that the replacement rate of English housing was 1,200 years, and that was when we were building 200,000 homes a year, which we are not at the moment. It is that long-scale issue that is the real problem.

The Chairman: We have seen that.

Paul Gamble: My organisation’s particular focus is disability. In functional terms, as Sue said, there is that crossover between disability and ageing. We know that the most common form of impairment caused by ageing is issues with mobility. We have quite good experience and clearly, there is a wide spectrum of housing need. For our particular customer group, which is predominantly wheelchair users, we did a research report with South Bank University which suggested there was a shortage of wheelchair-standard accommodation of around 78,000 in England, which is not a huge number.

The Chairman: It is not many. I would have thought it was more than that.

Paul Gamble: That is specifically in relation to wheelchair household need. The issue is that there is a whole spectrum of people with low mobility needs. We provide some homes specifically developed for the needs of wheelchair users when we know they are going to live there, but we also have this inclusive design standard, Lifetime Homes, which is the standard we would like to see generally incorporated within the standards of general needs housing. It focuses on those key elements of homes that need to change with the advent of ageing or impairment.
The big ticket items—the most expensive items—are ensuring that the doors are of a certain width, that there is level access to the property, and the ability to fit a ground-floor shower. We know from experience that those are the most common forms of adaptations required if we are talking about an occupant or visitor to the dwelling. That is our focus in suggesting that that is the move that we are finding in housing standards, not just in the UK but across the developing world. Obviously, most western countries are dealing with this demographic challenge of the ageing population.

In design terms, for us, the high-water point was the approach we took to the Olympics, not just the Paralympics, but the design of the services on that site. For me, in relation to housing, but also the wider built environment, it is about encouraging that sense of inclusive design. If we went to an airport now, we would think it very strange if there were steps anywhere. Equally, with commercial retail properties, the ability to assist consumers means not finding steps everywhere—that people find the property easily accessible, be they a wheelchair user, a parent with a buggy, or a wheeled suitcase user.

For some reason, in housing, because it is seen as the private rather than the public realm, seeking to provide those basic standards we expect to see in a private dwelling is seen as some gigantic step.

**Q68 Baroness Andrews:** I should declare an interest. It is probably well-known to both of our witnesses, with whom I worked closely when I was a Minister. We developed the policy for housing and ageing, which came out in the publication on Lifetime Homes and Lifetime Neighbourhoods, and proposed a set of national standards for the built environment. There is a question later on about planning, so I am going to leave the planning aspect.

I want to ask about policy. My first question is, do you think our understanding of the impact of ageing and the requirements on the built environment is any better than it was a decade ago, and is this in any sense reflected in policy? Secondly, you have been talking about policies for keeping people safe at home and, therefore, not being dependent on the health service and cutting costs—ageing in place—and about the shortage of suitable accommodation which older people can move into from inappropriate housing, thereby freeing up the housing supply chain as a whole. Do you think these things have to go together? Are they anywhere in policy these days, either at a local or national level? Thirdly, do you have any sense that the
demographic issues are effectively beginning to inform policy successfully in the UK at a local level or inside DCLG?

Sue Adams: There are a few questions there. Is it any better than a decade ago? I have to say, sadly, I think things have gone backwards. The shift in the housing world and housing policy field has been totally on the shortage of housing, the problem of accessing and buying your first home. We are seeing a very segmented approach to housing, which does not look at housing and homes and think about it across the life course. It says we have this here and now problem—which is much more of a finance problem, it has to be said—of how people buy a home when they are a younger person. Given the average age of purchase is 38, “younger” is the word I would use. Sadly, we have gone backwards from an idea that homes are potentially for your lifetime—that we are building homes that have to last a long time and, therefore, how do we second-guess what the shape of society is going to be in another few hundred years’ time? We are not taking the long view at all about the built environment, which is the strongest argument for a government vision and government policy about shaping the built environment. It is not quite the same as buying an iPhone that you can swap for a better model, and the market will sort it out. What we build has a massive influence on the whole shape of our society, be it the education of children, educational attainment or the health of the population. Sadly, I think we have rather gone backwards in relation to any ageing focus within DCLG at the current time.

The current debate about building numbers of homes, starter homes, seems to ignore the fact that people might age in those homes. Even if you can grasp that first rung of the ladder, we might find a lot of people cannot ever get beyond that first rung and there is a strong possibility they will have children and will age in those starter homes. That vision about the long term does seem to have gone.

On living safely and well in the current housing stock, versus moving to specialist and supported housing—

Baroness Andrews: Moving to suitable accommodation, which is not supported accommodation but just the right sized home.

Sue Adams: As I said at the beginning, the housing stock is the stock we have and quite a lot of it was built when life expectancy was around 48, in 1900. That puts it in context: the way
that society and ageing and households and people have changed enormously, but the stock
does not shift with that. We have 7 million older households—living in a third of the housing
stock. As I said before, only 4% of that stock has basic accessibility standards and of that 4%
a high proportion will be social housing, whereas 76% of our older population lives in the
owner-occupied sector, simply because of the way that regulations and the code for
sustainable homes was applied. We do have a shortage of good quality, age-friendly general
needs housing stock; not just of specialist housing for older people.

The Chairman: Can I ask one question that is burning away in my head? Does any other
country handle it better than we do?

Sue Adams: Paul will probably have a better international perspective.

The Chairman: The demographics, particularly in Europe, are more or less the same.

Sue Adams: On building standards and the quality of the built environment, I would have to
point to the Scandinavian countries.

The Chairman: And the Netherlands?

Sue Adams: Yes, the Netherlands, Finland, Austria, Switzerland.

The Chairman: Why is there no read ac
ross? Why do we not learn from them?

Sue Adams: I would like to know. I think it is the perspective of the role of the state in shaping
the built environment. We have World Health Organization age-friendly environments
knowledge from 2006.

Paul Gamble: There is a structural issue in relation to housing. Most of these standards are
controlled by building codes. In most of Europe they are often regional building codes. There
is a more political element to it in England, if you like, because building standards are applied
nationally. That tends to mean they become more politically fought over. One of the
interesting aspects is that we have regional planning devolution in London, and it is London
that has adopted the highest standards, in terms of adopting the Lifetime Homes standard
since 2004. It is interesting that, internationally, that is seen as an example of good practice
in changing the design of buildings to make them more inclusive. London is quoted
internationally as the standard, whilst we do the usual wandering around a number of other
countries looking for other examples.
In Australia, New Zealand and the US there has been far more emphasis on trying to adopt voluntary codes, with limited success, especially in Australia and New Zealand. In America, it is dominated by the Americans with Disabilities Act—the American forerunner to our Disability Discrimination Act—which sets standards for housing developments above a certain scale.

Sue Adams: On the built environment, we need a continuum; every single unit of housing we build in an ageing population is a very precious resource, so we need to set some bottom-line standards. There is certainly a role for specialist housing, and housing which is built for older people with support needs, because that is currently half a million—probably 700,000 households. There is some scope for growth there from around 5%. Maybe it could double but it depends on affordability.

Last but not least, you asked whether demographic issues are informing policy. They are certainly informing policy in the Department of Health. I do not see the join-up across with DCLG anymore.

Q69 Lord Inglewood: I think I understand what you are telling us, and what each of you told us in the evidence you submitted, but can I be clear. I am seeking a “yes” or “no” answer. Is what you are seeking a mandatory set of requirements dealing with the problems of ageing and disability to stipulate the way in which all new housing from here on is built? Is that right?

Sue Adams: We think there needs to be a bottom line of building regulations to set a basic line below which you cannot fall around accessibility standards to make homes flexible across the life course.

Lord Inglewood: Any sort of dwelling?

Sue Adams: Any sort of dwelling, yes.

Lord Inglewood: To try to get the context, have you any idea what the economic implications of that would be in adding to the cost of houses built, in the simplest terms?

Paul Gamble: There is some debate, obviously. The study that DCLG did suggests in relation to Lifetime Homes there is an additional cost of £500 per unit on average.

Lord Inglewood: The lifetime cost?

Paul Gamble: Lifetime Homes. The cost of introducing this new standard, based around what was the Lifetime Homes standard, is £500 per dwelling, roughly.
Lord Inglewood: That is £500 upfront on the capital cost, the purchase price?

Paul Gamble: I would challenge that. There is an obvious place to do the comparison. That standard has been in place in London since 2004, and we would argue that it has not been seen to slow the rate of development in London.

Lord Inglewood: You are saying something should be compulsory across the piece and you estimate that it will probably cost £500 for each house?

Sue Adams: We do not estimate. DCLG did their assessment on the application of Lifetime Homes standards, and they have been applied in London for more than a decade.

Lord Inglewood: The figure that emerged, to achieve what you want to see universally, was £500 per unit, full stop?

Sue Adams: If you applied it to a pattern book across the whole country, you could argue that you could reduce costs eventually.

Lord Inglewood: I am trying to get a sense of the financial implications of what you are telling us you would like to see.

Paul Gamble: It is a matter of controversy as to how precise the figure is. From memory, DCLG’s figure was £547, which was the cost difference between producing what we called the Lifetime Homes standard and the existing standard, which was Part M of the Building Regulations. We would say that cost is likely to reduce over time.

Lord Inglewood: Whether it is £400, £500 or £600 I do not think matters very much in the context of this debate.

The Chairman: It would not matter if it was £5,000, £6,000 or £7,000.

Earl of Lytton: Following on from Lord Inglewood’s point, the construction cost of housing where I live, down in Sussex, is about £150 per square foot, so a £500 increment per unit, I would have to say, does not seem to register in the correct order of magnitude as I see it.

We have housing of all different sorts, ranging from young people’s bedsits all the way up to millionaires’ penthouses, and everything you can think of in between. Some of it is built in what I might call topographically challenging locations, like the area of West Country where I was brought up; others are much easier to deal with. I am interested in the age versus disability issue. I am 65 and you would say, “He would say that, wouldn’t he?” Age does not equal disability, necessarily. Given the range of topography, different demands, different
profiles all the way through the strata of society—ranging from people who are young, fit, healthy, agile, to those who are older, or older plus a disability, or older plus a disability plus requiring care—how do you unpick all of this in providing a policy that makes sense in the built environment?

Paul Gamble: Let us say that at one end of the spectrum, you have someone who is a full-time wheelchair user, perhaps a full-time wheelchair user with a requirement for a carer. That has certain design considerations, but it is at the far end of the spectrum. We think about it as a functional triangle, with non-disabled people, fully mobile and then a range of different experiences. As you say, that is not necessarily linked to disability; it can be due to functional requirements of having children, having buggies and prams—those kinds of issues.

The Lifetime Homes standard is about trying to design and build homes that are as accessible and adaptable as possible, concentrating on the high-ticket items. They are not about a space standard. The standards are about focusing on areas such as the very expensive items of converting homes, such as increasing the door widths. If they are designed in at the start as the standard, which varies but is about 850mm, and we can get that standard built into the way home builders design their homes, that has virtually no cost because that is changing the specification. That is why we are quite confident about the savings. It is not about the need to have additional space. Of course, there will be sites which are steeply sloping, that require designers to think about things more carefully.

One of the reasons for trying to introduce this concept as an anticipatory standard or duty is the issue that was raised earlier. I disagree with Sue—I think the arguments about demographics have changed from 10 years ago, in the way that some of the climate change arguments have. I very rarely have to make the argument that society is ageing and that has a significant impact on the way the environment is changing. The problem is, it often appears as an introductory sentence and is not carried through in the detailed policy. We need planners and developers to think about disabled and older people as part of the customer base and society, rather than thinking of them as a special needs group.

The real problem with the construction industry, and even the housing association sector, is we tend to think about older and disabled people as separate, as a special needs group, not part of the wider community. Once you start thinking of them as mainstream, even on a
steeply sloping site, you can design buildings which are very accessible by arranging multiple
access points in the same way as you would arrange for car access. You do not think about
level access in terms of car access, but that is effectively what you are talking about. You are
talking about easy entry points to buildings.
I would agree with you that it does have an impact on the design. It changes some of the
vernacular house types we use. For instance, there is a particular house type with an integral
garage, often with a very narrow frontage. That is not a house type that we think is particularly
useful, but it has been quite popular because it is a way of developers meeting planning
requirements for car parking, for instance. Planning has impacts on the type and design of
housing you get. We are trying to ensure that ageing disability impacts in the same way as car
parking policy does.

Baroness Young of Old Scone: I was going to improperly ask Lord Lytton a question, and that
was whether he ever had a mother.

The Chairman: I bet he had a mother.

Q70 Baroness Young of Old Scone: I was very taken by your point about visitability and the
fact that older people in households are excluded from family events, often, because they
cannot access housing with their children.
I have two questions. What have we learnt from the London experience of applying the
Lifetime Homes standards, and are there any changes you would like to see? Particularly, is
the Government’s requirement that anything above the national baseline can be challenged
on viability causing problems, and what can we do about it?

Paul Gamble: The positive side from the London experience is that it had a significant impact
on the Government developing its own standards, rather than effectively borrowing
standards that, for instance, my organisation wrote. The new building standards include
something very similar to Lifetime Homes called—rather awkwardly—M4(2), which is the
second category of Part M of the Building Regulations, and Category 3 of Part M of the
Building Regulations, specifically for wheelchairs. It suggests that Government is supportive
of having that range of higher standards. We are particularly concerned that the inadvertent
implications of these standards may reduce the number of accessible homes being built,
rather than increase it. That is because of the viability, as you have mentioned.
Government have looked at viability standards in constructing the review of the new standards purely in terms of the financial viability of the housebuilding industry: effectively, what is the impact on the first sale price of that property? What they have specifically excluded from financial viability is any wider societal or health benefit for an individual or local authority or health authority. What we consider to be the benefits of this approach—having planning that incorporates thinking through the requirements of these revised standards—is removed from the viability. What looks like the viability assessment that local authorities will have to adopt will be one where, effectively, the housebuilder is able to say, “This is what we can build. If you expect us to introduce these voluntary standards, then, potentially, our development will be financially unviable for us and therefore you cannot have those standards”. How that precisely is going to work is being tested at the moment. At the moment, viability is purely the housebuilders testing their own financial viability. We think that is a huge opportunity lost.

**Sue Adams:** It takes out all the cost/benefit analysis of the social gain over the lifetime of a Lifetime Homes standards property. All the work that was done by DCLG, which could quantify the gain over the first decade—about £60,000 social gain—is completely taken out. Viability is purely in terms of the profitability to the developer; it does not look at the life course of the property and the social benefit. I do not see any other part of the country being able to apply those standards as the current assessment is shaped, and we might lose London.

**Baroness Young of Old Scone:** Why is it working in London at the moment?

**Sue Adams:** Principle.

**Paul Gamble:** Because it is an explicit part of the policy. One of the key issues is that it was adopted in London as a universal standard, so all homes which required strategic planning consent from the GLA were required to be designed to Lifetime Homes standards. That meant developers did not gain benefit from trying to reduce the number. It equally meant that developers knew they were under no competitive disadvantage compared to another developer; those standards were applied across the board. The industry accepted that was the price for developing in London, and it became incorporated into their standard designs. Critically, an independent developer could not get a competitive advantage by trying to game the system or reduce the standards.
Viability testing works by potentially creating an environment where developers will game the system. It will mean that they potentially can gain financial competitive advantage by reducing the number of accessible homes built, by arguing that they should develop 30% rather than 40%. From the kind of test cases we have seen, in reality, developers are talking about 5%, rather than 10%.

Baroness Andrews: Do you think it is going to change in London?

Paul Gamble: The London Plan is subject to examination in public. That has just been held and we are waiting for the examiner to come back. The Housebuilders’ Federation made very strong representations that the new standard, the new Category 2 of Part M, should not be a universal standard.

Baroness Young of Old Scone: If the developers outside London were saying, “I’m sorry, I can’t get this site to stack up and, therefore, I won’t build on it at the level of accessible homes you would like to see”, what is the solution to that? Is there a solution? Do you think it is generally gaming?

Paul Gamble: The practical example of that has been the operation in London since 2004. Since 2004, it has not been one long boom; there has been quite a major property slump, even in London, after the financial crash in 2008. The fact that developers have taken that on board demonstrates—I am not trying to present the developers as bad guys. But if they have a financial advantage in gaming a system, clearly, they will do. The problem is, we are creating that.

In London, developers were convinced that was the direction of travel in policy terms. They thought, “Lifetime Homes is being introduced in London; it’s only a matter of time before it will be introduced elsewhere in the country, so we might as well just get on with it. That’s the price of us developing in London”. They were starting to incorporate it into their supply chain, so their supply chain was being geared up for the standard width of doors, for example. The real concern we have is that developers may now have an interest in trying to reduce those standards, thinking that there is a chink in the armour and that perhaps we are not moving inexorably towards those higher access standards. It is that external change that we are particularly worried about. From our perspective, that movement was really positive. When the new standards came in, DCLG estimated how many Lifetime Homes were
produced—last year, when the standards were being discussed—and they said that 31% of all English housing was built to Lifetime Homes standards, and took the view that it would increase to 45% if the Government did nothing on changing standards by 2025. That was very encouraging. Unfortunately, now, the game has changed because the new standards and individual viability testing has been introduced.

**The Chairman:** Are you suggesting that it would have been better to stay with the original one and not introduce this new standard?

**Paul Gamble:** We welcome the fact there is a national standard. The Government have introduced the standard, so there is a presumption that they think the standard is a good thing. What we have always said is that, providing it leads to an increase in accessible housing, that is fine; the question is holding Government to account and gaining the figures. We know what was being produced and we obviously want to see that increase. Our fear is that that 31% figure is likely to fall very considerably. One of the things we will do, along with organisations like Sue’s, is to try and ensure that information is a standard part of what DCLG produces.

**Lord Inglewood:** When you were talking about planning developers, I think you referred to strategically identifying sites that required planning permission, or some such. Does that mean that the standards do not apply for the odd conversion? What about a warehouse conversion into flats?

**The Chairman:** A church?

**Lord Inglewood:** What about the other possible ways of creating dwellings? Do these standards apply in London?

**Paul Gamble:** Conversions are exempt.

**Lord Inglewood:** That is quite important, is it not?

**Paul Gamble:** When the policy was adopted, in London the GLA only had planning authority for significant strategic sites.

**Lord Inglewood:** My point is, if you build the odd infill house here, there and everywhere, they do not apply.
**Paul Gamble:** For a brand new infill house, the standard Building Regulations would apply. That would not necessarily mean the GLA had planning authority for a single dwelling; it is the larger sites.

**Lord Inglewood:** That is what I wanted to establish. Thank you.

**Sue Adams:** What is interesting is that it is different in Spain. Spain is the first country I have heard of that is now applying accessibility standards to renovation and conversion, largely because they have an oversupply of housing, so it almost became academic to have accessibility standards. The really important part became the improvement and conversion of the existing stock, such as blocks of flats that were being renovated. They have introduced accessibility standards and are doing great work on the training of designers and architects, so it becomes part of their thinking as opposed to an add-on.

We keep coming back to the ageing issue being somewhere that you never want to go, especially if you are a young architect and designer, but it is about bringing it in at the very early stages. We have very much focused on Lifetime Homes standards, and that is important, but there is a bigger issue about housing for ageing and inclusive places that goes above and beyond Lifetime Homes standards. It is very disappointing that only a few smaller builders have tended to be slightly more imaginative in thinking about small developments that are age-friendly and are not just of Lifetime Homes standards, but even better.

**Baroness Andrews:** They are among the most popular with builders?

**Sue Adams:** It is difficult for them to get land, of course, because of the land banking issue. They are small beacons. Those pioneers need to be encouraged. We have new opportunities, like Ebbsfleet—I think you are hearing evidence about that later—what a fantastic opportunity to create healthy places for the life course.

**Q71 Baroness Andrews:** This takes us slightly wider than housing. I heard what you said, Sue, that ageing is somewhere you never want to go. I presume that is because it is so unwelcoming at the moment in the built environment. You have also referred to the lack of joining up, particularly between health and housing. To what extent do those statements apply to the non-housing elements of the built environment: town centres, highways and roads, public realm, and so on? Can you describe for the Committee what a Lifetime
Neighbourhood would look like? We cannot go and see one now, but is there somewhere we could go to see one in this country or elsewhere?

**Sue Adams:** There are two questions there. Where could you go and see one? I am stumped on that. I cannot think of a place where I could say, “Go and have a look” and they have done it all. Manchester has led the way on the age-friendly cities network group, but we are still not seeing it applied to the physical built environment in Manchester. Elizabeth Burton has fantastic materials on assessing the physical external environment for being age-friendly, but we have not seen huge steps taken anywhere in this country towards a neighbourhood implementing those changes.

**Baroness Andrews:** What about the first part of my question, about housing and health not joining up? Are any of the other aspects of the built environment joined up?

**Sue Adams:** I do not like to keep sounding so negative. On the connection between what is being built and the shaping of neighbourhoods, I am not seeing health and wellbeing boards, for example, taking on a lead role in planning. I think that could be a role for the future. So far, the health and wellbeing boards have largely been concerned with how you use the better care fund and the pressing here-and-now issues around integration of health and care services—very focused around services. In relation to future recommendations for a widening of that role, the area that we have put a lot of effort into is working with Public Health England and trying to reach directors of public health to say, “You have a fantastic opportunity here”. Now that public health is back in local government, they could be a very positive force for shaping planning for health and ageing in the future. I do not see anyone being there yet.

**Paul Gamble:** Delft, in the Netherlands, is quite commonly used as an example that has done a lot in neighbourhood planning. Equally, the Legacy Olympic Village is a good place to start, and the development of the new park and sports facilities. If you want an example of integrated transport, shopping, developed to inclusive standards—there is an interesting tale of how those standards came about and what they were in the Olympic Park—that is being used internationally as an example of inclusive design.

For me, the benchmark of a Lifetime Neighbourhood is just a neighbourhood that is well cared for. We are talking about no potholes, and pavements and crossovers that work for all. We
are talking about well-kept communal areas where bushes do not knock you over or force you out into the road. We are really just talking about a good neighbourhood.

**Baroness Andrews**: Good for everybody?

**Sue Adams**: Good for everybody, yes.

**Paul Gamble**: Part of the problem is that how we are able to illustrate inclusive design principles is often by a lack of things. For instance, when we promote accessible homes, it is very difficult to take a picture of an accessible door and show that it looks like anything other than a door, or a window that you can open whilst sitting down. These are not things that feature in architecture journals.

**Lord Inglewood**: Is your point that one of the problems is an inadequate system in general for the proper maintenance of the public realm?

**Paul Gamble**: Yes.

**Lord Inglewood**: Does that go back to money?

**Paul Gamble**: In part, but the initial design as well. With new developments such as crossovers, it is about the ability to move from the pavement across the road and up to the pavement—it is about getting that detailing right. My focus is wheelchair users, but for anyone in the street who is slightly infirm, has a temporary injury or is pushing a buggy, that requires good design to start with and then maintaining it. It is about thinking through not just what is a good quality neighbourhood, but the functional importance of allowing people to enjoy and access that environment. That is the kind of issue that stops older people venturing out—when they think they have a six-inch kerb to get over, that there are roadworks, that there is an overhanging tree that blocks their path. It is about good neighbourhood management, but there is a real inclusive design aspect to it as well.

**Sue Adams**: The people who have done the most thinking and are trying their hardest to get this implemented are the Newcastle groups. They have worked with the local planners and are trying to make Jesmond an age-friendly place.

**Baroness Andrews**: Is this the Newcastle Elders Council?

**Sue Adams**: Yes. The Elders Council has worked with the local school of architecture on planning. It comes back to trying to normalise this, as opposed to seeing it as an add-on. That is the key. It is setting this as a vision that is good for everybody. It is about the way you look
at a lot of local housing strategies. They will have a general housing strategy and then say, “Oh yes, we’ve got an ageing population so we’ll review our sheltered housing scheme”. That is 5% of their elder population. It is about setting that vision.

I did not think of the Olympic Village because, interestingly, it has evolved into a very popular place for young people. In some ways, it is very disability-friendly and inclusive, but it does also shout at you, “This is a good place for young people”, because these fully accessible, well-designed buildings have been marketed at the young, fit and well.

**Q72 Lord Freeman**: I have a very specific question. How might the Community Infrastructure Levy or Section 106 provisions be reformed to encourage a more adequate supply of suitable housing for older people, or those with restricted mobility?

**Sue Adams**: Do you want to start on that one, as a developer?

**Paul Gamble**: It is limited because the prospects for Section 106 agreements are diminishing anyway. Our concern is that they become part of the negotiation. Our concern is that issues to do with access and inclusive design are tradeable features that can be offset, for instance, by the percentage of supply of affordable housing or a grant to a local school, or a transport project. Our real concern is trying to make the standards non-negotiable. These are things we feel should be at the forefront of developers’ and designers’ minds from the outset of the project. It is something they should be expected to incorporate. To answer your question, we are nervous about the idea that it is seen as an add-on that could be negotiated out.

**Sue Adams**: We understand that the retirement housing sector, the builders of specialist housing sectors, put a very strong argument that their footprint is larger because they have communal and shared spaces and corridors, and want that to be taken into account, so that there is not a perverse disincentive to build that sort of housing because of CIL. That is a slightly different argument from tradeability.

**The Chairman**: That is a very useful point. There is one more question, but I am wondering whether you could write to us with the answer? The question is, are there further measures, such as financial incentives or initiatives, and changes to the national planning policy, which might help to encourage greater provision of suitable housing? If you could, we would be very grateful. I think I am a bad Chairman, but we always seem to end up not getting that answer.
It is such an interesting and broad subject, of course. Thank you very much indeed; it has been very illuminating and very useful.

Paul Gamble: Thank you.

Sue Adams: Thank you very much for inviting us.

Chartered Institute for Archaeologists (CIfA) - Written Evidence (BEN0063)

The development and implementation of national policy for the built environment

Evidence of the Chartered Institute for Archaeologists (CIfA)

Executive Summary

1. CIfA continues strongly to support reforms which facilitate the timely delivery of sustainable development in accordance with the National Planning Policy Framework (NPPF).

2. However, there is concern amongst CIfA’s membership that environmental safeguards in the planning system (including those which protect and promote the historic environment) are erroneously seen as a constraint on development, rather than as an integral part of regeneration, place-making and sustainable development. National policy for the built environment must maintain those safeguards and can best contribute to recovery by ensuring that we have a functioning planning system, supported by appropriate expert advice, which recognises the social, economic and environmental dimensions of sustainable development.

CIfA

3. The Chartered Institute for Archaeologists (CIfA) is the leading professional body representing archaeologists working in the UK and overseas. It promotes high professional standards and strong ethics in archaeological practice, to maximise the benefits that archaeologists bring to society, and provide a self-regulatory quality assurance framework for the sector and those it serves. CIfA has over 3,300 members and more than 70 registered practices across the United Kingdom.

Specific Questions

Policymaking, integration and coordination

1. Are the decisions that shape England’s built environment taken at the right administrative level?

4. Broadly, yes, since decision-making in the planning regime remains largely a matter for local planning authorities which facilitates community engagement and the consideration and protection of heritage assets at a local level.

5. However, there is a tension in Government policy between localism (which seeks to devolve planning and other powers to a neighbourhood level) and streamlining and centralisation (through which the Government seeks to redress perceived blockages in the delivery of development). This was highlighted most recently in the planning proposals of the Government’s Productivity Plan which include proposals to introduce a zonal planning system
for brownfield land and powers for the Secretary of State to write the local plans of ‘defaulting’ local authorities.

6. CIfA supports the Government in its efforts to produce a planning system which facilitates the timely delivery of sustainable development, but believes that this will not be achieved by by-passing or undermining the crucial role of local government in managing and protecting the historic environment (and thereby promoting sustainable development).

What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

7. National policymakers should set a framework in the planning and other fields for local authorities to deliver sustainable development, but must not be overly prescriptive, allowing local circumstances to be fully taken into account.

8. Government should also support local authorities in carrying out their planning duties and, in particular, in ensuring that they have access to appropriate archaeological and heritage services and up-to-date and professionally-supported Historic Environment Records.

9. Of course local authorities need resources to maintain such services, but central government’s supporting role goes beyond ensuring that such resources are available and includes

- helping local authorities to determine how archaeological and heritage services might best be delivered. The report of the Vaizey Inquiry into the future of local government archaeology services (http://www.archaeologists.net/news/140115-english-culture-minister-commissions-inquiry-future-local-government-archaeology-service) has still not been published and Government needs to move this initiative forward
- providing strong policy support for the management and protection of the historic environment as a key element of sustainable development (see for instance, http://www.theguardian.com/science/2011/jun/27/archaeologists-furious-bunny-huggers as one example where strong endorsement of archaeological policy was needed) and
- making clear that local planning authorities which do not fully address the implications of development on the historic environment are failing in their duties.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

10. There is increasing recognition across Government of the contribution of heritage to sustainable development, regeneration and place-making, but there is still work to be done. Departments such as Defra do not always recognise the historic environment as an integral part of the environment and consequently fail adequately to take it into account in considering sustainable development.

National policy for planning and the built environment

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment?

12. Yes, provided that sufficient regard is had, and weight is given, to the guidance and advice which sits below the NPPF, including the National Planning Policy Guidance (NPPG) and Good Practice Advice Notes on the historic environment (GPAs).

Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

13. All three limbs of sustainable development (economic, social and environmental) are equally important. Particularly in times of recession care must be taken not to prioritise economic factors at the expense of social and environmental considerations. What is required is a balanced approach to recovery through genuinely sustainable development.

4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

14. No comment, save that the introduction of a spatial element to national policy should not in any way undermine the appropriate assessment at a later stage of the implications of development for the historic environment.

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

15. No comment.

Buildings and places: New and old

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?
16. Government’s attempts to streamline and centralise planning powers (as noted above) are based upon a judgement that it is ‘blockages’ in the planning system that are preventing development coming forward, rather than, for instance, market forces. CIfA, as a body concerned specifically with the historic environment, questions this judgement but does not present evidence to refute it. What we can say is that proposed reforms such as the introduction of a zonal system for brownfield land risk bringing forward development without adequate consideration of its effects on the historic environment. This would reduce the level of protection for heritage assets and run contrary to the principles of the NPPF (including the presumption in favour of sustainable development) and of localism.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

17. So far as the historic environment is concerned, these aims will best be achieved by ensuring that heritage issues are fully addressed in the decision-making process. This requires access to information (contained in up-to-date Historic Environment Records) and appropriate expertise (provided by competent practitioners acting in accordance with professional standards). Government can assist in this regard by

- formulating clear policy and guidance which recognises the value of the historic environment and ensures that its value is fully recognised in practice. The NPPF is a good start, but a desire not to be prescriptive in guidance and advice has in practice diluted the force of the message
- introducing a statutory duty for local planning authorities to maintain or have access to an up-to-date, professionally-supported Historic Environment Record
- ensuring that professional standards are consistently applied (including those of CIfA: http://www.archaeologists.net/codes/ifa) by expressly endorsing those standards
- expressly endorsing the accreditation of practitioners and organisations by professional bodies such as CIfA and, where appropriate, requiring work to be carried out by accredited practitioners and/or organisations

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

18. The full potential of the historic environment to contribute to regeneration and place-making has not been realised. At present, local authority archaeology and heritage services are under severe financial pressure (with the future of many in doubt) and in many cases do not have the resources to ensure that that potential is fully realised. Government needs to provide meaningful support for these services and to address the matters identified in paragraph 17.

Skills and design
9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

19. The archaeological profession does have the skills to consider the archaeological implications of development. Local authority access to those skills is threatened by a lack of resource. The answer is not to suggest that other professionals, such as planners, can fully address those implications (as some local authorities have tried to argue), but to support local authorities in providing archaeological and heritage services and professional bodies such as CIfA in ensuring that the skills of practitioners are accredited and up-to-date.

10. Are we using the right tools and techniques to promote high quality design and ‘placemaking’ at the national level? How could national leadership on these matters be enhanced?

20. No comment.

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

21. Greater account should be taken of this. One way to improve communication may be to formulate and apply sustainability and other indicators relating to the historic environment.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

22. No comment.

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

23. No comment, save that we await with interest the conclusions of the Vaizey Inquiry into the future of local government archaeology services (see paragraph 9 above).

Peter Hinton
Chief Executive, CIfA

05 October 2015
1. About the CIOB

1.1 The Chartered Institute of Building (CIOB) is at the heart of a management career in construction. We are the world's largest and most influential professional body for construction management and leadership. We have a Royal Charter to promote the science and practice of building and construction for the benefit of society, which we have been doing since 1834. Our members work worldwide in the development, conservation and improvement of the built environment. We accredit university degrees, educational courses and training. Our professional and vocational qualifications are a mark of the highest levels of competence and professionalism, providing assurance to clients and other professionals procuring built assets.

1.2 Professionalism at all levels and stages within the construction industry is at the core of our work. We play a leading role in the development and continued improvement of standards in the industry at a national and international level. We recognise the challenges facing the built environment, such as the unprecedented skills shortage in the professions, the ageing workforce and the complexity of developing policy that improves coordination, design and the overall decision-making process, and we work with government and industry to outline and implement solutions.

2. Summary

2.1 Ensuring the construction industry has a sustainable supply of labour with the necessary skills is of paramount importance to the built environment.

2.2 Even as industry output levels recover and show signs of steady growth, concern over the resilience of the construction workforce remains, with a significant number of hard-to-fill vacancies recorded across the professions.

2.3 Difficulties recruiting the right calibre of candidate have been felt across the built environment professions. With the numbers enrolled on construction courses and apprenticeships having fallen sharply over the last few years, more needs to be done
to reverse this trend and ensure that the workforce is both sustainable and equipped with the necessary skills.

2.4 Official statistics value the UK’s construction programme at more than £100 billion\textsuperscript{52}. However, this ignores much of what most people think of as construction or construction-related, including the crucial design work contributed by architects and engineers, cash-in-hand work, construction work undertaken directly by non-construction firms, and it also ignores all the real estate activities central to the development, management and sale of the built environment.

2.5 When drawing up its construction industry strategy, the Department for Business, Innovation & Skills (BIS) recognised this disparity between how construction is measured and what it really is. It defined the sector as: (i) the construction contracting industry; (ii) the provision of construction related professional services; and (iii) construction-related products and materials\textsuperscript{53}. On this basis it estimated the industry to comprise of over 280,000 businesses, covering some 2.93 million jobs; 10% of total UK employment.\textsuperscript{54}

2.6 Calculations by Dr Stephen Gruneberg of the University of Westminster, based on official sources, suggest that construction is actually equivalent to 15.3\% of GDP\textsuperscript{55} - significantly higher than the official 6.4\% quoted by the ONS. That would make its contribution equivalent to about £250 billion annually.

2.7 With the introduction of the Localism Act 2011 under the coalition government and plans for devolution laid bare in the Queen’s Speech, we forecast profound changes

---

\textsuperscript{52} CIOB, \textit{No more lost generations: Creating construction jobs for young people}, February 2015

\textsuperscript{53} BIS UK construction: an economic analysis of the sector, a supporting document to Construction 2025: industrial strategy for construction - government and industry in partnership, 2 July 2013

\textsuperscript{54} BIS, \textit{UK construction: an economic analysis of the sector, a supporting document to Construction 2025: industrial strategy for construction - government and industry in partnership}, 2 July 2013

\textsuperscript{55} Provided in a note for \textit{The Real Face of Construction}, published by CIOB September 2014, by Dr Stephen Gruneberg: The question of the size of construction as a percentage of the economy rests on the difference between the net contribution of construction as an on-site activity only (i.e. the last stage in a process of assembly), and the share of the production of the built environment as a final good. Construction value added represents 7.4\% of all value added, a concept used to establish the total size of the economy, avoiding counting the inputs into the construction process from other sectors such as manufacturing, real estate etc. When you take them into account then the value of construction output (i.e. GDP) increases. As the size of the economy remains the same, the result is that construction is 15.3\% of the economy. If this method were applied to aggregate all sectors of the economy there would be double counting in some areas and so, in theory, one would need to subtract those inputs from the relevant manufacturing sectors and do the same in other sectors to get an idea of how final goods make up the economy. The reason for this issue is that the share of construction in GDP is based on value added, which is used to find the total size of the economy without double counting, not the relative importance of construction gross output as a measure of an industry producing final goods. Dr Stephen Gruneberg is Reader at the Faculty of Architecture and the Built Environment University of Westminster. He is an expert in construction economics and the measurement of construction output
to the way we approach the built environment at a regional level and think about both planning and design.

2.8 To reduce the sector’s reliance on the current system of development control and to deliver more projects ahead of schedule and within budget, as was outlined in the coalition government’s Construction 2025 industrial strategy, professionals in the built environment must work towards a more proactive approach to planning and design.

2.9 Amongst other factors, education and training will be central to this. Crucially, the task of ensuring excellence in the built environment will require current educational frameworks to go beyond the boundaries of each profession and deliver a well-connected, integrated syllabus.

3. Full response

Q1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

3.1 Following the outcome of the 2015 General Election, the Conservative government announced its intention to enter a new phase of dialogue with the construction industry. This transition marked a shift from a relationship which was previously built on the idea of a ‘partnership’ between industry and government. The implication is on ensuring the industry itself can create solutions to the major challenges it faces.

3.2 This change in positioning has been combined with the decision to discontinue the role of Chief Construction Adviser, a much valued resource and voice for construction professionals in the built environment. Given the economic importance of the sector, we believe the industry must be given a clear and effective channel to engage with government.

3.3 These changes, when combined with the government’s commitment to devolution, which was laid bare in the Queen’s Speech, signal a greater role for local authorities in the decision making process. As was expressed in the 2014 Farrell Review, a more proactive approach to planning would likely allow local authorities to use their time and resources more effectively. Whilst it is encouraging that the government’s reforms aim to give neighbourhoods a greater say over the decisions which affect them, there remains a strong case for a degree of centralisation in the decision-making process. To this effect, the government should aim to provide the industry with a sense of overall direction and engage in meaningful dialogue.

Q2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport,
infrastructure, sustainability and heritage? How could integration and coordination be improved?

3.4 There is an inherent complexity associated with the coordination of policy that covers the built environment. With a plethora of government departments linked to the built environment on issues as wide-ranging as economy, energy efficiency, building regulations and procurement, alongside departments such as DH, DfE, MoD and MoJ who spend billions of pounds on construction, it can often be difficult to decipher which department should assume primary responsibility for the implementation of each announcement and policy development. Currently, the failure to join the dots with each of the respective departments has created a somewhat fragmented approach to construction and the built environment.

3.5 Integration and coordination could be improved across each of the listed areas by providing an effective and direct channel for professionals in the built environment to engage with policy makers. Over the course of the last six years, the Chief Construction Adviser has provided an effective channel for the industry, including professional bodies, to engage with policy makers and we therefore welcome an independent review of the decision not to continue the role. However, overall the CIOB welcomes the recent BIS changes to the Construction Leadership Council and the indications of a greater level of dialogue between industry and government are positive. The use of prominent construction business leaders spearheading work streams provides a solid platform to deliver improvements to working practices and skills provision in the industry.

3.6 Another possible solution to improve the level of integration and coordination between departments would be to establish an independent infrastructure commission, as was previously recommended by Sir John Armitt. We believe the establishment of an independent commission has the potential to set a long term vision which could outline what infrastructure would be needed – and by when. By devising a vision and planning ahead in this way, the commission would also have the potential to manage industry expectations and clarify the demand for skills and labour. Nevertheless, it is important to recognise that better integration and coordination in the decision making process is no guarantee that this will be accurately reflected on the ground. And while there is scope for government departments to improve coordination, it is vitally important that this integration is both horizontal and vertical in scope.

Q3. Does the National Planning Policy Framework provide sufficient policy guidance for those involved in planning, developing and protecting the built environment and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?
Q4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

Q5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

3.7 To deliver an increasing number of projects ahead of schedule and within budget, we believe there ought to be a rethink to how we approach both planning and construction. In order to help deliver the government’s priorities for the sector, the majority of which were outlined in the Construction 2025 strategy, we welcome a shift towards a more proactive approach to planning.

3.8 To create a long-term planning approach, we recommend government to consider adopting a 10-15 year timescale for planning major developments. Given the significance of the sector in terms of its contribution to UK GDP, any timescale proposed should go beyond the duration of each parliament and seek to provide industry with a sense of clarity and stability. We believe a forward plan, such as the one proposed, has the potential to help the industry manage its expectations and workforce more effectively. Although the adoption of a 10-15 year timescale may be a useful place for policy makers to start, some of the pressures facing the built environment may require a longer approach to be taken. In particular, issues related to climate change, such as efforts to mitigate against flooding, may require an even longer consideration.

3.9 The construction industry itself should not be immune from criticism in the process of planning future built environment needs and requirements, particularly the business models of many major contractors, which are characterised by multiple levels of subcontracting and bidding low for work. This increases risk throughout the supply chain and means margins are often very low - typically 1 or 2%. Such low margins, which often turn into losses if there are problems on projects, inhibits investment for the future, decreases the scope to improve productivity and significantly reduces the opportunity to build a steady and stable workforce.

Q6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

3.10 The government has a significant role to play in terms of helping the industry to overcome the current issue of housing supply. And, whilst the government has committed itself to extending Right to Buy to housing associations, it is important to remember that such schemes are demand-side responses to predominantly supply-
side problems. Whilst the CIOB welcomes the government’s intention to build one million homes by 2020, it is essential that there is an added emphasis and focus on ensuring quality in the built environment. Housing built to poor standards affects not only its longevity, but the wellbeing of residents. In 2010, Ecotec produced various estimates of the impact of poor housing. While the estimates can be challenged, the study put the added cost to the police of responding to crimes related to poor housing at £1.8 billion a year, the costs associated with poor health at £2.5 billion a year, and damage to the economy by £14.8 billion a year through poor housing’s effects on educational standards.  

3.11 Ensuring high quality is, however, just part of the solution to the housing crisis. Affordability is strongly linked to the supply of housing. And whilst increasing the supply of housing has the potential to improve affordability, it is essential that properties are bought and occupied, and are not simply purchased as foreign investments. This, as has been frequently documented, does little to address the current shortage of housing, especially in the capital. Additionally, services associated with the wider home improvement sector of the construction industry – documented in ONS figures as the Repair, Maintenance and Improvement (RMI) sector – benefit economically from greater levels of owner occupation, and suffer from lower levels. This has been recently documented with home improvement retailer B&Q announcing the closure of 60 stores.

3.12 To ensure quality in the built environment, we need to see a greater commitment to improve training and professional development. According to research by the CIOB into the value of professionals and professional bodies, a poll reveals that 77% of the general public who had some prior knowledge about the role of professional bodies would be more inclined to trust a professional if they knew they were a member of one. A further 83% of the public who had prior knowledge of professional bodies agree that they help to raise standards. We believe these findings have important implications for professional bodies across a range of sectors, and we encourage government to fully recognise their role, and indeed ability, to develop and drive up industry standards and indirectly improve quality.

3.13 The CIOB also notes that the All Party Parliamentary Group for Excellence in the Built Environment will launch a consultation on the subject of building quality in the near future, which it will be issuing a response to and we ask the Select Committee to engage on this debate also.

Q7. How do we develop built environments which are sustainable and resilient, and what role should the government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and

56 Danny Friedman, Ecotec, *Social impact of poor housing*, March 2010
57 CIOB, *Understanding the value of professionals and professional bodies*, 29 September 2015
circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

3.14 To create buildings and develop environments which are sustainable we need to ensure that professionals in the built environment are suitably qualified and receive proper training. In the existing building stock, we need to see a greater commitment towards energy efficiency and insulation in order to reduce our reliance on unsustainable sources of energy. Adapting existing disused buildings to other uses is also vital and cost-effective. The recent trend in major towns and cities for disused office buildings to be adapted as domestic dwellings is a good example of making the best use of existing buildings and the legislative arrangements and incentives that encourage this should be continued and potentially extended to other types of development.

3.15 Decisions on whether to re-use buildings or replace them with new ones will very often be flawed because not enough is known about the energy performance and sustainability of either new or existing buildings. Indeed, the design vs as-built performance gap for new properties just highlights this disparity. However, the majority of construction activity concerns what we do to existing buildings and not in the construction of new ones. There are also various estimates of how many of today’s buildings will exist in 2050 with a figure of between 70% and 85% commonly quoted. That means a necessity to focus on what we do with our current building stock in terms of its use, re-use, management, retrofit and refurbishment.

3.16 As buildings are such valuable assets, mistakes can be costly. Consideration for refurbishment and new uses is made via feasibility studies and options appraisals. These take account of potential viable uses, the investment needed and ongoing in-use costs. This can then allow a comparison between re-use of an existing building with the construction of a new one. Whilst there can be a fair degree of accuracy in costing the initial work, the costs in use are much more difficult to accurately calculate and will increasingly see energy costs as a significant proportion that will increase in size over the life of the building.

Q8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

3.17 In keeping with the recommendations from the Farrell Review, more should be done to encourage these buildings to open to the public. Local authorities should identify those historic buildings most at risk and devise a strategy for their conservation.

3.18 Good practice repair and maintenance of pre-1919 buildings in particular can have a profound effect on energy performance. Building services and equipment has an obvious connect with this, but it also relevant to building fabric. Damp walls, for
example, could be over 30% less energy efficient than a comparative dry wall\(^{58}\) and manufacturers of liquid water repellents for use on masonry are now using the energy efficiency benefits as their main selling point. This and other evidence points towards maintenance and repair being a primary energy saving measure. It means that basic maintenance such as clearing overflowing gutters that discharge water onto walls is necessary to save energy.

**Q9.** Do the professions involved in this area (Skills and design) (e.g. planners, surveyors, architects and engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

3.19 The number of individuals starting construction apprenticeships has increased for the first time since the recession. The number of apprenticeship starts in 2014 was 18,493 – a 15% increase on 2013 – though many typically drop out\(^{59}\). A recent parliamentary commission set up by CITB and think-tank Demos found that 120,000 apprentices were required over the next five years to 2020.

3.20 According to figures from The UK Commission for Employment and Skills (UKCES)\(^{60}\), there will be a need for an average of 100,000 new recruits across the built environment a year between 2012 and 2022. Part of the reason for the high projection is the older than average age profile of the construction workforce; approximately 20% of the construction workforce is expected to retire in the next five to ten years.\(^{61}\)

3.21 UKCES projections suggest the construction industry in 2022 will employ more people than at any time since 1990, with the biggest growth rates in management and technical occupations rather than in the more traditional skills; in those ten years UKCES predicts almost 400,000 new and replacement management, professional and technical roles will be needed. The implication is that the profile of the construction workforce will steadily become more white collar. The shift is expected to be mirrored in the educational background of those within the industry. The numbers with higher degrees and doctorates is expected to more than double. To make this scale of transformation within the industry, newcomers to construction are therefore expected to be on average far more highly educated and the role for professional bodies in accrediting courses and providing relevant qualifications will likely expand in scope.

\(^{59}\) Building, *Apprentices in construction: One step forward*, 6 March 2015, David Blackman

\(^{60}\) UKCES, *The Future of Work: Jobs and skills in 2030*, February 2014

3.22 Aside from the professional roles, one of the more stand-out statistics from UKCES is that, with the steady decline in skilled trades in manufacturing and other sectors expected to continue, more than half of all new skilled trades jobs created in the UK between 2012 and 2022 are projected to be in construction. The UKCES projections suggest the industry needs to find 461,000 skilled tradespeople in the period 2012 to 2022. The combination of this and the ever-increasing array of professional roles should place construction central in the minds of careers advisers.

3.23 Even as industry output levels recover, concern over the sustainability of the construction workforce remains, with a significant number of hard-to-fill vacancies recorded across the professions. The increase in university tuition fees in England and Wales in September 2012 has also attracted a great deal of controversy and attention for its effect on the number of students applying to university. As a result, universities are now able to charge students up to £9,000 per year to study. According to the University and Colleges Admissions Service (UCAS) the numbers studying built environment related courses has slumped significantly, with UCAS reporting a 16% drop between those applying in 2011, and those applying in 2012.62 And whilst the government has committed itself to deliver three million apprenticeships over the course of the next five years, employers in construction have reported difficulties attracting and retaining the right calibre of candidate.

3.24 For many individuals, degrees remain an expensive route to a professional career. And, whilst apprenticeships often come without the cumbersome debt that is associated with university education, more needs to be done to advertise the various routes through which individuals can gain the necessary skills to progress in the industry. We believe that by protecting the term apprenticeship in law, and by increasing the routes through which it is possible to join the industry and progress, the sector will increase its ability to attract skilled recruits.

3.25 The CIOB has published a number of skills audits which document the shortages present in the industry. We have been clear that to address some of the skills problems, we need to see a greater commitment to help the industry help overcome some of the issues surrounding its image. Current perceptions of the industry reinforce the assumption that it is a dangerous, male-dominated and dirty field of employment. Initiative such as Open Doors (opendoorsweekend.co.uk/) do help to engage the general public and particularly schoolchildren by allowing access to construction sites, but more is needed to be done to change the image and reflect the fact that much of the work within the industry occurs off-site, and away from view. This includes showcasing the vast array of careers available within construction.

62 Higher Education Funding Council for England (Hefce), Data about demand and supply in higher education subjects – undergraduates in higher education disciplines, table 2.2.5, July 2013
3.26 Currently, there are a number of issues with the supply of labour to local authorities. To help overcome this, we believe teaching that covers the built environment should begin as early as possible. In keeping with the findings from the Farrell Review, local authorities should be encouraged to partner with schools specialising in subjects with clear ties to the built environment. Schools should also be encouraged to offer more built environment courses - similar to the Design Engineer Construct! (DECI) curriculum, which falls under the Class Of Your Own (COYO) initiative.63

3.27 Furthermore, to improve skills within the industry and help local authorities to source skilled personnel, educational establishments should also look to increase the integration of education courses which concern the built environment. To this effect, schools should be encouraged to offer exchange courses and placements to allow students studying construction-related courses with a greater appreciation for both architecture and planning, and vice versa. This, we believe, would provide professionals with more of a holistic understanding of the built environment, and its requirements.

3.28 As highlighted in the Richard Review of Apprenticeships, there has long been a social stigma attached to apprenticeships which place them as second-best to university degree programmes. There are perceptions that apprenticeships are for those who did not achieve the grades required to get into university and, as stated in the Review, this is a view that is shared amongst young people, friendship groups, parents and teachers. However, high quality apprenticeships provide one of the very few debt-free education routes that also enable individuals to ‘earn-and-learn’.

3.29 The work of the coalition government in raising the profile and social status of apprenticeships was positive. In 2011, £1.2 billion was invested into apprenticeship schemes, describing them as the ‘new norm’ for school leavers opting to not go to university. In the same year, 457,200 people started training (more than double the average number starting in the last decade). However, we believe the term ‘apprenticeship’ was used far too generously and many employers badged any retraining or work-experience under the name. These standards fall short of those proposed in the Richard Review. Furthermore, despite the positive number of apprenticeship starts, the National Audit Office (NAO) suggested that many of these apprenticeships were created in ‘fast growing’ sectors such as IT and telecoms and over a fifth of apprenticeships lasted less than six months.

3.30 Although the figures seem positive and it is clearly important to get young people into work, there must be rigorous and high standards to ensure they lead to fully fledged careers. With short term training in jobs that do not require any extra

63 Design Engineer Construct! - http://designengineerconstruct.com
learning badged as apprenticeships, it is no surprise that they are not an attractive option for young people. Furthermore, as the National Minimum Wage for an apprentice was until recently £2.73 per hour (and as of 1 October 2015 is £3.30), apprenticeships may be perceived as a way of recruiting cheap labour.

3.31 The erroneous perception that construction is a low skilled and low paid career choice makes recruiting apprentices even more challenging. This is disappointing since apprenticeships in Construction, Planning and the Built Environment tend to be considered among the most beneficial in any sector in terms of training quality. They often last two to four years and are designed by the sector skills councils that work with business representatives from relevant industry sectors to develop course content. Most courses are also recognised at Level 2 and Level 3 under National Apprenticeship Frameworks. Indeed, official statistics from BIS rate apprentices in Construction, Planning and Built Environment frameworks as being particularly effective in improving apprentices ability to carry out their job, with almost all (98%) reporting an improvement in this case. This compares to the lowest ranked subject in Business Administration and Law frameworks, where just over two thirds (69%) reported an improvement in ability to carry out their job.

3.32 Overall, the skills crisis in construction is complex and there isn’t one direct contributing factor. One consequence of the lack of available skills is the importing of migrant labour. Construction globally has always relied on migrant labour and, looking at the supply side, migration is essential to provide the flexible supply of labour needed to meet volatile demand generated at a local level. It reduces shortages when activity expands rapidly. It reduces unemployment among construction workers when workloads plunge. And it can help to smooth otherwise volatile wage rates, reducing financial uncertainty for clients, contractors and workers. But while migrant labour will always have a role to play in a flexible industry such as construction, it should not become a substitute for training UK citizens in sufficient numbers to provide a sensible base of workers needed within the nation’s construction sector.

Q10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

Q11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

---

64 CIOB, An Analysis of Migration in the Construction Sector, March 2015
Q12. How effectively are communities able to engage with the process of decision-making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

3.33 In order to increase the public’s engagement with the decision making process, local authorities should look towards creating a series of online forums. In doing so, this would provide the public with an opportunity to have their say on planning decisions which affect them.

3.34 However, it is important to realise that knowledge of what makes good buildings may not be widely held amongst the public. It is therefore important that the public have the opportunity to engage with planners, architects and professionals in the construction industry. If the public have a greater understanding of what makes good buildings, it may spur individuals to demand higher quality buildings and indirectly drive up industry standards.

02 October 2015
Chartered Institution of Building Services Engineers (CIBSE) – Written Evidence (BEN0102)

CIBSE is the primary professional body and learned society for those who design, install, commission, operate and maintain the systems and services both mechanical and electrical, which are used in buildings. Our members therefore have a pervasive involvement in the performance of buildings in the UK which makes a key contribution to a sustainable built environment. Our focus is on adopting a co-ordinated approach at all stages of the life cycle of buildings, including conception, briefing, design, procurement, construction, operation, maintenance and ultimate disposal.

CIBSE is one of the leading global professional organisations for building performance related knowledge. The Institution and its members are the primary source of professional guidance for the building services sector on the design and installation of efficient building services systems to deliver healthy, comfortable and efficient buildings.

Policymaking, integration and coordination

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

1.1 National policymakers should work closely with local decision makers, helping to set the strategic framework but allowing communities to have an influence on how their built environment develops. There should be more considered decision making across geographical boundaries, focusing on the best outcomes rather than what is possible constrained by bureaucratic / administrative / financial boundaries. For example, community renewable energy networks can be very effective if supported appropriately.

1.2 It is important that there is a distinction between planning requirements and technical standards relating to buildings and structures. Planning requirements should be sympathetic to local situations and needs, but technical standards should very largely be consistent across the country.
2 How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

2.1 Currently there is fragmented responsibility between Government departments which leads to significant gaps in implementation, enforcement and maintenance of policy related to the built environment.

2.2 Integration and coordination could be improved by taking a systems thinking approach. With any system, the whole is different to the sum of its individual parts. If the desired outcome of a sustainable built environment balancing the economy, society and environment is the whole, then the policy parts shouldn’t be developed in isolation without regard for the relationships between them. There is a history of a disjointed policy landscape in the UK which has led to poor outcomes e.g. energy and carbon reduction policy. Coherency is required to provide appropriate market signals to developers, and to provide the public with confidence that the Government is taking a long term view.

2.3 A stronger voice is needed within Government to champion a high quality built environment. Giving existing scientific staff within departments a built environment brief reporting to a Government Chief Built Environment Adviser (similar to the Chief Scientific Adviser model) would help to improve coordination across Government.

National policy for planning and the built environment

5 Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

5.1 Those involved in the development of strategic planning and built environment policy should be looking at least 20 years ahead. In particular, the issue of climate change demands this scale of activity. A timescale in decades rather than years or political electoral cycles is more appropriate. The creation of the National Infrastructure Commission indicates that there is recognition of the need for a long term view when it comes to the built environment.
Buildings and places: New and old

6 What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

6.1 It is difficult to predict the impact of the most recent changes, some of which have only just come into force. In theory the streamlining of technical standards for housebuilding should reduce costs for housebuilders, enabling them to build out existing consents more efficiently. But it is too early to know whether this will actually be the outcome. Some of the exemptions for small scale developments of a few homes may prove to provide a significant loophole for piecemeal development to less demanding standards, particularly for energy efficiency. Again, this needs to be monitored as the new requirements take effect.

7 How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

7.1 Finite resources will require careful management, and part of developing sustainable and resilient built environments will be embracing the age of limits. Resource security is becoming more of an issue, with risks affecting the availability and price of materials essential to industry. Construction clients are becoming increasingly interested in resource efficiency, particularly in terms of the embodied energy of buildings. Energy efficiency is a core principle of sustainable development that should be promoted, doing more with what we have rather than using up further valuable resources.

7.2 “Resilience is the ability of assets, networks and systems to anticipate, absorb, adapt to and / or rapidly recover from a disruptive event. In its broader sense, it is more than an ability to bounce back and recover from adversity and extends to the broader adaptive capacity gained from an understanding of the risks and uncertainties in our environment.” (Cabinet Office). The Government needs to ensure that the whole definition cascades through all their work on the built environment so that everyone has a shared understanding of what resilience means and can embed it in their area of activity.
7.3 Climate change has already, and will increasingly in the future impact on the built environment, for buildings in particular with regard to cooling and ventilation, leading to implications for the quality of the indoor environment, energy consumption and carbon emissions.

7.4 Assessment of these factors at the design stage is essential to evaluate how buildings will cope the demands that future climate will place on their envelopes, interior spaces and systems. The following adaptation measures are likely to be requiring attention: thermal performance and dealing with overheating; water conservation and dealing with flooding risk; and material durability.

7.5 There are also important questions regarding existing buildings; how, when and to what extent they will need to be adapted to cope with future climate change. Existing housing stock and built environment assets should be upgraded, at least half of the existing building stock will still exist in 2050. There have been numerous practical projects and research studies focusing on retrofit of different types of buildings, both domestic and non-domestic. These need to be brought together and the findings used to inform a scaled up national programme of retrofit to improve both sustainability and resilience of buildings.

7.6 A key focus is energy efficiency which should be made a national infrastructure priority. Our energy system is wasteful, costing consumers money as well as harming the natural environment. Reducing energy demand in existing buildings through better facilities management and retrofit is an effective way to reduce consumption and costs. We have the experience and knowledge to improve the performance of building stock, but need Government to provide an appropriate policy and legislative infrastructure to support and implement this on a national scale.

7.7 For new buildings, there has been a growing awareness for some time that many 'low energy buildings' use more energy than the designers thought they would. The performance of low energy designs is often little better, and sometimes worse, than that of an older building they have replaced, or supplemented. The difference between expected and realised energy performance has come to be known as the 'performance gap'.

7.8 There are two main reasons for this performance gap. The first is that the method of calculating energy use for the purposes of compliance does not take into account all the energy uses in a building such as energy used by lifts and escalators, for catering facilities, or for server rooms. The second is related to site practice. To deliver a building
that uses as much energy as expected requires that the design is built as intended, the 
engineering systems are commissioned effectively and the operators and occupiers of 
the building understand how to operate and maintain the building so that it delivers the 
expected performance. Making an accurate estimate of the operating hours and likely 
occupancy of the building is key.

7.9 Prioritising value rather than cost, and long term operational expenditure and 
environmental impact rather than just immediate capital expenditure will help to make 
the built environment more socially, environmentally and economically sustainable. 
There are many examples of people, products and projects that demonstrate 
engineering excellence in the built environment, as recognised by the CIBSE Building 
Performance Awards. The focus is on actual, measured performance, not design intent 
or performance specifications.

7.10 Again, a systems approach is required, considering the interconnectedness and 
inseparability of components of the built environment. For example, the interplay of 
buildings and existing underground infrastructure or the multiple benefits of both 
building level and site-wide green infrastructure. Standards are required to ensure a 
consistency of approach in developing the built environment (see also 9.4 and 9.5).

Skills and design

9 Do the professions involved in this area (e.g. planners, surveyors, architects, engineers 
etc.) have the skills adequately to consider the built environment in a holistic manner? 
How could we begin to address any skills issues? Do local authorities have access to 
the skills and resources required to plan, shape and manage the built environment in 
their areas?

9.1 There needs to be a significant increase in both trans-disciplinary education and working 
in the built environment. The Edge Commission Report on the Future of Professionalism, 
Collaboration for Change highlights that the siloed nature of the built environment’s 
education system needs to be reviewed, demonstrating relevance, encouraging greater 
integration and preparing future professionals for work in a multi-disciplinary 
environment.

9.2 For example, four Centres of Excellence in Sustainable Building Design have been set up 
in collaboration with Royal Academy of Engineering. They aim to enhance the curriculum 
for engineering students, enabling them to experience interdisciplinary, collaborative
problem solving to help them unlock the potential for innovation. This should be the norm rather than the exception. Without the different built environment professions working together and understanding each other’s skills and roles, a holistic approach won’t be possible.

9.3 There is little understanding of the built environment professions amongst school children which means that few will aspire to a career in this sector. Programmes such as Design, Engineer, Construct! which applies pure academic subjects to the latest construction industry practices, providing secondary-school age children with real world practical experience and employability skills, are valuable but unfortunately not widespread.

9.4 There is also a need for craft and technician level skills. Many tradespeople are competent in the areas that they have been trained in but for newer technologies that require integration with traditional services e.g. solar thermal systems, there is a significant training need. Training should be linked to common standards which in most cases do not exist. Setting minimum standards is a key step to provide greater confidence for specifiers and clients and these can also be included in the tendering/contracting process.

9.5 For example, the Heat Networks Code of Practice which has been produced as a joint project between CIBSE and the Association for Decentralised Energy (ADE) seeks to provide clear and measurable outputs which will ensure that a heat network operates effectively and meets client and customer expectations. If heat networks are to form a significant part of our future low carbon energy infrastructure in the UK then they need to be designed, built and operated to a high quality to deliver customer satisfaction. A programme of training and registration of heat network professionals has been developed to ensure that the skills necessary to implement the Code of Practice are available across the sector. The Code of Practice, supported by these trained professionals, should provide a step change in the heat network sector.

9.6 Local authorities need to be properly resourced to plan, shape and manage the built environment in their areas. The 2013 Farrell Review highlighted the longstanding and systemic skills gap in the public sector. A lack of capacity will hold back the delivery of a sustainable and resilient built environment for the UK.

Community involvement and community impact
11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

11.1 Those involved in delivering and managing our built environment should really focus on how they would feel working and living in the spaces that they are creating. Rather than classifying people as stakeholders and users, we need to think of them as people who aren’t separate from the built environment, they completely shape each other.

11.2 We can’t treat people as components with predictable properties that can be incorporated into a system. People just don’t behave in the ways that designers, planners and policy makers expect.

11.3 The Royal Academy of Engineering’s recent report, Built for Living, notes that the design of the built environment, in combination with other factors has the potential to influence human behaviour and therefore have a significant impact on health and wellbeing, performance and productivity and the stewardship of resources. Behavioural considerations need explicit consideration from the very beginning of any project and throughout its lifecycle.

06 October 2015
Chartered Institution of Water and Environmental Management – Written Evidence (BEN0078)

Call for written evidence

Background to CIWEM

CIWEM is the leading independent Chartered professional body for water and environmental professionals, promoting excellence within the sector. The Institution provides independent comment on a wide range of issues related to water and environmental management, environmental resilience and sustainable development.

Summary

CIWEM is concerned that the current and proposed reforms to the planning system are producing a deregulating effect when higher standards and quality design are needed to meet the challenges of a growing population and for the built environment to both mitigate and adapt to climate change. CIWEM considers a National Policy Statement for planning and the built environment should include:

Support for ever tightening building standards for thermal efficiency and water use

A presumption that new developments have sustainable drainage systems

Funding for parks and greenspace should be statutory within local authorities

A new national retrofit programme for energy and water efficiency

Appraisal tools, valuations and planning policy to adequately reflect the impact of the built environment on health and wellbeing

Incentives or regulations for developers to build on land within their ownership

The Government to work with the insurance industry to include ‘betterment’ policies for climate resilience

Further investigation into how to incentivise the development of distributed heat / energy networks

Strong championing for design principles that include social and environmental improvements

A national framework of low emission zones and active travel promoted within urban areas

Answers to the consultation questions

Policymaking, integration and coordination
Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

National planning policy should establish the guiding principles, so that local authorities can develop tailored Local Plans to reflect local needs. Neighbourhood plans allow for further local input. However the main issue in shaping the built environment is that local authorities are under increasing financial pressure, which is only going to increase, and do not have the resources to cope in their planning departments. There is evidence that the Planning Inspectorate has required Local Plans to be re-consulted on when national policy (not legislation) has changed, which can prove to be a very costly exercise and results in the plan being stripped of detail required to ensure a high quality built environment, rather than updated with re-consultation.

There is a concern that Permitted Development rights (that is, without planning permission) are extending and the Housing Bill will deregulate this further. This takes decision making away from the Local Authority. There is also a risk that in some areas of the built environment that Local Enterprise Partnerships may have too large an influence on neighbourhood plans and skew development towards business interests over those of the community.

Overall there is a lack of strategic perspective in England on decisions about resource use and ecosystems beyond the local level, such as renewable energy, waste policy, river catchment management (affecting the downstream built environment), integrated transport and green infrastructure. Some of this is left to local authorities to plan for and others are overridden nationally. There is a contradiction in some aspects of planning policy with local communities able to veto wind farms developments but unable to block hydraulic fracturing developments. The two should be more closely aligned to avoid contention and provide genuine local engagement.

How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

From an outsider’s perspective it appears that matters are not well joined up in Government. For example there are multiple savings that can be derived from proper planning such as, improved public and mental health (reducing costs to the NHS), mitigation and adaptation to climate change and social inclusion which decrease costs to the public purse in the long term.

Integration is difficult in any realm, however there could be a place for a cross department panel or similar to provide the holistic view. Design and sustainability professionals specialising in built environment should be included.

National policy for planning and the built environment
Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

The NPPF provides the minimum in policy guidance for those involved in planning, developing and protecting the built and natural environment. It relies upon Local Planning Authorities having in place a Local Plan and a planning department that is adequately resourced and skilled to provide more robust guidance and planning control.

Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

Planning policy does not lack a spatial perspective as it is plan-led, however this relies upon all the plans being in place. The NPPF is not spatial in itself. Local planning authorities are best placed to create the spatial perspective as they have the local knowledge necessary.

It could certainly be said that a strategic rather than spatial perspective is lacking in England. Matters that require a broader outlook such as climate change adaptation, ecological networks, infrastructure projects and energy are difficult to integrate within and between Local Plans without an overarching spatial plan.

Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

Planning practice guidance states that Local plans should have a 15 year time horizon and be kept up to date. We agree with this, however ideally there needs to be a strategic assessment above the local scale to ensure that we can adapt to new risks as they appear and address issues of national importance. Rather than setting a specific time horizon, planning for future built environment needs should build in resilience to future financial, political, and environmental shocks. In this way the built environment can be flexible to different situations that may arise in the future.

Buildings and places: New and old

What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

The forthcoming Housing Bill aims to drive housing development on brownfield land both through the Starter Homes programme and a statutory register of brownfield sites where local development orders can be made. There is a worry that in a bid to cut costs (developments will be exempt from financial commitments (Section 106 agreements and the Community Infrastructure Levy) and weaker building standards adopted), the Starter
Homes scheme may result in inadequate housing and areas with improper services and infrastructure. New homes should be built to be more resilient and higher efficiency standards for water and energy.

The Housing Bill will effectively give automatic permission on brownfield sites identified in the register through Local Development Orders. The government expects to see Local Development Orders in place for homes on more than 90% of brownfield land suitable for new housing by 2020. The Royal Town Planning Institute notes that imposing LDO requirements would be likely to slow down progress and implementing unused planning consents would do more to increase brownfield housing. The Government needs to outline whether land affected by contamination will be included on the brownfield register as this will have implications for environmental and public health (see also answer to question 9 on skills).

How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

Planning policy and building standards are the best way to make built environments sustainable and resilient. As some of the measures are costly in the short term (though not over the lifetime) developers are less inclined to include them unless they are made compulsory.

Communicating the benefits of sustainable and resilient buildings to people is key in ensuring these techniques are adopted, and government has a role here. People are much more likely to change their behaviour when they feel connected, for example, if they have their own solar panels they will be more likely to use their energy at times of the day when it is sunny and energy is in surplus. Education can also drive an improvement as people demand more sustainable and resilient homes and products that meet high standards for efficiency.

It is of great concern that the requirement to meet various levels of the Code for Sustainable Homes has been removed as this was driving positive change in delivering low carbon homes. Building standards need to be regularly tightened to increase change, for water and energy efficiency. It is also worrying to see that some domestic and non-domestic buildings are currently being built to 2006 Building Regulations because the development of these sites were started then.

It is easier to put in place measures when homes are being built. Installing water tanks beneath new homes to collect and reuse rainwater would reduce the impact on the water environment especially in the south east where there is water scarcity. This would be a fairly minimal capital cost but would need to be put in the planning conditions of large

---

65 ROYAL TOWN PLANNING INSTITUTE. 2014. Building more Homes on Brownfield Land.
developments to ensure uptake. Only exemplar developments are currently doing this when it should be becoming mainstreamed.

The government could also work with the insurance industry to explore how ‘betterment’ policies can be included to increase resilience. For example when a home is being refurbished following a flood, the insurance should pay to make sure it is more resilient to future incidents, with resistant flooring and electrics being moved above the water line. This change would mean that future insurance claims would be less.

Given that heating homes is a large contributor to England’s carbon dioxide emissions much more needs to be done to improve energy efficiency. The existing housing stock will need to be tackled by a successor scheme to the Green Deal which incentivises improvements. Whilst this has been a success for the private rented sector, lessons need to be learned as to why uptake was not greater in the wider population.

Local authorities need to be resourced to be able to put in place measures that increase the resilience of the wider community such as green infrastructure and sustainable drainage systems. More strategic sustainability issues can be solved locally such as putting in place decentralised energy providing homes with heat that would otherwise go to waste. Most energy is imported into cities where it could be produced and distributed locally.

Skills and design

Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

The skills are available however they tend to be in consultancies rather than local authorities. There is no problem in this, however it means that local authorities need to have the resources to pay for these services.

There need to be more sustainability professionals with a built environment focus in design teams within consultancies. There are currently a lot of professionals in this area however they are not used in all projects as they are seen as an added cost. Without standards such as the Code for Sustainable Homes, they will be used even less in housing projects.

The Government’s plans to increase the redevelopment of brownfield land may include areas affected by contamination which presents a risk to a range of receptors including humans, ecosystems, water quality, and property including crops and animals. Dealing with contaminated or derelict landholdings requires many technical skills, not least in dealing with regulatory and operational requirements. On any individual site, there may be only a single pollutant linkage or there may be several. To ensure technical skill and competence, a person qualified by Chartership through a relevant professional body should be used.
Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

The Code for Sustainable Homes encouraged better quality design in housing. It is difficult to see how standards will improve without this driver. The Building Regulations still offer some good practice, however some Building Control Officers do not look the developments in a holistic way, they just compare the regulations and compliance. On a building scale, more integrated tools and techniques should be used, such as Building information modelling (BIM).

National standards and leadership will be needed with strong championing for design principles that include social and environmental improvements.

Community involvement and community impact

Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

Urban green infrastructure can play a role in increasing social inclusion. In the UK and in cities around the world it has been noted that the distribution of socially excluded areas often coincide with sparse green space of poor quality. Planning at a city scale can help alleviate these discrepancies and create green spaces with a high aesthetic and cultural value.

Increasing contact with nature can offer an affordable, accessible and equitable choice in tackling health and well-being through preventative and restorative public health strategies. Academic studies have shown a positive relationship between access to green space and improved mental health and recovery from many chronic illnesses.

Appraisal tools, valuations and planning policy do not adequately prioritise the impact of the built environment on health and wellbeing. Although evidence is available and being

66 MALLER, C., TOWNSEND, M., PRYOR, A., BROWN, P., ST LEGER, L. 2005. Healthy nature, healthy people: contact with nature as an upstream health promotion intervention for populations. Health Promotion International: 21, 1. 47. and

05 October 2015
assembled continually, the case for good urban design is already proven and requires leadership and appropriate investment.

People who are physically active reduce their risk of developing major chronic diseases (heart disease, stroke, some cancers and type II diabetes) and the risk of premature death. Increasing participation relies on changing personal attitudes towards physical activity and this will involve making our environments more conducive for active living. Active travel is one of the easiest ways to achieve regular exercise but must be accommodated through the quality of the physical and natural environment with opportunities for recreation and exercise. The consequences of an ageing population will also have implications for improving accessibility in our towns and cities.

Air quality is an important influence on health that may be impacted by urban development. High traffic densities in urban areas can result in pollutants exceeding EU and UK targets for NO2 and PM10. Encouraging active travel, increasing uptake of low emission zones and providing more pollution free thoroughfares should be central to Local Plans.

How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

Neighbourhood plans allow for great engagement with the public, however they may not have the skills needed and could be susceptible to the influence of an articulate minority.

Developer led consultation events are sometimes fairly poorly advertised with limited information. There should be more open dialogue with the Local Authority, local people and developer. Local Authorities should take more interest in the developments in their area. Perhaps charging for pre-application advice is not the way forward and instead they should be actively involved and potentially take the lead role of consulting locals.

ROYAL TOWN PLANNING INSTITUTE. 2014. Building more Homes on Brownfield Land.
1. Does national built environment policy take sufficient account of environmental resilience? Is the regulatory framework fit for purpose?

Built environment policy is ultimately governed by the National Planning Policy Framework which refers to resilience to the impacts of climate change, including flood risk and water supply and demand considerations. However since it was adopted building standards and planning conditions have been gradually weakened, doing little to encourage water efficiency (particularly in areas of water scarcity), green infrastructure and SuDS implementation remains limited and inappropriate development still takes place in areas of flood risk.

There is a risk that at a time when greater resilience is required, the Environment Agency is facing resourcing issues and the lead Department of Communities and Local Government has little regard for climate change and resilience. Green infrastructure remains to be perceived as additional cost to development and new housing targets and the removal of requirements for section 106 contributions will only result in cheap and poor quality delivery.

The majority of improvements to the built environment need to be proactively retrofit into existing development, be this housing stock, public or commercial space. This requires strong leadership and drive at the local level. Local Authorities are also facing further cuts in funding and play a pivotal role in coordinating resilience in public spaces.

2. How does environmental policy integrate with other national policy priorities? How might built environment policies be better integrated to improve outcomes?

Cross-government integration of the environment with other policy areas remains poor. When approached DCLG officials have stated that they do not want to discuss climate change. Climate change adaptation staff in Defra have been reduced from 38 to 6. The Department of Transport and Health are not fully integrated so that transport policy encourages low carbon modes or good air quality, nor personal mobility on any meaningful scale, although NHS England is quite well engaged with the mobility issue. It is instructive that the Government has recognised that there is a need for improved cross-departmental cooperation in relation to flood risk management, with insufficient coordination of the various and extensive responsibilities. This principle might be applied to a whole range of other issues which are manifested in the built environment, such as health and wellbeing for example.
3. Is national policy on Sustainable Drainage Systems (SuDS) effective? What are the challenges associated with delivering SuDS through planning policy and does policy need strengthening?

The direction of national policy was changed somewhat with the decision not to commence Schedule 3 of the Floods and Water Management Act requiring Lead Local Flood Authorities to establish SuDS Approval Bodies (SABs). Instead, SuDS are now driven through the planning system which does not provide for adoption of sustainable drainage infrastructure, which is essential and which SABs would have done. This is a key obstacle to the widespread implementation of SuDS in England and in the absence of any clear provision for adoption under current policy, it almost certainly will require strengthening.

Possible Supplementary: What else can be done to support the provision of SUDS as part of new developments?

Simply a resolution to the issue of adoption is required. The decision not to commence schedule 3 in 2014 may need to be re-examined.

4. How can a spatial or ‘catchment-led’ approach to water management help deliver better outcomes? What are the other key issues in relation to securing effective water management in the built environment?

Current flood events illustrate that there is a need for serious focus on a full package of measures to manage water in catchments. Conventional defences are part of this package but catchments have been so heavily modified that downstream towns and cities have to be protected against ‘unnaturally’ high levels of flow.

The built environment should be seen in the context of the wider environment or catchment in which it is situated. Upper catchment measures, in combination with in-situ defences in the built environment may be able to significantly reduce flood risk. There is considerable potential for improved land management practice in upper catchments for the purpose of ameliorating flood risk downstream but there is a lack of quantifiable data available to support the principle of this. Very often measures which improve flood risk will also improve drought resilience, water quality and biodiversity. Improved methods of valuing such ecosystem services are being developed which will help lead to payments between beneficiaries and land owners.

5. How can the need for new housing supply be reconciled with the need to restrict building in high flood risk areas?

Housing may be built in areas of flood risk provided that it is designed and constructed in the right way. However building resilient homes will not prevent issues around safe access.

Pressure to build new housing stock both quickly and cheaply is unlikely to incentivise good design and construction standards but these are essential. Short term economic savings of
poor standards of design and construction are likely to be exceeded by costs of subsequent damage and recovery in the medium term.

The Environment Agency note that their advice is taken in around 97% of cases regarding development in flood risk areas. However the vast majority of planning applications have nothing to do with the Environment Agency. The Environment Agency is only required to comment where a development involves a Main River or the coast. Often planning authorities are unaware that there may be surface water flooding risk as they have taken a ‘no comment’ from the Environment Agency to mean that there is not a flooding issue. The Committee on Climate Change has found that 4,600 homes a year are constructed in areas of high flood risk.

6. What are the key challenges in relation to the environmental resilience of the existing building stock?

There is an extensive legacy of building stock in the UK which is vulnerable to flooding and which is also of poor thermal and water efficiency. Given that extensive replacement of such buildings is not a feasible (nor a sustainable) proposition, an extensive programme of retrofit will be necessary for thermal efficiency and in some cases for property level protection for flooding. The Green Deal did not deliver the intended outcomes but there is no policy or scheme in place which yet indicates that it will deliver the kind of widespread improvement necessary. Strong and ambitious policy will be required to achieve this.

Property level resilience can be effective. There is scope to include ‘betterment’ when insurance payments are being made following a flood, but it is unlikely a company would voluntarily include this without policy direction to do so.

Upper catchment measures and property level resilience should be prioritised, alongside hard defences, particularly in areas of high flood risk. Carlisle could be used as a pilot for such an approach.

7. Is there a case for a national committee, on the model of the Natural Capital Committee, to advise the government on the value of the built environment?

From the point of view of climate resilience and water and environmental management in the built environment, there is a real need for greater buy-in by DCLG (and other departments) and cross-departmental working to ensure that we have high quality, resilient built environments.

We do not consider there is a need for an additional committee as there are already two committees that can provide sufficient advice to Government on the value of the built environment. The adaptation sub-committee of the Committee on Climate Change would be able to provide advice on resilience whilst the Natural Capital Committee could advise on ecosystem services associated with nature in the built environment, spatial and catchment-
related issues as well as wider issues surrounding health and wellbeing (including mental health) which relate to the built environment.

Examination of Witnesses

Tony Grayling, Director of Sustainable Business and Development, Environment Agency, and David Wilkes, Honorary Vice-President, Chartered Institution of Water and Environmental Management (CIWEM)

Q283 The Chairman: Welcome to this evidence session of the Select Committee on National Policy for the Built Environment, Mr Grayling and Mr Wilkes—and members of the public too. We hope you enjoy it. You have in front of you a list of the interests that have been declared by members of the Committee. A transcript of the meeting will be taken and published on the Committee website and you will have the opportunity to make corrections to it where necessary. Could I begin by asking each of you to briefly introduce yourselves to the Committee, please? This is for the purpose of making sure that the transcriber knows who says what.

Tony Grayling: I am Tony Grayling. I am director of sustainable business and development at the Environment Agency.

David Wilkes: I am David Wilkes. I am an honorary vice-president of the Chartered Institution of Water and Environmental Management.
Q284 The Chairman: I am sure we will have a very good session today, particularly on the issue of water, so thank you for coming.

The first question is from me. Does national built environment policy take sufficient account of environmental resilience? Is the regulatory framework fit for purpose?

Tony Grayling: I think that the national framework is there, and at the heart of it is the National Planning Policy Framework and the supporting planning policy guidance. Alongside that are the adaptation provisions of the Climate Change Act and the framework that sets in place, so there are the vehicles for the integration of resilience into the built environment. I do, however, think that there is always a need to keep things under review and to learn from experience, and I am sure that there is always room for improvement.

The Chairman: I think that is a very apt description of the situation. The other areas that need resilience are the National Planning Policy Framework and the guidance. The way things are happening at the moment, they have to be up in the air. Life is going very quickly through this area with the issue of climate change and the local issues regarding the floods that have happened. It is in a state of flux. Are you taking that into account? Is there anything that should be firmed up in these agreements?

Tony Grayling: It is certainly the case that our approach as a statutory adviser in the planning system is to take account of our latest understanding of climate science and the likely impacts on England in particular. Our work incorporates the latest UK climate projections, but they date back to 2009, and we are about to go through a process of updating those projections. With the events that we have had over the last few days, with the serious flooding in Cumbria and Lancashire, it is important that we stand back and take another look.

The Chairman: Indeed, because it is not only the UK situation with the frightful flooding that we have had but also what is going on in Paris.

Tony Grayling: Absolutely. Primarily, Paris is about the world coming together to ensure that greenhouse gas emissions are reduced so that in the future there are fewer impacts from climate change. However, as a result of greenhouse gas emissions already made, we know that inevitably there will be further climate change.
The Chairman: There is no point in double-guessing. We will have to wait a while. When are we going to have the conclusions of the discussions taking place in Paris at the moment?

Tony Grayling: It is not an area of responsibility for the Environment Agency; the lead department is the Department of Energy and Climate Change. I am watching eagerly, as I am sure you are, and I believe the organisers in Paris think that they could reach conclusions by the end of this week. Experience has shown that these UN climate change conferences tend to overrun, and there are all-night sittings, but they eventually get to a deal, and the signs are reasonably positive on this one.

The Chairman: Mr Wilkes, what are your views on that?

David Wilkes: I would agree broadly with that. We will see the headlines through the newspapers and through the television. I am cautiously optimistic that common sense is prevailing. I would amplify what Mr Grayling has said; there is a lot of evidence that greenhouse gases have been emitted into the atmosphere over the last 200 years, and there is so much inertia in our climate systems that, precautionary wise, we should not expect the weather and the climate for the next 100 years to be the same as we have seen for the previous 100 years. I think we are set to see change.

The Chairman: Change like the change that we have had over the last three or four years?

David Wilkes: I fear so, yes.

The Chairman: That is not a very happy scenario, is it?

Q285 Lord Clement-Jones: In that context, the Greenpeace report suggesting that something like nine out of 20 sites identified for housing are at risk of flooding does seem to be quite an interesting counterpoint to overall national policy. How can that sort of situation arise? Is the report correct, and therefore do our policies need to be reviewed?

Tony Grayling: I have seen that report and I would say in response that the critical thing is that when there is a major housing development, the local authority, when it receives the planning application, is obliged to consult the Environment Agency, and we will give our advice as to whether we think the location is suitable for housing and whether particular design measures need to be built in to ensure environmental resilience, including resilience to flood risk. The evidence from our work is that in 98% of cases where we respond on flood...
risk, the outcome is in line with our advice, either because the planning application was suitable, or was amended in line with our advice, or was withdrawn or refused. In 98% of cases where there are housing developments, our advice is taken.

The Chairman: For clarification, is that statutory? Do they have to ask for your advice, or is it a “nice to have”?

Tony Grayling: No, they have to. We are a statutory adviser in the planning system.

The Chairman: So they cannot go ahead with a development unless they have advice from you on this issue?

Tony Grayling: For major developments that is absolutely correct, yes.

Lord Clement-Jones: Despite what Greenpeace says, these sites will be resilient as a result of having taken your advice?

Tony Grayling: I cannot comment on the individual sites because I have not seen that level of detail, but our advice might be anything from, “Yes, go ahead. Your planning application is suitable”, to, “No, we do not think that the development should be allowed to go ahead”, or something in between with resilience measures built in.

The Chairman: Do you have a similar situation with your responsibilities on water?

Tony Grayling: We also advise on issues to do with the management of water and waste water, and land quality and water quality.

The Chairman: And that is statutory also?

Tony Grayling: That is a complicated question. It is statutory for flood risk and a number of other things, but not for everything.

The Chairman: Would you like it to be for everything?

Tony Grayling: We have been in discussion with the Department for Communities and Local Government about rationalising where we are and where we are not a statutory consultee. The fortunate thing is that local authorities tend to take our advice even where we are not strictly a statutory consultee but where they consider we have the relevant expertise.

The Chairman: That is good. Have you anything to add to that before I open it up to the Committee, Mr Wilkes?

David Wilkes: No, I do not believe I have.
Q286 Earl of Lytton: I am a chartered surveyor and in the past professionally I have suggested that there ought to be an approach to dealing with surface water run-off in existing housing stock, which of course by bulk is the major portion of what we are dealing with. The suggestions have fallen on completely deaf ears as to whether there should be some conditionality when a property is extended, and whether there should be surface water attenuation, if not actually a SUDS approach. Is that because it is not considered relevant or that the stock of older buildings is safe from this surface water surcharge? Why has that suggestion seemed never to have had any traction?

Tony Grayling: Surface water is a real issue and the risk of flooding from surface water is likely to increase with climate change, as is the risk of flooding from rivers and the sea. Under the framework for flood risk management, the primary authority for surface water flood risk is the lead local flood authority. Generally speaking, that is the county councils, so they ought to be incorporating into their local plans and into their approaches to development in their area policies that are about the management of surface water flood risk, as well as the management of flooding from the rivers and the sea.

Earl of Lytton: Do you scrutinise local plans to see whether that sort of provision is included or not?

Tony Grayling: We are also a statutory consultee on local plans and, yes, we will inspect local plans in relation to the flood risk policies that they contain.

David Wilkes: The Earl of Lytton’s point is well made in that there is significant surface water risk to existing properties. It is sometimes very surprising why people do not take advantage of grants opportunities to reduce their risk. There is almost an apparent philosophy that people are in denial and think that it probably will not happen, so they may as well save their money and energies for doing something else.

The Chairman: What about the car having precedence, in other words people concreting over their gardens?

David Wilkes: That has to be something that we discourage.

Q287 Baroness Young of Old Scone: I should declare some interests having been the chief executive of the Environment Agency and also a trustee of IPPR when Mr Grayling was there,
and I have also been an honorary fellow of the Chartered Institution of Water and Environmental Management, so I am compromised in both directions, but nevertheless—

**The Chairman:** Any more?

**Baroness Young of Old Scone:** There are probably a few more in there. I have two questions, one for Mr Grayling and one for Mr Wilkes. Clearly, the assumptions that are made about the future increased risk of flooding from climate change are very important, because houses and buildings last for a very long time. Do you think that the current assumptions that are being made about future flooding risk are sufficient, or are we building houses in those parts of the flood plain that may be resilient against the sorts of floods that we have experienced in the past but not the future? A one-in-100 year risk of flood will rapidly become a one-in-50 year risk, and perhaps even a one-in-30 year risk in the very near future.

I will give Mr Grayling time to think about that while I ask Mr Wilkes his question. In your very useful evidence, you said that you did not think that the current policy arrangements were particularly good on several fronts, including building standards for thermal efficiency and water use, sustainable drainage, parks and green space, energy efficiency and water efficiency, retrofit and join-up across the whole spectrum of the green environment, and the environment in general. Could you tell us more about that part of your evidence? I will leave you time to think about that while Mr Grayling tells me the answer to the first one.

**Tony Grayling:** The current approach is based on our best understanding at the moment of the likely impacts of climate change in the future. Over time our understanding gradually improves, but it is only a gradual improvement. For example, I would not expect the next iteration of the UK climate projections, which are due to be developed by about 2018, to be radically different from the projections that we are currently using that were published in 2009, just as those projections were different, but not radically different, from those published in 2002. There is a gradual change, and I think we have always to be updating our approach in line with the best available science. It is quite hard to judge that against individual events such as the serious flooding we have seen over the last few days. The truth is that it is almost impossible to make a direct attribution of those events to underlying climate change,
because you have a lot of natural climate variability and underlying that is a longer-term trend of climate change.

**Baroness Young of Old Scone:** It is true to say, however, that that phenomenon of storminess, if it happens as predicted, will become more frequent with climate change?

**Tony Grayling:** That is right. The climate predictions suggest that we can expect warmer and wetter winters, with a higher propensity for intense rainfall events. There has been some statistical attribution of, for example, the serious flooding that we saw in 2000, and I think the Met Office has recently published some evidence that suggests that if you have the kind of atmospheric circulation conditions that we saw in the winter of 2013-14, an intense rainfall event over a 10-day period is more likely than it would have been in the absence of climate change, yes.

**Baroness Young of Old Scone:** On that basis, are we achieving tough enough standards on flood protection and prevention of building in the most vulnerable parts of the flood plain, or is the Environment Agency in the position where it has to walk a dreadful line of not declaring too many areas unsafe because it does not have the money to protect them?

**Tony Grayling:** We do, honestly, try to use the best available science. In the light of the events over the past few days, we have made a commitment to have another look at the process by which we design flood schemes, particularly in the areas that were impacted, and the allowances that are built into climate change. I would not want to pre-empt the outcome of having that look. I believe that we are doing our best to incorporate the best available evidence about climate change and its impacts on the UK.

**The Chairman:** Mr Wilkes, do you want to add anything to Lady Young’s question?

**David Wilkes:** I think my colleague has adequately dealt with that part of it.

**Baroness Young of Old Scone:** Could we have Mr Wilkes’s comment on his evidence, because Mr Grayling seemed to be implying that everything in the garden is rosy, when the evidence is very much the opposite—that it was not, particularly?

**David Wilkes:** The first on the list was to do with the thermal efficiency of buildings. Given that almost a third of the UK’s contribution to climate change emissions comes from the heating and cooling of buildings, that is an area where we could be looking at making
considerable savings. With the Code for Sustainable Homes and the codes for commercial retail buildings, the problem is not so much new stock but our existing stock of buildings, and the lack of incentive, and lack of easy ways in which people can afford to make their buildings more thermally efficient, so cooler in summer, healthier for people to live in, and using less fuel to heat them in the winter.

**The Chairman:** But the general public are not really aware of these implications, are they?

**David Wilkes:** Absolutely, and the philosophy, I suggest, is much more short-termist: how much do I have to spend for heating this winter?

**The Chairman:** We have dealt with this in previous sessions. If you had meters and everybody could see how much it is costing them to keep the lights on or to keep the heating at 20 degrees, or whatever, it would be all right, but there seems to be objection to putting them in. I do not know why. Would you be for these meters in homes?

**David Wilkes:** I am very much in favour of education and then making it easy for people to understand what actions they can take to retrofit existing property.

**Q288 Baroness Andrews:** I would like to follow that and come on to a couple of other areas. Some developers are still building to Code 5 but very few. There are a lot of new technologies that would enable some retrofitting. Do you have any idea how much it would cost to retrofit 22 million houses built before 1922, or whatever it is? That is the scale of the problem, is it not, because, as you say, a third of our carbon emissions are coming from homes?

That is a very specific question, but the general point you are making in your evidence, Mr Grayling, is there is a loss of regulatory impact because so much has been effectively deregulated in recent years. You propose a policy statement for planning. Do you think that the NPPF could be strengthened in such a way as to put back into it, with any effect, some of the things we have lost? What arguments would you use to persuade the Government?

If I may ask our other witness a question, we lost PPG25 in the course of creating the National Planning Policy Framework. PPG25 was the old planning policy guidance on flood control and was extremely popular and very effective policy guidance. Have we lost anything from that through the NPPF which we could make a case for restoring in the NPPF?
Tony Grayling: I will, if I may, pick up on that first because part of my own team’s responsibilities is planning policy guidance. We are satisfied that all the important elements of PPS25 were incorporated in the National Planning Policy Framework and in the supporting planning policy guidance. There is always room for us to have another look and to improve things. We have had some success in that. For example, we have been able to influence the development of building standards so that a higher standard of water efficiency can be applied to new housing in water-scarce areas, for example. Looking at planning guidance and reviewing it and making sure that it is fit for purpose is an ongoing process.

Baroness Andrews: That is guidance, is it not, and councils do not have to follow that guidance, do they? It is not compulsory.

Tony Grayling: No, in principle they do not have to follow our flood risk guidance either, but in practice they do because they accept that our advice is authoritative.

The Chairman: It sounds as though we need to strengthen the statutory implications of this. It seems as though you can take it or leave it if you are a builder. Is that right?

Tony Grayling: It is the planning authority that makes the decision.

The Chairman: So the planning authority can take it or leave it?

Tony Grayling: The developer puts in a planning application, but it is up to the local authority whether to accept that planning application, or to reject it, or to require amendments to be made that build in resilience conditions, including flood risk, water resources, energy efficiency and so forth.

The Chairman: So it is actually the local authority? It is not the local authority under a statutory order?

Tony Grayling: Local authorities have to balance a lot of different factors when they make decisions on planning.

The Chairman: Do you think it is too loose, in other words?

Tony Grayling: I do not, no. If we continue to have serious concerns about planning applications, there is provision for them to be called in. A necessary feature of our system is local democratic input into planning decision-making, as well as having a national planning framework within which those decisions are made.
David Wilkes: Could I come in and amplify that? I speak as one of the authors of PPG25 and the guidance to PPS25.

The Chairman: Really? We have just asked to get it.

David Wilkes: I am pleased to report that many of the provisions of PPS25 still exist through the National Planning Policy Framework. When we were drafting the guidance to PPS25, we attempted to make the concepts as simple as possible to understand. We said that it is the elevation—the height of your property/assets—relative to the likely height of flooding which is really important. We worked on a sequential test and a vulnerability test, and what we tried to enshrine within the guidance is the principle that the most vulnerable property/assets—hospitals, electricity substations, residential bungalows for elderly or infirm people—should be chosen deliberately to be sited in areas of the highest elevation, and then there is a cascade down and, as the vulnerability decreases, you can have offices, shopping precincts and car parks, which it may be more acceptable to flood occasionally, right down to open water space for sailing and recreation, which is entirely flood-compatible type land.

One of the underpinning principles is that you need to look very carefully at the levels of where you want to do your new building. We were mindful that there are economic forces and existing development and you cannot be absolutely pure, so there was the concept of the exception test. Although there are some undesirable characteristics of potentially developing in flood-risk areas, on balance, there are social, economic and existing land use reasons whereby, knowingly, you will accept that development.

My observation, since we were writing those policy statements 10 years ago, is that it is applied in a fairly patchy way dependent upon which local authority you have, the skills and competencies of the planning officers and the understanding of planning committees.

The Chairman: Where do the insurance companies come into this, because the fact remains that, if you are going to buy a new house, you would want to know the risk, and, if they say it is high risk or low risk, surely that should be available to all of us?

Tony Grayling: I confess that is not my area of expertise.

The Chairman: Just as Mr and Mrs Ordinary in the street, so to speak.
Tony Grayling: I think that incentives should be built into insurance policies for householders to build resistance and resilience measures into their homes. I believe there is an aim to build that into the new Flood Re scheme, but I confess to not being familiar with the details of that.

The Chairman: That is interesting.

Q289 Baroness Rawlings: I wanted to follow up on an earlier question very briefly. It all sounds wonderful and there is the admirable policy today to build the houses that are desperately needed. I have visited a few housing developments, and none of them has gardens, and there are very few trees and more and more concrete, as you were saying. I imagine that is because of the cost to the developers and they do not want to waste land on gardens that people do not seem to want because of the upkeep. How does this pass the advisory capacity that I see you have? To bring in insurance, surely insurance is vital for any of these developments or any new houses? That might be hugely expensive, with the very sophisticated, special draining systems that they have now that do not allow any natural seepage. What is your view on that?

Tony Grayling: For a major development, our advice is bespoke, so we would tailor it to the particular proposed development.

Baroness Rawlings: “Major” means what?

Tony Grayling: More than 10 houses. The National Planning Policy Framework first of all steers development away from high flood-risk areas and, as David was describing, there are the sequential and exception tests where, if there is a proposal to go ahead with a development in somewhere at significant risk of flooding, then you have to be able to demonstrate that development is really necessary, that it could not be put somewhere else, that it is safe, that resilience has been built in and, indeed, that it is not adding to the flood risk for existing properties. Our advice would cover all that. The planning guidance also says that preference has to be given to sustainable drainage systems as part of that. The advice of ourselves and the lead local flood authority would cover that.

Baroness Rawlings: So you would prefer sophisticated drainage to having any grass or trees?

Tony Grayling: The drainage system can include water storage areas and areas where the water can filter into the environment, which may be through grass in some cases.
David Wilkes: I agree with your point. It is well understood that rain falling on vegetated areas has more chance of soaking in and being stored within the catchment. At a macroscale, if the house builders and people are choosing to have smaller gardens and maybe porous areas to park cars, then one of CIWEM’s recommendations is to counterbalance that with the provision of more parks and more open space. If people live in high-rise flats, then maybe they should be within five or 10 minutes’ walk of public open space, where there are the health and recreational benefits, and there is a mimicking of natural water movement through the catchment, through that green and open space.

Q290 Baroness Andrews: Can I broaden this out beyond flood risk and talk about the co-ordination of environmental assessment and impact? Mr Grayling, you said something about patchy implementation across local authorities, which I presume would apply to the way environmental impacts are weighed up anyway. It has been argued by other witnesses that within the planning framework we have now moved away from assessment of planning based on land use and capabilities and choices to contestability and viability due to housing pressures and so on. There is a question there of whether environmental impacts are being sidelined or parked while we get on with other priorities.

The third thing we have heard is that the loss of spatial policies is making it extremely difficult to plan across boundaries and across sectors, which again would have an impact on your ability to make your voice felt in big infrastructure schemes or even housing schemes. It all seems to be adding up to a situation that was never well co-ordinated but which is now more fragmented and more likely to reduce your ability to influence planning as a whole—positive planning, or indeed even defensive planning. Is that too negative a statement?

Tony Grayling: I think the framework is good. The National Planning Policy Framework instils the principles of sustainable development within it. It sets out some of those principles quite clearly and seeks to balance the different objectives of development, which are economic and social as well as environmental. Planning policy guidance seeks to do that as well. I would say that the proof of the pudding is in how that framework is implemented, particularly at local level. The local plan that a local authority is responsible for producing is absolutely key, in our
view, in ensuring that there is a spatial plan for that area and also in ensuring that it is joined up with neighbouring authority areas. As you know, there is a duty to co-operate.

Baroness Andrews: Is that working?

Tony Grayling: By and large, it is working. You will probably be able to find instances where it has not worked well, but you will find instances where it does work well. The framework is there, but it needs to be well implemented, and that requires ongoing attention. It is not a one-off event. We feel able to play our role in providing advice at various levels, and that includes providing advice on the local plan as well as advising at national level the shape of our responsibilities in relation to national planning policy. We are also a statutory consultee on nationally significant infrastructure projects. Major developments also require environmental impact assessments, and we provide our advice on those as well.

Baroness Andrews: In recent years, have you lost capacity? Has your budget been cut?

Tony Grayling: Our budget has been cut. That is an absolute fact. We have had to find ways of carrying out our responsibilities more efficiently, and targeting our resources so that we give advice on the most important things.

Q291 Baroness Andrews: How concerned are you that you are not able to give advice to the smaller local authority, for example, with a big challenge? How do you prioritise your advice? If you are now having to prioritise your advice in different ways, as many arm’s-length bodies are, how do you make those choices?

Tony Grayling: We make those choices on the basis of environmental risk. We target our bespoke advice on major developments where there are significant environmental impacts and significant flood risk issues. We have adopted a system of more standard or standing advice for smaller developments and ones that are less risky.

Baroness Andrews: So you are still a statutory consultee in every intent and purpose, but for smaller—

Tony Grayling: Not every. It is quite a complex picture as I was describing earlier. It needs a bit of rationalisation, in our view.

Baroness Andrews: Are small developments required to come to you for advice or not?

Tony Grayling: Not minor developments, no.
Baroness Andrews: So 10 and fewer?

Lord Inglewood: Is “minor” below 10 houses?

Tony Grayling: Fewer than 10 houses, unless there are very specific issues, for example critical drainage issues or high flood risk.

Lord Inglewood: I wondered whether “minor” was being used in the sense of extensions or garages. I am now clear what you are talking about.

Tony Grayling: We tend not to be consulted on things as small as extensions.

The Chairman: You have a huge amount of experience in giving advice, and sometimes it may be taken and sometimes it may not. I have been struck by a couple of our site visits. On one of them, it looked as though they had this particular issue well sorted. They had a water feature that took off the water that was lodging on flat roofs, et cetera. Do you have a catalogue or some sort of reference, even on your website, to say, “If you are thinking of building, do think about this and look at the way X in Nether Stowey or somewhere has dealt with the advice that we gave them freely”—or whatever—“It is not only a nice thing to have, it is pretty essential, and long term you ought to be thinking about that”? What I am trying to say is that the general public gets bombarded with stuff and we do not know how much is important and how much is merely nice to have. You must be the repository of all this, so should you make it available and would you make it available, and is this an area where the Government should encourage you to make it available?

Tony Grayling: We try to promote good practice and best practice. In partnership with Natural England and others, we have published a handbook for that. Again, it is an evolving situation, but we are always trying to promote case studies that show good practice.

The Chairman: Good. And is uptake okay?

Tony Grayling: The honest answer is it varies, because there is a tendency to do the minimum that complies with our advice rather than necessarily going to the next stage, but there are lots of examples of good practice.

Q292 Baroness Young of Old Scone: The Earl of Lytton talked about one aspect of sustainable urban drainage and the issue of retrofit and why that had not happened. Can we look at the whole issue of SUDS? Is the policy working well and does there need to be any strengthening
of planning policy? There is the issue of SUDS maintenance, which was always a big challenge. It is comparatively easy to get planning authorities to introduce SUDS, but who looks after it after it is in, because it is there for ever?

**David Wilkes:** I believe that SUDS is a very sensible precaution. It is motherhood and apple pie. The technical advice and the landscape ideas are all there but, as you say, take-up is slow and disappointing. I would like the country as a whole to say, “We are going to grasp this and make it work”, and we should not be too afraid about what the likely maintenance costs are. We have universities across the land and we have joined-up thinking across the institutions that this has to be the way forward.

**Baroness Young of Old Scone:** What changes in policy would you like to see to make the implementation of SUDS more universal?

**David Wilkes:** Ultimately, for the lead local authorities to show leadership, to say that this is what will happen and to get to grips with it. We learn with experience how we operate and maintain those systems.

**The Chairman:** Are you looking for statutory recommendations, in other words, not leaving it to the councils but the Government saying, “This is what we have to do”?

**David Wilkes:** Professionally we have been thinking this way for 20 years.

**The Chairman:** And nothing has happened?

**David Wilkes:** We have seen in other countries—Australia, mainland Europe, North America—much better uptake of these systems because in those places there has been just a bit more confidence to say, “This is the right thing to do. We will do it. We are not going to end up with increasing the national debt if something goes slightly adrift in our forecast of what it would cost to maintain it.”

**The Chairman:** That is very useful. Thank you very much indeed.

**Q293 Baroness Young of Old Scone:** Perhaps I could add another question before Mr Grayling responds. We have in the Flood and Water Management Act a provision for statutory implementation of SUDS that has never actually been commenced. In your view, should it be a statutory provision, because relying on the good will of local authorities may not have the right effect?
Tony Grayling: The Government decided to go down a different path and not to implement SUDS advisory bodies as proposed and for which there is provision in that Act, as you rightly say. It has taken a while to get the framework in place, but there is now a good framework. It is different from the one the Act proposed, but at the heart of it again is the lead local flood authority providing advice as a statutory adviser to district councils in relation to proposed developments. We have been working alongside the lead local flood authorities to ensure that they have the capacity and skills to take on this task, and, by and large we do. Defra published the guidance in April of this year and the framework is a little untested, so I think we need to give it time to see whether it is working properly, in the same way that we review whether our flood advisory statutory role is working properly. We need to take a look at whether the advice given by lead local flood authorities is taken up in planning decisions.

I think there is also a key issue, as Baroness Young has said, in relation to the ongoing maintenance of sustainable development schemes once they have been implemented, and that requires resources. In the Environment Agency we have also been thinking about whether there could be some incentives for householders or developers in relation to this. One idea, for example, is lower water bills for developments that have sustainable drainage schemes because they are putting less pressure on the existing water infrastructure, which is therefore reducing costs to the water company, but I think these things need further thought, and at this stage it is just an idea.

The Chairman: Could you not enlarge it and come up with a great proposition? If we are so behind other countries in doing this, why do we not get a move on? It is lovely to say that it is nice to have, but just say, “Please, we need it”.

Tony Grayling: We are constantly working alongside our colleagues in Defra—

The Chairman: Tell them to get a move on.

Tony Grayling: —to improve policy. As I say, it has taken a while to get the framework in place and we need to give it time to see if it is working or will need further review.

The Chairman: Time rather than a kick. Lord Lytton, do you want to come in on this?

Earl of Lytton: I am sorry to come back to another aspect of this. In the context of the very large number of homes that we are being told are required, some of which will be new
build, some of which will be secured by conversions and permitted development and things like that, I am interested to know how your advice as to best practice on matters of surface water drainage feeds through into the development control process, given this pressure from on high for these new things. You say that you are a consultee. What is to stop your advice being overridden by other factors? How quickly would you be able to step in and remedy that situation if, for instance, a quarter of a million homes are built per year over the next five years?

**Tony Grayling:** I guess the proof of the pudding is in the eating, and we keep an eye on it constantly. Every year, we review how effective our advice has been. In the last year for which we have full data, 2014-15, our advice on flood risk was taken in 98% of cases. In others words, the outcomes of the planning decisions were in line with our advice in 98% of cases. Our advice goes wider than flood risk for new homes and, if you look at our overall advice, outcomes in line with our advice amounted to 96% of cases. That includes our advice on water resource management, waste water management, land water and quality. Advice on sustainable drainage comes from the lead local flood authorities, not from us, and they probably need to put in place similar monitoring arrangements for understanding whether the advice they give is actually taken by district councils in making their planning decisions.

**Earl of Lytton:** Is that something Mr Wilkes would agree with?

**David Wilkes:** I do not think there is any more I can add to that; I agree with it.

**Q295 Lord Inglewood:** You said earlier that if you thought your advice was not going to be adhered to, and you really felt strongly about it, that you could approach the Minister with a view to getting a call-in. Is that a frequent happening, or is it a very rare occurrence in practice?

**Tony Grayling:** It is a relatively rare occurrence. It only happens in a handful of major developments each year, and then of course it is up to the Minister.

**Lord Inglewood:** Do they tend to listen to you?

**Tony Grayling:** I hope they listen to us, but of course Ministers are weighing our advice as an expert adviser against other local democratic factors and it is up to individual Ministers to balance between those things.
The Chairman: Reverting back to what you said about good practice being spread, when you have successes with these bigger cases, do you make a big song and dance about it so other councils realise they should be doing it? Imitating the best.

Tony Grayling: We try to within the limits of our resources, as I was describing earlier. We also work with developers, and, alongside Natural England, we have a forum with the major developers where we are regularly discussing these kinds of issues and the design features we want to see them incorporate into developments.

The Chairman: You could be the heroes of the sector and get a gold star.

Tony Grayling: That would be nice, but it requires constant attention to get a gold star.

Q296 Baroness Parminter: On that point, Mr Grayling, you said you have a forum with the developers and that is going well. Might it be more effective if that was a process that was led through DCLG and there was clear guidance to the developers about what standards were required to meet resilience requirements in the future?

Tony Grayling: To be clear, the forum was set up by Natural England, and congratulations to Natural England for doing that. We have joined in, and DCLG is also invited to that forum. During all this the developers have to operate within the framework of the National Planning Policy Framework and the planning guidance, upon which we also advise, as well as the local plans that are put in place.

Baroness Parminter: Indeed, but I want to press you on this. The guidance is very high level. It is strategic objective level rather than providing clarity. As the Chairman was saying, we want to promote best practice, so would it not be better if there was clear guidance from the department that could assist developers as they look to meet the resilience requirements of the future?

Tony Grayling: We have published that kind of best practice guidance.

Baroness Parminter: You have?

Tony Grayling: Yes, in consultation with government departments we developed a handbook and we have published it.

Q297 Lord Inglewood: We all know there is enormous pressure for more housing. At the same time, as recent events have shown, it is not a good idea to build houses where they
might flood. Is there any obvious way of getting round this problem? Clearly, if you do not build on certain sites, you have to build somewhere else, and you then run into all kinds of other planning constraints. We are a relatively small country with a large population, compared to many. What is the way of getting out of the vicious circle?

**Tony Grayling:** I honestly believe that the National Planning Policy Framework and the associated guidance provides the right framework for reconciling the different pressures on development and the different objectives you are trying to achieve.

**Lord Inglewood:** It is not a structural, systemic policy problem; it is a much more specific, site-by-site assessment where we think things may be going a bit wrong.

**Tony Grayling:** I am not sure the degree to which you could argue they are going wrong, on the basis of our data, which is that our advice is taken in 98% of cases where there have been developments.

**Q298 Lord Inglewood:** In the recent flooding in the north-west where I actually come from, a lot of the houses that have been flooded are not new houses but old houses, and that poses a completely separate problem about how you deal with a set of circumstances where the incidence of possible flooding suddenly becomes much greater than before. What do you do about it?

**Tony Grayling:** I agree with you that existing housing and development is a different problem and an increasing one in the face of a changing climate which is increasing flood risk in various ways. You have to deal with that by looking at whether you can cost-effectively enhance existing defences or build new flood defences or other types of flood risk management scheme. You cannot eliminate all flood risk, so you also have to look at property-level protection measures and ensuring that they build in resistance to water getting in, and resilience, so if water does get in, the property can rapidly recover. There are costs associated with that and it includes things such as having stone floors and having electrical sockets higher up on the wall.

**David Wilkes:** The height to which you build and the height at which you put other land use is really important. For instance, we have talked about areas of public open space when you have high-density residential living. If that open space is at a lower level to the built property,
in extreme conditions the public open space, the grass, gets wet and is out of use for a couple of days, but it is not the end of the world. It is attention to detail on quality design that is really important going forward. As you say, we are a small island and we really need to make every square metre of our land use work for the benefit of humans and wider nature together.

**Q299 Lord Inglewood:** Can I just go back to flood defences? How should the cost of doing some of these major schemes be apportioned? Is it right that the state should pay for it all, or should the affected householders pay for it all? If a new house had flood mitigation measures, then the purchaser of the house would be paying for them. If you have an existing house which suddenly becomes liable to flooding, is it right—and I am not saying it should or it should not—that the state picks up the bill for protecting them?

**Tony Grayling:** We have partnership funding arrangements in place, so in relation to grant funding from us, the state does not meet the full cost of all schemes. There is an expectation that there will be a local contribution, and that contribution can come from other public sector authorities, yes, but also from the beneficiaries and from the private sector.

**Lord Inglewood:** Do you think that is the right way to approach it?

**Tony Grayling:** I think you have to strike a balance in that sense, yes. There is a case for a substantial amount of public funding, but that does need to be balanced by beneficiaries also contributing.

**The Chairman:** But the beneficiaries contribute anyway by way of insurance, do they not?

**Tony Grayling:** The insurance money does not necessarily go to pay for the big schemes.

**The Chairman:** Of course, yes, that is right. Lady Young, you wanted to come in on this?

**Q300 Baroness Young of Old Scone:** I am sorry to bang on about the effectiveness of the current policy. I am delighted to hear that advice from the Environment Agency being implemented by local authorities is now way up in the 90% level. Nevertheless, the Committee on Climate Change told us that 1,500 new homes are built on average per year within areas that are currently at high flood risk, which is a one-in-30 year risk, which is a considerable high risk, and a further 3,100 homes are built within areas with a one-in-100 year flood risk. Thus we are still seeing 5,000 houses a year being built against your advice, presumably?

**Tony Grayling:** There are two parts to the answer to that. We have had a debate with the Adaptation Sub-Committee, whose members are good colleagues and friends, and I think they were to some extent misinterpreting the data when they published those figures, because there is no absolute prohibition on building housing in flood plains. In some cases, it is appropriate if the right design features are put into the development. Even so, in 2% of cases, our advice is not taken so, yes, there are houses being built against our expert advice on flood risk. It is a small proportion, but it happens.

**Lord Inglewood:** You would recommend to any possible purchaser that they should not buy them. Is that right?

**Tony Grayling:** I do not think it is for me to make that sort of recommendation, but I would say that there is a buyer-beware issue.

**Lord Inglewood:** Caveat emptor.

**Tony Grayling:** There is a developer-beware issue here, too.

Q301 **Baroness Parminter:** Pressing on that point a little further—as Baroness Young said, it is a small percentage but a real number affecting real people—your response earlier to Lord Inglewood was that there are costs attached to making these properties “safe”.

**Tony Grayling:** Yes.

**Baroness Parminter:** Would it be your contention, then, that these costs are incorporated into the process such that, if planning permission is given to a developer to build in an area of flood risk, certain resilience measures have to be part of the scheme and they have to be met by the developer, so there is a mandatory obligation for planning applications being granted in those few occasions, as you put it, that are contrary to your advice?

**Tony Grayling:** We would want our advice to be taken in 100% of cases.

**Baroness Parminter:** Indeed. I accept that.

**Tony Grayling:** We also accept that there are local democratic factors that legitimately need to be taken into account. I do not think it is for the Environment Agency to overrule local democracy. The final decision needs to be taken in a democratic manner.

**Baroness Parminter:** With respect, I was not arguing that you should in any way subsume the democratic process; I entirely support that. I am asking whether, if a decision is made contrary
to the Environment Agency’s recommendations, the costs to make those properties flood resilient should be met in full. You said earlier that you have guidelines for making properties flood resilient. There should be a standard that says that these have to be taken into account and that the costs have to be met by the developer in advance.

**Tony Grayling:** There you are into buyer-beware territory, because you may find that unless those properties have those features built into them, that property will not be insurable.

**Baroness Parminter:** It is too late.

**Lord Inglewood:** A house exists at that point. The developer might catch a cold because he could not sell it, and I would not have much sympathy for that particular developer, but if you happen to be the poor person who has bought it, albeit foolishly, you have suddenly found yourself in a rather damp position.

**Tony Grayling:** True.

**Q302 Baroness Rawlings:** With all that you have described very clearly, are there any other key issues in relation to securing effective water management in the built environment that you would like to suggest that we have not covered, or have we covered it all?

**Tony Grayling:** Our conversation has been quite wide-ranging. If you are talking about major developments, from our perspective it is quite important that right at the outset of conceiving those developments a proper strategic flood risk assessment us made, proper water cycle studies are done, and the local authority and the developer think from the outset about what you might call the environmental infrastructure that needs to be put in place to ensure that development is environmentally sustainable in terms of water use and waste water management, and whether it is properly safe from flood risk and is resistant and resilient. Those are the key issues from our perspective.

**Q303 Lord Inglewood:** On this topic—and I speak as somebody who actually has some land upstream of some of the flooding in Cockermouth—if you can establish large areas upstream of houses that you can flood, you mitigate the effect of the water on the dwellings, obviously. Do you think that enough priority is given to making sure that we can increase areas where water can go sideways in a benign way, because if you can have flood plains and water
meadows you can mitigate this problem relatively inexpensively, although it might require payment?

**Tony Grayling:** I think there is further to go in that direction. Landscape-scale flood risk management is going to be an increasingly important feature. Our own approaches require that we look at landscape-scale approaches before we decide whether that alone or that in combination with a physical barrier is the appropriate approach to flood protection. Part of the issue is more confidence in the properties of a wall that retains water than in our understanding of upstream water storage, and I think we still have to learn from experience as to how effective those approaches are, but I think that is the direction we should be going in.

**David Wilkes:** I would support entirely the concept that whatever we can do to slow the movement of water through the catchment has multiple benefits. We have talked about flooding, but there are also benefits for drought, for keeping vegetation, for wildlife—

**The Chairman:** And fishing.

**David Wilkes:** They are all there if you see water as a precious resource and not a threat, and you try and hold within a catchment. Technically, it is more about how you reduce peak flood flows from heavy rainfall through our towns and cities. You almost have two bites of the cherry: you have an attempt through making better use of the flood washlands and the floodplain rivers. We are becoming very good at doing relatively minor engineered interventions to maximise the timing and the amount of storage of water within the valleys and within the flood plains. The second concept is rain falling on the surface of the hills on a catchment and then running off towards the river valleys. There are simple techniques you can use such as planting hedges along the contours rather than across the contours, which will slow down the sheet runoff for all the benefits that I have tried to articulate. Then of course there is the choice of vegetation and trees. Vegetation with deeper roots will help absorb more water and store it over a longer period. Of course there is a tension between that and feeding ourselves and agricultural production. We are back on to some of these weighty issues of how we find a point of balance between what is sensible and what is a real danger to human well-being and our economic way of life.
The Chairman: You have painted a very interesting picture, Mr Wilkes. It must be juggling with so many things at the same time. Is it beyond the wit of man?

David Wilkes: There is evidence that enlightened landowners and organisations such as the Forestry Commission are really making very positive steps forward. We also have some great academic institutions, which are capturing this science and writing it up. I truly believe that here in the UK we have some of the best ideas and some of the most creative brains, equal to or better than those in other countries.

The Chairman: That is encouraging.

Q304 Baroness Young of Old Scone: The ideas are there, but the question I would ask—I am unclear and I am seeking after fact—is: who is actually responsible for making sure that landscape-scale, activity and approach happens? Is it the Environment Agency? Is it a series of local authorities collaborating with each other? Who takes the lead in order to get that vision to happen?

David Wilkes: From what I observe it is a coming together of minds, it is a willingness of organisations to say, “This seems very sensible”.

Baroness Young of Old Scone: What happens if they do not come together?

David Wilkes: Then it is not happening yet.

The Chairman: A Country Life campaign.

Q305 Earl of Lytton: We come to the question of the key challenges in relation to the environmental resilience of the existing building stock. Mr Grayling, you have answered the questions regarding making individual properties resilient to flood, and I hope that the guidance is explicit and out there somewhere. I want to look at the other environmental parts—energy conservation, water use, sewerage, surface water dispersal issues—all of which are largely, and necessarily, on a per-property basis. What are the challenges in broad environmental terms in making the existing stock more resilient in that way?

Tony Grayling: Your question identifies some of the key challenges in addition to flood risk. We know that climate change is going to affect the distribution of water resources so that we will sometimes have too much of it and sometimes too little. I think we are going to have to become more efficient in how we make use of water resources. Of course, that pressure is
exacerbated by new development and population growth as well as the effects of climate change. There are things you can do at a property level to make properties more water efficient by retrofitting measures.

Another key issue is the danger of heat stress as temperatures gradually increase, and of course peak temperatures will also increase significantly. We know that events such as the heatwave we saw in Europe in the summer of 2003 are likely to become more and more commonplace as a result of underlying climate change, so we will need to take measures to ensure that people do not overheat in their properties. You are right to identify reducing emissions as a key challenge, although, in a sense, that is not about resilience of the individual property; that is about the contribution of the household sector to the UK’s overall commitment to reduce greenhouse gas emissions to limit, as part of an international agreement, future climate change. It is a much bigger question in that respect.

I have to say on that latter one we are not the chief adviser; the chief adviser is the Committee on Climate Change. Our core responsibilities relate to flood risk, water management, water quality and land quality. We also operate an advisory service called Climate Ready, which deals with heat as well as those other issues.

Q306 Baroness Andrews: I would like to give Mr Wilkes an opportunity to answer the question I asked some moments ago about the extent to which developers are able to implement Code 5 to the highest standards, because that addresses many of the issues about water conservation, heat conservation, lifetime homes and so on.

We live in an ageing population. Quite a lot of attention is being paid to how we make houses fit for older people to stay in, or to building houses that are suitable and desirable so they will move out of houses that are inappropriate and sometimes unsafe. A lot of that is to do with design. Is addressing issues of conservation and resilience in the housing stock part of a policy to promote well-being in general in the environment? Is there a policy issue there?

David Wilkes: Perhaps I should confess that I would not style myself as an expert on these matters. I know that Code 5 sets some very ambitious standards, and I would hope to bring it on. Personally, I thought Code 4 set some very high standards, which amplifies the point I
tried to make about us having good ideas in this country. Part of my frustration is that we do not get on quickly enough with implementing those ideas.

**Baroness Andrews:** We have a deregulatory impulse at the moment.

**David Wilkes:** There is this continued tendency towards deregulation. Again, it is about the correct point of balance in saying that we are building properties that we would expect to be here in at least 70 years’ time, maybe in 100 years’ time. Would we want future generations to say, “Why were they so slow? Why were they so backward looking in 2015?” It is about how we get that balance right. We have good ideas.

**Q307 Baroness Whitaker:** We have heard evidence that national government does not join up very well the departments whose interests bear on this, which you have both laid out: economic, social and environmental. We have also seen evidence that the Natural Capital Committee was a useful model in that at one point it brought together a certain number of disciplines. Is there a case for a national committee perhaps on the model of the Natural Capital Committee to advise the Government on all the elements of the value of the built environment and to strike the balance that you refer to from time to time but you do not exactly characterise?

**David Wilkes:** Valuing natural capital is a very interesting concept. I think we are doing well.

**Baroness Whitaker:** We do not have that committee any more.

**Tony Grayling:** It is about to be re-established, actually.

**Baroness Whitaker:** That is very interesting.

**Baroness Young of Old Scone:** It is only for the natural environment.

**Baroness Parminter:** It is not statutory.

**Baroness Whitaker:** I will rephrase my question. Do you think that could encompass advice to the Government on the total value of all the elements of the built environment, or do you think there should be a parallel committee of some sort, or even a person?

**David Wilkes:** I have a dislike of too many organisations. I have a natural tendency to recommend that you try to communicate the right thing to do, and you try to engage people and carry them with you.
Baroness Whitaker: Could that remedy the holistic deficit, if I could call it that, which we have heard quite a lot about?

David Wilkes: Valuing natural capital can help give real evidence to counterbalance what is a risk of short-term economic and growth tensions—

Baroness Whitaker: How is that advice to be brought together and pushed towards the attention of decision-makers then, if there is no organisation to do it?

David Wilkes: If you do the work, if you gather evidence and get the data, then you are able to present it.

Baroness Whitaker: Who is doing this then? Is it separate institutions? Who or what is going to bring it together?

David Wilkes: It is coming together through the universities, through taxpayer-funded research and through the committees, I believe.

Baroness Whitaker: You do not think there needs to be a co-ordinating mechanism or person?

David Wilkes: I would look first to existing mechanisms and encourage people to listen to what is happening on matters that are relevant to their present responsibilities.

Tony Grayling: I think it is an interesting idea, although I have to say it is not one the Environment Agency has taken a view on, so I do not feel I can say one way or the other whether it is a good idea. I do not think you could join it to the work of the Natural Capital Committee. One of my other responsibilities is leading the Environment Agency’s work on natural capital. It is focused on the natural environment rather than the built environment, and I do not think it would make a good fit. If you were going to establish such a body, you would need to think carefully about how its remit related to existing bodies’ remits. For example, the Adaptation Sub-Committee of the Committee on Climate Change, in relation to the resilience of the built environment, already covers those issues. Are we lacking a holistic approach? We might, but that is not because there is not the potential within the existing framework for there to be one. The National Planning Policy Framework and planning policy guidance are the vehicles for integration in this arena.
The Chairman: We have come very close to this decision in some of our previous sessions and it is always ends up with the word “leadership”. There is no doubt that there are people out there who could build things together. It could be the Chief Scientific Adviser. It could be anybody. If you have any further thoughts on that, or indeed on anything else that was raised today, or something that we have not thought about at all, we would be very grateful for a few scribbled words. We do not want take any more of your time, but it has been a fascinating session. I am sure I speak for the whole Committee when I say thank you very much. You have engaged brilliantly with us all, so thank you.

10 December 2015
Memorandum from the City of London Corporation

Submitted by the Office of the City Remembrancer

Local Control over the Balance of Office and Housing Uses in the City

1. The City is an office-based employment cluster at the heart of the world's leading international financial and business centre. It is recognised as being a ‘nationally significant area of economic activity’ and has been granted a local exemption from national permitted development rights for change of use from commercial to residential. It is also recognised in the Mayor’s London Plan as being “a strategically important globally-oriented financial and business services centre”. This recognition justifies a distinctive City of London Local Plan that reflects the importance for the UK of the financial services industry centred on the City and that places greater emphasis on employment growth than housing growth.

2. The current planning system allows for a distinctive local plan to be prepared if justified by local evidence. The City Corporation argues that the balance between national and local policy should continue to allow such local flexibility. In particular the City Corporation wishes to retain local control over change of use from offices to housing in the City to ensure that it can protect existing office stock and encourage additional office stock in the City to accommodate projected employment growth. Housing growth in the City would be directed to identified existing residential areas. Recognising the need to boost housing supply nationally, the City Corporation is meeting London Plan housing targets and actively working with neighbouring boroughs to boost the supply of affordable housing. However, the Corporation believes this should not be at the expense of employment space that is still making an active contribution to economic growth.

Local Autonomy to Set Planning Application Fees

3. The City Corporation currently operates planning application fees based on fee scales that are set nationally. It is known that the nationally-set planning fees do not cover the total costs of processing planning applications and, therefore, there is a public subsidy to planning applicants. There is also a cross-subsidy between planning applications of differing complexity. The actual processing costs vary across the country as building occupation, staff and other costs vary. Where the fees received are significantly below the processing costs there is the likelihood that local planning authorities will not be able to fund the skilled staff needed to support timely and
effective decision making. As the economy continues to recover, planning authorities will play a vital role in delivering the development needed to sustain economic growth. Local planning authorities need to be resourced properly to be able to perform this vital role and to avoid unnecessary delays in the development process. Local fee setting would provide a mechanism to help ensure these resources are available.

4. If it is the intention that applicants should pay the full cost of processing planning applications then it would be appropriate for local planning authorities to have local autonomy to set planning fees locally, based on the actual local costs. This would improve the resources available to local planning authorities and attract the best skilled. As a consequence, the quality and timeliness of planning decisions would be improved, to the benefit of the built environment and the economy.

**Local Involvement in the ‘Listing’ Process**

5. Local authorities should continue to be involved in the evidence gathering process that is part of the consideration of buildings to be ‘listed’ for special architectural or historic interest. Local authorities have specialist local knowledge of the site, area, history and planning policy context that should form part of the consideration. Local consultation during the listing process will enable communities to engage with the decisions that shape their built environment.

**Local Consultation Requirement at Pre-Application Stage**

6. Major development proposals should be the subject of consultation with local people before submitting a planning application. Although this obligation formed part of the Localism Act 2011, the provision has not yet been brought into force (except for onshore wind farms). Therefore developers in the City are encouraged to consult local people voluntarily and to demonstrate what account has been taken of local views received during the preparation of the planning application. Making pre-application consultation a requirement, through bringing into effect relevant provisions in the Localism Act, would improve the engagement of local communities in the decisions that shape their built environment.

**Review of Duty to Co-operate**

7. The Government has appointed a panel of experts to consider ways to streamline the local plan-making process. In parallel, the Government is reconsidering local government powers and structures in order to encourage greater regional
cooperation between local authorities. Both subjects should be considered together as changes to local government structures and powers may provide scope to simplify some of the existing local plan-making processes, for example the ‘duty to co-operate’.

8. The ‘duty to co-operate’ created by the Localism Act 2011 applies to all local planning authorities, in part in recognition that the abolition of most regional planning organisations after 2010 increased the importance of co-operation between the remaining local planning authorities. The existence of some strategic planning authorities, such as the Greater London Authority led by the Mayor of London, and the possible creation of new regional groupings led by new mayors, provides greater scope for more strategic planning issues to be considered at a strategic level – for example the relationship between major cities and their hinterland. Issues that would benefit from more strategic planning include the strategic pattern of housing, transport and other infrastructure investment, the balance between employment space and housing needs, waste management and air quality improvement initiatives. If such matters were dealt with effectively at the strategic level, there would be scope to simplify the existing ‘duty to cooperate’ required of local planning authorities and thereby to streamline local plan-making.

**Importance of Green Space**

9. In addition to its responsibilities as planning authority for the City of London, the City Corporation also acts (in its private capacity) as custodian to 11,000 acres of open space across the south east and fully appreciates that the built environment cannot be considered without also giving due consideration to the natural environment. As well as the ‘grey’ infrastructure necessary to foster economic growth – eg transport, utilities, services – it is also important to ensure the green infrastructure is right. Not only does this mean providing quality public places and parks but also consideration of safe walking routes, cycle ways, places to play and surface water drainage. This has been illustrated to good effect recently with the Queen Elizabeth Olympic Park which has benefited from a long term master plan and investment in both green and grey infrastructure.

16 October 2015
Colchester Borough Council – Written Evidence (BEN0083)

Response to Questions

Colchester Borough Council

Policymaking, integration and coordination

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

More might be done to devolve powers to the immediate local authority and neighbourhood levels, though this would require additional resources (e.g. to support local communities develop neighbourhood plans) and offering options on possible policy taking into account local issues.

A priority issue, is the lack of local control involved in guiding and making decisions with regard to local transportation matters which typically have significant impacts in shaping our built environment, e.g. relating to development densities (determining how much land needs to be allocated and whether this supports sustainable transport modes), layout and public realm design. Local highway matters do not appear subject to any meaningful levels of public consultation, democracy and national arbitration, unlike say the planning system, with the problem made worse when Highways Authorities are in a higher tier local authority (e.g. County) rather than that of the Local Planning Authority. For example, most Highways Authorities do not meaningfully adopt Manual for Streets which was produced by government to promote a more holistic transportation approach though is not mandatory to Highway Authorities and cannot be forced upon them by local authorities.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

Planning and Transportation teams should be combined given the wealth of overlapping and competing agendas. Where two tier structures deliver these functions then agency agreements should be sought to embed highway engineers within the authority responsible for planning functions.

Treasury considerations and development industry advocacy appear to consistently trump built environmental considerations and without reasonable consultation, debate and consensus, as evidenced by emerging national policy, e.g. office-to-residential permitted development rights have promoted development though at the expense of preserving some of the worst built environments in the country. In this respect, decision-makers should be better informed by the value of place-making on quality of life and economic growth, supported by further research.
National policy for planning and the built environment

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

The NPPF provides a concise document which generally serves its national outline strategic purpose, though should be stronger in charging local council’s with formulating local policies (including those which provide more detail such as design guidance), supported by adequate local resources and further guidance to help form such policies.

Specific issues with the NPPF include:

The section on ‘Requiring Good Design’ is effectively contradicted by only suggesting that “poor design should be refused”, putting uncertainty in the planning system and which inevitably leads to a much lower enforceable minimum requirement of “not bad enough to refuse”. Government should make ‘Requiring Good Design’ more implicit in policy.

There is no statutory requirement for local authorities to employ/access specialist design expertise (e.g. urban and landscape designers) to guide development and advise on proposals at pre-app and application stage, despite planners generally being ill-equipped to provide this at an advanced level. This should be addressed by setting standards for employing specialist design expertise to guide development, advise on proposals at pre-app and application stage, and represent on planning committees (as happens in Australia).

4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

No, given the strategic level that national planning operates. However, it should be stronger in charging local council’s with formulating local policies with spatial elements, supported by adequate local resources and further guidance to help form such policies. A priority would be the need for allocations to be better informed by a range of spatial elements tested through visualised analysis and design.

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

There is no consistently optimal timeframe, though the 20 years typically planned in local plans appears generally appropriate.

Buildings and places: New and old

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level,
required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

Policies will have some impact on housing supply, though this will continue to be hindered by brownfield viability and delivery issues, local resistance to greenfield development, land banking and inadequate or onerous CPO powers.

Increased CPO powers offer the greatest potential. In particular increased CPO powers for greenfield land should enable local authorities to facilitate growth in the right places (subject to consultation), capture land value, generate local support based on local benefits; avoid the currently confrontational developer-led allocations process which adds cost and delay; and promote self-build and community-led development more likely to deliver development quicker, better respond to local need, achieve higher design quality and empower local communities. Such an approach is advocated in more detail by Urbed in their winning Garden City proposal to the Wolfson Economics Prize 2014.

Priority sites affected by viability issues should be subsidised by public sector funding or tax breaks to incentivise. There needs to there be greater acceptance of lower capital receipts with regard to land being disposed of by the public sector where this will help delivery of homes and to facilitate high quality design and place making.

Higher density development formats should be promoted which are palatable to the public and take the pressure off locally unpopular greenfield land requirements, e.g. discouraging traditional retail and business park formats involving high levels of surface parking; relocating overhead electricity infrastructure underground where this eats into development areas; reducing landfill tax relating to underground car parking and basement accommodation; and reducing car parking ratios supported by greater proportions of shared/unallocated spaces, remote multi-storey parking, and significantly increased investment and priority with regard to car clubs, car sharing, rapid transit, cycling etc.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come?

Transportation is arguably the key to promoting more sustainable and resilient built environments, though Highway Authorities are generally car-orientated, detached from local planning authorities and have unquestioned authority. Recommended solutions include:

Either devolve Highways Authorities into local planning authorities (e.g. boroughs/districts) or ensure central (e.g. County) teams work directly to and for local planning authorities.

Require most transportation proposals to be subject to planning permission or support at borough/district level.

Make it mandatory to promote Manuel for Streets compliance.
Significantly increase investment in sustainable transport.

How can the best use of existing housing stock and built environment assets be made?

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

The historic environment is relative and should therefore better reflect local as well national importance, lower status as well as higher status buildings and places of local significance, the weight afforded to undesignated buildings and places needs to better take into the account the views of local people. For example, what might be considered unimportant in York might be relatively important in Basildon, and humble working-class areas often need greater levels of protection as demonstrated by the misguided pathfinder programme which unnecessarily demolished much valuable Victorian terraced housing areas across northern England.

Skills and design

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

Most local authorities do not employ specialist design expertise (urban design) and a 35% reduction in conservation capacity (IHBC 2015) has occurred since 2006. During this period Historic England (English Heritage) has suffered significant cuts with a commensurate reduction in capacity. This capacity is essential to help guide development, bridge the different design strands and advise on proposals at pre-app and application stage; despite planners generally being ill-equipped to provide this at an advanced level. This had started to be understood and occur, but was curtailed by budgetary cuts and not being a statutory requirement.

Planning committees need to be provided with relevant training and would otherwise often struggle to fully understand specialist built environment aspects. This might be addressed by and having specialist experts supporting the committee alongside democratically-elected local representatives.

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

The promotion of design review in the NPPF would be more effective if this was more clearly defined to include design officer review as well as panel review, and if local authorities could charge developers for panel review, i.e. the cost/time involved this would
encourage LPA’s to access these paid services; currently the costs are a barrier to resource challenged authorities.

Funding cuts to Design Council/CABE mean it is not fit for purpose as a national design champion. Its status and resourcing should be significantly increased to provide national leadership

‘Building for Life’ is a useful tool for ensuring the design quality of homes and neighbourhoods, though the lack of nationally accredited training and arbitration, absence of scoring and ease with which awards are achieved, means the initiative has been excessively watered down.

The Homes and Communities Agency seem distracted by capital receipts and numbers as opposed to quality of the built environment and should revert to weighting quality criteria when disposing of land and funding affordable housing.

Community involvement and community impact

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

No, the system is under intense pressure from Governmental priorities, developers, development numeric targets and under-resourcing, and as a consequence often inadequately takes into account such matters. Improvements might focus on greater devolution to better supported local communities, and more research and guidance related to the role of the built environment as a key driver of growth and wellbeing.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

The planning system is effective in trying to engage and take views on board in shaping growth. However, there is room for improvement. The importance of strategic policy and the allocations stage of plan delivery is often not understood and therefore missed by the general public. This should be addressed as part of a wider overhaul of the allocations process, i.e. which is less developer led and better aligned to a more ‘engaging’ strategic planning process benefitting from visualised analysis and design, i.e. master planning. Planning committee processes may inadequately allow local people
to represent themselves, i.e. a 2 minute slot with no involvement in the follow-on debate prior to decision can appear unfair and frustrating; especially where they also possess relevant expert skills.
Local highway proposals, which invariably have a significant impact on the built environment, do not appear subject to any meaningful levels of public consultation, democracy and national arbitration. This should be addressed by (i) either devolving Highways Authorities into local planning authorities (e.g. boroughs) or ensure central (e.g. County) teams work directly to and for local planning authorities, and (ii) ensure transport proposals go through the same engagement processes as planning.

Financial measures

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

Measure could include:

- Extension of tax relief on new builds including works to protected heritage assets and publicise/extend tax breaks on brownfield land.

- Reduction of landfill tax relating to underground car parking and basement accommodation, to increase development densities and avoid car parking dominated environments.

- Encourage design quality as well as capital receipts when disposing of public sector land, e.g. by promoting development briefs and giving design adequate criteria weighting/thresholds for assessing bids.

- Increase funding in sustainable transport, which in turn would facilitate reduced parking ratios, enabling increased development densities and completing the self-fulfilling cycle by providing the catchment populations to further support sustainable transport.

05 October 2015
Policymaking, Integration & Coordination

1.1  Decisions are taken at the right level but are not necessarily the right decisions. National Policy should be set at government level but it frequently fails to achieve the housing that is required as the end result.

1.2  Not enough affordable homes are being built because they are not cost effective for developers; naturally, developers will seek ways around the policies, such as keeping the developments to small pockets of large market-houses to keep below the threshold for being required to build affordable homes.

1.3  With the abolition of the former detailed national Planning Policy Guidance has come a lack of ability by local authorities to enforce the good intentions of National Policy, because there is now a lack of clarity about how Policy should be interpreted.

1.4  With the adoption of so many Local Plans around the country either being delayed or challenged, there is little that many planning authorities can do to safeguard the built environment for which they are responsible.

2.1  It would help if Government departments communicated with each other properly and clearly set out the requirements for infrastructure to be included in all developments large and small, and ensured that the needs and requirements of communities are put in place first, not as an afterthought which is open to ‘re-negotiation’.

2.2  We have seen evidence in East Northamptonshire of a developer so anxious to secure permission for a large housing development that it downplayed the projected costs – and now is unable to make sufficient profits from house sales to meet the S106 obligations imposed with the planning permission. The developer is now ‘re-negotiating’; in other words being excused the S106 contribution.

2.3  Lack of resources at local authority level appears to be the reason why planning enforcement has become almost non-existent, and officers appear to prefer to cultivate a ‘positive working relationship’ with erring developers rather than work primarily to safeguard the amenity and wellbeing of neighbours affected by condition breaches.
2.4 National Policy is doing nothing to protect local character and heritage through design principles, nor ensuring that infrastructure is prioritised rather than negotiated away when development is almost complete.

National policy for planning and the built environment

3.1 The NPPF is far too vague to be useful at the sharp end of planning, building and protecting the built environment. It relies on Local Plans to provide local detail, and provides no contingencies for where there is no adopted Local Plan.

3.2 The principle of ‘brownfield first’ has been all but abandoned in the race to provide as many houses as possible.

3.3 The NPPF is silent as to the required mix of housing types, or indeed a method for assessing what types are needed; the proliferation of smaller households (because of population growth, ageing population, divorce, etc) cannot be addressed by the market alone because developers require the profits that come from selling larger properties.

4.1 The spatial perspective has, in effect, vanished. Local designations that formerly protected rural areas from overdevelopment have been abolished or weakened. Landscape character no longer seems to carry weight.

4.2 The loss of a regional perspective has made it difficult to tie together the local and the national dimensions and to take account of cross-border implications of planning proposals.

5.1 Superficially, the principle of a five-year housing supply seems to be working reasonably well from a strategic point of view. However, what is actually delivered, for the reasons given in paragraph 3.3, bears little resemblance to these figures.

5.2 Factors affecting long term outcomes are either unpredictable (eg economic downturn) or a response to changes in political strategy (eg after a General Election) so there seems little point in tinkering with planning timescales other than ensuring that policymakers at all levels remember to keep an eye on the long term.

Buildings and places: New and old

6.1 It seems likely that the relaxing of the planning system combined with the current local government budget cuts will result in more building of unsuitable housing on unsuitable sites.

6.2 It will not achieve the thousands of affordable houses of good, sustainable, environmentally friendly (green, carbon neutral etc.) quality that is required in this
country.

6.3 Selling off social housing will only exacerbate this trend; that policy should be abandoned immediately, and if anything the Exception Site rules should be expanded so that more social housing can be built and occupied by those who need it.

6.4 It is well known that there is a huge demand for smaller properties, so if the commercial developers cannot or will not provide these, then the housing associations should be encouraged and even incentivised to do so – rather than being required to sell their existing stock.

6.5 The redevelopment of brownfield land, which by definition tends to be located in the vicinity of existing infrastructure, should be incentivised, especially in comparison to the development of greenfield sites and Green Belt.

6.6 Either there should be financial levies imposed for building on previously undeveloped land, or tax relief on remediation and decontamination work that can discourage developers from seeking to build on brownfield land.

7.1 Policies should be put in place to ensure all new development and repair and restoration of existing housing stock is carried out to sustainable standards.

7.2 Grants for retrofitting insulation and other energy efficiency measures should not be limited to people on benefits or so-called ‘low incomes’; since the late 1980s there has been a massive growth in the number of self-employed people who do not qualify for benefits no matter how badly their business may be going.

7.3 It is not enough to decree that new houses must meet modern standards; provision must also be made for existing properties that do not have cavity walls, etc.

7.4 Proper funding needs to be made available so that existing housing stock can be brought up to standard; this will not only improve quality of life for people, but will reduce the long term reliance on fossil and other fuels for heating – at a national level.

7.5 Infrastructure is key to sustainability and resilience, and it makes sense to maximise what is there already, especially when developers seem unable to deliver it and still make a profit.
8.1 Considerable care should be taken by all planning departments and authorities to preserve all national and historical assets to the best of their ability. Housing development should not be given if it will ultimately be to the detriment of these.

8.2 The historic environment is not something to be ‘used’, primarily for economic gain, but it can be incorporated into creating public places that are social, welcoming and beneficial to quality of life; I refer to a recent article by the Project for Public Spaces for details of how this may be achieved in a practical sense. http://www.pps.org/reference/11steps/

**Skills and design**

9.1 An understanding and appreciation of Design, and of the social implications of building development, are two areas that seem to be lacking across the board within planning authorities.

9.2 The division of responsibilities between Planning Officers (who look at the site) and Highways Officers (who look at access but not necessarily at the site in real detail or over a period of time) is an obvious example of why it is at present impossible for planning decisions to be considered ‘holistically’.

9.3 Too often, the only people in a position to understand the day-to-day implications of, say, allowing gates across an entrance next to a busy road, are the most local consultees – ie neighbours and parish councillors; lip service is often paid to their ‘local knowledge’ but in reality it carries no weight at all if the planning authority fears that its decision could be Appealed.

9.4 An understanding of the real risks and costs of Appeals, by planning officers as well as councillors and the public, would be beneficial – as would a National Policy that ensures the Planning Inspectors do sufficient research before making their Appeal decisions.

10.1 Every region should have universities providing accredited Planning degrees. The East Midlands is chronically under-supplied in this regard.

10.2 Awards and public information films that highlight design excellence would raise appreciation by the general public, who will also include developers, designers, clients and planners.
10.3 Resourcing planning enforcement is essential for when things go wrong; funding it centrally could be one way to ensure the money is ring-fenced, rather than undermined during a time of austerity.

10.4 Developers are by nature interested in ‘viability’ and ‘profit’ rather than ‘high quality design’ and ‘place making’ so it cannot be left solely in their hands to provide these things.

Community involvement and community impact

11.1 Tower blocks built in the 1960s and 70s that have subsequently been torn down, and ‘ghetto’ towns where gangs and so on rule the areas with people afraid to venture out at night, are examples of the result of bad planning.

11.2 Throwing unconscionable sums of money at public building is not the answer either.

11.3 Town planners now seem to realise that cramming people into high-density housing does not work, and that integration of old and new styles, and large and small houses, produces a healthy mix of people and integrated resilient communities.

11.4 However it may be that academic studies to prove these common-sense lessons will be needed before any government would dare to make these a matter of National Policy and make them the norm in the real world.

12.1 Opportunity to engage is theoretically available through the planning application process but this does not ensure that the ‘voice of the community’ is actually heard.

12.2 Planners and planning committee members do not always seem to see the same ‘street scene’ as the community; this can lead to, for example, allowing town houses to be built in small rural villages otherwise consisting of small cottages and farm workers’ dwellings.

12.3 At a local level, the planning process is off-putting and seems to the general public to be more like a lottery than a real process with firm rules and obvious consequences.

12.4 The rules governing the public’s ability to address Planning Committee meetings are draconian and poorly-explained, and often feel unfair because of how they are applied at Committee meetings.
12.5 Inaccuracies in legal advice during these meetings cannot be challenged, and a lack of local representation during Committee discussions can lead to one-sided debates and poor decisions.

12.6 Whilst it is extremely helpful to be able to view planning applications online, there are a number of issues which deter the public from doing so: drawings scanned the wrong way up, large drawings that cannot be viewed properly on a normal computer screen nor printed out on a domestic printer, layers of click-throughs and poor signposting, emails used to send generic letters but without even a link to the correct application. These should be simple matters to address, yet it seems that some planning authorities do not feel any need to do so.

Financial measures

13.1 I refer to the recommendations given in paragraphs 6.3, 6.4, 6.5 and 6.6 above.

– End –

27 September 2015
The Committee on Climate Change was established under the 2008 Climate Change Act. We advise the Government on carbon budgets and report to Parliament annually on progress against budgets and the 2050 target. Our Adaptation Sub-Committee reports to Parliament every two years with an independent assessment of the progress being made with preparing the UK for a changing climate.

Changes to the built environment are needed in order to achieve carbon budgets, while the impacts of climate change on people and communities will to a significant degree be determined by how well the built environment is adapted to the future climate. The CCC and ASC’s first joint progress report to Parliament in June 2015 found that policies to reduce emissions from buildings need strengthening. We set out that:

- **GHG emissions from buildings** - 17% of the UK’s direct greenhouse gas emissions are from buildings, as well as indirectly accounting for two-thirds of power sector emissions.
- **Energy efficiency** - improvements (e.g. insulation) to existing homes contributes both to reducing emissions and alleviating fuel poverty. Recent policy changes have resulted in a slow-down in the rate of installation of insulation measures. The Government needs to address this and set out the future of energy efficiency policy, ensuring that both carbon budgets and fuel poverty targets are met. This may include a greater role for local authority-led delivery, based on positive experience from Scotland and Wales.
- **Decarbonising heating** - is one of the biggest challenges for carbon budgets. Currently, low-carbon heat accounts for less than 2% of heat demand. The Government needs to develop an action plan to address this shortfall, also ensuring a better integration with energy efficiency. Such an action plan should allow various options to be pursued (e.g. individual heat pumps and district heating infrastructure).

At the same time, many aspects of England’s built environment are ill-prepared for a changing climate. We highlighted in particular:

- **River and coastal flood risk** – many towns and cities are located on the floodplain, with over 240,000 properties in England currently located in areas of high flood risk (with a 1-in-30 annual chance of flooding or greater). These numbers are projected to increase in the future with sea level rise and projected increases in peak river flows. Furthermore, 1,500 new homes on average are built each year in areas that are currently at high flood risk. A further 3,100 homes are built per year within the 1-in-100 year floodplain, many of which will be in the high risk category in time. Existing flood risk management policy focuses on building bigger defences where possible and affordable but fails to address
the increasing numbers of homes and other properties elsewhere that are falling in to the high flood risk category.

- **Surface water flooding** – progress has been slow with managing this risk in urban areas, which is projected to increase in the future due to heavier rainfall events combined with the continued paving over of front gardens, in-fill development and an ageing public sewer network that is already near to capacity. Many of the recommendations of the Pitt Review into the 2007 floods have not been implemented, particularly on the use of sustainable drainage systems in new developments. Local flood risk management strategies, a requirement under the Flood and Water Management Act 2010, have yet to be finalised by the majority of local authorities in England.

- **Overheating** – up to 2,000 premature deaths per year can be attributed to hot weather, and this could increase to 7,000 per year by the 2050s. However, there are no policies for tackling the risk of overheating in the built environment. A number of drivers are increasing vulnerability, including an ageing population, the condition of existing buildings such as hospitals and care homes, the loss of urban greenspace and the design of new buildings. Building Regulations do not currently require consideration of heat stress or the fitting of passive cooling measures in new development.

- **Water scarcity** – the risk of significant supply-demand deficits during periods of drought is projected to increase due to the combined effects of climate change and population growth. This could affect public water supply. Although some progress is being made, with per capita consumption gradually falling, further steps to increase water efficiency in buildings are required.

Most of England’s existing homes and other buildings will still be in use in 2050. Extensive retrofitting will be required to make the building stock more energy efficient, suitable for low-carbon heat sources and resilient to even a 2°C rise in global mean temperature. This is not, however, currently happening at any scale. Coordinated and targeted actions that support both emission reductions and adaptation will be more efficient than considering each issue in isolation.

As well as the significant challenge of retrofitting the existing building stock, consideration will also be needed of longer term and more fundamental changes to the built environment in relation to opportunities this provides for both reducing emissions and for adaptation. Planning and transport within existing urban areas, as well as the location and design of new centres of population and transport and infrastructure links between them, will become increasingly critical. Climate change is likely to become an increasingly important driver in the future, affecting where centres of population will and will not be viable. Nowhere is this more the case than on the coast, where rising sea levels will have significant implications for many major conurbations over the rest of this century and beyond, including the capitals of all four UK countries. The ASC is currently undertaking a major climate change risk assessment for the UK, required by the Climate Change Act, which will explore the latest evidence of risks to the built
environment.

The joint CCC and ASC Progress Report Summary can be found here.

The CCC’s 2015 Progress report can be found here, with chapter 2 covering progress in buildings.

The ASC’s 2015 report can be found here, where chapter 2 of the report covers the Built Environment. A more detailed technical annex to the Built Environment chapter, which contains the range of data underpinning the ASC’s analysis, can be found here.

As statutory independent advisers to Parliament, members of both the CCC and ASC frequently meet with a range of Select Committees to provide input into their hearings. We will, of course, be more than happy to provide further evidence as the inquiry develops.

06 October 2015
Confederation of British Industry – Written Evidence (BEN0054)

CBI input to the House of Lords Select Committee on national policy for the built environment

1. The CBI is the UK’s leading business organisation, speaking for some 190,000 businesses operating across the UK. With offices across the country as well as representation in Brussels, Washington, Beijing and Delhi, the CBI communicates the British business voice around the world.

A robust planning regime is integral to improving the built environment

2. The business community is concerned that the UK is falling behind its international peers on infrastructure quality and delivery, with serious implications for investment across the wider economy. A 2014 CBI/URS survey found that three-fifths of firms believe that EU countries possess better infrastructure than the UK, while 99% of companies want the UK to raise capital investment levels in line with the G20 average to narrow the gap in infrastructure quality. Energy and transport are regarded as particularly problematic sectors, with a majority of respondents expecting these areas to worsen in the next 5 years.

3. Housing offers a similarly alarming picture. In 2013/14 there were just over 140,000 homes built across the UK, but England alone requires 240,000 homes delivered annually to keep pace with population growth and new household formation. The shortage of housing is considered especially acute in London, where roughly half of all firms reported difficulty recruiting junior and midlevel staff in the 2015 CBI/CBRE London Business Survey.

4. The problems facing infrastructure and housing delivery are interconnected. Improving the quality and speed of project delivery for the English built environment requires greater policy clarity and certainty, including at national level, and a more efficient planning system which can address national needs strategically instead of tackling problems in isolation. Only an integrated approach to housing and infrastructure planning can fully provide the homes, roads, power plants and runways the UK needs to remain at the forefront of the global economy.

Planning reforms in recent years have been encouraging, but still more needs to be done

5. Firms have seen a growing recognition among policymakers about the importance of a strategic approach to planning. The publication of the National Planning Policy Framework (NPPF) in 2012 was a major step in simplifying and streamlining the planning system, while the National Infrastructure Plan has offered some clarity about potential investment opportunities in the pipeline. Recent announcements in the Productivity Plan introducing a brownfield register and a zonal system for housing have continued this encouraging trend.
6. However, maintaining progress on planning will require these reforms to embed to create political stability and certainty for business. The politicisation of the planning process is widely regarded as a leading barrier to creating a modern, high-performing built environment. More than half of respondents to the CBI/URS survey regarded political rhetoric as a major barrier to infrastructure investment.

7. Sustaining planning reform will also require improvements in planning performance. With planning authorities under severe strain due to skills shortages, under-resourcing, and capacity constraints, business and government must find innovative ways to help planners reach decisions in a prompt manner. There is some discussion in the business community about the pros and cons of paying higher planning fees if there are assurances of timely and quality decisions, while other efficiencies such as creating pooled planning authorities should be trialled to maximise existing capacity.

**Communities must be engaged at an early stage to gain local support for national ambitions**

8. Policymakers will have to connect the infrastructure England needs with the built environment communities want through early engagement and an appropriate mix of incentives. Many developers already go well beyond statutory requirements and engage communities early during the pre-application stage. Communities do not wish to feel bribed to support new housing or infrastructure developments. Accordingly, pre-application consultations should therefore ensure that those most affected by development have the greatest voice about the services or opportunities they wish to see, creating a constructive and ongoing dialogue with business throughout the development process.

**The greatest scope for improving the built environment in the long term is by creating a joined-up, cross government approach to planning at both national and sub-national level**

9. While depoliticising the planning process, boosting capacity among planning inspectorates, and strengthening local incentives can offer quick wins for creating a better built environment, these improvements are dwarfed by the potential of creating a cross-government, long-term outlook on housing and infrastructure delivery, as envisioned by the recent announcement of an independent infrastructure commission. A “national needs assessment” laid out by the commission must go further than the existing National Infrastructure Plan and offer short, medium and long term views on development and infrastructure needs and priority areas for the built environment as a whole, with spatial considerations for supporting new housing projects and vice versa. In addition, combined authorities and metro areas can use the national approach as the guiding framework for developing their own spatial approaches to building the homes and infrastructure needed for the future.
10. The benefits of a joined-up approach through the independent infrastructure commission would be most apparent at the pre-construction stage. Businesses would not only possess greater investment clarity for individual projects, but have insight into the nation’s long term priorities for the built environment when deciding to fund development. The local variations in the planning process would also diminish. Once a project begins, land disposal could be effectively coordinated among departments, allowing development to start quicker and at lower expense to firms and government.

**Transforming the planning system requires political will**

11. The infrastructure commission must be kept objective and apolitical to fulfil its purpose of strategically planning England’s built environment, with accountability for the assessment of national need assured through regular reporting requirements to policymakers and the public.

12. Removing the politics from planning demands bold and brave thinking from decision-makers. We urge the government to sustain the positive direction of travel on planning to better develop England’s built environment in the months and years ahead and help the nation thrive.

05 October 2015
Construction Industry Council – Written Evidence (BEN0053)

CIC Flood Mitigation and Resilience Group
Submission to the Lords Select Committee for the Built Environment

Submission made by Sue Illman, CIC Champion for Flood Mitigation and Resilience

SUMMARY
This submission reflects the discussions and conclusions of the APPG for Excellence in the Built Environment Commission of Inquiry, published in April 2015 entitled ‘Living with Water’. The responses are therefore specifically around water management, and their relationship to the built environment, with a particularly emphasis around flooding and resilience. The responses have been provided around the questions posed by the Call for Evidence, but it is hoped that the Committee will consider the full recommendations of the APPG report and its summary, which is included below.

- **Strong leadership**: Government needs to foster clear leadership on water issues and appoint a Cabinet champion to set in train a longer term vision for delivering a co-ordinated long term flood and water management strategy and it must ringfence funding to do so.

- **Strategic land review**: This new water champion should instigate a review of land use policy, placing water and climate change alongside a range of other emerging priorities for a multi-functional landscape.

- **Public debate**: There needs to be clarity on what level of disruption the country finds acceptable as a result of water exceedance. At the moment there are differing standards around the country.

- **Learning to live with water**: We need a high profile programme to inform and educate the public on the importance of making homes flood resistant and resilient and managing expectations about water.

- **More cash for maintenance**: There needs to be even stronger emphasis on maintenance funding to ensure that existing flood protection assets are sustained.

- **Retrofitting for resilience**: Government should undertake an investment programme to retrofit towns and cities to make them more resilient, as an additional aspect of their flood defence spending. Seeking synergies through every aspect of regeneration and ongoing maintenance programmes and by working with all relevant stakeholders (highways, water companies) will also make retrofitting more cost effective.

- **Better design standards**: Everywhere in this country is in a water catchment so we need to reduce water runoff from every building, whether new or existing – helped with new Building Regulations for designing for flood resistance and resilience.
● **Using insurance to incentivise resilience**: The insurance industry needs to give thought to how it can incentivise improving flood resilience of properties, rather than simply reinstating structures to inadequate pre-flooding standards.

● **Using Flood Re insurance to promote resilience**: The Flood Re scheme, should be used to drive households’ resilience & recommend the measures by the Sub-Committee on Adaptation are adopted.

● **Considering the most vulnerable**: Government needs to consider how we protect those who cannot afford flood insurance, particularly in tenanted properties. Local authorities can no longer support them.

● **A bigger role for professionals in the built environment**: Promote greater co-ordination of professionals through a new Construction Industry Council grouping which could act as a sounding board through which to channel flooding policy.

● **SuDS and maintenance** We believe the greater uptake of Sustainable Drainage Systems is vital and that the Government is mistaken in not implementing Schedule 3 in the Flood and Water Management Act 2010. to provide clarity over their management and maintenance and standards.

**Policymaking, integration and coordination**

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

1.1 The NPPF is the main instrument for delivering decision, but it may now not be prescriptive enough related to some aspects of water matters, resulting in a wide variability in approaches across the country; some of which are not delivering good decision-making for the built environment. Local differences should be accommodated, and may not always accord with ‘bigger picture’ national policy. Localism was intended to reflect that.

1.2 The Local plan process seems to be suffering from too many drafts being rejected – suggesting there is something wrong in the process, whether that is at the Local Authority level, governmental or with the Planning Inspectorate. This may also reflect the difference between the local view (which may understand local issues better) and national policy.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

2.1 Policy is generally poorly coordinated, as departments do not appear to share their knowledge, concerns and objectives. Specialist advice is not taken where authoritative research is available in another department, (or the Environment Agency or Natural England)
and they are frequently unaware of what other departments are doing and their knowledge/research base; nor do they collaborate to ensure that the key purposes of new policy, and the way it is integrated within the system is coordinated. A more systemic perspective of the relationships between physical, biological, economic and social processes would allow the effects of actions in one area, sector or initiative to be better understood by all and could then properly inform decision making. This would encourage the convergence between spatial planning and water management.

2.2 Policy does not appear to take the opportunity to maximise the opportunities available, for example, by taking advantage of multi-functional and multi-beneficial opportunities. This has resulted in surface water still being seen as ‘a problem’ and not as a valuable resource in all forms and in all places. The complex mix of organisations involved in the water domain (their roles and responsibilities) also militates against an integrated and coordinated approach.

2.3 This has particularly been seen with the intervention of DCLG taking over the role of implementing SuDS from Defra, and the consequent abandonment of the implementation of Schedule 3 of the Flood and Water Management Act. The Ministerial Statement that now guides planning was not rooted in all the research and development that had been undertaken by Defra over the last 10-12 years. It has created:

- voids in policy as aspects of Schedule 3 are now unresolved;
- uncertainty and diversity of interpretation over what will be acceptable at planning;
- encouraged issues of dealing with drainage properly to be seen as a factor in the ‘planning mix’ rather than as a part of critical infrastructure;
- no structure for the formal adoption or long term maintenance of SuDS;
- no measures to address resilience to flooding at the local scale;
- no integration with urban design so that addressing flood volumes could be aligned with requirements under the WFD to address water quality, or to improve biodiversity, green infrastructure and amenity in all new development;
- a complete lack of understanding (or belief) of the financial and environmental benefits that can accrue by adopting a multi-functional approach to sustainable drainage design, despite Defra studies which support this approach;
- lack of teeth in setting clear standards which mandatory compliance through legislation would have achieved;
- policy appears to have been influenced by lobbyists, whose beliefs around water management have prevailed with government who fear that housebuilding may be compromised; this opinion being at odds with the rest of the industry, and government’s own research and advice.

National policy for planning and the built environment

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?
3.1 The most recent edition has gone some way toward clarifying the approach that ‘all
development that is clearly sustainable should go ahead’, so there is now a more reasoned
and structured approach. However, there are still difficulties in terms of how broad and non-
prescriptive the NPPF is in detail. This allows too much variability in interpretation locally and
seemingly similar and adjacent jurisdictions to plan and utilise significantly different
infrastructure systems.

3.2 DCLG currently see the NPPF as the main instrument for delivering SuDS, but key elements are
missing. To make it work for water management, it needs to refer to the CIRIA SuDS manual,
which is comprehensive. The issue of SuDS adoption is still unresolved, with house-builders
anxious to have procedures put in place, and a proper adoptive framework available through
local authorities that applies nationally.

3.3 If multiple benefits are to be available through development, then DCLG would need to
recognise and promote ecosystem services and natural capital to enable this to be achieved,
not only through SuDS, but whole site design. SuDS design and planning should be about
delivering all possible benefits, not just flood risk.

4. Is national planning policy in England lacking a spatial perspective? What would be the effects
of introducing a spatial element to national policy?

4.1 Yes, we have lost the ability to consider policy outside defined administrative boundaries as
LLFA’s relate solely to County or Unitary authority boundaries. With regards to water
management, it works best within the devolved nations, but even here boundaries do not co-
incide between administrative authorities and water catchments, making the relationship
between planning and water management on a catchment basis more difficult, despite the
introduction of river basin and catchment management plans. Water company boundaries
don’t align with administrative boundaries either, and there are a raft of other organisations
at a local scale who have an interest, so that planning can be fragmented, and does not allow
for a large-scale spatial vision, although Defra’s Catchment Based Approach (CaBa) is gradually
becoming more effective, delivering coordination, collaboration and partnerships in local
water management with benefits for both local communities and the economy..

4.2 National policy doesn’t reflect the variation that occurs throughout the country, where the
needs and requirements of (for example) the south-east, are very different to the north-west.

4.3 Spatial planning has also not addressed the continuing problem of inappropriate building on
flood plains as repeatedly highlighted by the Adaptation Subcommittee on Climate Change.
5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

5.1 The original Foresight Flooding Report, was started in 2000 and published in 2004 looking forward 100 years, but it developed a vision for the next 30 years to be implemented from 2010-30, and encompassed all aspects of water supply, management, flooding and coastal change arising as a consequence of both our existing environment, and the development needed as a consequence of population growth and climate change. This was updated in 2008 and again in 2014 in response to flooding in the Somerset levels. These matters require long term sustained and consistent policy, outside the range (or control?) of any single government, and are best addressed via a rolling programme of policy that reviews, adapts and builds on understanding how policy may need to develop in response to a changing world to deliver society’s long term needs, and environmental stability.

5.2 Ideally this would be an adaptive management/adaptive policy pathways approach that supersedes strict planning time horizons. It is predicated in this concept that if and when there is a change in external and internal drivers, an alternative policy pathway (pre-defined) is pursued. This has worked very well for the Thames Estuary (TE2100), optimising the life of the Thames Barrier. The approach, developed in the 2000s is still seen as a global flagship concept. The planning process could consider this approach, as it needs ‘agility’ ie to be easily modified to ‘enable’ rather than to be constraining ‘preventing’ until new knowledge has been incorporated that then allows change in regulations/policies.

5.3 Consequently, any future vision/policy should consider the next 20-30 years as a minimum within the context of up to the next 100 years.

Buildings and places: New and old

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

6.1 The last government’s insistence that planning decisions should permit new development if the authority did not have a proper 5 year housing land supply has probably now been satisfied by the large number of permissions that have been granted over the last 2-3 years. Sadly, obtaining permission doesn’t guarantee that houses will be built, nor that their locations were appropriate in land planning or environmental terms.

6.2 It is inevitable that there will be a need for major new settlements to accommodate the housing numbers likely to be required, but there are no strategic land planning policies in place to ensure that major urban extensions or new towns (see the Wolfson Economics Prize winners strategies for new garden cities) can be developed in appropriate locations, or to
guide their planning, siting and design, as was undertaken by the development corporations in the past. Environmental factors must increasingly play a key role alongside the provision of, and access to infrastructure.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

7.1 Surely to be ‘sustainable’ is by definition to be ‘resilient’? There seems to be some confusion (in government) as to what these terms mean? At present, sustainability is only narrowly defined/utilised in policy, with resilience becoming a favoured term. Resilience is currently about ‘bounce-back’, but should be about ‘bounce-forward’. For example, ‘bounce back’ is where insurance companies pay to reinstate a property that has been flooded. What is needed, however, is to ‘bounce-forward’, which would make the property more resilient than it was before the damaging event.

7.2 Efficiency in approach allows multiple changes to be brought together, such as integrating retrofit SuDS with highways renewal. This is regularly undertaken in the Netherlands, and is growing elsewhere in the world in a process termed ‘mainstreaming’. As major refurbishments come up in our building stock or urban environment, all appropriate opportunities to make these climate proof (and ‘bounce forward’) should be taken.

7.3 NEW HOUSING

- We should require all housing to be built with Sustainable Drainage Systems that address managing surface water to 1 in 100 years plus 30% for climate change. Both the storm event and climate change% should be periodically reviewed to ensure its adequacy. SuDS have been shown scientifically to be more flexible, adaptable and hence resilient than piped drainage systems.
- This should apply to ALL new housing, wherever it is situated, as all development affects housing and buildings downstream regardless of the size of the development, and nearly 50% of all new housing comes from small scale developments.
- All new housing in areas of flood risk (flood zones 2 and 3), must have resilience to flood water in-built when they are constructed.
- All housing areas should consider exceedance, and understand how water can be managed through a site without risking people or property
- The approach to water management should encompass supply and recycling of water as well as disposal and flooding – closing the water cycle within any scale of development, also know as Water Sensitive Urban Design (WSUD) – and integrating that approach with urban design, can achieve a wide range of multi-functional benefits, and provide a robust, attractive, biodiverse and healthy environment for people to live and work.
- Any infrastructure must be appropriately managed and maintained in the long term if it is to provide its services. SuDS is no exception, so that long term responsibility for its management and maintenance must be clear, and then properly funded (but need not be excessively expensive), and its ownership held within an organisation who has long term capacity to do
so. We must not allow short term expediency of saving money to determine inappropriate long term planning (passing the responsibility to volunteer groups that are not robust or well-established and who could disband/move away).

7.4 EXISTING HOUSING

- Houses affected by flooding must be grant aided to provide the additional monies necessary to make them resilient rather than insurers just paying to reinstate to the same standard – thereby allowing them to continue to flood when the next extreme rain event occurs. Flood Re does not address this.

- Almost all of our major towns and cities are built on rivers, and are drained by combined foul and surface water systems. These are not designed to take the additional flows that now occur as the cities have expanded, become increasingly dense as they are redeveloped, or to cope with the increasing number of storm events. This has been recognised through the requirement for LLFA’s to produce Surface Water Management Plans, and through the implementation (at a very slow and small scale) of SuDS retro-fitting projects around the country. The problems caused in our existing towns and cities far exceed the problems caused by new buildings, but in combination the effects are becoming more extreme. There is therefore a need to promote and support a long term approach to retro-fitting.

- There is a role for flood alleviation and flood management schemes both in and around cities directly affected. However, such measures are expensive, and only of benefit for short periods of time in any one year. So whilst essential, these need careful design and integration to ensure that whilst providing physical benefit, they equally provide features that enhance the quality of the urban environment in which they are constructed. Well planned schemes can also release land for development, which could help part fund the flood relief measures.

- At the larger scale, we need to comprehensively consider catchment management issues, as towns and cities are invariably sited in the middle and lower parts of catchments, and are directly affected by land management upstream and consequential down-stream flooding. ‘Water-friendly’ land management practices should be promoted through our agricultural grant systems, based around the existing Catchment Based (CaBa) approach. As with urban retrofitting, small scale measures at the farm scale can have a significantly beneficial effect when they are aggregated in any particular area. These measures are currently available, but only implemented at a small scale.

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

No response

Skills and design

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?
9.1 The professions at present are reasonably well skilled, but need to press on strongly to embed modern approaches to sustainable design, and to genuinely value and understand the skills of their co-professionals, particularly within the more specialist professions. The key is an openness and willingness to genuinely collaborate, to admit lack of knowledge, and to acknowledge that the profession of the project leader may need to vary from project to project, to ensure that projects have the requisite skills sets required.

9.2 Local authorities have had their staffing resources significantly reduced during the recent central government cut-backs. Delivering sustainable water management through the planning system, or indeed highways or other works can require the authority to provide comprehensive and coordinated advice across the full range of professions (planners, urban designers, landscape architects, drainage and highways engineers, arborists and ecologists). Few authorities now have that resource in house, or the ability to buy independent advice to support them.

9.3 Many District and Borough councils do not have the skills to determine planning applications that are required to have SuDS (which fall within the scope defined by the DCLG Ministerial Statement). They lack the in-house expertise to do so, and many do not have the financial resource to seek advice from their County Council, which is the Lead Local Flood Authority (LLFA). This means that the drainage aspects of planning applications are often not properly considered, and are often treated as just another element within the ‘planning balance’ instead of part of essential infrastructure, leaving homes and development potentially vulnerable to flooding through inappropriate consideration of the proposals.

9.4 The lack of understanding of this area of design, compounded by a lack of diverse professional input means the following problems can arise:

- that the policy base and appropriate SPD’s may not be in place,
- that sufficient information is not required for a planning submission,
- that inadequate pre-application advice is often given, and
- that planning conditions are not appropriate.

9.5 It also means that the opportunity for the good quality, multi-functional benefits of integrated sustainable design in new developments is often missed.

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

10.1 Despite whatever may be said, high quality design and place-making is subservient to ‘lowest cost’ which is perceived as good value. It isn’t. In relation to water, Defra’s own studies have demonstrated that multi-functional integrated SuDS are cheaper both in capital terms and whole-life costs. Additionally, these studies do not consider the value of the benefits that will accrue when such good quality design is used – this can now be measured using the Valuation tool produced by CIRIA (BeST), which will measure the financial value of all benefits relating to SuDS and the green spaces within which they sit, from the improvements to air and water quality, to health and well being.
10.2 Government has been mislead by arguments that SuDS can be too costly due to land take, but it is easy to see that those wishing to oppose such systems can produce deliberately uneconomic schemes. Most of the volume house-builders accept and understand the need for SuDS, and some use good quality integrated design to maximise the value of their open space, and achieve higher values, and easier sales.

10.3 The concept of a ‘Chief Architect’ has been promoted through the Farrell Review in particular, and this role has been effective in other countries in promoting quality design at a National Level, particularly where other professional roles are also included (Chief Planner and Chief Landscape Architect are also used). Construction Industry Council has, however, argued for a more generic title for such a post that is reflective of the wider construction industry.

10.4 The Farrell recommendation was based upon the role of Chief Construction Adviser but since publication of the Farrell Review, the government has announced that the post of the Chief Construction Adviser (CCA) is to be discontinued from November 2015. This decision has been universally criticised within the construction industry and is likely to lead to even less integration of policy across government departments since the CCA provided the opportunity for much of that co-ordination.

10.5 The APPG Report advocated that the Cabinet should include a member with the specific role of water management, and this role could and should encompass high quality design as an inherent part of this role.

Community involvement and community impact

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

11.1 This area is not adequately addressed in the currently planning system, which is a ‘numbers-based’ approach to the provision of specific facilities (xmx2 of open space/’000 of population, a ‘Local Area of Play’ within xmx walk distance to each house etc). The way that the urban environment affects those who live and work in it is well documented in research. In addition, a number of the built environment professional institutions have published guidance documents that articulate the problems, promote solutions and demonstrate how they work through a range of case studies, both in new build and through regeneration projects (see the Landscape Institute’s ‘Public Health and Landscape: Creating Healthy Places’ for example).

These comprehensive approaches to site design and place-making should be promoted through national and local policy, and at the local level through inclusion in Development or Regeneration Plans. Sadly, the aspirations of such Plans are rarely realised, due to over-development of sites, but can be improved through integrated sustainable design. However, this requires healthy outcomes to be comprehensively planned into the development from the initial conceptual design stage.
12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

12.1 Public engagement must be genuine if it is to be effective, with those organising the process being open and honest about the extent to which the public can help to shape or determine change. Engagement must give the community the opportunity for real choice that is meaningful, otherwise the process becomes irrelevant or even destructive to local relations. However, such engagements are time consuming and consequently costly, and therefore have to have a scope that has defined limits, whilst also being flexible in its approach.

12.2 It is important to remember that where new communities are being proposed, the consultation only engages with those who live in the area, not the people who will be the ultimate direct users/residents of that new development.

12.3 Most planning consultations do not genuinely consult with a view to empowering local people in the decision-making process, and are invariably about informing the public about development and change that is potentially already determined, but with a superficial ability to influence minor or peripheral issues – such as, ‘would you like a pond or a wetland in the public open space?’, rather than, ‘is the scale of the development proposed suitable for this location?’. Enabling Community Groups and Community Champions to arise, and then embedding them in the process, can and does enable better places for people that fulfil their needs now and in the future, whilst delivering sustainable attractive landscapes that are valued by the community.

Financial measures

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

No response

05 October 2015
Preamble

The professions that procure, plan, design, construct, maintain and manage the built environment form a major part of our national economy. The construction industry employs millions directly but it is also an enabling sector for the wider economy. The building and upkeep of new offices, warehouses, homes, infrastructure, service facilities and new places generate jobs, development and growth. Unlike most economic sectors, construction activities and the built environment professions are widely dispersed throughout the country.

All development must have a construction component. Our health, education and transport systems all rely on the construction industry to design, build and maintain the built environment which underpins our social and economic frameworks.

To achieve national economic growth in tandem with best value, the construction industry needs a commitment to a programme of investment in infrastructure and housing; a commitment to quality in the built environment; and co-ordinated planning for construction.

The Construction Industry Council is the representative forum for the professional bodies, research organisations and specialist business associations for professional services’ providers in the construction industry.

It provides a single voice for professionals in all sectors of the built environment through its collective membership of 500,000 individual professionals and 25,000 firms of construction consultants.

Questions

Policymaking, integration and coordination

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

National development needs not only investment in housing, infrastructure and skills; it also needs a suitable administrative framework in which to flourish. Strategic planning is vital but so too is the context in which this planning takes place.
Sustained investment in transport infrastructure is essential as a catalyst for economic growth. However the slow speed of decision-making is hampering development and often this is because decisions are not being made at the right level. More effective strategic planning is required, particularly at the sub-regional level, to drive forward economic regeneration.

We strongly welcome the Chancellor of the Exchequer’s decision - announced on the day responses to this inquiry closed – to create a new independent National Infrastructure Commission. The decision to put this Commission under the leadership of a former Labour Minister and to give it a cross-party consensus is also remarkably refreshing, in principle, and appears to place major economic decisions beyond the usual confines of party politics and into the collective consciousness of the country as a whole.

It is essential that major decisions to shape the connectivity within England’s (and Britain’s) built environment are taken at this independent, strategic level. This must incorporate a high-level view of HS2 phase 2 and HS3 and action on the choice of airport options following the Davies Commission report. This new infrastructure should be effectively delivered and well co-ordinated with other transport modes.

While we support and endorse the establishment of a public company to manage the strategic road network, the maintenance of the whole highway network (including local roads) should remain a key priority.

There is scope for transport planning by fully integrated transport authorities within city regions.

2. **How well is policy co-ordinated across those government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and co-ordination be improved?**

Too many government departments have split responsibilities for various aspects of the built environment and there is far too little co-ordination between them.

Fragmentation is apparent in the many diverse roles of government as policy-maker, sponsor and regulator. Various responsibilities for housing, infrastructure, construction, planning, design, sustainability, heritage, building regulations, health & safety are split across at least ten departments. The role of government as a client is split across every spending department with little or no co-ordination.

In the past, procurement processes have often been wasteful across government. With public sector construction contracts totalling more than £37bn per year, there is much
scope for improvement beyond the strides made by the government across the last parliament with its Government Construction Strategy. However, procurement is still costly and time consuming on both sides and more needs to be done. In particular, there needs to be a cross-government drive towards new outcome-led procurement models with a clear business case for value; and buildings and infrastructure should be procured on the basis of both capital and operating costs.

The only apparent and effective co-ordinating mechanism was provided by the Chief Construction Adviser (a role established in 2009 following a recommendation of the Trade and Industry Select Committee). A fundamental responsibility of the CCA was to provide advice across government in matters relating to construction and the built environment and to act as “the glue” in terms of integrating departments on these issues.

The Government has recently taken the decision to discontinue the role from November 2016 without any review of the effectiveness of the post over the past six years and without any plans whatsoever to fill the void in this co-ordinating role. It is a retrograde step that has been roundly and universally criticised by the industry at large.

**National policy for planning and the built environment**

3. **Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment?**

Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

After a long period of significant change, the new planning system needs to be allowed to “bed down”. Some improvements, however, could usefully be considered.

It is essential that an adopted local plan is in place, alongside a five-year land supply programme, in every local authority.

As land supply is a critical factor, particularly for new housing, local authorities and other public bodies need to bring forward more land for development.

We should monitor the operation of changes to the planning system to ensure that land for house-building is coming available at a rate that is sufficient to support local demand for new homes and to create demand-pull for innovation in the delivery of housing including the increased use of offsite construction solutions.
Some flexibility is needed to permit large-scale housing in sustainable locations (such as a new Garden City) as this is likely to be preferable to developing multiple small sites for which it is much harder and more costly to provide infrastructure.

With local authority finances under unprecedented pressure, administrative delays are occurring in development and renewal programmes, which can kick-start economic recovery at a local and national level. Local Government reform cannot be allowed to hamper economic development.

4. **Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?**

Yes. Access to green space, high quality housing, active transport (involving significant opportunity for walking and cycling) and clean air are all elements of a healthy built environment. Planning and creating this environment generates long term savings in health spending.

5. **Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?**

The former (coalition) government’s timescale for industrial strategies was looking forward from 2010 to 2025 and this elongated timescale of three full parliaments is an essential requirement for planning future built environment needs and establishing policies to meet them. A longer timescale to 2050 is essential in relation to reducing and changing the energy use from the built environment.

**Building and places: New and old**

6. **What role should government play in seeking to address current issues of housing supply? Are further interventions, properly co-ordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?**

There is a crisis in all sectors of housing affecting affordability and access to the housing market. Huge sums are spent on housing benefits that could be better used to construct homes and generate jobs.
The housing market is not currently capable of delivering sufficient houses to prevent a serious stock shortfall from continuing to escalate. The number of homes built each year is significantly below the 250,000 that are needed and the shortfall each year increases the numbers that are needed for the future.

We must increase the number of new homes built each year, especially in the affordable sector. These homes have to be of a suitable quality and size to allow for changing and diverse needs. Actions are required to create an atmosphere of confidence in which new market entrants and existing players are willing to invest in house-building.

A secure and reliable stream of land that is suitable for house-building is a fundamental requirement for a healthy house-building industry and a healthy society. We should bring forward Government and local authority land disposals and address concerns about the suitability of those sites for housing development and introduce a mechanism that delivers “oven-ready” plots for house-builders to develop with short lead-times.

In particular, we recommend that Local Authorities should be allowed – and encouraged – to sensibly borrow to build new homes; and a fresh look at the funding of affordable homes is urgently required.

Increasing the number of new homes each year will require a much greater number to be manufactured offsite for onsite installation. If the UK is to benefit from an increase in manufacturing capacity to produce offsite components and assemblies - and at the same time create jobs in an expanding manufacturing sector – capital investments must take place. The Government should therefore incentivise investment in the development of offsite construction systems. We recommend that a joint Treasury/Industry working group be established to consider how best this might be done.

We must develop new models for the delivery of housing, which encourage the engagement of the best possible capabilities and expertise from across all segments of the industry, including those that can best influence the contribution that offsite solutions can make to process efficiency, quality and value.

Government and industry should consider the case for establishing an Institute for Future Housing Research and identify the priority requirements for an initial work programme and options for funding such an Institute.

7. **How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking?** Will existing buildings and places be able to adapt to changing needs and circumstances in years to come? How can the best use of existing housing stock and built environment assets be made?
Energy security, affordability and the need to decarbonise continue as challenges both for the UK government and for industry in general. Each of these factors must be managed carefully and a mixed approach is required to meet current and future needs.

Government must do more to drive energy efficiency within businesses and also in relation to the vast number of existing buildings. In particular, a new approach to retrofitting insulation to our ageing housing stock is needed. In this respect, we welcome the establishment – by DECC – of an independent review led by BRE Chief Executive, Peter Bonfield, to examine standards, consumer protection and enforce energy efficiency schemes to “ensure that the system properly supports and protects consumers”.

8. **To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?**

No response

**Skills and design**

9. **Do the professions involved in the area (eg planners, surveyors, architects, engineers etc) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to skills and resources required to plan, shape and manage the built environment in their areas?**

There is a serious problem of both skills shortages and skills gaps within the construction industry, in general, and this also affects the built environment professions to some degree. The industry is also disproportionately older, white, male and more able-bodied than other sectors of the economy.

Outreach programmes in schools that highlight the range of career opportunities within construction and the built environment and to encourage younger people – from diverse backgrounds – to join the industry should be encouraged on a national scale.

Skills shortages in the professional sector need to be addressed by a more flexible migration policy.

Professional training opportunities, both full-time and part-time, for construction occupations need to be encouraged and a cross disciplinary approach to training within the built environment professions should be fostered.
Structural changes in the economy and the construction industry are highly likely to impact on the type, level and nature of activities undertaken by built environment professionals.

The skills requirements for new systems of working – such as Building Information Modelling (BIM) and the effective use of offsite construction methods - must be met if the new systems are to achieve long term savings and efficiencies and we are to maintain our international competitiveness.

There will be an increasing focus on the whole life performance and operational costs of buildings and infrastructure, particularly with regard to systems operation and energy usage. This will require increasing levels of understanding on the part of the built environment professions of whole facility performance and how the different elements of a facility inter-relate to drive overall performance and cost.

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

The built environment is an essential part of our quality of life. Good design and an integrated approach to creating communities and the landscape in which they sit are all vital. Central to this vision, is a long-term approach to creating sustainable buildings and infrastructure, which will have a low impact on the environment and can be easily and safely maintained.

We need to understand that good landscape planning helps to make the best use of land by identifying the most sustainable sites for development.

A commitment to cohesive national standards in respect to energy, water, space, access and security needs to be maintained.

The use and promotion of environmentally sustainable building designs and techniques is cost effective in the long term.

Government and the private sector alike should make the Design Quality Indicators (DQI) - a quality measurement system that assesses and evaluates input from all stakeholders to a project - a commonplace – or even mandatory – requirement for all new buildings.

Community involvement and community impact

11. Do those involved in delivering and managing our built environment, including decision makers and developers, take sufficient account of the way in which the built environment
affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

The Design Quality Indicator (DQI) mentioned in response to Q10 above, enables a full and detailed consideration of the views of all those whose lives are impacted by a new building to give their views from the start of the project. Thus, those stakeholders consulted at the outset of a school project would include teaching and ancillary staff, pupils and parents and those who may use the school after-hours as a community facility; similarly stakeholders engaged by the DQI on a new hospital project could involve all medical and other staff, patients and their families and those who simply pass by everyday.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

There needs to be clarity in the role of the Local Enterprise Partnerships (LEPs) in relation to other local structures and their role in setting out the strategic priorities of the local area.

Financial measures

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

Local Authorities could be incentivised to provide land for housing through targeting of City and Growth Deal funds to those authorities with local plans and five year land supplies in place.

We should look at the development of new financing models for future house-building programmes, including the removal of local authority loan caps and the engagement of more open-market sources of finance.

Government should consider the case for capital investment in the design and development of new offsite production systems for housing to be subject to tax breaks.

Government should also consider the case to incentivise and grow the self-build sector. This could include incentives to encourage house-builders, landowners and others to offer for sale construction-ready plots for self-builders.
Government and industry to examine the case for the introduction of a stimulus fund to encourage new housing schemes involving a significant percentage (by value) of offsite construction methods.

There could be improved co-ordination and evaluation across the range of current initiatives (eg Enterprise Zones. Housing Zones, City Deals and the Regional Growth Fund). An expert resource within central government is needed as a point of contact with local authorities to connect them with the local strands of funding and implementation.

If city regions have greater powers and fiscal devolution together with the flexibility to borrow and retain revenue generated by growth, they can be much more rigorous in pursuing co-ordinated programmes of development and construction that will benefit the local population.

Note

The CIC Flood Mitigation and Resilience Group has made a separate submission of evidence.

Many of the statements in this submission are taken from Constructing a Better Future [Recommendations on achieving quality and best value in the built environment] published by the CIC in May 2015; and the Offsite Housing Review, published by the CIC in February 2013.

Further information about the CIC – and a full version of the Constructing a Better Future report - can be found at www.cic.org.uk and further information about the Design Quality Indicator (DQI) can be accessed at www.dqi.org.uk.

On behalf of the Construction Industry Council

05 October 2015
RESPONSE TO THE SELECT COMMITTEE ON NATIONAL POLICY FOR THE BUILT ENVIRONMENT

“The development and implementation of national policy for the built environment”

Section 1: Policymaking, integration and coordination

There needs to be greater coordination between Government Departments and national and local government to address the skills challenge faced by construction, if we are to meet Government targets across housing, design, transport, infrastructure and sustainability.

Construction will create over 220,000 new jobs from 2015-19, as the industry grows 2.9% annually over this period. The industry wants to attract the best talent, creating thousands more apprenticeship opportunities, to ensure future requirements across the built environment are met. We also need to upskill the existing workforce, supporting schools, colleges and universities to develop relevant training that will create a skills legacy in the UK people can be proud of.

To do this, national and local government, working with construction, need to develop more coordinated policy on the built environment, with skills and people at its heart. Skills policy should be based on evidenced future skills demands and a clear understanding of whether we have the recruitment and training in place to meet them. National strategies on infrastructure and housing should be coordinated with local place-based growth strategies, to ensure the right skills are in place to deliver the built environment we want and the long-term employment opportunities it brings.

Any national skills policy on the built environment should support the right information, incentives and requirements for training providers to meet construction’s skills needs – from careers advice to more relevant training. Where there are clear skills pinch-points, appropriate skills interventions should be made, to ensure the industry has the skilled people it needs to respond to our housing, major infrastructure and sustainability targets.

CITB, working with construction employers, is contributing through:

- Ground breaking Labour Market Intelligence, which, for the first time in any industry, will show how the supply of qualified people matches future industry demand for skills.
- The first industry-wide careers portal for construction Go Construct, showcasing all careers across construction and promoting apprenticeships and other vocational education.
- Supporting schools, colleges and universities with a new Provider Strategy, clearly outlining the training the industry will need to meet future skills needs.

Significant changes to training programmes, qualifications and apprenticeships will be needed to incorporate new technologies such as Building Information Modelling (BIM); increase awareness of energy issues; and develop new skills in response to big projects such as New Nuclear Build.
This pressing need for a coordinated approach comes at a time of great change for the skills sector, with the introduction of an Apprenticeship Levy on large employers, reform of further education provision and the roll out of new apprenticeship standards. These initiatives should be targeted to support any new national policy on the built environment.

Recommendations:

- That skills be put at the heart of built environment policies, with clear evidence on the future skills requirements of construction and the training in place to deliver this – identifying and addressing skills pinch-points.

- National policy on the built environment should encourage greater coordination between key Government policy areas, including infrastructure, housing and apprenticeships, and Local Enterprise Partnership growth strategies.

- Policies should be developed in partnership with existing initiatives, such as the Government’s Construction Leadership Council.

Section 3: Buildings and places: New and old

Creating a better built environment in the future requires new approaches to the design and construction of buildings and infrastructure, and also a new philosophy of repair and maintenance of our existing buildings, which represents almost 40% of all construction output in the UK. Policy on the built environment needs to recognise the different environmental conditions our built environment will be subject to in future decades and the skills and behavioural changes that will be required across industry to meet them.

We believe that this transition can be achieved through education and training, giving industry the knowledge and motivation to promote and adopt alternative, more sustainable and resilient solutions and to integrate these as part of business-as-usual activity. Government too has a vital role to help educate employers of the need to adopt more sustainable and resilient solutions, both in setting a clear policy direction and as the largest client of UK construction.

It will be the SME supply chain, which makes up over 98% of the construction industry, who will transform the UK’s built environment. Government have a key role in supporting SMEs through:

- Incentives, for example a new programme to replace the Green Deal initiative.
- Procurement, where there are few SMEs currently successful in securing government contracts and benefitting from the new approaches to doing things they demand, such as BIM.
- Training, where Government will have to intervene to address skills gaps through regulation and funding.
Recommendations:
• National policy on the built environment should articulate a clear vision for upskilling construction SMEs, including how to encourage the uptake of more modern methods of construction through incentivisation, procurement and training. Key opportunities include a replacement for the Green Deal and increasing SME participation in public procurement.

Section 4: Skills and design
Further and Higher Education courses in design, allied to the construction sector, but which do not contain a work-based element to training, often do not provide necessary skills levels. This is particularly true for understanding Health & Safety risks on-site.

Research by the Green Construction Board (2014) also identified a number of critical barriers to the adoption of a holistic (lifecycle) approach to the design, construction, repair, maintenance and demolition of the built environment. These include:
• Lack of understanding of the business case to invest in higher efficiency options
• Insufficient training on communication/business case skills
• Lack of understanding and ability to communicate the business case for low carbon to client
• Inadequate training on linking project costs to carbon/energy outcomes and whole-life costings
• Variable quality of CPD for sustainable outcomes

On other specific skills gaps, research has outlined the need to dramatically improve levels of energy literacy across the design professions, increase the incorporation of building physics into the teaching of design principles and ensure the design of inclusive environments is embedded through the design and build process.

Inclusive environments are places that work better for everybody including schools, parks, homes, or community resources. Inclusive design is the responsibility of everyone who works in the built environment: planners, those who commission new buildings and places, access
consultants, designers, architects, engineers, surveyors, property owners and facilities managers; however, there is currently very limited training available.

More systemic is the issue of the silo nature of construction occupations and the barriers this presents to improved collaboration and communication. The professional bodies need to work together to break down these occupational silos and support the growth of a more holistic approach to the built environment, particularly on cross-cutting issues like sustainability, building energy performance and inclusive design.

Improving communication and coordination between professional disciplines involved in design, construction and management of building and infrastructure assets would undoubtedly unlock opportunities for a more widespread adoption of a holistic approach to the built environment.

Recommendations:
- The Professional Engineering Institutions and Royal Institute British Architecture who set design courses should consider including a Health and Safety element.
- A widespread adoption of collaborative planning processes with training and CPD to support the uptake between construction firms, architects and end users should be facilitated by Government and Industry.

Section 5: Community involvement and community impact

Ensuring the built environment meets the needs of the wider community is the essence of inclusive design. If we are to meet the needs of the current and future population, designing and building inclusive environments is essential. People involved in delivering and managing our built environments must embrace inclusive design and inclusive environments which in turn will impact:

- An ageing population
- Stronger communities – tackling social disadvantage
- Economic growth – through environments where those requiring care are more self-sufficient
- Buying power – where disabled people are welcomed into the community and then have the opportunity to spend
- Regulation – access for all is a component part of legislation

Critical to this will be ensuring that those involved in building the communities where we live have a clear understanding of how this environment impacts upon us. Equally important are the long-term benefits the building process itself can bring to local communities through training and employment.
There are currently a range of different initiatives by both Government and industry to improve the social benefits from construction locally, including the Social Value Act, new guidance for construction procurements over £50 million and a range of industry diversity and inclusion initiatives the industry itself is running.

CITB, working with construction employers, is contributing through:

- To support skills and employment in local communities through procurement, CITB will continue to set up **National Skills Academies for Construction** on government projects over £150 million **pounds**, and use the **Client Based Approach** to help government achieve greater value on projects with smaller budgets.

- Our **Shared Apprenticeship Schemes** bring Local Authorities together with SMEs to share the cost of apprenticeship training between multiple employers on procurement projects.

It is crucial that any social outcomes from construction projects are lasting for those people who benefit and sustainable for the construction industry to create. A range of reports have talked about an apprenticeship post-code lottery that has been created as a result of individual local authorities looking to drive higher and higher numbers of apprenticeships in their local area without understanding if these will lead to long-term placements and careers. Instead, local authorities should work in partnership with construction at a LEP level to drive lasting training and employment outcomes through procurement.

**Recommendations:**

- **The Cabinet Office should work with local government and the construction industry to increase awareness and take-up of powers coming out of the Social Value Act, with a focus on driving lasting and sustainable social value outcomes from construction procurement.**

- **National and local government should use CITB’s, industry approved, National Skills Academy for Construction’s and Client Based Approach to drive social value outcomes in a way that is sustainable for the construction industry.**

**About CITB**

CITB is the Industry Training Board for the construction sector, working with industry to train a safe, professional and fully qualified workforce. Through the Construction Levy, CITB provides direct funding and support for skills to help construction employers of all sizes become more innovative, productive, lower cost and lower carbon, supporting construction to compete effectively for work at home and abroad.
Members present

Baroness O’Cathain (Chairman)
Baroness Andrews
Lord Clement-Jones
Baroness Finlay of Llandaff
Lord Freeman
Lord Inglewood
Earl of Lytton
Baroness Parminter
Baroness Rawlings
Baroness Whitaker
Lord Woolmer of Leeds
Baroness Young of Old Scone

Examination of Witnesses

Professor Rachel Cooper OBE, Professor of Design Management, Lancaster University, Dr Richard Simmons, Former Chief Executive, Commission for Architecture and the Built Environment (CABE), 2004-11, and Professor Mark Tewdwr-Jones, Professor of Town Planning, Newcastle University

Q1 The Chairman: Good morning and welcome. I have already welcomed two of you. I particularly welcome you, Dr Simmons, because you were not waiting outside, so to speak. It is very good of you to give up the time. It is for us an exciting opportunity and an exciting day, because it is the first of our formal witness sessions. We have still not produced the call for evidence or issued a press notice on it, because we have had all sorts of complications with this Committee, which we do not need to go into; I am very happy with the Committee we have. You have had your copy of the questions. A list of the interests of all the Members has been declared and they are in front of you. As this is our first meeting, Members who have interests to declare will also need to read them into the record—they have already been made aware of that—before they ask their question. A transcript of the meeting will be taken and published on the Committee website, and you will have the opportunity to make corrections.
to the transcript where necessary. Before I ask the first question, would you please introduce yourselves?

**Professor Cooper:** I am a professor of design management and policy at Lancaster University. My research over the last 20 years has been concerned with the built environment, particularly design decision-making and the people who make design decisions: not just designers but planners, policymakers, developers—anybody involved in creating the urban environment and, indeed, all sorts of other products and services. I have looked at agendas such as sustainability, resilience, well-being and liveability generally in cities. At the moment I am doing a five-year study on liveable cities. I focus mainly on well-being and the physical environment. I am currently a member of the lead expert group for the Foresight programme on the future of cities. I am also a non-executive board member of the Future Cities Catapult. A lot of my work at the moment is about the future of cities. I have also done a very detailed piece of work on density and the built environment.

**Dr Simmons:** I am Richard Simmons. I am a chartered town planner and I am currently practising as a consultant and as visiting lecturer at the Bartlett School of Planning at UCL. Until recently I was visiting professor of city design and regeneration at the University of Greenwich, and before that I was chief executive of the Commission for Architecture and the Built Environment while it was a statutory body. When I speak about it, if I do later, I will refer to “statutory CABE” or “CABE”. By that I mean as it was when I ran it, as opposed to how it is now as a charity. My interests are town planning, design, master planning and the way in which the built environment can be improved.

**Professor Tewdwr-Jones:** Good morning. I am professor of town planning at Newcastle University. I am also director of Newcastle City Futures, which relates to the Foresight future of cities programme and is a collaborative arrangement between the city council, the universities, the local enterprise partnership and the private sector in Newcastle to think about the vision for Newcastle’s future. My areas of expertise are in relation to governance, politics and planning, and I have some interest in housing and economic development. I served on the Government Office for Science’s Foresight land use futures project between
2008 and 2010, and I now lead a Newcastle demonstrator project as part of the Foresight future of cities programme in Newcastle.

Q2 The Chairman: Thank you. As you are all very busy people, I thank you very much for giving up your time. I hope you did not have too difficult a journey.

I am asking the first question. What are the main built-environment challenges that we are currently facing and how might these change in the near future? How ready are we for the demographic changes, such as migration and ageing, climate changes and increasing resource demands? You could spend two hours answering that, but I am afraid we do not have that time, so we need really good, pithy, quick answers.

Professor Cooper: In my experience over the last 20 years, and most recently on the Foresight programme, we have a lack of foresight ability at both national and local level. Thinking about the demographic change—the increasing population—is a challenge. A lot of smaller cities do not have policy units. They really do not know how to address it and often do not think in the long term; they have a small planning department that is concerned with planning today and they do not think about the future. Alongside that, we have the capacity to look at statistics and data—satellite data, land use—but the ability to access that data, use it and make intelligent decisions is quite challenging.

Dr Simmons: I would like to pick up on the question of how we get lots of new housing built in ways that are going to make places attractive to live in. At the moment we are short of both skills and the ability to think strategically about how to provide a new built environment that will be more than just a repetition—but with housing for sale—of the kinds of out-of-town estates that we used to build historically. This is both about the quality of the places where people live when they get new housing and about how we decide where to put those new houses strategically. Those are two of the really big issues.

Professor Tewdwr-Jones: I am interested in the relationships between the different sectors. If we know the population is increasing and that we are going to have an ageing society, what is the implication for housing, for infrastructure and for the built environment? What are the assets—I do not mean economic alone; I mean social and resource assets as well—that can be identified in places and could perhaps be capitalised on by individual local authorities and
others? Where, then, are the intelligence gaps and the data gaps? As Professor Cooper highlighted, local authority planning departments are a shadow of their former selves these days; they have been hollowed out. The question then is: where does the intelligence and data come from to inform policy-making and to create some advantage for places to shape their own future? In Newcastle, the university has stepped into that vacuum to some extent by providing the expertise and the knowledge, but there is intelligence, there is mapping and there is data, and it is essential that the public consultation—the democratic element—is there as well. At what stages are the public, citizens and businesses given an opportunity to come in and discuss those opportunities? Last and by no means least are issues to do with governance and policy. Having worked on the land use futures project, I recall how governance and policy operates: it is through different sectors and silos. Places do not work in that way; they work the other way. That is why it is important to get those intersections on the ground: to overcome the silo issues that are apparent in policy and governance areas. At national level you can tick all the boxes and say, “Economic growth, social and environmental”, but on the ground there are trade-offs.

**The Chairman:** You must have a secret plan yourself.

**Professor Tewdwr-Jones:** I wish I did have a secret plan—or at least if I did that anyone would take notice of it.

**The Chairman:** This is a completely British problem at the moment, where there is silo management in everything. You are steeped in all this and you obviously care about the people who are going to be living in these places, how they are going to be living, the feel-good factor, et cetera. You must have come up with some radical views. Are you going to share them?

**Professor Tewdwr-Jones:** “Treading carefully on eggshells” seems to be the most appropriate phrase I can use. Essentially, you have to build coalitions. There has been some advantage in being an academic and in Newcastle for only three years—I will not be an honorary Geordie for decades yet. Nevertheless, as a new kid on the block I have gone in and talked to different institutions, different groups and politicians and played a bit of naivety, to some extent, to get them to work together and think together. That is the first stage. Then it is about starting
to bring the public in. There may be not only silo mentalities but an element of suspicion and mistrust on the part of different organisations working together. Get the public involved. Start with visual exercises about facing the future. The public are steeped in knowledge about the concerns of places. On the back of that, you can start to persuade hearts and minds to come on board and share some of the ideas. Only at that stage can you really put some what you might call innovative ideas on the table about how you overcome a silo mentality through social innovation and linking age into housing, into digital and so on. That is when people start to see the potential.

**Professor Cooper:** I totally support that. I have done the same thing. I have embedded research fellows in local authorities to look at how they behave in planning, retrospectively and prospectively. You do need these facilitators at different levels of policy-making. In local authorities there is often a lack of relationship between the transport department and the planning department and so on, and you need another role. Some cities, like Manchester, have a policy unit and do foresighting—they think ahead—but if you are a small place, like Preston or Lancaster, the ability to do that is limited and you need that facilitator, that integrator. We have engaged with the public too. At Lancaster University we did an 18-month engagement with 3,000 people talking about the future of a part of Lancaster. You get a very detailed and thick report, but somebody then has to interpret it and make intelligent decisions that cross the whole policy domain locally and regionally and then nationally. We do not seem to have many of those sorts of people.

**Dr Simmons:** I want to pick up your point, or the one that you implied, about international comparisons. I did a research project with an American charity for the Government of Singapore a couple of years ago. We tend to think about ageing in terms of care and so on. The Government of Singapore wanted to benchmark the whole of Singapore against five global cities, including London, to find out if their built environment was good enough for people who are ageing, because they have an ageing population. We came up with a methodology to compare Taipei, London, Chicago and a number of other cities to find out which were best prepared for providing things like access, so you could get from your home to the shops or to the doctor’s surgery. It is important to look at what people are doing
internationally. It is quite hard sometimes—the translation is difficult—but that was a way of
thinking about the built environment and ageing outside the silos.

**The Chairman:** Absolutely right. Is there any chance that we can have a copy of that, or
excerpts or articles about it?

**Dr Simmons:** I can share the methodology. The Government of Singapore have not, as far as
I know, put it in the public domain, although it did show that Singapore was way ahead of the
rest of us.

**The Chairman:** As it is in everything, apparently. There is just one question from me before I
pass to Baroness Andrews. You were talking about getting the public involved. We have done
quite a lot of work here in the House of Lords about getting schoolchildren involved to tell
them what we are all about. I wonder if architects, construction companies, builders or
designers have ever gone in a group to schools or said to the Department for Education, “Why
do you not do it?” or, “Why do you not facilitate it?”—a lot of manufacturers do things like
this, and they have an eye to the main chance—i.e. making sure that people are interested
and have the skills and can join them. It is just a thought and I am not going to hog it.

**Q3 Baroness Andrews:** Good morning. I need to declare my interests before I ask questions.
I am a vice-president, like many people, of the National Parks association; president of the
Friends of Lewes, which is where I live; trustee of the Prince’s Regeneration Trust; and ex-
chair of English Heritage, which is not on the list.

My question has been slightly overtaken, Chair, by some of the answers that have already
come. You have described the role of Foresight and its land use futures and cities programmes
and so on, and the importance of getting additional intelligence. That in a way is part of the
answer to the question, “Are the problems long-standing?” because these are long-standing
problems that deal with intelligence, information and lack of capacity to analyse what is going
wrong. I am going to turn the question around a little, because I know you have had this. Of
those problems, which do you think we are least informed about and which are the least well
understood? Where could the Committee look to draw out some positive recommendations?
Is there a need for more information in particular areas?
A supplementary question is: are we being taken by surprise at the moment by any changes in the planning landscape or the local authority landscape that are making the systemic difficulties more intense?

**Professor Tewdwr-Jones**: We are aware of the trends in each sector. There is a difference between whether that knowledge of the trends is then informing policy development at national level and how it is being dealt with on the ground locally. Perhaps in the absence of cross-cutting national policy or spatial visioning, that does not mean to say that nothing is happening on the ground in individual places. There is a lot of entrepreneurship on the part of local authorities where they are able to work with others in identifying the problems, overcoming them and identifying opportunities for working with others to address some of these problems. What is missing is a geographical perspective—a spatial perspective—from national policy, which would reveal where the critical geographies are, for want of a better phrase. In other words, some of these trends are more problematic in some areas of England and Wales than in others. For example, if you take parts of England where we think there is going to be a great increase in population in the next 30 years, we roughly know the areas that will receive that population. It will be an arc that will stretch all the way from the Wash down through Cambridgeshire, Northamptonshire and Oxfordshire to Hampshire. That is the corridor for population growth over the next 30 years. If you then add in other sectors—this is not necessarily a popular thing to do in Whitehall, believe me—such as climate change threat, the threat of rising sea levels or grade 1 agricultural land, you realise that you are talking about the same area. You are talking about predominantly, say, the Fens. Naturally, it is the best agricultural area because it is drained, but it is also a growth area in terms of population and therefore of housing demand. It has an incredible amount of infrastructure associated with it that might be vulnerable to rising sea levels. There is no perspective in Whitehall that puts all those different departmental sectors and policy areas together to look at specific geographies of vulnerability. That is where the geography—the spatial element—could come in. If you go to that area, there are local authorities and others that are working on some of these issues because they need to. Even if there is an absence in policy terms,
they are still working on these things on the ground. So there is the geography: the spatial element.

In the future, increasingly maybe under devolution, how do you make the public an integral part of discussions about long-term change across areas that are larger than communities or individual local authorities? That is where the issues lie.

**The Chairman:** Is that not something that could be batted back to you as a group of professionals, like the point I made about schools and talking to the public about it?

**Professor Tewdwr-Jones:** Indeed, yes.

**Baroness Andrews:** It sounds as if you are regretting the loss of the regional spatial strategies. Would that make a big difference?

**Professor Tewdwr-Jones:** My view of the regional spatial strategies is that they were an essential part that captured all these different trends in a synoptic way. Unfortunately, the plans became dominated by the housing numbers issue, and with their loss we lost a great deal of other essential intelligence work associated with them, to the point where there is now a vacuum in strategic thinking at local authority level.

**Dr Simmons:** Another area where we have a gap in policy understanding is in the rapid pace of change outside the built environment and how it impacts on the built environment. Things are changing faster and faster, but the built environment moves at a fairly glacial pace, and unfortunately policy does, too. Combined with that, we have an issue about not fully understanding policy risk and reward. At the moment, we spend a very long time worrying about building airports and railways, if I can pick two random examples. I am just about to go off to Japan and there is no debate about high-speed anything there; you just get on the Nozomi Shinkansen. We struggle to keep our built environment policies up to speed.

In terms of the regional spatial strategies, I would say that there was a benefit in bringing together something like a regional development agency and a regional planning something. I know that “regional” is not necessarily a word that people like to use, but something larger than local where you connected the economic into the spatial. There is a positive there. We need to be able to do things much faster and to change our plans more in the way software gets updated, so that rather than updating the whole operating system we update parts of it.
Professor Rachel Cooper, Dr Richard Simmons, Professor Mark Tewdwr-Jones – Oral Evidence (QQ1-12)

**Professor Cooper:** I would advocate not so much a strategy that is set in stone but a national vision that can be interpreted as the context demands locally or regionally. One of the other things is exactly what you were talking about, Mark: interdependency. We really do need to understand the social, economic and environmental interdependencies and all those factors at a national, regional and local level—just to sum up that answer.

**Lord Inglewood:** I will not declare my interests now. What you are saying is both very abstract and very complicated, but is it getting anybody anywhere? Are we just bogged down in a cat’s cradle of systems and consultations and processes controlling change, and as a result nothing much happens?

**Professor Cooper:** Interesting. There are lots of systems and processes. If you look at the national policy framework and the guidance, there is an enormous amount of guidance and processes that are available that a lot of people do not use, do not understand or do not integrate. Maybe we need a radical look at all those intervening factors and to change the structures in some way. For instance, lots of neighbourhoods are producing their own neighbourhood plans on a very local scale. They do very well, I would say, if they have some active residents who get involved, who are skilled enough to contribute to a plan, who can develop a survey as volunteers, and they produce a neighbourhood plan that can go into a local authority plan. Some places are really pushing forward with their neighbourhood plans without a wider regional scale and without a wider simple vision. There are all sorts of stipulations about the environment, social aspects and economic aspects, but people look at a local level and do not have a simple, straightforward vision at a national level. We may need to un-complicate the systems.

**Dr Simmons:** The inverse of your question would be that sometimes those systems enable difficult decisions, which are political decisions, not to be taken. There is a quid pro quo: if we had better and simpler systems—which I agree we need, and when I was at CABE I argued very strongly for simplifying both planning and building control—we would also need decisions and decisiveness. As I said in my submission, there are many wicked issues. The built environment itself is a complex cat’s cradle, both of systems and of politics, so you have to find a way of addressing that.
Lord Inglewood: What you are saying is that you want politicians with guts.

Dr Simmons: And to get to decisions quicker and to take them. I recognise that that is really tough in this environment.

Professor Cooper: And the potential to take innovative approaches. We still build houses in the same way we have always built houses, but there are all sorts of methods, such as using offsite manufacture, and quicker ways of doing it.

Professor Tewdwr-Jones: There is also the issue of governance. As well as systems and policies, you have a multitude of different agencies that have to work together in order for development to be delivered. That sometimes causes the delay in the system—the fragmented nature of governance between landowners, developers, local authorities, the public, utility companies and numerous transport operators, all of whom have their own strategies and their own plans. For specific projects, they have to come together and work together. This is about overcoming some of the wicked problems that Richard mentioned that relate to the institutional landscape that we find ourselves in today.

Q4 Lord Clement-Jones: My question is about understanding the policy failures of the past. Was there ever a golden age? Have we ever got it right?

Professor Tewdwr-Jones: In the past things were easier, one might say, when fewer institutions were involved, but I am not advocating turning the clock back to some golden post-war era. I do not think it was golden anyway, to be honest; there were difficulties even at that stage. If you look at analysis of the evidence of the impact of policies over different time periods, you will see similar problems occurring, albeit in a different context. In the 1950s, for example, the policies of the Ministry of Housing and Local Government expected towns to prepare development plans for the future—20-year futures—on the belief that people would live and work in the same place, while the Ministry of Transport simultaneously rolled out the motorway programme, which encouraged people to work in a different place from where they lived. One policy effectively cancelled out another policy in specific localities. It is in the nature of the land problem and of the built environment and flows over land where these things happen. We do not run away from them; we address them, but there will always be another set of issues that we have to pick up at some point in the future. What is lacking
today is the policy evidence. There has been a hollowing-out of research on the impact of policy. That has gone. There are no CLG research projects any more that evaluate the impact of policy.

**Lord Freeman:** I am expecting a very quick answer from Professor Tewdwr-Jones. Would you encourage this Committee to look at the structure of central government and the cross-cutting responsibilities? For example, this area from the Wash down to the south coast is covered by at least five different ministries. Should we focus on that particular issue?

**Professor Tewdwr-Jones:** At the end of the land use futures project, we suggest that this can be co-ordinated only by the Cabinet Office. It cannot be co-ordinated by different spending departments; we need a synoptic vision of the spatial impact of their different policies. From that point of view, I agree that a strategic vision, as Rachel highlighted, that was centrally located would be of benefit. It might actually save on cost later on as well.

**The Chairman:** Before we move on to the next question, I leave you with the wonderful picture of Coventry and of Ground Zero: the two “born out of disaster” types of issue? One is fantastic and one has to be knocked down.

**Q5 Baroness Finlay of Llandaff:** If I may, I will start off with my interest, which is in the health and well-being of people. That is why I have declared that I am incoming chair of the National Council for Palliative Care: because of things like hospice and hospital design and the impact on the way patients respond to illness and how families cope with dealing with it. I am also clinical lead for palliative care for Wales, and we see the long-term effects of poor housing and so on. I also have to declare that I am personally involved in a planning dispute, which is not the nice end of things.

We really wanted to ask you about the buildings that we build today that will be our future heritage and whether what we have now from the last 30 years of commercial and residential developments will have any kind of legacy value and whether it will be able to adapt to changing needs, so we particularly want to ask you about the long-term survival of buildings, energy efficiency and use, and the use to which those buildings are put and how you see that. If I might I will just throw in that listening to the previous discussion I began to wonder whether there needs to be almost a national vision for what our built environment should be.
achieving in all the different areas that people are signed up to. In different areas in life in the country we have mission statements and so on, but there does not seem to be any common agreed purpose as to where our built environment is going and what we intend to leave behind.

Professor Cooper: There is a lot there. From the point of view of the housing stock, I did a study about six or seven years ago of various buildings in parts of Clerkenwell. What was revealed was that the older buildings—let us not take the sustainability and energy aspect, because that is another issue—were much more flexible for different types of families. The newer buildings were one-bedroom apartments, probably not very well built, that were not flexible if a family wanted to stay there and were probably okay for young people but not necessarily for the older generation. Developers, I have found in various other studies, tend to what I would call value-engineer out issues to do with sustainability such as social sustainability—anything that might be put in by planners or regulation that say, “Build it this way for the long term”. If costs or profit margins come into it, they tend to value-engineer those out, because they can. That is one thing about the stock that is currently being built, particularly when it is dense too—when they are building a lot in one area.

The other issue is health and well-being in communities. Local authorities now have the responsibility for public health. I am not sure they think about the relationship between their role in delivering public health and social care and the design and development of their cities. They do not connect those two. They now have to deal with the social care and public health and the funds they have for it, and they are making decisions about the walkability, the accessibility and the green spaces in their local communities without thinking about the impact on health and well-being in the long term.

Another piece of work that I am just about to start on is looking at how we think about where healthcare is provided spatially in cities. Often local authorities do not think about that. We have had this concentration of healthcare in the bigger hospitals, but then we talk about beds being blocked because there is nowhere locally for older people to go. Again, spatial thinking and planning about where we place and deliver healthcare that will not always be telecare
for people in their homes but will be community hospitals for people who are not blocking beds in acute hospitals has not been undertaken. I think that answers some of your questions.

**Dr Simmons:** If you move on from housing to the commercial world, a lot depends on whether you think that in, say, the next 30 to 50 years the private car and the lorry will be the dominant modes of getting around. Over the last 30 years, we have moved a very large amount of retailing out to the periphery and have put it into relatively short-life—I would imagine—tin sheds quite a lot of the time, and we have built huge distribution depots on motorway junctions, so we are now pretty dependent on that lifestyle. People who do not have access to a private car are seeing their city centres and town centres hollowed out and do not have the same access to retail opportunities unless they go online. Then we are pushing lots of vehicles back into town to deliver from these out-of-town centres. I would say as somebody who uses those services myself that they are very convenient if you have a car and a computer, but I doubt that they are really very sustainable for the long term. I also doubt their environmental sustainability. If we can move to a form of movement that does not require us to put carbon into the atmosphere, which we may do—at the moment even electric cars do that, just from a power station rather than from the car—there may be something to be said for it. But if the economy changes radically around the internet, even more so than it has done already, we may find ourselves with lots of empty or unmarketable sheds around the outside of towns as well as inside towns. If manufacturing goes to smaller locations using new technologies like 3D printing and so on, we might find ourselves with quite a lot of legacy that we do not know what to do with. That is a pessimistic scenario. There may be more optimistic ones that no doubt Mark will be able to give us.

**Professor Tewdwr-Jones:** I was just going to comment on the health and planning relationship. Quite a lot of work has been undertaken over the last six years or so on planning for health and looking at, say, planning out obesogenic environments or how young people use public spaces and certainly public squares, and whether alcohol is involved. Quite a lot of work has been done to try to overcome some of those problems through policy development work and evidence base. I was involved with a NICE group called the Spatial Planning and Health Group, which sat from 2009 until we were abolished in 2010, and with a Department
of Health/CLG-funded report on spatial planning and health that reported in 2010 as well. Unfortunately, that came out at a time when the policy backing at national level to encourage planners and health professionals to work together basically went. The work has continued on the ground. There are some very interesting groups such as the Spatial Planning and Health Group, and there is some very innovative local authority work such as in Tower Hamlets, where the different professionals are working together on these issues, but, unfortunately, without the national policy legitimation it is difficult in some cases to persuade practitioners on the ground to work together to address these problems.

Baroness Finlay of Llandaff: Can I just follow up on that with my question to you about a national vision and whether you feel that there needs to be some very clear health-related requirement within buildings? I am horrified by the number of times in new hotels you cannot find the stairs—they are only fire escapes—whereas going up and down the stairs would be a good thing. Having been a GP in an area with high-rise blocks, I know perfectly well what happens when the lift does not work and you are trying to go up the back stairs, which are awful. I just wonder whether there are some very simple things that would be energy efficient and would switch behaviours of people without having any kind of major cost implication, really, or government involvement.

Professor Tewdwr-Jones: There is a desire at national level to address place and well-being. Those are the most appropriate phrases, not “planning”. As soon as you say “planning”, people immediately think construction and development and change of use. It is about a larger perspective of the contribution of well-being and place. There might be economic development potential and there is certainly planning housing potential of doing so. On the ground, that could be addressed through changes to building regulations for example requiring certain standards, and the threshold could be raised accordingly. But you need that awareness. In Scotland, its national spatial planning framework and land-use strategy deliberately address issues like well-being, health and education, which in a narrow statutory sense are not planning issues. Technically they are not planning issues. If you address them from a spatial planning perspective, you can suddenly say, “It all relates to place, it all relates to the well-being of communities”, so it is a legitimate issue—addressing how these problems
Professor Rachel Cooper, Dr Richard Simmons, Professor Mark Tewdwr-Jones – Oral Evidence (QQ1-12)

relate to the opportunities through design, planning and so on. That is a way of bringing different Ministers together around the Cabinet table.

**Q6 Baroness Andrews:** It is another example of the failure of integration and it picks up on the demographic point about an ageing society. It is what you said, Professor Cooper, essentially. It is a bigger picture. We need to plan for ageing, not just to solve bed blocking but to plan for a whole range of options within the housing supply system, so that houses are flexible enough for people to age in place as well as having specialised housing for people who are frail and dependent and have different sorts of needs. We began to address this issue in CLG some years ago, but, like the health and the housing integration, it has tended to collapse. My question is: what could drive the policy changes here? We are beginning to articulate the notion of a national idea. With the well-being boards, could we incentivise local authorities to begin to have a bigger sense of place creation, particularly in relation to demography?

**Professor Cooper:** Yes, we should. It is about designing and planning for the life course of communities. It is a mode of thinking of interdisciplinarity, integration and planning through the life course, and enabling communities to take on foresight. Often communities think about now or tomorrow or five years and do not understand the long-term implications for them and their communities and their children. I spoke at the Cheltenham Science Festival a few weeks ago and I did something for the public—10 tips for designing a healthy city. Somebody left and said, “We are doing the marketplace in Cheltenham. I am going to take your 10 tips”. That was a member of the public. It is complex—planning regulations are complex—but you can make it easier for people to understand some of the basic principles of designing places for the long term and help people to engage in it without it feeling burdensome.

**Dr Simmons:** I am slightly concerned that we have not mentioned the market at all yet. The market is very important as probably the major provider of the built environment. In this context I once saw a scheme that was half housing association and half private sector. The scheme had smaller doors in the private sector part. That is because the house builder had bought a shedload of doors but the housing association specified a larger door. That is a market issue and there are only two ways to deal with that: one is by regulation and the other
is by the market dealing with it. In Canada, the mortgage companies insist on certain standards before they will mortgage a property, including things like larger doors. They have their own building regulations through the mortgage companies. It seems to me that before we fall back just on regulation we should think about whether there are market mechanisms that we can use to drive change as well.

Q7 Baroness Young of Old Scone: I really just want to make things more complicated. I thought that the debate about health and the built environment and planning was very good, but then there is replication if you bring in the green environment, future-proofing against climate change or land-use constraint. Are we at the point where this thing is now too complicated to be decided at a local level?

Professor Cooper: Some solutions work in both ways. Green spaces support health and well-being. Some recommendations will work across those complex dimensions, but again there are some competing issues. Increased density to reduce going into the green belt, and density around interchanges—train stations—in the built environment works because in some senses it reduces movement, travel, energy use, et cetera. On the other hand, if it is not designed well and built well and does not have access to green spaces and views, it affects our physical and mental health, sense of crowding, fear of crime, et cetera. We still have to understand those interdependencies and find mechanisms to do that. With visualisation and new technology we can do some of that modelling. That does not mean that it remains in the domain of the professionals who can understand the intelligent, but visualising these issues and doing them in such a way that the communities can get involved is very important.

Dr Simmons: I have experience of working with communities on these kinds of projects. I have worked, for example, in inner-city Hackney on the reconstruction of a housing estate with people who have very poor educational opportunities in the first place. Two of them got degrees at the end of the process of involving them. It is about engaging people with information. They knew why they were poor. What they lacked was agency—the ability to address that. They were also able to understand more complex issues, interestingly, than their councillors. What is needed is resource, because you cannot have that kind of conversation just by turning up and saying, “Here is a plan. What do you think of it?” You have to sit down
with people, go through all the issues they are dealing with, leave some of them at the door and deal with the ones you have to address. It requires resource, which we do not provide at the moment.

**Q8 Baroness Whitaker:** Still with the concept of better place-making. I declare my interests as honorary fellow of the Royal Institute of British Architects, president of the South Downs Society, and president of the Newhaven Historical Society close to where I live. We have the impression that most of the professionals have place-making pretty clearly in their minds. It is certainly very evident in the Farrell review, and Professor Cooper has drawn our attention to the pros and cons of urban density. I will not read out her extremely good text on it, because we have all had it. But those who are not professionally expert in this area perhaps have not yet come to it—and I do not exclude politicians from this. My question is really about the process of improving decision-making and the capacity of those making decisions. How can we ensure that new developments respect their surroundings and improve the area in which they are sited, and how do you foster a sense of community and place both in the residents, which is not so hard, and in those who make the official decisions?

**Dr Simmons:** You are right; we know a lot about making good places, and I think we have all provided some information for you on that. You are also right to point at decision-makers, because places arise as a result of a series of decisions, some of which are quite small, such as someone putting up a garden shed and it annoys their neighbour, and some of them are extremely large, such as somebody building an airport near you. Those are all decisions that affect the quality of place. As my colleagues at UCL have said, a degree of subsidiarity is required. You have to decide where you are going to make those decisions.

The first thing is to be clear about where those decisions get taken, who has the right to take them and who has the right to contribute to them. I do not think we are always clear about that. Dealing with that issue first would enable you to get an honest conversation going. Going back to my previous comment, the second thing is that everybody needs information. We now have access to masses of data and to huge numbers of case studies about how to do things well, but not everybody gets at it and not everybody gets it.
The second thing is for us to provide people with data and information. The third is to enable people to have the skills they require. That does not mean that you have to train to be an architect. If you think about it, the built environment is the one thing we all understand, probably, because we spend all our time in it—we are in it now—so we are all experts. The question is how we extract that expertise. At CABE we ran a programme called Design Review. At the end of it, I started to get my team to engage local people on the Design Review panel. They were initially resistant. They said, “Well, they are not experts”. They came back from the first review and said, “It was fantastic. They are real experts on their locality”. I said, “Yes, obviously”. It is important to be honest with people and to say, for example, “We need 3,000 new homes and we are going to have 3,000 new homes, I am afraid. I am sorry about that. Now we want you to help us to produce the best result”. Or, alternatively, “How do you feel about having 3,000 homes?”. People often ask the wrong question. My final point is: ask the right questions.

**Professor Cooper:** I did a study of decision-making in local authorities, retrospectively over 20 years and 10 years, and prospectively. Multiple parties get involved in decision-making, but often they do not understand where they are in the process and they do not know what the values are that they are bringing to the table. I looked at a prospective process of decision-making in Salford and nobody ever mentioned sustainability when they were starting to make decisions such as who they selected to do the strategic plan, and they did not articulate as a group at the beginning what their values were. This comes back to a national and local vision. What are your values for a place? What do you want to achieve? If you do not have that at the beginning, you cannot work out who you are choosing, what decisions you are making and why you would make those decisions. You cannot track them back. We need to have a clear understanding of the process that people are going through and when they need to articulate the values and the criteria on which they are making decisions—the politicians and what I would call the decision-makers, the decision-takers and the decision-informers. There are different groups of people making decisions: the local community, the planning officers and developers. They sometimes really do not understand their roles in that process.
Professor Tewdwr-Jones: I have had experience of working in rural areas enacting innovative public participatory processes for communities. In the Brecon Beacons, 34 villages were covered with “planning for real” exercises. I have also worked in inner-city areas of Newcastle undertaking the same sort of work. It strikes me that in planning and policy-making the current terms are very much on consultation of existing strategies and existing processes. In other words, it is not a blank bit of paper. We need to move to a process of participation, so you start to enact processes that are very much on the terms of the communities, not necessarily on the terms of the experts. That is the first stage.

Then there is the issue of the translation of community desires and community voices into something more meaningful through the policy process. You need experts to be able to do that translation—the mediation. In neighbourhood planning and localism around England at the moment, a whole industry has emerged very rapidly in training to be a mediator in the translation of the community desires into a neighbourhood plan where suddenly there are constraints—legal constraints, difficulties of policy wording and statutory constraints. The mediator becomes an essential person to do that. It could be a planner, it could be someone else. It could be an architect. It could be someone who is not trained in the built environment but who understands the policy syntax of use here. From an academic point of view, we started to look in architecture and planning at whether there is a necessity to train up place leaders—not planners, not architects, not civil engineers, not surveyors but place leaders—who have some skills in the mediation and the translation, who understand where the public are coming from, who understand businesses but who understand the wider issues to do with infrastructure, land acquisition and all the wicked problems that are associated with delivery on the ground. I am not saying that we are producing a super-professional here, but someone with a clear understanding of the difficulties and complexities. That is probably what is needed in the future, and existing professional disciplinary areas in universities, such as planning and architecture, will have to go through revised curriculum design to take account of that.

Baroness Whitaker: That is a very interesting suggestion. I have come across organisations that do that, but we ought to develop that. I have a two-part supplementary, if I may. It would
be helpful to us—and if you have one on the stocks already, maybe you could send it in; if not, maybe the secretariat will be able to help—to have a map of decision-making as it works now, not as it has happened in the past but what it is really like. We also would find it extremely useful if you have any good and bad examples of, say, density in urban areas: places where the decisions have worked well, places where the community—perhaps New Islington in Manchester—have really come in. It would be very helpful to us to be able to explain our points to our audience later on.

**Lord Inglewood:** Professor Tewdwr-Jones, you were talking about developing community thinking and community ideas and then you suddenly dropped in the need for the mediator because of the conflict between policy and community. That is crucial, because policy is top-down and community is bottom-up. If you happen to be a community in a nice village somewhere, for example, where they are proposing to build a new town, that community is going to get rolled over. It is a nice idea, but is it realistic?

**Professor Tewdwr-Jones:** There has to be a meeting of minds.

**Lord Inglewood:** But in most of the world there is no meeting of minds.

**Professor Tewdwr-Jones:** Of course. You are dealing with land and you are dealing with a scarce resource. Land is either a resource or a commodity, depending on which side you look at it. Those issues will never go away when 90% of the land is owned by 10% of the people of the UK. I am not advocating a change in that, incidentally, but there will always be the need for mediation. When Stevenage new town was designated in 1946 there was enormous opposition to it from the locals, not surprisingly, who did not want to see concrete put down near them. That has never gone away. Your Lordships will probably know about nimbyism. I am sure you know about BANANA—“build absolutely nothing anywhere near anyone”—as a mantra, increasingly so these days. People will give their opinions about development irrespective of whether they live near a development these days as well. It is a democratic right, you could argue, but there has to be a meeting of minds. Planners are currently performing the role of mediator, but they are caught as well in having to take account of national policy requirements, local core strategy policy requirements, and infrastructure and land-ownership constraints, along with the desires of the public. That is not to say that we
should not do that. We should acknowledge and be honest with the community about where there is discretion and where there are limits to what can be done. So, there are issues of principles, there are issues of design and there are issues of delivery. The public can be involved with any one of those stages, but let us not pretend that the public have carte blanche over all those areas; there will have to be some constraints.

**Q9 Baroness Rawlings:** Good morning and thank you for your clear explanations. My declaration of interest is that I am a trustee of Chevening in Kent. I have been listening very carefully to what you have been saying. The word “sustainability” seems to keep cropping up. Professor Tewdwr-Jones, you have written that you prefer to use “resilience”, yet Dr Simmons is using “lasting”. I wondered perhaps if we could clarify “sustainability”, and I wondered who you thought would be responsible for making certain that the standards are sufficiently high on all this. I will, if I may, include the integration of recreation areas in this, rather than coming back with a supplementary. We have not really mentioned trees, greenery and areas that unfortunately are so littered nowadays in places. I wondered where volunteers came into this. Sorry, that question is a bit muddled and all over the place.

**Dr Simmons:** I suppose we could go back to Vitruvius, the Roman author and architect, who came up with “firmness, commodity and delight”, as it was translated in the 17th century. There are a number of dimensions to resilience. I quite like the term “resilience”, but it tends to be seen as quite technical. Whenever there is an emergency in London, London resilience rolls out and that is how you deal with terrorism. The language can get quite confusing. I would like to talk about how we make buildings and places that last for the long term that people love and that go on providing what I have called built environment services over a long period of time. Not everything can be lasting. Some stuff for the Olympics, which I was involved in, was just temporary, so we are not saying that everything has to last, but even that was reusable. It is really about creating things that go on being useful for us over time. That is how I see it in simple terms.

**Professor Tewdwr-Jones:** Spot the academic, moving from one “ism” to another. I have tried to move away from “sustainability” because to some extent, in my personal view, it has been politically appropriated. If a Minister stands up and says, “Sustainable development is defined
as job creation”, for me that is no longer sustainable development. That was why I moved away from “sustainability” to look at “resilience”. It relates to land use futures. How do you take account of a series of wicked problems? How do you bounce back from shocks to the system, whether extreme weather events or economic shocks to the system? Resilience is about how you bounce back, keep on going, keep calm in the process and think about policy in that way. I acknowledge that there are sustainability elements and they are enduring—

**Baroness Rawlings:** They are lasting elements.

**Professor Tewdwr-Jones:** Absolutely, and possibly embedded in forms that we can take forward. I would think that there were sustainable processes in how the Olympics was done that could be long-lasting—not just the developments, but the means by which everyone collaborated institutionally—and that should serve as lessons for all of us.

**Dr Simmons:** That is the point about who owns this. No particular person owns it. The investor should own it, coming back to the market, and we are seeing some of the big investors starting to look at the question of whether things will last and be suitable for their tenants or their investments over the long term. That is a really good thing. Some of the banks take that perspective and they will no longer invest in stuff that is only for the short term.

**The Chairman:** Can I interrupt just for a moment? I was wondering whether we would make the full hour before anybody mentioned finance, money or bankers, and we have not.

**Dr Simmons:** No. They are very important.

**The Chairman:** They are.

**Dr Simmons:** I mentioned them earlier as well. The market has a role to play. The customer also needs to be better informed. I do not just mean people buying houses, I mean people such as Marks & Spencer, with their plan A. There is no Plan B. They are now quite demanding tenants on issues of environmental sustainability and energy, for example. It is a shared responsibility. The Government need to create, if you like, the playing field and set out where the corner flags are, but then it requires others to engage, as you say, in a collaborative way.

**Professor Cooper:** I did a four-year project on sustainable cities. There are 300 or more dimensions of measuring sustainability—I have just done a study of well-being—and 1,000 different individual items that you could think about that contribute to well-being. It is
impossible. But making a place liveable for today and the future and understanding the context-specific criteria and values for each place become important. There is a high-level national vision of a liveable nation and the cities in it. Then there are local visions that are specific to a place. This is what I meant about decision-makers knowing what the vision is and what the values are for that place and using those as criteria when they make decisions.

**Baroness Andrews:** Would you agree with me that we have probably lost this argument? We argued passionately in this House that the principle that should underlay the national planning policy framework should be a presumption in favour of sustainable development, instead of which we got a presumption in favour of development. Does that not articulate the conflicts of interest between growth, development and sustainability?

**The Chairman:** Thank you. Good point.

**Baroness Rawlings:** I am just wondering about the integration. We have not really talked about trees, greenery and litter and volunteers all in one package.

**Professor Cooper:** That is what I was going to add to my comments about values, vision and knowing. I come from Manchester. Every time I go down Oxford Road, there is an empty site where the BBC was that is a car park at the moment. Manchester has very little green space in the centre of its city. We can use technology—we can use satellites—to understand the provision of green space. Green space is essential for people’s well-being, particularly in dense places, and we need some simple, clear policy about the provision of green spaces: spaces for children—not just manicured parks and swings, but places that they can take risks, and water and so on—and spaces that are accessible for older generations. We need to think about green space through the life course in liveable places. I am not in the planning area so I do not know about regulation, but I do think that Manchester could consider that the BBC area should be a park rather than a car park or another development.

**The Chairman:** We will see what we can do.

**Dr Simmons:** I try to avoid special pleading, given my former role at CABE, because it sounds like whingeing, but one of the things that did not survive the closure of statutory CABE was CABE Space. It was a fantastic resource and nothing has replaced it, I am afraid. It made exactly the kinds of advocacy points but also helping people develop skills in a very tough
environment for green space, and encouraging volunteering, which is probably the only way we can keep our green spaces to the standards we would like, given what has happened to public expenditure. If I was going to rekindle anything of statutory CABE, I would start with CABE Space.

**Q10 Lord Freeman:** May I first declare an indirect interest? My wife is involved in the field of necessary preservation and renovation of historic buildings. Can I also say as a former Minister for the Cabinet Office that I shall certainly follow up Professor Tewdwr-Jones’s comments? My question is: how effective are we at rejuvenating existing housing developments and communities, and what lessons have been learnt?

**Dr Simmons:** I have done some of it in the past. We are quite good at it when we do it. There are different levels of doing it. There is sweeping away the disasters of the past and replacing them. When we have engaged the communities concerned in the process of rebuilding places, we have done some really quite good work. We have done some good stuff in Brixton and in the Stonebridge estate, if I think of London examples, and in Hulme in Manchester. I worked on Holly Street in Hackney and I went back after 10 years and said, “What is it like?” They said, “We got exactly what we wanted. We are just an ordinary Hackney street now, not an estate with a postcode any more”. We have some brilliant successes. When it comes to things like retrofitting, which I know may come up later on, smaller-scale refurbishments and so on, we have lost some of that. We used to have housing action areas, which I worked on as a young lad, and general improvement areas. Some of that has faded to some extent, so we are perhaps less good at those kinds of large-scale refurbishments. When it comes to environmental work, such as large-scale insulation projects, we are perhaps less strategic than we used to be. We rely a lot more on the energy companies through their obligation, for example. We have lost some of the strategic tools that we used to have, but when we do it, we do it pretty well.

**Baroness Whitaker:** Some of the rejuvenation involves getting rid of crime that estates have fallen into. Do you have some good advice about that?

**Professor Cooper:** Hulme was a 1960s disaster that was knocked down because it was full of crime and redeveloped. They redeveloped the park and thought very carefully about all the
principles of what we call “designing out crime”: eyes on the street, being able to see across the whole park, and areas that enabled youths to hang out without it destroying the place. There are principles, particularly on designing against crime.

**Baroness Whitaker:** Have they been effective?

**Professor Cooper:** They have.

**Baroness Whitaker:** Before and after research would be helpful to us, too.

**Professor Cooper:** Yes.

**Lord Clement-Jones:** One of the aspects of retrofitting that is on the increase, as far as I can see, is the switch from office buildings to residential. I just wondered what the implications of that were.

**Professor Cooper:** That brings in issues not just of retrofitting office buildings into apartments, which you probably get in London, but of whether mixed-use space works or not. Again, we did a study in 2005 and 2008 and looked at various parts of London, and mixed-use—there is a view that it creates a community—does not necessarily work. Choosing the right buildings to retrofit into apartments and the use of mixed-use has to be thought about much more carefully and, again, context-specifically.

**Lord Clement-Jones:** Often it is just land values.

**Professor Cooper:** Exactly.

**Dr Simmons:** Often you are not retrofitting a whole community, so you are building homes but there is no school to serve them, for example. You have to think about some of the strategic implications.

**Q11 Lord Woolmer of Leeds:** I have no interests to declare in relation to this inquiry, you will be delighted to know. An awful lot of people would think that we were talking about airy-fairy things. There is a huge shortage of housing and it is now very acute. House prices and rents have shot up. Why have we failed to build sufficient houses? Not merely not sufficient, but vastly under provided for. Is this to a degree a matter of public policy? Secondly, if we are somehow to improve on that, will that bring about problems in place? In other words, in the haste to get something done—private buildings or otherwise—will they just get the things built?
Professor Tewdwr-Jones: There are a variety of reasons why we are in the current housing predicament. It was popular for a while to suggest that planning, not just the lack of housing, was to blame for everything, but it is not quite that simple. Yes, there are delays in the planning process, but that is because, as I said earlier, of the fragmented institutional landscape, the need for consultation; sometimes overwhelming public opposition to schemes against professional advice—which might suggest approval, and delays between outline permission and detailed permission. There are also issues to do with land supply and the appropriate location that the market is interested in—mismatches between where local authority planners might suggest that land could be available and where the market would prefer to build. Housebuilders do not build major developments in one go; they phase schemes as well, so there may be land with permission but it is not yet implemented, and market reasons as well as physical constraints why that is the case. Also, there is a tendency to view new housing almost as a lifestyle choice, certainly in the way it is advertised, so I question whether even an increase in housing supply will make any difference to affordability unless it is vast. We have done it well in the past. The loss of state housing did not help matters—the loss of local authorities being able to build for all sections of society—and maybe the figures demonstrate that the private sector cannot do it alone and that there needs to be a mix, or at least that we need, certainly for our cities, to begin to realise that mixes of tenure are more appropriate than chasing owner-occupation as a desirable goal. All these issues are very relevant. Some attempt is now being made to release public land to get that developed quickly, but I share your concerns that if we build too fast we might see history—what happened in the 50s and 60s when we built too fast—repeating itself: namely, that we will have to replace very shortly because the housing is not of good standard. There is also an issue about the size of housing, going back to density. In the 50s and 60s, houses and apartments had much better densities and layouts than they do today. I do not want to point the finger of blame at any one problem; there is a range of issues. What could be done? Certainly I advocate building new settlements and garden cities as one solution. It is going to take that sort of Herculean effort to be able to address the backlog, let alone future demand from population increases, but you are looking at areas that are under considerable
pressure, and that means looking at the south-east of England, and we know there are political and public sensitivities with that.

**Dr Simmons:** We do have a real challenge. I agree that the planning system is not necessarily the only problem, but we have a problem now with the so-called duty to co-operate. As you will be aware from what has been happening with the London Plan and the Bedford 51, the local authorities around London all got together to say that they did not want to take any housing to serve London, even though the south-east of England has been London’s dormitory for over 100 years. There are issues with somebody having to say, “Sorry, but a strategic decision is required here”. It is also a very complex market. I agree that there are risks. The risks in creating places would be less if garden cities were addressed as garden cities as opposed to a solution to the housing problem—in other words, if we were talking about creating genuine multifunctional cities. Very often, people see them as an opportunity to use a good brand, because garden cities are a great brand, to popularise new housing. What we should be doing is looking at creating places that function and that have sufficient housing for their needs and recognising that some places, like London, are bigger than the artificial boundary created by local government.

**Professor Cooper:** There also needs to be some creative thinking about how we design and build homes and whether we can do them quicker, using off-site manufacture, and make them faster but better-designed and to last longer and to be flexible. We really need to think about what sort of homes we want, whether they will work though the life course, how they can be designed quicker and how they can be implemented on the ground quicker.

**Lord Woolmer of Leeds:** Would all the good ideas that we have heard today about place and improving things, and the need for new systems and to do things differently, slow down achieving better house-build even further?

**Dr Simmons:** I do not think so. We already know what needs to be done. When I was at CABE, housebuilders at a DCLG seminar I was at said that they preferred brick construction to off-site manufacturing because they felt that it was something they understood and they had the people who could do it. This is a question that we do not have time to answer today, really,
but there are all sorts of structural issues in the industry that need to change as well. We have all the components; it is assembling them in the right order that is the issue here.

**Q12 Baroness Young of Old Scone:** I am going to put a thesis to you and I want you just to say yes or no. Is it true that the resistance from local authorities to the housing targets would not have existed if we still had the same scale of public housing development by local authorities that we had in the 1940s and the 1950s?

**The Chairman:** There is no yes or no answer.

**Professor Cooper:** Possibly.

**Dr Simmons:** It would be easier to do it if we had that.

**Professor Tewdwr-Jones:** Yes.

**Dr Simmons:** But not everywhere.

**Baroness Young of Old Scone:** I just want to make the point that we have not built affordable housing on a sufficient scale since we stopped local authorities doing it themselves.

**Professor Tewdwr-Jones:** Yes.

**Dr Simmons:** Yes.

**Baroness Young of Old Scone:** I rest my case.

**The Chairman:** I am afraid that my time-management skills have failed me totally on this one. I had no idea that it was going to be so riveting. I really feel very sorry for Lord Clement-Jones and Lord Inglewood, who had good questions too, and, indeed, Baroness Young. Would it be really dreadful of me to ask you if you could look at those questions and just do a few lines? I do not want great sheaves of paper from you. I apologise. I shall just say mea culpa.

**Lord Clement-Jones:** On Question 9, Lord Chairman, you have woven criticism of the planning system into what you have had to say to some degree, have you not?

**Lord Inglewood:** A lot of what I was going to ask has been covered.

**Lord Clement-Jones:** Even if I am not asking a question, perhaps I ought to make a declaration.

**The Chairman:** Yes, you should.

**Lord Clement-Jones:** I am London Managing Partner of DLA Piper UK, the law firm, and a member of council of UCL.
Lord Inglewood: Chairman, while they disappear, can I make my declaration, as it is still in public, even though nobody is listening? I am a non-practising chartered surveyor. I own Hutton-in-the-Forest, a grade 1-listed building open to the public. I have agricultural and residential property in Cumbria. I am a trustee of the Elton Estate, Raby Estates and Thoresby Estate. I am a political adviser—unpaid, I fear—to the Estates Business Group. I am a director of the Historic Houses Association and a trustee and on its parliamentary and tax committee. I am chairman of the Cumbria Local Nature Partnership. I am a member of the advisory council of the Friends of the Lake District. I am president of the Cumbria Wildlife Trust, patron of the Lakeland Housing Trust and, like Lady Andrews—I have missed it out—I am a vice-president of the National Parks association.

Lord Clement-Jones: And a jolly good fellow.

The Chairman: That is exactly what I was going to say. Now, the Earl of Lytton, please, likewise.

Earl of Lytton: I am in the thick of this. The simple ones: I have a house in west Sussex. I have tenants and a lodger. I am a co-owner with my wife of rural estates in Somerset and Sussex and I have various residual interests as lord of the manor of manors in Surrey, west Sussex and Somerset. I was until recently a director and sole principal of my own chartered surveying company, John Lytton & Co Ltd, now finished trading. I am now a part-time employee with a firm of chartered quantity surveyors, Lawrence Foote & Partners (London) Ltd. I am a director of a farming estate that also runs sporting interests. I am a previous commissioner of the RICS Land and Society Commission, which looked at localism and community ownership. I am current chairman of the industry consultative committee of the University of West London, which brings together industry and students and the academic side, and chairman of the Rights of Way Review Committee, which deals with public rights of way. I am a trustee of the South of England Agricultural Society, which runs the South of England Show. I am a vice-president of the National Association of Local Councils and of the Local Government Association. I am a current sponsor of a private Bill aimed at determining property boundaries more simply. I am a member of innumerable professional bodies: the Institute of Revenues, Rating and Valuation; the Chartered Association of Building Engineers; the Chartered Institute
of Arbitrators; and RICS. I am also a member of the All-Party Parliamentary Group for the Private Rented Sector and—it is not here—of the APPG for the Built Environment. You will understand why I have remained relatively silent.

The Chairman: Just finally, Baroness Parminter, who has only just joined us.

Baroness Parminter: Apologies for being late. I am a very dull bear in comparison to my colleagues. I just declare that I am the spokesperson for Defra matters in the House of Lords for the Lib Dems.

The Chairman: And I have nothing to declare. That is why I am doing the job I am doing. It is all in the past. I do not think I have anything, other than that I have been a householder for many years. The biggest investment people make in their lives is their houses, and the one they are most disappointed with is their houses.

Witnesses, thank you very much indeed. It has been extremely kind of you and you have been battered by our questions, but you have been more than useful.

09 July 2015
Create Streets – Written Evidence (BEN0195)

Policy on the built environment should focus more on what is popular and what is correlated with good wellbeing outcomes rather than on ‘good design’ where evidence shows a material disconnect between the preferences of planners and architects and the rest of the population.

1. Focus of our evidence

This submission only answers questions where we believe we have something to contribute. Some of our research could have ‘slotted in’ at various points so please excuse us if we have not perfectly chosen. We have focused on our areas of expertise, research and work which are primarily to do with increasing popular support for housing at sufficient density to meet housing needs and in a way correlated with wellbeing and happiness. Our primary focus is London so our evidence is London-centric. We hope that this is not too distracting. Although the land-value points are less acute elsewhere most of our points will still hold true for most (not quite all) of England.

2. About Create Streets

Create Streets is a social enterprise that encourages the creation of more urban homes in conventional, terraced streets rather than complex multi-storey buildings. We do this through research, arguing for policy change, working with communities and consulting to councils and landowners. Our work has created considerable controversy and discussion as well as support from both sides of the political spectrum. According to Sir Simon Jenkins, former Chair of the National Trust, ‘Create Streets speaks London’s language’.

3. Response to your specific questions

Policymaking, integration and coordination

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

Two thirds of British adults say they would never even consider buying a newly-built home and only 21% say a new home is their preferred option. This is an astonishing fact that would probably not be replicated in any other ‘market’ in the UK outside the world of antiques. When you consider that new homes should be better, more sustainable, lighter, cheaper to run, this failure of most modern ‘place-making’ is profound and systemic.

Changing this so that new homes, streets and places are not just acceptable to the general population but actively desired, sought and lobbied for (seen, as they should be, as better) seems to us the most critical role of national planning policymaking. National (and local) policymakers should be far far more interested in asking questions such as:

- What types of place do the public like?
- What types of new building do the public like and want to see built near them?
- What types of place and home are correlated with good wellbeing outcomes (probably largely composed of evidence on happiness, physical health, mental health, community engagement and sociability levels)?
- What types of building and place prove popular over time and thus hold their value?
- What types of building maintain reasonable maintenance costs over time and thus last longer and are more ‘sustainable’?

The evidence on matters such as this currently being used to support policy is, in our view woefully, recklessly inadequate. In all the talks we have given to local housing or planning teams we have never once met an official who can confidentially set out with numerical precision and data what residents or potential residents want to see built.

Our research has shown that most of us crave a ‘sense of place’ that most contemporary housing just fails to provide. Figure i sets out a summary of our wider research on what seems to work for most people most of the time or to be correlated with good wellbeing outcomes. In a nutshell it could be summarised as well-connected walkable streets nearly always at human scale, with green space interleaved throughout, with variety within a pattern and normally with at least a good proportion of the architecture feeling like it ‘belongs’ locally. People like a ‘sense of place’. High rise should normally only be for the rich or for commercial uses and almost never for children.

---

Page 539 of 1964
These preferences matter in the fight to build the homes we need. Most of us prefer not just more human scale homes but also more conventionally-designed ones. An Ipsos-MORI poll that Create Streets recently commissioned asked respondents what buildings they would support being built on brownfield land near where they live.

Q2 I am now going to show you five different types of new housing... to what extent would you support or oppose the building of new homes similar to the photo in your local area on brownfield land?
This survey found that 64% of adults supported the building of new homes locally on brownfield land. 14% opposed it. Respondents were then shown five photos illustrating different types of housing and, for each, asked if they would support or oppose the building of 10 similar style homes in their local area. The most conventional in form, style and building materials won 75% and 73% support. Less conventional, more innovative homes won 34% and 23% support. Popular design can clearly change minds. Among the 14% who opposed building ‘in principle’, half changed their mind for the most popular option.\(^\text{71}\)

These preferences matter in the fight to build the homes we need. Most of us prefer not just more human scale homes but also more conventionally-designed ones. *Figure iii – Vicious circle of land supply, land prices, credit inflows, housing codes, design culture and political support for new development*

---

Our failure to build sufficient homes is arguably the most profound failure of public policy over the last generation. We are in a vicious circle created by a plan-led, supply-constraining planning system which pushes up land prices and creates barriers to entry. Together with misconceived housing and building rules (see below) and, in London, large capital inflows this imperfectly aligns new housing in type and style with the type of housing for which there is most support. This makes it harder to reform the planning system and increase, systemically, the supply of new housing (see fig iii.) Planning policy should be about breaking this vicious circle. One way to do is by better aligning what we build with what people actually like.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved? We have no view on this.

National policy for planning and the built environment

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

In the NPPF as implemented throughout England insufficient focus is placed on what people like. What planners and architects like (which is too often not the same) trumps a rational approach to creating popular places. It is worth setting out at length why this matters.

In 1987 a young psychologist was conducting an experiment into how repeated exposure to an image changed perceptions of it. A group of volunteer students were shown photographs of unfamiliar people and buildings. They were asked to rate them in terms of attractiveness. Some of the volunteers were architects and some were not. And as the experiment was
ongoing a fascinating finding became clear. Whilst everyone had similar views on which people were attractive, the architecture and non architecture students had diametrically opposed views on what was or was not an attractive building. Correlations ‘were low or non-significant’. The architecture students’ favourite building was everyone else’s least favourite and vice versa. The disconnect also got worse with experience. The longer architecture students had been studying the more they disagreed with the general public on what is an attractive building.73

The young psychologist was David Halpern and he now runs the Cabinet Office Behavioural Insights team (often called the ‘Nudge Unit’). Two decades on, he is very clear that ‘architecture and planning does not have an empirical, evidence-based tradition in the sense that … sciences would understand. There are very few studies that ever go back to look at whether one type of dwelling or another, or one type of office or another, has a systematic impact on how people behave, or feel, or interact with one another.’ 74

If he is right then the process of a professionally-derived borough plan, of planning consent and of expert design review is the very worst way imaginable to build our towns and cities. The very act which confers value on a site (the granting of planning permission) is a process whose key players are, empirically, the very worst judges available of what people want or like in the built environment.

But is he still right? A glance at the criteria of architectural prizes is not reassuring. Few if any place value on evidence of popularity or provable correlations with wellbeing. Certainly RIBA’s prizes specifically demand evidence on sustainability but not on what members of the wider public think.75 Similarly, in a 2004 study into attitudes to housing conducted for the Joseph Rowntree Foundation, nearly 60% of the public said they disliked flats. Only a little over 20% of ‘experts’ shared that view.76

To investigate this further Create Streets recently conducted an informal poll. We asked our twitter followers and the members of our e-mail distribution list (in total about 4,000 names) to take part in what we termed a ‘pop-up’ poll. In total 283 took part. We asked respondents ‘which of these would you most want to see built on an urban street very near to where you or a close friend live?’ and presented four options whose order was randomised. We also asked their profession. 37% of respondents worked as architects, planners or in creative arts.

Figure iv – Options in Create Streets Pop-up poll77

75 Though it is reassuring to see the August 2015 launch of the RIBA Journal McEwan Award to fete projects ‘a clear social benefit, right across society.’ This is a step in the right direction.
77 The poll ran online between 1 April and 22 May 2015.
We were not surprised to find that among our overall respondents place trumps time. 87% of our respondents preferred the two options which most clearly referenced historic housing forms (at the top of figure iv) and which had a very strong sense of place. This was nearly seven times more than the 13% who preferred the two more original forms which prioritised a sense of time over a sense of place (at the bottom of figure iv).

We also found that the sharp and important distinction between what non-design specialists and design specialists would like to see built is still there. 25% of supporters of the more popular two options worked in planning, architecture or creative arts. 46% of supporters of the less popular two options worked in planning, architecture or creative arts. People are from Mars. Professionals are still from Venus. In other studies it has been shown not only that architects have different views on buildings to the rest of the public but that they cannot predict what the general public will like.78

The melancholy implication of this is that architectural awards are a good indicator of popularity – but only if you invert them. We are aware of nine architectural or planning prizes awarded to the two least popular two options. We are not aware of any architectural or planning awards garnered by the most popular option has received.79

These prejudices of too many in the design and planning establishment are not just idle personal preferences. They palpably influence what actually happens. In a 2014 design meeting for a major London site, the ‘traditional’ built form of conventional developments was openly ridiculed and dismissed as unworthy of discussion even though it is what the

---

79 The second option has not been built so is not able to win awards.
Similarly, in a June 2015 meeting of very senior officials and architects at which Create Streets was present the Director of Housing and Regeneration at an important London borough spoke (without apparent irony) of the ‘horrid Edwardian streets that most of us live in’ and complained of ‘dreary terraces.’ When a senior and respected decision-maker does not just disagree with the vast majority of the public but is actually contemptuous of their views it must be time to ask if the whole public procurement and planning prioritisation process needs dramatic rebuilding from the bottom up. Certainly, in public sector design competitions for city-centre development and estate regeneration marks are routinely (in our experience always) awarded very materially for ‘innovation of design’. In at least two cases that we are aware of this was despite the explicit request from councillors that a more conventional, even traditional, design would be more appropriate.

The point is not that design innovation is necessarily bad. Clearly it is not. It is often excellent. But it needs to be balanced with the familiar. And in at least two case, design competitions was being run in contradiction to what had been requested by council leadership. It is hard to conclude that the system is under effective democratic control.

4. **Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?**

We are quite not sure what you mean by a spatial perspective. It is true that it is insufficiently possible for local people’s spatial likes and preferences to be reflected in what is built. But the main issue, is that planning, housing and building rules have too many perspectives.

Certainly in London, these remain misaligned with what most people want. It is worth exploring this point. Borough rules on light seem to tend to larger blocks with more open space between them as opposed to narrower streets. They also make it hard to trade off high levels of light in some rooms versus less light in others. A recent report by four important residential architectural firms explained;

> ‘Given their enduring popularity (and value) you might suppose that they [Edwardian Mansion blocks] would provide the ideal model for today. But, sadly, modern planning and building regulations outlaw some of the key design features that enabled Edwardian architects to create such opulent buildings on such small footprints. Apartments of this era typically offer spacious and bright front rooms with bay windows and balconies forming their distinctive street facades. Meanwhile the rear rooms are quite dark and have privacy distances way below current standards. To us it seems a satisfactory trade-off, which should be encouraged rather than prevented.’

Rules on streets themselves matter too. In our 2014 survey, a majority felt that (borough-level) highway rules acted as a barrier to street-based regeneration. In our prompted survey of barriers to street-based regeneration the ‘Need to build wider or different streets to meet

---

80 Private information. A member of Create Streets was at the meeting which was for an (ultimately) public sector client.
council rules’ achieved a score of 5.9/10. Many industry practitioners were particularly vocal on this point with some of the most emphatic comments we received criticising the impact of highway engineers on good design and place-making via issues such as required turning circles, refuse collection standards, lines of site and road access. Alastair Mellon, of Providence Developments, was clear that ‘Highways engineers should not be allowed close to any development. They insist on a whole series of regulations that kill a development.’ Mike De’Ath of HTA Design agreed; ‘the worst streets are designed by highway engineers and refuse collection people. They’re dead but technically proficient.’ Others complained about inappropriate minimum road widths. There was, however, a sense that the situation was improving with John Spence, an architect at calfordseaden and also a member of Create Streets, one of several commenting that their impact ‘seems to be getting less.’

The ban on recycling open space between buildings into private gardens can make it very hard to redevelop estates into streets. Key Performance Indicator 3 states that there should be, ‘no net loss of open space designated for protection in Local Development Frameworks due to new development.82’ When estates are regenerated this can and has impacted this metric.83

However, we also know that most people would sacrifice poor open space for small private or communal gardens.84 But they cannot. The GLA are quite categorical that, ‘the definition of open space ...does not include private residential gardens.85’ In our 2014 prompted survey of barriers to street-based regeneration the ‘Need to include more open space to meet the London Plan’ and the ‘Need to include more open space to meet local council’s requirements’ both achieved scores of 5.6 out of 10 as a barrier. It was generally felt that planners cared about this more than residents. In the same survey the ‘Need to include more open space to satisfy local residents’ only achieved a score of 4.9/10. Ingrid Reynolds, Director in Housing and Public Sector at Savills summarised the majority view when she said that, ‘the reduction of open space is potentially a barrier. It is more likely to be the planners saying you’ve got keep or add to the open space than residents. Part of the general planning strategy is to retain public open space.’

Although not as widely felt, in our prompted survey of barriers to street-based regeneration ‘Difficult to build this form of flats and comply with London Plan’ achieved a score of 3.9/10. ‘Difficult to build this form of houses and comply with London Plan’ achieved a score of 3.6/10.

---

84 Evidence has shown for many years that people prefer private gardens (however small) to less usable communal space. In an early 1980s survey of residents’ views of London multi-storey housing, the main dislike was the way the estate was set out and the lack of individual gardens with 54 complaints. Coleman, A. (1985), Utopia on trial, p. 33. Recent evidence from RIBA supports this. In a survey of apartment block residents they found that, ‘private gardens were preferred to shared gardens’. This was particularly true in London. ‘Those in urban London [were] most keen across all the groups to have some outside space in their new property.’ RIBA found that typical apartment block residents interviewed ‘appreciated that the properties were set in a natural area [but] they felt that this space was difficult to use as a personal outdoor area as sharing the area with others did not tend to work well.’ RIBA (2012), The way we live now, p. 49., p.52.
The impact of national rules on building terraced flats and houses was felt to be less. (3.2/10 and 3.1/10 respectively to the same questions). Andy von Bradsky the chairman of PRP, one of the architectural practices designing many homes in London at present, commented; ‘Lifetime homes are potentially a barrier… [for example requiring] level access from street to threshold. But sometimes a raised ground floor is a benefit in terms of house typology.’ Alastair Mellon also complained about ‘the insistence on elevators over four storeys.’ (this has now reduced to any non-ground floor entrance). Nigel Franklin of calfordseaden and a member of Create Streets was more concerned about the impact on spatially efficient terraced houses: ‘The London plan works well for flats. It is less easy for houses. Stairs have to be shallow pitched – this needs more floor-space. The through the floor lift is easy for two storeys. It is difficult for three or four storeys. It adds challenges all round and costs as well as less ideal storage provision due to the area required for stairs and lifts.’

To summarise the access and internal barriers;

- Requiring lifts in all apartment buildings makes it more expensive to recreate the typology typical of many dense, street-based areas of London with apartments on a number of floors off one staircase. This also incentivises higher building as the cost of lifts does not increase substantially as more floors are added, once the initial cost is incurred.  
- Rules against staircases being too narrow or too steep make it harder to build the conventional tall but thin London terraced houses
- A requirement that ten percent of homes be fully wheelchair accessible and for all homes to be built to ‘Lifetime Home’ standards biases the system in favour of large blocks

Four contributory barriers add to this;

- A dislike for on-street parking biases the planning system against conventional terraces and streets
- Heavy requirements for bike storage, make it much harder to build terraced flats and conventional terraced homes
- Heavy requirements for bathrooms on storeys with bedrooms make it harder to build the conventionally tall but thin modest London terrace homes
- Finally, requiring ‘weather protection’ over front doors adds yet more cost to terraced streets with multiple entrances

---

86 Key rules are clauses 3.2.5, 3.2.6, 3.2.7 and 4.3.2.
87 Key rules are clauses 3.2.8, 3.1.3 and 4.10.2..
88 Key rules are clauses 4.9.1 and 3.2.7.
89 Clause 3.3.3.
90 Clause 3.4.1.
91 Clauses 4.6.2 and 4.6.3.
92 Clause 3.1.4. This is not as material a cost as others mentioned above.
A range of rules on windows and room heights also make it harder to build houses which obey the classical rules of proportion and ‘fit in’ with historic neighbourhoods.\textsuperscript{93} Regrettably the situation is currently getting worse. Proposed changes to the London Plan will require lifts in all blocks with apartment entrances on more than one floor (currently only required in blocks of four or more storeys). A better disincentive to building human scale terraced streets, particularly in the suburbs, it is hard to imagine. Hopefully the next Mayor of London will stop this insanity.\textsuperscript{94}

It should be stated that not \textit{all} practitioners agree with this analysis. Some feel they have evolved adequate work-arounds which allowed them to deliver good schemes under the current rules. Alex Ely of Mae Architects (and one of the authors of the London Housing Design guide) told us unambiguously in 2014 that ‘Planning and design is not a barrier’ and that the current rules made it ‘easier for streets.’ Most, however, at least in private, seem worried by their cumulative impact. Peter Redman (the former head of Notting Hill Housing and of the housing teams at both Lambeth and Southwark), told us that the ‘standards required by those who lay down the rules’ mean that ‘attractive streets just don’t conform.’

When we started to complain about the way that some (well intentioned) regulations were making it harder to build our most popular street forms and housing types it was a lonely battle. One very senior London politician even commented privately that there was no political chance of opening up these issues. Another told us we would be ignored at best, eviscerated at worst. It seems that the situation is, slightly, beginning to shift and that more planners and architects who care about the built form of London are daring to put their head above the parapet and to challenge the collective ‘group-think’ to which the whole industry has subscribed in recent years. Richard Lavington (of Maccreanor Lavington Architects) said in evidence to the GLA in March 2014:

\begin{quote}
\textit{One very efficient way of delivering family housing at a certain density is with narrow-frontage terraced houses, but actually Lifetime Homes [embedded in the London Plan] is very obstructive to making that work particularly well. Once you get to three bedrooms, you need a very large bathroom on the entry level and that actually obstructs the width of the plan; which means you have to go into a very narrow kitchen and through that into a living space at the back. . . . you are prioritising the lifetime use of the home and disabled access over its efficiency and use for a family; a family without disabled kids and things like that, admittedly. We are applying that across every new-build single home in London.}
\end{quote}

\textsuperscript{93} Clauses 4.4.6 and 5.4.1. The point is not that new streets should necessarily obey classical rules of proportion but it seems perverse actively to prevent them – particularly when the consequent buildings seem to be so popular. Boys Smith, N. (2013) \textit{Why aren’t we building more streets in London} explored these issues in more detail There has been some consequent movement (for example the relaxation of standard 3.2.5). Mayor of London, \textit{Funding Prospectus} (2013), p. 26.

\textsuperscript{94} ‘Boroughs should seek to ensure that units accessed above or below the entry storey in buildings of four storeys or less have step-free access.’ GLA, (May 2015), \textit{Minor alterations to the London Plan}, p.8.
Then at a talk to the National Housing Federation, in December 2014, Ben Derbyshire the Managing Director of HTA Design, one of the larger London residential practices, agreed: ‘it’s actually quite difficult to design streets which are streets in the sense that citizens will recognise.’ The architect Peter Barber echoed this in a lecture to the Royal Academy in July 2015: ‘planning law makes it very difficult to design streets.’ The report cited above, *Superdensity the Sequel*, rightly picked up on these concerns. Andrew Beharrall of PTE architects stated publically at the launch that ‘it is time for a review’ of the London Housing Design Guide which is ‘leading to rising homogeneity’ and, he stressed, making it impossible to build well-loved housing types such as the Edwardian Mansion block.

The Mayor of London, Boris Johnson, has agreed with much of this analysis though also made clear he plans to do little about it. In GLA Questions in July 2014 he stated;

‘One of the difficulties of course is that within the London Plan there is this stipulation that any building above 3 storeys must have a lift. Now we could take that out and say that you wouldn’t need to have a lift till you were at 5, 6, 7, 8, 9 storeys. The trouble is that I think we’ve got to the stage now where people would find that suddenly a restriction on the accessibility of the building and people would say ‘are you really seriously taking going to take lifts away when we have so many elderly people, so many disabled and so on and so forth. Walk ups which are so attractive are limited in their flexibility. And that is one of the problems that we face. If you put in a lift for a building of 4,5,6 storeys people will say well why, the economics of it won’t add up. You’ll be spending an awful lot on the core and shaft of the lift and not actually maximising the potential habitation in the building.’

Hopefully, the next mayor will be bolder. Because it *does* matter. In case this discussion about regulations seems abstruse, here are two real world examples of the impact that the rules are having. Firstly, in January 2015 an architect in East London explained to us in the presence of senior DCLG officials that he had not been able to meet residents’ passionately felt preference for streets of terraced houses. ‘Of course we couldn’t do that, we wouldn’t have got planning…the council would have insisted on open spaces, you just can’t build houses like that any more, all the space standards, all the rules….’

And currently being built in a (good) development in Kensington and Chelsea are a row of terraced houses to the north of Portobello Road. They are in the right of figure v.

*Figure v – Terraced houses from 1825 and 2015*

---

95 Ben Derbyshire, lecture to National Housing Federation, London Development Conference, 2 December 2014.
96 Cited by Peter Murray, the Chairman of New London Architecture on twitter, 3rd July 2015, [https://twitter.com/PGSMurray](https://twitter.com/PGSMurray)
The houses are manly 7.5 or 7.9m wide and are shallow with wide corridors and gently-sloping wide stairs. Of course they are fully compliant with all national, London and borough requirements. But they are also grossly inefficient terraced houses in consequence and compared to historic norms. The house on the left of figure v was built in 1825. It has narrower staircases, a narrow corridor and is slightly deeper. It fails current London rules on at least 13 separate points (and probably far more). It is also, like many thousands of similar houses across London both very valuable (because very popular) and a very spatially efficient way of building a house - the preferred type of home for about 80-90% of Britons. It has an almost identical Net Internal Area as the new homes which are 35-45% wider than it. If the modern homes had been built on the template of (though not necessarily in the style of) the historic homes there would have been about 22 of them not 16. That is an example of the ‘price’ of the London Plan. We are sacrificing what most Londoners want on the alter of narrow codes and ill-informed dogma.

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking? We have no view on this.

Buildings and places: New and old

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

The Government should remove unnecessary internal rules and require local planners to reference, empirically, what people in their area like. It should be less possible to frustrate neighbourhood plans in urban areas via multiple rounds of questions from councils over many months. The new brownfield zoning approach set out in the recent Bill should firmly reference evidence on popularity of different built forms and styles.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places
be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made? We have focused our answers on other points.

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets? We have focused our answers on other points.

Skills and design

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

In short, no but we’re out of space to address at greater length. More understanding of what people like and want and better data on wellbeing are key. Design of homes and places has become dangerously over-specialised and obsessed with innovation at the expense of normality. Place-making should be a service industry. It thinks it is an art form. And local planners are too busy micro-managing to these rules to actually be able to spatially plan in their areas.

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

No. Design needs to be dramatically democratised with far greater use of design codes, co-design, direct planning and empowered neighbourhood plans.

Community involvement and community impact

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

No. The growing research on wellbeing and the built environment is being insufficiently used or actually misapplied because so little read or understood.

To give two examples, it has become axiomatic that ‘green space is good for residents’ and that ‘light is good for people.’ These are both true points but, as in all things, they require compromise. Not all green space is good. It can be scary, little-used, ill-kept. Worse, the trade off for over-providing open green space can be less private green space (which most people prefer), less modest elements of green space scattered through a development, more flats,
higher rise and fewer houses (all likely to be correlated with less good wellbeing outcomes\textsuperscript{98}). Similarly, the search for maximising light at every window frequently has the effect of ‘pulling urban developments apart’ into a series of larger more discrete buildings with large elements of green space between them. More windows may have more light but the price, again, is a less fine-grained urban form with fewer houses, flats in bigger buildings, probably less private green space. We are categorically not using emerging

Another example. Current UK national rules demand level access for all homes to a property. In an urban context where properties almost always have only one public primary entrance this prevents steps up to a front door as used to be common in terraced streets of houses or flats. This is ostensibly to help elderly or disabled residents. Clearly some, perhaps many, new homes should have this stipulation. It must be right to increase access for the disabled and the infirm. But should all? Might we actually be making worst. There is actually very credible evidence from the US that older residents actually stay healthier for longer when they have steps up to the front door. For example, one US study found that ‘elders who resided on blocks with more front porches, stoops, and buildings built above grade had significantly better physical functioning at 24-month follow-up than did elders who resided on blocks with fewer of these architectural features.’ \textsuperscript{99} This level of interaction between evidence and housing and building regulations, or their interpretation at local level is just not taking place remotely sufficiently.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

It is very hard. Much (not all) consultation is a faked ‘post hoc’ PR exercise. Consultation should follow pre-application review not vice versa. Strong and credible quantitative evidence of public support for a development should be a good reason to consider it appropriate even it fails detailed borough, GLA (for London) or UK specifications.

Financial measures

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing would encourage better design and place-making by private sector developers?

The problem for London and the South East is that land values are so high that development volume is pushed to absurd densities as higher build cost becomes irrelevant in comparison. Where high density is not permitted and density is capped then downward pressure on build costs is likewise immense. In the South East it is hard to resolve the problem in the short term.

\textsuperscript{98} See Boys Smith, N., Morton, A., Create Streets (2013) and Boys Smith, N., The Wellbeing of Place (forthcoming) for much more evidence on this and similar points.

However, one (partial) solution is to encourage investment from long term patient capital who properly understand how the values and maintenance costs of different types of places pan out over time. This would be better correlated with more conventional urban forms. Long term pricing data is fascinating in this regard. The Halifax data series shows that ‘traditional’ pre-1919 homes in a ‘conventional’ street format in London have risen by 1284% in price since 1983. Their more modern contemporaries have risen by half as much. Older homes are worth 50-70% more as well.100 Meanwhile, Savills research shows how parts of London which are well-connected and in the form of high-density terraced streets and squares are more valuable, other things being equal, than areas which are not.101

- Same pattern is replicated in UK data, in other regions & in comparison with 1946-1960 housing
- In 30 years market shows consistent & ubiquitous preference for traditional buildings in conventional settings
- This has been the most rational ‘product’ for long term landowner / investor to hold

19 October 2015
SELECT COMMITTEE ON NATIONAL POLICY FOR THE BUILT ENVIRONMENT

Call for Written Evidence

Croughton Parish Council, Northamptonshire

1. Context:

1.1 Croughton is a small rural Parish (380 homes) in south Northants. It is located 4 miles south of the local Northamptonshire market town, Brackley, within 3 miles of the Oxfordshire border and 5 miles of the Buckinghamshire border. The area generally is close to areas of vigorous economic and housing development (large-scale housing developments in Bicester (7 miles), Banbury (10 miles) and Brackley itself. There are also major plans for the expansion of the nearby American USAF Base (USAF Croughton) over the next 8 years. There are issues and concerns for the increased flow of traffic through the village resulting from these developments and pressure for housing developments within the Parish.

2. Community involvement and community impact

Question 11: Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

2.1 Overall, the relationship between decision-makers at District and County levels and the Parish Council and local community has been reasonable. There are however times when the local community are frustrated because clear account is not taken of the understanding local people have of their local context. For example,

a) a new affordable housing development utilised red bricks not in keeping with any other materials in the vicinity (Decision by District Council) despite the District Council being excessively pernickety with many small planning submissions from the community.

b) a small number of business on a small scale industrial estate in the Parish continually flout terms and conditions by working outside their required time limits and noise levels making life very difficult for residents with no fear of penalty from the District Council.

2.2 Sometimes planning officers and other local authority administrators act without a sense of accountability to the local community and act belligerently in their dealings with individuals within the community. Are regulations so complex and rigid that it is impossible to enforce them in a reasonable and effective way that is in the best interests of the community?
2.3 The key to improving the impact of the built environment upon the well-being of residents is to design appropriate procedures to ask them listen to them and act upon that advice in the spirit of localism and when the local community are proactive in voicing their concerns to district and county councils, respond in an appropriate manner with decisions that reflect a clear accountability to the community.

Question 12: How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

2.4 Consultative procedures that are meaningful need to be designed that involve the local community voice. Possibly create a citizens forum for wards that feed into the decision-making process. Give more credence to the data (quantitative and qualitative) that Parish Council’s submit to argue cases. If local advice is not taken it should be mandatory for other Councils to state objectively why that advice has not been taken.

2.5 Boundary issues need to be overcome where there are factors affecting a case that lie across administrative boundaries that should not deter case officers from investigated all relevant factors that affect a case to arrive at a balanced judgment. Joined up thinking is required. A case officer should be compelled to consult with all relevant agencies irrespective of whether they lie outside their geographical administration area. Currently, often, administrative officers have a narrow blinkered view when they research cases.

2.6 All communities should be required to have a local plan with standing (agreed between Councils and community) which should always be the key reference point for the decision-making process.

National Government should not have the legal right to overrule this.

2.7 Barriers to effective public engagement include apathy and feelings of disempowerment. What facility is there for local communities to fight causes they feel are unfair? Parish Councils and local communities do not have the resources to do this. There should be an appeals mechanism that allows Parish Councils to appeal what appears to be decisions that do not act in the interests of the local community. Local development can be divisive. All decisions should be subjected to a transparency check.

30 September 2015
Dear Chair,

Thank you again for the invitation to The Crown Estate to give oral evidence to the national policy for the built environment select committee on Thursday 17th September 2015.

As outlined at the evidence session, we operate as an independent commercial business, created by an Act of Parliament, returning all our profit to Treasury. Our business takes in a diverse range of assets, including Regent Street and much of St James’s in London; regional retail; large swaths of rural land; the UK seabed and around half the foreshore.

Following on from the evidence session, there were two points which we promised to follow up on in writing. These included our disposals strategy, following a question from Baroness Rawlings, and any work we have carried out in relation to natural capital accounting, following a question from Baroness Parminter. These have been addressed under the headings below.

**Disposals and our investment strategy**

The Crown Estate operates across four core sectors: London’s West End (Regent Street and St James’s), dominant regional retail, strategic land for housing, and offshore wind. By concentrating on these areas, where we have critical mass and specialist skills, we are able to gain competitive advantage and outperform the market.

Last year we undertook nearly £1 billion of capital activity, around half of which was disposals alongside acquisitions, development, and asset management. Our disposal of assets is informed by our investment strategy to raise working capital to allow us to invest in our core sectors. This is particularly important to us as we are not allowed to borrow.

The other way in which we raise capital is through the use of strategic joint ventures, for example we manage Regent Street on behalf of ourselves and our partner, Norges Bank Investment Management (NBIM), after establishing the Regent Street Partnership in 2011.
This saw NBIM acquire a 25 per cent leasehold interest in the Street. In total, we manage strategic joint ventures containing over £1.5 billion of our partners’ funds.

**Natural capital accounting**

Leading businesses increasingly recognise the importance of being able to understand, measure and communicate the value they create beyond financial return. This helps demonstrate transparency, inform decision-making and ultimately underpin commercial success.

The Crown Estate has developed an approach called ‘Total Contribution’, which in broad terms covers our economic, social and environmental contributions to the UK and takes account of material issues affecting our performance.

As part of strengthening our understanding of how we measure value, in particular the significant natural resources we manage, we have worked with the Natural Capital Committee to pilot a scheme in Windsor Great Park, part of our rural estate.

Windsor Great Park is uniquely protected within The Crown Estate Act, which means it cannot be traded. It currently runs at a net income deficit of £1.4m a year and is therefore sustained by the financial support of the wider Crown Estate and the profit that it generates from actively managing assets throughout the country.

It is our aim to generate a net profit from Windsor for the first time ever during the 2015/16 financial year by being more creative in what we offer to our customers, whether they are the public or private businesses based on the Estate, and by achieving a better understanding of the opportunities that the Estate offers.

The Corporate Natural Capital Accounting framework identified the high environmental and cultural value not fully reflected in our financial accounts, which is an important part of understanding the long term risks and opportunities of the business’s assets. For example, it identified that the enjoyment of about 3 million visits to Windsor Great Park annually can be valued at an additional £1.9m per year.

Taking account of these wider social values, the Windsor Estate delivers a significant net benefit to society. This is equal to £4.4 million per annum gross external benefit. The reporting statements record the net benefits that accrue to The Crown Estate and the external values that the Park delivers to the local community, visitors, and globally.

If the committee would be interested to learn more about how we measure value, we would be happy to arrange a meeting. Alternatively, there is also more available on our website: [http://www.thecrownestate.co.uk/our-business/how-we-measure-value/](http://www.thecrownestate.co.uk/our-business/how-we-measure-value/)

I hope the committee finds this detail useful. If there is anything else which we can provide to clarify or help inform the select committee, please do not hesitate to get in touch.
I would also like to extend the invitation to you or a colleague from the select committee to visit Regent Street where we have overseen a £1bn regeneration of the Street, focussing as much on place-making as the individual buildings, to create a world class business, retail and leisure destination.

Yours sincerely,

Steve Melligan  
**Strategic Land Manager**

16 November 2015
Examination of Witnesses

John Grinnell, Deputy Head of Development, and Steve Melligan, Strategic Land Manager, The Crown Estate

Q73 The Chairman: Mr Grinnell and Mr Melligan, were you sitting in on the previous session?

John Grinnell: No, we were not.

The Chairman: I did not want to have to repeat something that you had already heard. Welcome to this evidence session. We are very grateful that you have given up the time. You know what we are about; we are supposed to report in March on national policy for the built environment. Some of us are very expert and some of us, including me, are completely the opposite. You have in front of you a list of interests that have been declared by members of the Committee. A transcript of the meeting will be taken and published on the Committee website. You will have the opportunity to make corrections to that transcript where necessary. Could I begin by asking each one of you briefly to introduce yourself to the Committee?

John Grinnell: My name is John Grinnell and I am deputy head of the development team at The Crown Estate. I am a chartered surveyor with 25 years’ experience in the property industry, primarily in the development sector. I have been involved over that period of time with the development of retail, offices and residential property throughout the UK, both in...
The Crown Estate – Oral Evidence (QQ73-83)

an advisory and client or principal role. I have worked in partnership with many other
developers and investors over that period of time and also with public sector local authorities
on many challenging and very complex developments.
Perhaps I may offer a few words about The Crown Estate itself and its activities. The Crown
Estate is an independent commercial property business that takes its mandate from The
Crown Estate Act 1961. We have two principal stakeholders: first, the Treasury, which is the
beneficiary of the net revenue that we generate; and, secondly, the monarch, who is the
owner of the capital of the business. Consequently, income and income growth very much
lead the total returns to our business. I am pleased to say that we have been very successful.
Our total returns over the past financial year were over 20%, which is in excess of the
benchmarks set for us, and we generated some £285 million back to the Treasury, which itself
is about a 6.7% increase on the previous year.
If we look to what our business actually looks like, we are a specialist real estate business and
operate in four key sectors. First, some 50% of our portfolio is based in central London, in the
Regent Street and St James’s area, which many of you may well be familiar with. These are
world-class leading assets that we hold. Secondly, we have a regional portfolio of prime retail
and leisure-based assets of very high quality. We are one of the largest owners in the UK.
Thirdly, our rural portfolio provides the opportunities for housing. Fourthly, there is the
offshore wind sector.
Our ownerships derive partly through inheritance and partly through the positive choices we
have made through our investment strategy. The key characteristics of that business are, first,
the critical mass of our assets. These are in carefully chosen sectors and locations throughout
the UK. Secondly, we have a high level of expertise in our staff. We have a very diverse range
of professionals within our organisation, but we work together very much with a common
purpose. Thirdly, we have a mid-long-term outlook on the supply and demand dynamics that
impact upon the business.
The value of The Crown Estate last year was £11.5 billion. In addition, we have some
£1.5 billion which we have invested in our strategic joint ventures with a number of partners,
such as Norges Bank Investment Management, which is the Norwegian sovereign wealth
fund, Oxford Properties, Gingko Tree Investment, and a number of others.
Over the past six to seven years we have actively managed some £500 million to £1 billion worth of capital movements. This is through a mixture of activities: selling, buying and development.

Lastly, we seek to ensure that our developments and investments very much deliver real benefits back to the local communities and UK plc as a whole. Why do we do that? We do that because that is very much aligned with our long-term commercial interests, our reputation as a business and the relationships we have with our stakeholders.

The Chairman: That is very clear. We have read quite a lot about it, but that makes it much clearer. Mr Melligan, you are the strategic land manager of The Crown Estate.

Steve Melligan: I am indeed. Thank you for inviting us to this session. I am very pleased to be here. We will do our very best from The Crown Estate’s perspective to help you out with your work on the national policy for the built environment.

My background is in planning. I am a chartered town planner; I have been in the sector for about 25 years. I have had a wide variety of roles within that remit. I have been in the public sector; I have worked for planning authorities writing local plans, so I have direct experience there. I have worked for house builders in finding, delivering and promoting sites. I have spent a long period in consultancy acting for a variety of public and private sector clients. More recently, I have moved towards the client sector. I spent seven years with the Church Commissioners for England in a role similar to the one I am performing here at The Crown Estate.

In terms of my role at the Crown, I manage a portfolio of about 70 potential development sites. This is land we have held over many decades or land we have acquired for that purpose. We use our own internal resources; we promote our own sites through the local planning process; and we seek to get allocations in local plans. With the benefit of an allocation for a change of use, be it residential, commercial, industrial or retail, we will submit an outline planning application, get outline consent and then go to the market with that outline consent in place. It is worth emphasising that we are not house builders. In effect we deliver consented sites to the market and then work with the house builders to deliver those sites in the future.
Finally, to give you an idea of the scale, the 70 sites we deal with probably have a capacity of about 15,000 to 20,000 new homes and 5 million to 6 million square feet of commercial space over those 25 years.

Q74 The Chairman: In this session we are going to concentrate on place. We have a specialist adviser who is Professor of Planning and Urban Design at UCL. You describe yourselves as successful place-makers. What are the lessons for good place design and development, and what considerations are necessary to ensure that developments are sustainable, lasting and integrate well with their surroundings?

John Grinnell: Perhaps I may take the reference point of Regent Street, which is perhaps the easiest place to start. Regent Street itself is the subject of a £1 billion investment programme by The Crown Estate and our partners Norges Bank Investment Management. We are now some 13 years into a 20-year vision for that estate. That is of critical importance to how we approach our work. To take a step back in time to 12 or 13 years ago, those of you who may have been familiar with Regent Street at that point will know that it was very drab and had poor-quality occupiers of buildings both in terms of the retail space at the lower levels and the offices above in terms of the public realm and environment within which we operate. If you contrast that with how it is today, it is a world-class, leading destination. It is hugely popular with massive global appeal. We have had nothing but positive feedback about that. How did we achieve that vision? We adopted a very proactive approach in establishing that vision, implementing that vision and ultimately delivering it. That vision itself is informed by the contiguous ownership we have in Regent Street and therefore by the strategy. The strategy is what devolves from having the vision in the first place. Ultimately, it is very much a commercial strategy; it is a revenue-generating asset. We adopt a mid-long-term outlook, so this is about building over time. Rome was not built in a day, putting it very simply. It is an incremental approach. We start with a series of initiatives, such as buying in long leasehold interests. If we go back 10 or 12 years ago, the control of the street had gone to other parties. Having wrested that back, we undertook a very strong period of engagement and established relationships with all the parties we work with, which is the next part of our strategy and approach.
One of the key elements is the engagement with those stakeholders. The obvious stakeholders are Westminster City Council, the GLA, the Mayor of London, Historic England, or English Heritage as it used to be in terms of our relationship on the street, and all the parties who touch upon that estate. They are the retail occupiers—those already there and those not there. The same applies to the office occupiers—those who are there and those who are not there. There are also the residents, the shoppers who come into those buildings and the users of the place in which we operate. That is absolutely key to what we do.

**The Chairman:** That is all terrific for somebody in your position who has the two masters of the Treasury and the monarch. You are also dealing with what start off as wonderful historic buildings. What are the lessons we could incorporate in our report that tell us what considerations are necessary to ensure that developments are sustainable, lasting and integrate well with their surroundings? If you want to be a successful place-maker, that is very important.

**John Grinnell:** Very much. The key lesson learnt is that place-making must be local; it must be relevant to the community in which you operate. That itself is a strong commercial driver; it is imperative for what we do. If we do not understand that community, engage, listen and respond, we are simply not going to create the places we should be making. If we do not create the right places, of course people will not come. If people do not come, no revenue is generated. The two things are totally intertwined.

**The Chairman:** The very difficult one is getting the consultation right and getting people to engage. People might have wonderful ideas, but still will not bother to go along to a meeting or get engaged. It is a matter of how you drag them in, but I guess that in your position you do not have to do that. The very mention of The Crown Estate will drag them in.

**John Grinnell:** That certainly helps, but I hasten to add that that helps because of the reputation and credibility we have.

**The Chairman:** Of course.

**John Grinnell:** That reputation and credibility is about how we have gone about our activities.

**The Chairman:** It is about consultation in the first place.

**John Grinnell:** Exactly.
The Chairman: But it could have been 400 years ago, could it not, whereas here we are today in 2015?

John Grinnell: Absolutely. That is what we do; that is how we go about that activity.

Another lesson we have learnt is strong leadership internally of our business. That is based on creating that strong vision in the first place, and being very clear about what we need to do. Having had that earlier listening, it is a matter of looking at that, analysing it and working out how we can put back the right buildings. Ultimately, it is about ensuring durability and sustainability, and that is achieved not only through the beauty of the architecture in its own right and its materiality, but the quality of the public realm and the uses within those buildings. Ultimately, those uses have to attract people in and we can do that only if we listen and understand that wider audience.

Q75 Baroness Whitaker: Mr Grinnell, you described the principles of your process. I want to get a better feel for the outcome. Could you quickly tell us what your vision is of this public realm? What do you want Regent Street to look like, and how do you want it to work?

John Grinnell: The starting point is making sure that you have the right occupiers in the buildings in the first place: the attractors or the pull.

Baroness Whitaker: For instance?

John Grinnell: It is the quality of the retailers who operate within the street, so it is the names. If you look at the types of retailers we have in the street at present, we have a flagship store for Burberry. We have many other key retailers. We recently opened one of our schemes called 10 New Burlington Street where we have J Crew, an American clothing retailer. That is their first store in the UK. It is the quality of that retail that draws people to the destination. In addition, we have the support facilities that sit behind it. If we look at consumer trends occurring at the moment, people want a much broader range of opportunity. When they arrive in a location they want the quality of the urban fabric and the environment that we occupy, but they also want to have that range of uses, so that when you go into Regent Street it is not just about retail; it is about the oases and so forth of the leisure uses that we have; it is the quality, range and mix of the restaurants that operate within that space. We are very fortunate in London that we also sit on the doorstep of massive cultural facilities; we have the theatres and everything else. It is also about ensuring that the highways and pavements
work. For instance, we have undertaken a lot of widening of the pavement and tried to get a balance between that and ensuring the free flow of vehicles and public transport through that area. The recent diagonal crossing at Oxford Circus, with which you may well be familiar, was the product of some five years or more engagement with TfL, GLA and various other parties to get that openness and freedom of movement of the population. We are sitting there with Oxford Circus. I think the tube station is the third or fourth busiest in London. The others are generally busier only because they have mainline stations sitting on them. That is where you tend to come to when you arrive in the west end if you are going to go shopping or go to these other facilities. It is a matter of getting that balance between how that works and the competition between users. Often, they clash with one another. For us, it is about listening, learning and working out how we can achieve, through the use of the expert advisory teams working on our behalf, the right outcomes.

Q76 Baroness Andrews: Talking about retail, you are probably one of the few landowners in the country that can choose how they spend or use their land. Do you sell your land or do you always keep control of it? We have been talking about places that are made already, such as Regent Street, but there are these places which you are now creating by virtue of investing in out-of-town retail centres. The question is: how do you make a good place without impacting in a detrimental way, say, on the nearest town centre, for example, or the nearest agricultural and rural environment? Those two questions are connected.

Steve Melligan: In terms of our urban sites outside London and the main cities and the housing sites we promote throughout the UK, broadly speaking we sell freeholds, because the UK housing market certainly in these areas is very comfortable with freehold disposals. I think occupiers and new home buyers want to buy the freehold of their property. Long leaseholds have not caught on outside London and the main conurbations. Generally speaking, we are happy to sell freeholds in that context.

In terms of your question about the impact on agricultural estates, pretty well all the sites we promote for housing—they are mainly greenfield but some are brownfield—generally come from our agricultural portfolio. These are farm estates that are situated on the edge of existing urban areas, be they towns or villages, where a local plan finds a need for new housing in an area. If it so happens that The Crown Estate has some land that might suit that need, we are
very happy to work with planning authorities, local communities, parish councils and town councils to bring forward those sites, promote them within the system and get consent.

**Baroness Andrews:** Are you doing that on an accelerated basis? Given the intense pressures for development, you must be a really prime target for a local authority that wants a bit of land.

**Steve Melligan:** In terms of our commercial mandate, we are more than happy to accelerate our sites as quickly as possible. We might talk later about the local plan system and the extent to which that might be holding up the process, but from The Crown Estate’s perspective we are more than happy to promote our sites quickly and effectively in tandem with planning authorities, and get them to the market and sold to developers for them to deliver the sites. For example, the idea of us land banking is very far from the case.

**John Grinnell:** To pick up the second question, if I understood it properly, we have our existing ownership of retail parks, shopping centres and so on. What happens in terms of the new space and centres we create? The two are totally connected. We talked earlier about the lessons from Regent Street. The way we approach our assets is the same. We apply the same standards in London as elsewhere. The retail parks themselves are very much a reflection of consumer needs and aspirations. It is about accessibility and convenience in those locations. We cannot escape the fact that we have big car parks at retail parks. It is part of the nature of the beast in that sense. For us, though, it is about creating durable and sustainable returns on those assets. When we look at our existing parks and at our new parks, this is very much about ensuring that we have a broad range and mix of uses, rather than just a few odd retailers sitting in close proximity. To reference one of my earlier points, it is also about a community function.

For us, a successful business is very much intertwined with the whole point about the drive on sustainability. There are a number of issues that roll out of that. On our new developments, we work very closely with the planning authorities, the highways authorities and others we are engaged with to understand how the impacts of those movements can be mitigated. At its most basic level, we are talking about things such as travel plans and others, but it is about the detail; it is about the content; it is about how you manage that process. It is about ensuring that there is the appropriate infrastructure, the appropriate highways and
pedestrian areas, to allow people to move comfortably. It is also moving beyond that to ensure that, in responding to people’s desire to go to retail parks, we are firmly embracing technology and innovation on those parks, whether that be through simpler elements such as electric vehicle charging points and so forth, or through recycling, making use of the fact that you are drawing people to a location and providing recycling facilities.

This year, for instance, in addition to that, we had what is known as our Thrive series of summer events. This was about engaging with the communities we operate within. For that particular event, it was about encouraging people to be fit, to be active, to do things. We will bring people from our business along with other experts, people who work and operate in that field, and try to encourage our customers, the users of the retail units, the restaurants, the facilities on those parks, to get fit and active. We rolled that out this year. It has gone across 10 retail parks, as well as Princesshay shopping centre in Exeter, of which we are 50% owner, with TH Real Estate Henderson investors, where we in fact had the leader of the council involved in this. It is great because it is impacting at all levels of the community and people can see this. It is an enjoyable event; it is getting people in. In that sense, it is about community. It is being a part of the very fabric of the areas we work in.

Again, we have a large range of experts who work with us to see what we can do in the future. There is no such thing as the status quo in our world; you are constantly having to respond, activate and move forward.

The other aspect that I suppose is probably relevant to pick up is that the consumers—and I am sure we are all consumers around this table—are becoming ever more conscious of how the retailers and other operators work, whether it be in their manufacturing sectors, how they source their produce, the quality, the pay, all those elements. We therefore want to work very collaboratively with the best retailers. We want to ensure that that landlord and tenant relationship moves well beyond what we have all been used to in the past, to being a true collaboration where we understand each other, we understand the buildings we operate, within retail parks in particular, typically with big wide open doors on the frontage, lots of air coming in and out, lots of heat, et cetera. It is not only embracing the technologies, but also working with the operators as to how they can improve themselves, and there are some very good retailers out there who really take this to heart.
One key element we implement is what we call our post-occupancy evaluation when we create a new building. It is to then look at performance of those buildings, so we capture the data, say, for the next three years and analyse that data. We look at how those buildings are performing in their own right. Have we got things right? Is there more we can do, moving forward? It is that constant process again.

**The Chairman:** We are going to have to have shorter answers. I am sorry about that.

**Q77 Lord Inglewood:** In your opening remarks and in your last response, you referred to the money you generate and the returns you give to the Government. If my memory is right, in the case of Regent Street there are those architectural historians who say that the demolition of the Nash Regent Street between the wars was one of the biggest architectural disasters to strike London. First of all, does the Crown Commissioner believe that in the long run they took the right decision at that time? Secondly, is the return you have to give back to the Government something that inhibits you from designing good schemes, taken from the perspective of society as a whole?

In this context, when you were, for example, doing the Regent Street scheme, obviously the land use in there is not that debatable, but in the detailing of what you were doing, particularly in the case of listed buildings, there is really quite a scope for alternative approaches. Do you feel the planning system and the listed building control system assisted you, or would you have done it better had you been left to your own devices?

Finally, you say you are two-thirds of the way through a big scheme. How many changes have you instituted as you have gone along? Is it a very flexible scheme, or is it a rigid approach you have?

**John Grinnell:** I will make a note of that before I forget. Perhaps I can very briefly deal with the first question. That was a decision made well before our time.

**Lord Inglewood:** I appreciate that. That was a bit of a tease, I am prepared to say.

**John Grinnell:** If I reference very quickly the comments I made earlier about the vision, the changes that have occurred on the street over the period of that vision are testimony in their own right to the success and the correctness of what we do and our approach to doing it.

**The Chairman:** But are you not changing it all over again?
John Grinnell: It is a constant process of change. The reality is that we are a commercial organisation operating in a constantly changing environment, as I said before, so we have to be responsive to that. That is the only way we can respond to what people want. It is the only way we can respond to the customers and ensure, therefore, we are addressing these—

Lord Inglewood: Can I stop you there? Who are the customers here? Are they the customers of your tenants? Are they the people in the street? Are they the people who just come to London as tourists, walk down it and do not go into the shops?

John Grinnell: All the above and more. You asked the question with the use of the word “inhibit”. As I said earlier, we are a commercial business. We invest in sectors for sound commercial reasons. As it happens, within Regent Street and indeed elsewhere, we are the owners of historic buildings or buildings that sit within conservation areas. In addressing the challenges that those buildings provide, it is about ensuring the future sustainability, the durability of those buildings, that they are retained, that the relevant historic elements that we have, the key parts, are retained successfully for the future.

How do we do that? That is very much within the vision that we have. The listed buildings we have, the historic elements of the buildings we have, are very much a part of that eclectic mix of the quality of the urban fabric that we have. What you will see, though, is that, working with the local authority, Westminster City Council in this case, working with Historic England—English Heritage, as it was—over a long period, and with, sitting alongside us, huge expertise in the teams of professional advisers that we have, we work through the details of how we respond to that consumer-driven piece and all the customers we have, whilst at the same time preserving the elements of those buildings that have that historic merit, the pieces that should be retained, but in a sound commercial way that ensures we secure the right retailers that will have a longer term on the street, the occupiers of the office buildings that will have a long-term presence on the street. That is a very detailed, very complex process. We are very fortunate that, because we have worked so hard at that, we have become very credible; we have a great reputation as a result. You would only need to walk down the street to see that there has been a positive outcome as a result of that, so, no, we do not believe that inhibits it. It is very much part and parcel of what we do.
Steve Melligan: You also asked about whether Treasury targets effectively inhibit our abilities.

Lord Inglewood: Does the requirement to give that particular rate of return, in practice, make any difference to the way in which you carry out the developments, or are the commercial imperative and the quality imperative such that the two come together?

John Grinnell: Certainly, if you take Regent Street as an example, absolutely, those two things are totally intertwined. There is no question of that. It is a commercial driver in its own right.

Steve Melligan: If I may complete the answer, that applies across the board in all our core sectors. In terms of what I do, in terms of the rural housing sites, we are driven forward by our commercial mandate and we will seek the best commercial return we can possibly have. That is entirely in line with achieving good-quality design on site at specific locations.

The Chairman: Which has the last say?

Steve Melligan: I do not think I can recall a position where there was a last say on these sorts of sites.

The Chairman: Oh, I see—very smooth.

Q78 Baroness Whitaker: Looking at it from another angle, you have a very successful commercial operation. I would just like to know whether your explicit remit is mainly fiduciary—i.e. the effective stewardship of the capital you employ—or whether you have anything articulated, written down, about other objectives. May I give you one example in relation to out-of-town shopping centres? The sustainability of these has been questioned, because not all but most people rely on car journeys to get there. Does that kind of factor come into your thinking, and, as a matter of fact, how do you assess the effect of internet shopping on shopping centres anyway? What other objectives do you have and what is the prioritisation in your explicit, written-down remit that every employee has that says, in effect, “This is our mission.”?

John Grinnell: Essentially, we are here to drive commercial revenue back to the Treasury. That is basically what we do. We are hugely conscious of the issues you have just mentioned when it comes to retail parks.

Baroness Whitaker: How conscious? How expressed and how communicated?
John Grinnell: It is at the forefront of our thinking. As I said before, we apply the same standards wherever we work, and it is ensuring those assets work within that community. We work very closely with local authorities on travel plans. We would like to ensure that public transport facilities are available on new developments as much as they are accessible and convenient to normal car users.

Steve Melligan: It is quite interesting. In terms of the housing sites that we promote, invariably when we go out to public consultation and invite comments from the local communities, traffic is always the number one issue. Certainly, it is one of many, many planning issues that we have to deal with directly in terms of site promotion. What that tends to generate is that we need to understand what the impacts are locally and what mitigation is required to deal with them. That then will generate, probably through Section 106 agreements, a whole variety of mitigation measures, which our developer and we will be bound into. Typically, in terms of traffic generation and impact, we will be talking about increasing public transport, more buses, maybe free bus passes for a given period. It could be simple things, such as providing cycle racks at local retail centres or community halls. There are a whole variety of measures built into the design element of a scheme, attached to obligations in a Section 106 agreement, to make sure that the developer feeds these through and delivers these obligations on the ground.

Baroness Whitaker: Would it be accurate to say that you, as it were, pay attention to the climate of opinion and current thinking about all these externalities to the commercial operation, but you do not have a responsibility to initiate anything like that?

Steve Melligan: In terms of the broad approach to planning and development, as we have said several times today already we are driven by a commercial mandate that is absolutely clearly out in the 1961 Act, so that is where we start. We have said that, in terms of promoting any form of development around the country, there is a whole variety of issues that we have to grapple with. We spend often many, many years on working through what those issues are, how we deal with them and delivering mitigation.

Baroness Whitaker: Would the appointment of a government chief architect or a general place-making adviser have any effect on your operation at all, do you think?
Steve Melligan: I think it would be a positive move. There is already quite clearly a person who fulfils that role in a planning policy context, but not in design. On the question of dealing with planning authorities around the country over the past few decades, there used to be quite a strong design input available to officers to draw upon in dealing with detailed design matters for all schemes, and that is often missing these days in dealing with applications, unfortunately. I think that then leads to officers maybe feeling less able to be a bit more robust in working with developers for better design. The system is there to be used.

The Chairman: There are architects looking at you.

Steve Melligan: Absolutely right. There is far more scope for better design, through things such as housebuilding schemes, in this country. Maybe there needs to be a bit more dialogue, discussion and impetus from local authorities in taking that forward.

Q79 Baroness Parminter: You have made it quite clear that you do not see that you have any duty to make your developments environmentally sustainable. Nevertheless, is there anything that you are doing on building a circular economy or measuring natural capital that is distinctive in the marketplace?

John Grinnell: As we were discussing earlier, sustainability is very much at the heart of what we do, in each and every asset that we own, and it is commercially driven. That is what our customers want to see, and what they want to hear is what the best retailers want to see and hear, so it is very much within what we do. What was the second part of your question?

Baroness Parminter: I was asking whether there was anything distinctive either on building a circular economy or on measuring natural capital. I heard something about your scheme in Windsor, where you are looking at natural capital, so I am just interested.

John Grinnell: I am afraid that is totally outside my remit and understanding.

Steve Melligan: I am very happy to provide details after this session on that particular issue, if that is helpful.

Baroness Parminter: Thank you.

Q80 Baroness Young of Old Scone: It is clear you do not think local authorities are quite up to the job as you would like them to be. You talked about them being part of the delay issue in housing development and, just recently, about the need for their design skills to be
sharpened up. What do you think should happen to make local authorities more effective partners with folks like you?

**Steve Melligan:** In dealing with 70 sites around the UK, we deal with many dozens of local authorities. We have quite a depth of experience in dealing with a wide variety of planning authorities, departments, offices and members. It is fair to say that our experience is pretty variable. We find some authorities are well resourced, professional, expert and very good to deal with; in other cases, less so. In terms of the local planning system particularly, I think the NPPF has been very effective in driving forward planning consents in the past couple of years. It is a big improvement compared to maybe a couple of years ago. That national policy push has had a very strong positive impact in producing local planning policy and consents for delivery.

Having said that, there is no question that most of us in the industry would agree that improvements could be made, though not to fundamentals; I think the fundamentals are probably good and need to be kept in place to provide us with some certainty and consistency.

I could pick out the duty to co-operate as a good example. When I started out in planning, many, many years ago, we had a very complicated four-tier system, from national planning, through regional planning and county planning, to local planning. I think everyone thought it was very comprehensive, but it was very unwieldy. It took many, many years to do anything at all.

When the middle two tiers were excised and we were left with national and local planning, I think we all thought that would be a big step forward. It has been, broadly speaking, but the duty to co-operate is all about getting local authorities together jointly to work out and resolve sub-regional issues between them, and although there is a duty in place it is not necessarily being carried through with sufficient impetus to give the right answers quickly enough. We are finding that authorities of maybe different political persuasions find it quite hard to work together to deal with quite difficult development issues. They often concern issues such as greenbelt, major housing leases in more difficult areas of the country, a whole variety of issues on which we would quite like government to add some additional push in making that duty a bit stronger.
Baroness Young of Old Scone: Is that the primary cause of delays in local authority consenting, or are other things getting in your way?

Steve Melligan: For what we do, because we get sites allocated and get to an outline planning consent stage, we find the planning application stage is broadly speaking a lot better than it was, that is for sure. Again, it is variable, and depends on resource around the country in terms of planning authorities. When we contract with a developer to take on a housing site, they have to get their reserved matters approved, get their pre-commencement conditions signed off with the planning authorities. Our contracts are often tied in to certain stages of performance before our commercial returns come in, so we are very interested as to how they get on through the reserved matters stage. They tell us and we see directly that often they are taking far too long to get their reserved matters consents approved.

One issue is that if a site is allocated in a local plan for a certain use, should there be a need for a planning application to go back before a committee? If the authority has already approved that scheme in principle, is there a need for endless detailed debates about quite minute issues relating to a scheme such as brick colour, or elevational treatment where there are professional officers in place who are quite qualified and able to deal with those sorts of issues? Should that not be something that trickles down to officer level?

The Chairman: It is overegging the pudding in trying to check things.

Steve Melligan: I think so.

John Grinnell: We could certainly make exactly the same comment on the commercial sector in that sense. Even with the slimmed-down NPPF, which is definitely taking a much more positive, more favourable approach to growth—that growth is good and development is good—even where sites are allocated, as Steve has just said, we are still finding quite a variety of approaches from local authorities in terms of the sheer volume of material that needs to be submitted for something that is essentially already agreed upon.

As developers, when you are investing significant amounts of money at the front end, which is all about trying to build confidence that this scheme is capable of being taken forward and being delivered, that can be quite off-putting. We have been very fortunate, very lucky, in most of the authorities we have worked with, but I certainly know of experience from others.
in the industry who have not had that same position. That reduced amount of involvement and expectation at the front end definitely is patchy across the country.

The Chairman: Is this a case, though, where they are more risk averse than in normal commercial activities? It worries me, because you think about piles of documentation that have to be sifted through for planning applications and things such as that, whereas it is only simple reduced things. What we need are people who are confident enough at the top of the business who say, “Yes, we do not need to go through all that or do this, that and the other”. I am not being derogatory about it, but it is a local authority type of mentality, because they have not been allowed to take big decisions, so they are risk averse, I think.

Steve Melligan: That is not entirely inaccurate.

The Chairman: In other words, yes.

Steve Melligan: Historically, as planners, we all enjoyed the halcyon days where you had a red line around a plan and that was basically it: you put that in on a plan and you sought consent, with very little information. Now, maybe that was insufficient, and clearly there are impacts that we need to deal with in a sensible, technical way.

The Chairman: We need more confidence.

Steve Melligan: Absolutely right. We ask for a huge amount of information. From our point of view, we are a strong commercial operation and we can afford to invest our own resources in employing armies of consultants to produce volumes of work. A lot of landowners, promoters, SME developers and small builders cannot do that, and that is a frustrating factor.

The Chairman: It is an interesting point. Maybe we will investigate that further.

Q81 Baroness Rawlings: One of your four themes was education. I have to declare my interest as having been responsible, possibly before you were both in post, for securing from The Crown Estate the old Public Record Office in Chancery Lane for King’s College London library, which is highly successful and which over 10,000 students now use daily. It won the award for the best garden of the year. I can say that this is a concrete example of all that you have been saying this morning. I wonder how many other sites like this you sell off completely or sell the leases for, and how you develop the policy for future certain uses of these areas that you have disposed of.
**John Grinnell:** In terms of trying to understand the question, we have our four sectors that we have invested in. The London assets—Regent Street, St James’s—are our core assets. They are in our long-term ownership, so we do not dispose of those in their own right. We will undertake swaps, purchases, sales, disposals around the edges of that, to facilitate development and ensure further investment into those. The regional portfolio is about a wider investment strategy, which is about an active process of purchase and sale. Beyond that, for the wider Crown Estate business I am afraid it is not something I can comment upon, but we could come back to you with a written answer.

**Q82 Baroness Andrews:** As part of my question, I should declare an interest as the ex-chair of English Heritage. I would completely endorse what you said about it working very closely with you, particularly recently on the Recent Street development and the development of the Atlantic Bar. A wonderful conservation job was done to bring that back to its art deco brilliance. It is an absolutely splendid piece of work. Lord Inglewood asked about the impact of having to deal with listed building regulations, and you have answered that, so my only question is this. You are very good at working within the constraints of the historic environment and trying to balance the issue of harm versus development. Other people find it much more difficult. What sort of advice might you have for your typical developer on how to get the best benefit out of that balance?

**John Grinnell:** Dare I say probably copy what we do, if that does not sound arrogant?

**The Chairman:** If it is not broken, do not fix it.

**John Grinnell:** Our approach is one we have evolved over time and we constantly seek to improve upon that. It is one of working directly or very closely with people such as English Heritage—Historic England, as we now have it—the local authorities and all those other parties, working through with groups such as the Twentieth Century Society and others, to understand what the issues are, what is absolutely key to retain, what is important to retain within a very commercial environment, what therefore is going to ultimately help to add value to that environment and how we can bring the best of the new and the best of the old together to ensure that we create those spaces. Our approach is an approach about openness, honesty and integrity.
Baroness Andrews: It is also about the vocabulary you use, which is that the historic environment, whether you define it as a building, a streetscape or whatever, is an economic asset, so you are able to show developers and place-makers that it is going to be of a real benefit in economic and social terms, not just, as it were, a heritage issue.

John Grinnell: Totally. If we look outside London for a moment, we are also jointly the owners with Land Securities of the Westgate shopping centre in Oxford, one of the most highly known heritage cities on the globe. We have a major scheme there, with 800,000 square feet, the best part of 80,000 square metres, depending on which currency one uses, of new commercial space, but within an incredibly sensitive historic environment. The amount of time and effort we and our partners have expended on trying to ensure we bring about the right form of development, with the right form of buildings, the right quality of the public realm and all those pieces we have already referenced, is huge. It is a massive, massive investment of time and energy, but, ultimately, it comes back to that same point: it is commercially driven and it does drive value. The two things are totally linked together.

Q83 Baroness Parminter: I want to talk more about digging down into your initiatives with local communities and how they get involved in the developments. Are there any specifics you would cite as being absolutely critical in making developments work for you and meeting your financial responsibilities but bringing people on board at the same time?

Steve Melligan: Shall I start with the housing sites we deal with outside the main conurbations? In a planning context, all applicants are required to consult on schemes. At The Crown Estate, we believe it is far more important than a box-ticking exercise. We genuinely believe that close community consultation has huge benefits for both sides. For us as a commercial operation trying to achieve something on the ground, it is through consultation that we can try to engender some support locally for the particular scheme. Clearly, that will help us get through the application and committee process, which helps us directly.

From the other side of the fence, local communities deserve to understand and to participate in the way the scheme will be affecting them, because, although we are landowners in their environment, we are outsiders looking in. Often, the best people to understand the local issues, things such as traffic, educational implications, resourcing certain things, are the
people who live in that village or in that town. We do an awful lot of consultation. We probably do far more than most people in our situation and we are very proud of doing that. We tend to do it a little earlier; we tend to do it more often; and we tend to do it a bit more openly, with more information to hand.

We tend to do it as a two-stage process. First of all, we will go into a local community and hold an exhibition. I will go along personally, with my team. It is important that The Crown Estate is represented personally, because people do not just want to see an army of consultants; they want to see the person who will actually benefit from this, which is fair enough. We go in with basically a blank piece of paper and invite people to tell us what they think the issues are, and then we will go back, maybe in a few months’ time, with some more detailed proposals worked up. We might use things such as charrette workshops to try to get some genuine feedback and ideas.

Public consultation gets a bad press, because the public do not really believe it is being done genuinely. It is easy to go along a tick-box process, achieve what you have to and then move on, and that achieves absolutely nothing. What we are trying to do is to achieve schemes we can look back on in years to come and be quite proud of, and, if the local community is not proud of it, I do not think we can be either. From that point of view, the consultation we do, which is lengthy and can be quite costly, is always beneficial in terms of engendering real ideas and inputs about the design of our scheme and the master-planning.

**The Chairman:** How often would you do that? Say you had done a development and, three years after it was up and running, you do a post-audit, so to speak, of the contribution to people of place-making. How do they feel? Do they like it? Are there great improvements? Are there any improvements they think could be made, or is there anything else?

**Steve Melligan:** That is a very good point. We have some larger schemes that are a thousand or several thousand homes in scale, so these are effectively new communities starting from scratch. These schemes will take 10, 20 or 25 years to develop out, so not only do you have to be very flexible in planning at the start so you have that flexibility as things change over the years, but you have to work closely with local authorities and local communities to ensure you have that flexibility built in. As The Crown Estate, where we own the land in its entirety, we have a lot of control over the way sites are taken forward, which is a huge advantage. One
of the many drawbacks of the planning system is site-delivery, and when you have multiple land ownerships that is often the biggest constraint to getting sites delivered quickly and efficiently. Where we own land in its entirety, we have far more ability to plan things appropriately at the outset and then stay in the scheme right to the end, in that way delivering the sorts of outcomes you are alluding to.

The Chairman: That is exactly what I was saying. Also, it gives people confidence that they have made the right investments and that they are happy.

Steve Melligan: It does.

The Chairman: That could easily trickle down to the following generations.

Steve Melligan: Agreed. Also, from a commercial point of view, if we can get the scheme right at the start, if we set the right tone in terms of quality, that will help house prices, which will help our commercial returns. It suits our commercial purpose to have high-quality schemes.

The Chairman: I have always believed in, “Love the consumer”. They say, “The customer is always right”, although we all know they are nearly always wrong, certainly in the areas where I have been. You just have to listen, and together you can get the thing sorted.

This has been a great session. Thank you both very much indeed. I just have a final question. Are there any other issues you would like to raise with us? If so, please write to us, because I think we are just about worn out after our long session today. It has been great, and we are not worn out because you have bored us, but there is so much to try to grasp and get into my tiny brain. Thank you very much indeed.

John Grinnell: It has been a pleasure to meet you.

The Chairman: It is lovely to meet people from The Crown Estate, because I have known about them for years, but it has always been way up there. Thank you.

17 September 2015
Summary

1. The Government places great importance on the quality of the built environment. It is the space in which people live, work, and interact on a day-to-day basis. It is about creating places, buildings, or spaces that work well for everyone, look good, last well, and will adapt to the needs of future generations.

2. National planning policy and planning guidance is clear on the importance of the built environment to future development.

3. All sections of society have a role to play in the delivery of a high quality built environment. The Government sets the overall national framework for development with local authorities, local communities, industry bodies and companies using their skills, knowledge and techniques to deliver quality design in their local area.

Policymaking, integration and coordination

Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

4. Organisations and people at all levels of society have an interest in and therefore an important role in shaping the built environment.

5. The Government’s main role is to set the framework and conditions to facilitate development. Through the National Planning Policy Framework, the Government sets out planning policies for England and how these are expected to be applied. The Framework sets out requirements for the planning system that are relevant, proportionate and necessary. It provides a structure within which local people and their accountable councils can produce their own distinctive local and neighbourhood plans, reflecting the needs and priorities of their communities.

6. Local government is critical in the delivery of great places. National planning policy strongly incentivises plan making – encouraging all councils to engage their communities and put up-to-date Local Plans in place as soon as possible, to set out a vision and a framework for the future development of their local area.

7. Recent Local Plan progress is positive, 65% (217) of local planning authorities have adopted a Local Plan and 82% have at least published a draft Local Plan. The Government
wishes maintain this momentum and set out its intentions for all local authorities to produce plans by early 2017. This was set out in a Written Ministerial Statement on 21 July. This may be found at:

http://www.publications.parliament.uk/pa/cm201516/cmhansrd/cm150721/wmstext/150721m0001.htm#15072122000005.

8. To support delivery the Government will publish league tables on how areas are progressing their plans. In addition, to accelerate production of a Local Plan, the Government will intervene to arrange for the plan to be written, in consultation with local people, where no Local Plan has been produced by early 2017.

9. The move of public health teams into local government is an opportunity to improve the health of local communities and address some of the most pressing health issues. This new context provides a strong base for good practice in the integration of health, planning and design, as well as engagement with the local community.

10. The Government recognises that infrastructure plays an important role in shaping the built environment. Decisions and funding for infrastructure is a matter that is determined jointly between Government and local authorities. Expectations for sustainable infrastructure delivery are set out within the national planning policy – both at plan-making and decision-taking stages. Local planning authorities have a range of powers to ensure that infrastructure is provided at the appropriate time in respect of development.

11. Through the Nationally Significant Infrastructure Planning regime established by the Planning Act 2008, Ministers make decisions on projects of national rather than local significance in the sectors of energy, water, waste, waste water, transport and can also do so with some major business and commercial projects. For example, Thames Tideway Tunnel and Hinkley C Power station were consented through this system. Although decisions for such projects are taken nationally, the process entails rigorous and mandatory community engagement and consultation by developers and provides a key role for local authorities. The independent inspectors who examine each application, and Ministers, have to take account of local views and representations in coming to their conclusions and decisions.

12. Local planning authorities may raise their own funding for infrastructure delivery through the Community Infrastructure Levy. The levy can help foster a community’s acceptance of development by giving communities real power in deciding and delivering the infrastructure priorities for their area. A proportion of the levy is made available directly to address local community priorities with 15% of levy receipts going to parish or town councils; 25% where there is a neighbourhood plan or development order. There are currently 97 levy charging authorities, including the Mayor of London. Section 106 planning obligations are individually negotiated agreements between the local planning authority and developer that assist in mitigating the impact of unacceptable development to make it acceptable in planning terms.
13. To help facilitate high quality development, and relating to the recommendation in the Farrell review for a Chief Architecture Officer, the Government has created a Design Advisory Panel. This Panel is made up of high quality architects and representatives from a wide spectrum of architectural and design industry bodies with a remit to help ensure delivery of good design, particularly housing.

**How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?**

14. The Government has established strong policy co-ordination of matters affecting the Built Environment. Cabinet Committees provide the official forum for decision-making and consideration of inter-departmental issues. Alongside these, the Government has established a number of Implementation Taskforces to monitor and drive delivery on the most important crosscutting priorities, including a Housing Implementation Taskforce chaired by the Secretary of State. These bring together senior Ministers and officials on a regular basis to track progress; spot potential problems and blockages and agree plans for resolving them; maintain momentum and ensure accountability; and make sure that actions are followed through. Each taskforce reports to the Prime Minister and Cabinet on a regular basis.

**National policy for planning and the built environment**

*Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?*

15. The Government attaches great importance to developing and protecting the built and natural environment. The NPPF is explicit that the purpose of the planning system is to contribute to achieving sustainable development, and that the three ‘pillars’ of the environment, society and economy are mutually dependant and should not be pursued in isolation. The NPPF supports growth and helps create the homes and jobs that the country needs – permissions for homes has now risen to 242,000 in the year to June 2015, an increase of 35% from the year to March 2012 when the NPPF was issued. Communities have been given greater power to shape the places in which they live, and help protect and enhance our natural, built and historic environment. Over 8 million people now live in areas covered by a neighbourhood plan. The NPPF also has a role in developing healthy communities and tackling some of this country’s most pressing health challenges, such as obesity, physical inactivity and the needs of an ageing population.
16. The Framework should be taken into account when preparing local plans, and is a material consideration in planning decisions. The opportunities for delivering sustainable development, and what it means in practice, will depend on the individual proposals and the local context. The weight that is attached to any particular aspect of sustainable development will depend on the type and location of the proposed development.

17. To supplement the Framework, the Government published online and streamlined planning guidance in March 2014, reducing over 7,000 pages of guidance to a simple accessible online guide.

Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

18. The Government does not consider that it is necessary to have a national spatial plan in England. In 2010, the Government inherited a broken planning system which was centralised, bureaucratic and complex, and which alienated and disempowered local communities. Planning reform delivered through legislation and the National Planning Policy Framework were essential to deliver the necessary homes and infrastructure by working with and not against local communities. The Localism Act 2011 and the Framework reaffirm the importance of local and neighbourhood plans as the primary basis for identifying what kind of development is needed in each area and puts power in the hands of communities to shape the places in which they live. To date, 65% (217) of local planning authorities have adopted a Local Plan and 82% have at least published a draft Local Plan.

19. The Localism Act 2011 abolished previous top-down regional strategies, and devolved power to encourage development of neighbourhood plans. It also created the Duty to Co-Operate, which requires local authorities and other public bodies to work together constructively, actively and on an on-going basis when they are planning for strategic cross-boundary matters in their Local Plans. The Government announced in its Productivity Plan “Fixing the foundations: Creating a more prosperous nation”, published on 10 July, its intention to strengthen guidance on the Duty.

20. The Government is promoting further locally led action for proposals by groups of local authorities to use devolution deals to seek to work together delivering the best approach to planning for their areas jointly. Building on the successful Growth Deals, 38 towns, cities, counties and regions submitted ambitious proposals to the Government in September to take control of how public money is spent in their area. On 2 October, the Chancellor of the Exchequer announced a deal with Sheffield City Region, details of which may be found at: https://www.gov.uk/government/news/chancellor-hails-historic-deal-for-sheffield. This deal will give the newly created directly-elected Mayor powers over strategic planning.
21. In addition, the introduction of a national spatial plan in England would take a considerable time to prepare, and would be a costly undertaking. We do not consider that it would be as cost effective as the current system.

*Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?*

22. The built environment is constantly changing, albeit at very differing rates according to the location. Buildings and streets in some communities have stayed in place for many years - even though their use may have changed – whereas in others they only remain so for a limited period. Examples include large housing estates which are in need of regeneration.

23. In planning terms, there is a trade-off between local plans being sufficiently forward looking but not going so far into the future that plans cease to be useful. National planning policy requires local plans to be drawn up over an appropriate time scale, preferably a 15-year time horizon, to take account of longer term requirements, and be kept up to date with sufficient flexibility to adapt to rapid change. This does not prevent an individual planning authority from creating a longer term vision for development in its local area.

24. For specific areas of land – particularly on large scale schemes – specific tools such as masterplanning can help make sure that local authorities, in partnership with developers and local communities, can actively plan ahead to take account of specific circumstances. For example, creating a sense of place which encourages walking and cycling and promotes physical activity may reduce health needs in future years.

**Buildings and places: New and old**

*What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?*

25. Since 2010, the Government has carried out a range of measures to fix the broken housing market and drive up housing supply to help meet the housing needs of this country. Over the next Parliament we want to maintain this momentum and press ahead with new measures to increase access to home ownership, including doubling the number of first time buyers, and increase housing supply.
26. The Government is committed to helping more people to own their own home including extending the Help to Buy schemes, extending right to buy to tenants in Housing Associations and delivering 200,000 Starter Homes exclusively for first-time buyers under 40 years old. On 10 August, Government launched a one-off £36million funding package to accelerate the delivery of starter homes. Government will support councils and directly buy land, in order to bring forward brownfield sites that would otherwise not be built for starter homes. We have also committed to further increasing housing supply including 275,000 affordable homes between 2015 and 2020 and doubling the number of custom and self-built homes by 2020.

27. The Productivity Plan combined with the Rural Productivity Plan contain a number of new policies to boost housing supply. These include:

- Ensuring that up-to-date Local Plans are in place by 2017, and looking at ways of reforming and streamlining the Local Plan process;
- Measures to speed up delivery of the planning process, such as introducing a permission in principle;
- Making home ownership more affordable for young first time buyers by committing to building 200,000 Starter Homes offering a 20% discount exclusively for first time buyers.

and the Rural Productivity Plan may be found at: https://www.gov.uk/government/publications/towards-a-one-nation-economy-a-10-point-plan-for-boosting-rural-productivity

28. We will be doing further work to progress these and other housing-related commitments ahead of the Spending Review in the Autumn 2015.

29. These new measures build on the many actions the Government has taken since 2010. On planning these included:

- Abolishing regional strategies which built widespread local resentment;
- Publishing a clear, streamlined National Planning Policy Framework including the presumption in favour of sustainable development and measures to increase the supply of housing;
- Introducing neighbourhood planning which gives local communities more influence over where housing should go in their local area. So far over 1,600 neighbourhood planning communities are engaged in preparing their own plans and over 8 million people live in an area covered by a neighbourhood plan;
• Making planning more efficient by removing unnecessary steps for the system through extending permitted development rights to make better use of our existing building stock by allowing change of use of certain types of buildings to homes.

30. These planning reforms are delivering real results:

• Planning permission granted for 242,000 new homes in England in the year to June 2015, an increase of 44% on year to June 2010
• Plan-making has significantly improved. 65% of local planning authorities have adopted a Local Plan and 82% have at least published a draft Plan;
• Over 608,000 new homes have been delivered since April 2010;
• Completions are up 22% over the same quarter last year. Housing starts in the year to June 2015 totalled over 136,320 and are at their highest annual level since 2007;
• 100 successful neighbourhood planning referendums to date – first 81 plans and orders are now in place;
• The British Social Attitudes survey reveals that local support for housebuilding has doubled in the last four years, from 28 per cent in 2010 to 56 per cent now, while opposition to local housebuilding has more than halved during the same period.

31. In addition, more than 260,000 affordable homes have been delivered since April 2010, including nearly 186,000 homes over the last four years through the Government’s affordable homes programme with £19.5 billion of public and private investment. This achievement is 16,000 homes above our target.

32. The Government has also taken action to increase supply and improve choice, quality and cost in the private rented sector through up to £10 billion of Housing Guarantees supporting investment in large-scale, professionally-run private rented and affordable homes. The £1 billion Built to Rent Fund is helping to fund up to 10,000 new homes for private rent and has supported delivery of over 4,000 homes to date.

How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

33. The Government’s has set a national policy framework to encourage and facilitate a sustainable and resilient built environment which has placed sustainable development is at the heart of the planning system. The policies in the National Planning Policy Framework, taken as whole, constitute the Government’s view of what sustainable development in England means for the planning system.

34. Building Regulations, which set requirements for building work, address issues of sustainability as well as the safety and health of those who use buildings. They set minimum
requirements for energy performance and water efficiency and address other aspects of construction such as structure, and rainwater drainage which reflect likely climatic conditions over the building’s design life, and which help to ensure resilience. The Government reviews the technical standards to ensure that they address both societal and environmental challenges and undertakes research to ensure that the requirements of the Building Regulations are based on robust evidence.

35. The Government recognises the importance of action in the built environment to reduce carbon emissions and build resilience to climate change. Reducing emissions from buildings will require improved energy efficiency measures and changes to heating systems in properties. Government is committed to considering both together through a stable long-term framework which explores the potential role of regulation, and to thinking about them from the perspective of consumers, home-owners, landlords, tenants, tenants and industry. In the last Parliament building energy efficiency standards were improved by 30% helping to ensure that buildings in England are built to sustainable standards which reduce carbon emissions.

36. The Government also recognises issues such as overheating in new and existing buildings which have been identified by the Committee on Climate Change and supported by the evidence of the UK Climate Change Risk Assessment. The Government will consider research to understand better what an overheating standard might look like and the options to help industry and others address the risks.

37. The Government has increased flexibility in the planning system through permitted development rights which allow the best use of existing buildings. These include permitted development rights for the change of use to retail, restaurants and cafes, assembly and leisure, schools and nurseries, and homes from specified previous uses, and extending permitted development rights for extensions to existing commercial buildings and homes.

38. For the promotion of delivery of healthy sustainable neighbourhoods, the key to successful places lies in the communication between services and proximity of amenities, from healthcare facilities to green infrastructure to local transport networks. Compact neighbourhoods that feel safe, well connected and provide access to several amenities and destinations, seem to have a positive impact on health and wellbeing.

To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

39. Conservation and enhancement of the historic environment is one of the principles of national planning policy. This helps to ensure that the UK meets its international commitments towards protecting our cultural heritage for present and future generations (including those in relevant Council of Europe and UNESCO conventions)
40. National planning policy recognises that the historic environment can be a stimulus to economic development by acting as a catalyst for regeneration and inspiring high quality design. It requires local authorities, in developing a positive strategy for the conservation and enjoyment of the historic environment, to take account of opportunities to draw on the contribution made by the historic environment to the character of a place. It sets out a clear expectation that all planning processes should respond to local character and history and that local authorities should look for opportunities for new development in relation to heritage assets to enhance or better reveal their significance.

**Skills and design**

*Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?*

41. The Government recognises the importance of adequately-resourced local planning authorities to deliver high quality places. Local authorities need to give planning the priority it needs, to support local growth, provide new housing and safeguard the quality of both existing and new environments.

42. Planning application fees were increased by 15% in November 2012. This has provided an additional £32 million per annum for local authorities. We are considering the future delivery of planning services with a range of organisations, and the wider resourcing of local authorities is being considered as part of the Spending Review. It is for local authorities to decide how to deploy their resources, including working with local partners and employing external assistance where necessary, to deliver a quality service for their communities.

43. The Government funds the Planning Advisory Service and welcomes the sector led support it provides local planning authorities in strengthening skills and expertise for both planning officers and councillors.

44. The Government recognises the need for the UK to develop the higher level of skills required for its long-term economic success. Apprenticeships are our priority for equipping people with the high level skills that our industries need. The Productivity Plan sets out radical ambitions to deliver 3 million apprenticeships this Parliament. We are introducing an apprenticeship levy to help fund the increase in quantity and quality of apprenticeship training. The levy is designed to increase employer investment in training and apprenticeships.
45. The Government is working closely with the housebuilding and wider construction sector to help it grow the skills it needs. This includes helping to ensure that the apprenticeship levy is right for employers and that there is a range of training opportunities available.

46. The built environment professional bodies such as Royal Town Planning Institute, Royal Institute of Chartered Surveyors, and the Royal Institute of British Architects also have an important role in anticipating future needs, trends and supporting the development of skills and capacity in the sector. Institutes of Technology registered with professional bodies have the potential to significantly maintain and enhance the skills needed to deliver a sustainable built environment.

47. Use of tools such as design codes, design review, the Building for Life 12 housing design checklist and community involvement techniques can help to engage the right people in design discussions at an early stage and this can help to gain support for development and drive up design quality and gain support for new development locally. We welcome the sector led support provided by organisations such as Design Council CABE in helping to promote the use of these tools.

48. We also welcome the many industry-led awards schemes such as the Housing Design Awards, Royal Town Planning Institute Planning Awards, Royal Institute of British Architects Architecture Awards, that aim to encourage innovation and promote good design and place-making. These highlight successful schemes and reward effective collaborative working amongst built environment specialists such as local authorities, developers, architects, landscape architects, surveyors and construction teams.

Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

49. The Government attaches great importance to improving the design quality of new homes and neighbourhoods. A good framework has been established through strong messages in the National Planning Policy Framework and planning guidance. Section 7 of the Framework emphasises how local authorities should plan positively for design, while the guidance sets out key principles and practical tools for delivery such as the use of design codes.

50. The Government is also showing strong leadership and commitment to design through its housing programmes by:

- Encouraging good design through its support for the development of large sites such as at Ebbsfleet. The Ebbsfleet Development Corporation has set up a design panel to work
with home builders as they develop their designs and layout for new housing at Castle Hill, which has already set a high bar in terms of quality of design.

- Promoting good design through its flagship Starter Homes programme. The Design Advisory Panel, involving leading figures from the design and architecture sector, played a lead role in developing a Starter Homes design exemplars document, published in March 2015, to help ensure that new starter homes are popular with buyers and communities and designed to stand the test of time.
- Involving design experts to ensure that the Government’s estate regeneration programme improves the design quality of new homes and the local area.
- Encouraging industry-led innovation through the Government’s support of the Housing Design Awards

51. In order to support action on health through the built environment, Public Health England has published or co-produced a series of guides, evidence briefs and reviews that recognise the role of the built environment and has been working with NHS England on the Healthy New Towns Programme.

**Community involvement and community impact**

*Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?*

*How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?*

52. The Government recognises the health, economic and social benefits to individuals, communities and the nation of increasing physical activity levels and promoting healthier lifestyles. The Government’s response to the Health Select Committee report on the Impact of physical activity and diet on health recognised the need to increase level of physical activity, improve diet and reduce obesity as key public health priorities. The report may be found at: [http://www.parliament.uk/documentscommons-committees/Health/Cm-9001-government-response-sixth-report.pdf](http://www.parliament.uk/documents/commons-committees/Health/Cm-9001-government-response-sixth-report.pdf).

53. National Planning Policy is clear that the purpose of the planning system is to contribute to the achievement of sustainable development, which includes the health, social and cultural well-being of local communities. Through the National Planning Policy Framework and supporting guidance local authorities are encouraged to ensure development plans and proposals promote active, healthy lifestyles and well-being including
active travel, like cycling and walking, and access to high quality open space and sport and recreation facilities. It is for councils and local communities to use their local and neighbourhood plans and existing planning powers to shape where development can go and create well-designed, safe and attractive places.

54. The Government’s reforms have increased the emphasis on community engagement and the Framework sets out that a wide range of people should be involved in plan-preparation such that plans represent, as far as possible, a set of agreed priorities for the sustainable development of an area.

55. More people are engaged with the planning process simply as a result of more Local Plans coming through the system, as well as through strong take-up of the new powers introduced through the Localism Act 2011 enabling development of neighbourhood plans.

56. Neighbourhood planning gives communities direct power to develop a shared vision for their neighbourhood and shape the development and growth of their local area. Communities are able to choose where they want new homes, shops and offices to be built, have their say on what those new buildings should look like and what infrastructure should be provided, and grant planning permission for the new buildings they want to see go ahead.

57. A neighbourhood plan qualifying body should be inclusive and open in the preparation of its plan and ensure that the wider community is kept fully informed of what is being proposed and has opportunities to be actively involved in shaping the emerging neighbourhood plan. The community has a final opportunity to express its view on a proposed neighbourhood plan through a popular referendum.

58. To date, over 1,600 communities have begun the process, with over eight million people living in a neighbourhood planning area. Over 340 plans have reached consultation stage, and over 80 have passed referendum and been formally ‘made’. All the neighbourhood planning referendums so far have been successful, with an average Yes vote of 88% on an average turnout of 33%.

59. Qualifying bodies have come up with many ingenious ways to engage with and consult their communities in the preparation of a neighbourhood plan. For example:
- Downham Market residents were invited to write and draw all their ideas on the village hall, which was due to be painted the next day. Photos were then taken of everything that they wrote;
- In Tattenhall, a disco was thrown for the town’s teenagers, who had to fill in a survey on the future of their community to gain entry; and
- in Heathfield Park in Wolverhampton, a 3D model of the town was produced to allow the community a chance to say what they did and didn’t like and where new development should go.

Financial measures
Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

60. Paragraphs 25 to 32 of this response include a number of practical financial measures which the Government has put in place to unblock development and make more land available for housing.

61. The government also intends to create a £1 billion Brownfield Regeneration Fund to focus on unlocking homes on brownfield land for additional housing.

62. The Government will be undertaking a review of the Community Infrastructure Levy later this year, which will provide an opportunity to consider how it can better support the Government’s housing and growth agenda.

63. Paragraphs 49 to 51 of this response include a number of mechanisms through which the Government is encouraging better design and place making by private sector developers. Our planning guidance lists a number of planning processes and tools, including:

a) good consultative and participatory techniques – particularly to capture the views of local communities, who best understand the way in which their places operate;

b) good design codes, masterplans and briefs; and

c) design review – local authorities with local design review arrangements in place can provide assessments of individual proposals to support high standards of design.

14 October 2015
DCLG Response to further information requested by the Lords Select Committee on the Built Environment

Baroness Whitaker: Retrofitting – an analysis of what has been done and what needs to be done

The Government’s Carbon Plan, published in 2011, sets out illustrative scenarios to demonstrate different ways in which the fourth carbon budget (2023-2027) could be met through different combinations of actions in the buildings (domestic / non-domestic), industry, power, transport and agriculture sectors.

In the domestic buildings sector the Plan said that:

Looking beyond 2020, we may need: between 1 million and 3.7 million additional solid wall insulations by 2030; and between 1.9 million and 7.2 million other energy efficiency related installations, such as improved glazing.

Many energy efficiency measures are inherently cost effective and help people and businesses save money on their bills, but barriers, such as upfront costs, disruption and lack of information can make it challenging to deploy some measures.

Current deployment in Great Britain versus Carbon Plan scenarios

<table>
<thead>
<tr>
<th>Measure</th>
<th>Deployment in 2014</th>
<th>Remaining potential (as at end March 2015)</th>
<th>Carbon Plan Scenarios (2023-30)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Solid Wall Insulation</td>
<td>63,000</td>
<td>7.5m</td>
<td>1m – 3.7m delivered by 2030</td>
</tr>
<tr>
<td>Cavity Wall Insulation</td>
<td>320,000</td>
<td>4.7m</td>
<td>All remaining potential captured by 2020</td>
</tr>
<tr>
<td>Loft Insulation</td>
<td>200,000</td>
<td>7.1m</td>
<td>All remaining potential captured by 2020</td>
</tr>
</tbody>
</table>
As at end March 2015, in Great Britain:

73% of 19m suitable homes had cavity wall insulation

70% of 24m suitable homes had loft insulation

4% of 8m suitable homes had solid wall insulation

Baroneess Finlay of Llandaff/Baroness O’Cathain: Research into overheating as a health issue in relation to building regulations.

Improving and decarbonising buildings will require changes to both energy efficiency measures and heating systems in properties. The Government is committed to considering both together from a consumer perspective.

In order to make the transition to a low-carbon economy we need to change the way we generate, distribute and use heat in buildings. The Renewable Heat Incentive is the main policy influencing the uptake of low-carbon heat technology, by providing the long-term financial support needed for households to make the switch to renewable heat.

The Renewable Heat Incentive is currently supporting almost 35,000 domestic heating systems and over 10,000 non-domestic installations. As at the end of May 2015, 3.75 terawatt hours of renewable heat has been generated and paid for through the scheme which is enough to heat the equivalent of almost 250,000 UK homes for a year.

Other policies such as Building Regulations have been successful in reducing heat emissions from buildings, for example through the requirement to install a condensing boiler when a heating system needs to be installed.

Baroness Whitaker: Some examples of countries of similar population density that do/do not have a spatial plan.

Using the 2014 World Bank data of population data (people per sq. km of land area) we have looked at countries of similar population density and the existing planning system.

Spatial Planning
Since May 2010 the Government has reformed the planning system to deliver the homes and infrastructure that this country needs by working with, and not against local communities. Our reforms have simplified and streamlined the planning system, removing the previous Government’s top-down approach and making it more accessible to local communities.

The National Planning Policy Framework sets out the Government’s planning policies in England and how they are to be applied. It is intended to support growth and help create the homes and jobs that the country needs, put power in the hands of local communities to shape the places in which they live, and help protect and enhance our natural and historical environment. The Duty to Cooperate, introduced in the Localism Act in November 2011 requires local councils in England to cooperate with adjacent planning authorities and related organizations on cross-boundary strategic issues for example homes and jobs, commercial development, infrastructure, health, security and cultural infrastructure, climate change mitigation and adaptation.

In Europe various compendia of spatial planning systems can be found. For example, Denmark, Germany and Italy have a similar system where central or federal government set overall guidelines for planning while the municipalities are responsible for translating the overall guidelines and visions into actual spatial planning through municipal plans and local development plans.

Several European countries - Cyprus, Switzerland, Luxembourg, Malta and the Netherlands included - have a spatial strategy which in general operates on three tiered planning system – national, regional and local. For example the Netherlands has a Spatial Planning Act but in so far as possible spatial planning policy and its implementation are shaped at the municipal level. The municipalities are able to set appropriate regulations based on their knowledge of the local situation.

In Poland and the Czech Republic there is no strategic coordination. The municipalities have the main responsibility for managing the spatial processes.

Within the United Kingdom Scotland, Wales and Ireland all have a national spatial plan. Northern Ireland has a Regional Development Strategy

In the Far East – Japan and The Philippines have a national spatial plan.

Baroness Finlay of Llandaff: Also, some information regarding the work on homelessness policy.
The Department for Communities and Local Government analyse the national and the Combined Homelessness and Information Network rough sleeping statistics to better understand the intelligence they provide on demographics, trends and emerging needs within the rough sleeping population and consider what that means for how we design policy, and target funding for tackling and preventing homelessness.

We do the same with the P1E statistical returns from local authorities that report on specific aspects of statutory homelessness, for example the reasons for loss of last settled home, why people are found to be in priority need etc. These provide a robust time series of information that demonstrates key trends. For example we used this data to shape the delivery of a programme of funding to help local authorities to test innovative and sustainable approaches to tackle the use of bed and breakfast accommodation for families with children. The data allows us identify those areas facing the greatest pressures which helps us design the scale of the programme and understand any area effects. The availability and the use of the data in designing the programme prompted Ministers to create a new publically available table (Table 793 families with children in B&B over 6 weeks) showing all those authorities making use of bed and breakfast accommodation for the first time.

The lessons learnt from the funded areas has been used to help other authorities to reduce their use of this type of accommodation.

A set of this data is available at: https://www.gov.uk/government/statistical-data-sets/live-tables-on-homelessness.

Lord Clement-Jones: A list of people and developments that have been considered for awards.

There is a range of Government-supported and industry awards which recognise the achievement of quality in the built environment. A selection of those are listed below with a summary of each and references to further information about the people and developments that have been considered for or achieved commendations.

Construction - The Prime Minister’s Better Public Building Award is the pinnacle of the British Construction Industry Awards which aim to recognise excellence in including overall design, construction and delivery of buildings and civil engineering projects. The Government has sponsored the award since its inception in 2001. Lead sponsor is the Cabinet Office with the department for Business, Investment and Skills as a sponsor partner. Any Government project nominated across a selection of categories is eligible for the award.

The award provides an opportunity to celebrate excellence in public sector construction and infrastructure. It also highlights the Government’s construction priorities of fair payment,
supply chain integration, efficient procurement processes, sustainability, whole life value, design quality, use of apprentices, safety, and performance against milestones. The award also considers the replicability of the project, ensuring best practice can be shared and reused. Government can use the Award to emphasise its priorities and help ensure industry is well placed to support the delivery. The winner of this year’s award will be announced in October 2015 and past winners include:

University College Hospital Macmillan Cancer Centre, London

Manchester Metropolitan University Student and Business Hub

Tate Modern, London

City Learning Centre, Bristol

Bournemouth Library

A650 Bingley Relief road, Yorkshire

Jubilee Library, Brighton

City of London Academy

Dalby Forest Visitor Centre, Yorkshire

Royal Alexandra Children’s hospital, Brighton

Joseph Chamberlain sixth form college, Birmingham

New Stobhill Hospital, Glasgow

Velodrome, Olympic Park, London

Housing - The Housing Design Awards partnership, supported by Government, runs the Housing Design Awards which aims to celebrate and reward excellence in new-build housing design. Information about the scheme and recent and past commendations is found at - [http://www.hdawards.org/](http://www.hdawards.org/).

Industry partners, House Builders Federation, Design Council CABE, Design for Homes also run the Built for Life scheme which aims to give the homebuyer confidence that important design elements of new homes have been checked during the planning process. Further
information including recognised new-build housing schemes is here 
http://www.builtforlifehomes.org/

Parks and green spaces - The Green Flag Award Scheme, launched in 1996, is the national benchmark for quality public green spaces. It is highly regarded and credited with being a cost effective way to raise the quality of urban green space and local people’s engagement with it. The Scheme is recognised and used by the majority of local authority green space managers and increasingly by community and voluntary groups. The Scheme is not a competition or a means to rewarding excellence; it delivers a recognised and consistent standard for green space. The Scheme has predominantly covered parks and community gardens, but its range extends to woodlands, nature reserves, allotments, cemeteries and open spaces around social housing. This year (2015) over 1500 sites were successful in reaching the standards required. The Scheme is currently run, under licence from DCLG, by Keep Britain Tidy. Further information is available here -
http://www.greenflagaward.org.uk/

The Landscape Institute Awards aim to encourage and recognise outstanding examples of work by the landscape profession. Further information about the scheme and recent and past commended schemes is here - http://www.landscapeinstitute.co.uk/awards/

Heritage - The Angel Awards, supported by Historic England and co-funded by the Andrew Lloyd Webber Foundation, celebrate the efforts of local people in saving derelict and damaged historic buildings and places. Further information about the Awards and recent and previous winners is here https://historicengland.org.uk/news-and-features/angel-awards/.

Planning - The Royal Institution of Town Planners runs the Awards for Planning Excellence scheme designed to encourage and reward outstanding achievement in planning. Information about the scheme and recent and past commended schemes is here - http://www.rtpi.org.uk/events/awards/.

Architecture - The Royal Institute of British Architects annual Awards, including the Stirling Prize, recognise excellence in Architecture. Further information about the Awards and recent and previous commended schemes is here - https://www.architecture.com/RIBA/Awards/Awards.aspx

Built environment including public realm - The Civic Trust Awards aims to recognise high quality architecture, design, planning, landscape and public art where this has made a positive cultural, social or economic contribution to the local community. Further information about the scheme and recent and past commended schemes is here - http://www.civictrustawards.org.uk/
Urban areas - The Urbanism Awards, run by the Academy for Urbanism, aim to identify, promote and share lessons from great places. They aim to recognise the best and most improved urban areas. Further information and commended schemes is here - http://www.academyofurbanism.org.uk/awards/

**Baroness Whitaker:** Some good examples of local authorities engaging the public in the planning process and of neighbourhood planning.

In this section we have provide details of 4 Local Plans and 4 neighbourhood plans which were prepared innovative ways of engaging and consulting local communities.

Local Plans

**Winchester - Local Plan adopted March 2013.**

In 2010 Winchester Council designed and introduced a Blueprint as a new community engagement toolkit. The toolkit aimed at helping local people to tell the Council what they think their local communities need now and in the future. It asked the local community to consider the needs of different people, how their needs may be supported and how things may need to change so that emerging planning policies reflect local requirements. The Council also prepared Blueprint 'packs' to help Parish Councils and local groups to run their own discussion events.

The Council challenged people to put themselves in the position of others and to help provide focused responses. Using the toolkit the community discussed the role of characters in their local area and how their housing, employment and community requirements may change over the longer term and whether their needs are, or should be met in their local area. Parish Councils and local groups were encouraged to run their own events and many took the lead by not only organising their own events, but encouraged other local groups and individuals to participate.

The planning engagement project ‘Blueprint’ won a regional Royal Town Planning Institute (RTPI) award in 2011 for its innovative approach to the planning process.

**Tower Hamlets - Local Plan adopted September 2010.**

Tower Hamlets Council strive to undertake consultation that is suitable in exploring key planning matters and is inclusive of all communities within the local area.

In 2010 the Council uploaded a short animated film to its website to make it easier for Tower Hamlets residents to understand how they can have their say on local planning issues and get involved in consultation activities. The Council included links to YouTube where the
animation is available in both English and Bengali and with subtitles; on YouTube these animations have a combined viewing total of 2,695.

More recently in March 2015 the Council uploaded a short film called Looking to the Future: Raising Aspirations in Tower Hamlets in order to help parents, carers, children, young people and school staff discuss the importance of having aspirations to raise achievement. The aim of the film is to improve outcomes for individuals, their families and the wider community. On YouTube this short film had a viewing total of 192.

Harrogate - Local Plan adopted February 2009 and is expected to be reviewed in 2016

Brandon Lewis MP wrote to Harrogate Council in March 2015 to encourage them to maintain their efforts on the review of their adopted Local Plan and to offer support from the Planning Advisory Service. In the past the Planning Advisory Service have helped the Council to scope and run an event to plug in to their existing Parish and other groups.

The Planning Advisory Service have helped the Council to scope and run an event to plug in to their existing Parish and other groups.

The Council has started working towards a new Local Plan for Harrogate district and in March 2015 they went live with their new online consultation system. To support the consultation process the Council have published several ways for the local community to get involved this includes registering directly with the Council to receive notifications when consultations start.

The Council distributed details on the Local Plan consultations with Council Tax and Business Rate information in advance of the first consultation setting out, how to register on to the consultation database and where to view the documents on the website.

Ashford - Existing Local Plan adopted July 2008. The Council are currently reviewing the existing plan and preparing a New Local Plan for the Borough; it is expected to be published for public consultation in early 2016.

Taking the lead from the award-winning idea from Winchester Council, Ashford have created a set of ‘characters’ to represent a cross section of a local community – all with different situations and issues that need to be addressed. The idea is that people can use these characters to communicate their own aspirations but also think about issues that might affect others in their community. There is also the ability to create your own character. The Plan-It consultation links closely with the government’s approach to neighbourhood planning.

The Council has sent Parish council’s a copy of the Plan-It consultation documents and information about how to complete it.
Neighbourhood Plans

Tattenhall, Cheshire West & Chester

The Tattenhall Parish Council wanted to engage with the teenagers in their village so that their views could be represented in the neighbourhood plan. To achieve this, the parish council held a disco in a warehouse loaned to them by a local property owner. The price of entry to the disco was to complete a survey, and in total 62 responses were submitted. These surveys provided invaluable feedback on retail and sports facilities and bus services amongst other issues.

Uppingham, Rutland

In Uppingham, the town council was not struggling to engage with teenagers in the development of their neighbourhood plan, as they readily contributed their views on social media. However, they found it hard to engage primary school children, who would be impacted just as much by a plan with a lifetime of more than a decade. Members of the plan steering committee therefore held discussion sessions in the local schools, leading debates on open-ended questions about the area. A number of interesting issues emerged on topics the adults had not considered, such as where children did not feel safe, how green spaces could be improved and where wireless signal was poor. All these views helped inform policies in the final neighbourhood plan.

Downham Market, King’s Lynn and West Norfolk

When Downham Market first decided to produce a neighbourhood plan, they wanted a way to quickly inspire and engage the community, as well as finding out what it was they were most interested in and what they wanted dealt with in their plan. They decided to take advantage of the fact that the town hall was due to be repainted to invite the whole community to attend an event whereby they could all draw, paint and write their ambitions for the town on the walls. This inspired a great outpouring of ideas that helped set the agenda for the development of the plan. The next day, the walls of the town hall were painted over, but not before photos were taken of all the ideas.

Heathfield Park, Wolverhampton

In the deprived inner city area of Heathfield Park, those preparing the neighbourhood plan needed a way to engage those living on the local estates. Working with local specialist manufacturers, they produced a 3D model of the area and its buildings, alongside models of proposed new developments. The models of existing buildings were coloured black and the future buildings orange (in homage to Wolverhampton Wanderers), and this provided a great way to visualise the neighbourhood in a simple and accessible way. It allowed people
to understand the impact of development and the power they had to shape it, and inspired high levels of engagement with the neighbourhood plan.

Although Public Health England does conduct some primary research relating to the built environment, particularly in the field of environmental hazards, it mainly commissions a range of evidence reviews and tools to guide and support local practitioners in the delivery of key policy aims.

Public Health England have summarised below a range of factors in the design and access to the built and natural environment which have an impact on health, including:

Healthy Communities and Neighbourhoods: Design of the Public Realm

Transport and Active Travel

Housing

Healthy Food Systems

The table below is a summary of the evidence according to the four dimensions noted above, adapted from existing literature:

<table>
<thead>
<tr>
<th>Healthy Communities and Neighbourhoods</th>
<th>Walkable built environment is supportive of physical activity, including walking and cycling for active transport and leisure; Walkable neighbourhoods positively influence overall mobility and physical activity levels of older adults Having access to a variety of amenities within close proximity of home makes active transportation and physical activity more convenient; Enhancing street connectivity can promote social cohesion and sense of community, as well as active transport; The location and treatment of green and open spaces facilitates contact with nature, as well as contact with the community. Proximity of housing to noisy areas can result in sleep disturbance, fatigue and other mental health problems.</th>
</tr>
</thead>
</table>

Page 604 of 1964
| Healthy Natural and Sustainable Environment | A loss in biodiversity and biological productivity can result in direct negative impacts on health, such as the loss of the mental and physical benefits of being in and viewing nature; Research supports strong relationship between exposure to nature and reduction of stress, chronic diseases, anxiety and helps cognitive function; Vegetation has the potential to clean air of pollutants and consequent promote health and wellbeing; Vegetation can have cooling effects, reducing impacts of extreme heat events on health; Green spaces can help mitigate against flooding and assist in the delivery of sustainable environments; More deprived areas have less access to green space therefore less opportunities to harness the benefits of exposure to green space and nature, and are also more exposure to air pollution. |
| Transport and Active Travel | Traffic calming methods, such as narrow traffic lanes and residential traffic diversion can reduce traffic speed and volume which reduces pedestrian and cyclist injuries and encourages active transportation; Traffic reduction measures can also have positive impacts on reduction of air pollution and noise pollution; Expansion of out-of-town centres can have a negative impact on active travel, particularly levels of walking and cycling, consequently reducing opportunities for physical activity. Traffic volume contributes to community severance and makes it harder to maintain social networks. |
| Healthy Food Systems | There is a link between exposure to unhealthy food options and unhealthy eating, as well as increasing levels of obesity; There is a clear link between deprivation and obesity; Research suggests that small scale urban agricultural activities can promote local access to healthy food and can support the building of community networks and increase in social interaction. More deprived neighbourhoods and neighbourhoods with lower built environment quality seem to also be linked to higher alcohol consumption. |
| Healthy Housing | Energy efficient housing helps people afford to live comfortably in their homes and avoid illnesses that are caused by cold and damp housing conditions; |
Adequate quality housing with suitable ventilation contributes to good indoor air quality by reducing the presence of contaminants such as dust mites, mold, as well as other chemicals; Evidence shows that elderly people and children seem to be more vulnerable to poor housing conditions; Evidence shows that the highest proportion of “non-decent” homes is within the private sector, particularly the private rented sector. Homeless people suffer from a disproportionate amount of ill health and make significant use of health resources.

Sources: adapted from:

Other sources of evidence

The reorganisation of the public health system as part of the Care Act 2012, and the new responsibilities which local government has for the public’s health, provides a new context and an opportunity for developing good practice in the integration of health, planning and design into the built environment.

The Office for National Statistics has been measuring national wellbeing since 2011 and this is recognised in their measurement framework, which was developed on the back of a national debate on what matters to people in their lives. The framework includes objective indicators of progress related to the built environment and where we live e.g. levels of crime, greenhouse gas emissions, access to and use of the natural environment and access to transport. These indicators are augmented by people’s subjective view of progress and of their life experiences in this area e.g. fear of crime, satisfaction with accommodation and sense of belonging to the community. [http://www.ons.gov.uk/ons/guide-method/user-guidance/well-being/publications/index.html](http://www.ons.gov.uk/ons/guide-method/user-guidance/well-being/publications/index.html)

Baroness Finlay of Llandaff: Body of literature and research on the built environment, brought together from different disciplines – is this collated and if so where?

The link below provides a body of literature on the built environment that has been commissioned by Her Majesty’s Government.
Lord Woolmer of Leeds: Estimates of what proportions of housing (new and existing) will be social rented and private rented over the next 15 years.

Since 2010, over half a million additional homes have been delivered in England. More than 260,000 affordable homes have been delivered since April 2010, including nearly 186,000 homes over the last four years through the Government’s affordable homes programme with £19.5 billion of public and private investment. This achievement is 16,000 homes above our target.

The Government has also taken action to increase supply and improve choice, quality and cost in the private rented sector through up to £10 billion of Housing Guarantees supporting investment in large-scale, professionally-run private rented and affordable homes. The £1 billion Built to Rent Fund is helping to fund up to 10,000 new homes for private rent and has supported delivery of over 4,070 homes to date.

The most recent English Housing Survey report, shows that in 2013-14, of the 22.6 million households, 64% were owner-occupiers, 19% private renters and 17% social renters.

Going forward, the Government is committed to helping more people to own their own home including extending the Help to Buy schemes, extending right to buy to tenants in Housing Associations and delivering 200,000 Starter Homes exclusively for first-time buyers under 40 years old.

We have also committed to further increasing housing supply including 275,000 affordable homes between 2015 and 2020 and doubling the number of custom and self-built homes by 2020.

We will be doing further work to progress these and other housing-related commitments ahead of the Spending Review in the Autumn 2015. This will draw on evidence from a range of sources including:

Department for Communities and Local Government’s house building stats: https://www.gov.uk/government/collections/house-building-statistics
Department for Communities and Local Government’s stats on the housing market and house prices: https://www.gov.uk/government/statistical-data-sets/live-tables-on-housing-market-and-house-prices

26 October 2015
1. How will the Housing Growth Partnership assist in the entry of smaller house-builders into the market, and what progress has the Partnership made to date?

The Government recognises the issues that Small and Medium size Enterprise (SMEs) face in accessing development finance. It has already put in place a number of initiatives to help SMEs builders access the finance they need to build more homes and grow their businesses including through the Housing Growth Partnership. This is a partnership between the Homes and Communities Agency (HCA) and Lloyds Banking Group to help smaller builders access the finance they need to build more homes and grow their businesses. It will provide £100m of funding from Lloyds Banking Group and the HCA and is supporting the growth of SME house builders and expansion in the UK housing stock. It aims to support around 50 investments, with the aim to provide an additional 2,000 homes. It is early days but Lloyds report that demand has been strong with a number of deals in the pipeline.

In addition, the Autumn Statement announced further measures to support SME builders including the Housing Development Fund which aims to provide access to £1 billion of loan finance for up to 5 years supporting the delivery of 26,500 homes through to 2024-25. The new fund brings together and expands the Builders’ Finance Fund and Custom Build Serviced Plots Fund providing added flexibility to enable the Government to support emerging markets. We are working now to further develop the fund which will be introduced later this year.

2. Are design policies and priorities within the National Planning Policy Framework likely to be subject to any change as a result of the current NPPF consultation? Will the present level of emphasis on design be maintained?

No, we are not proposing changes to the design policies and priorities within the National Planning Policy Framework as part of the current consultation.

We continue to attach great importance to improving the design quality of new homes and neighbourhoods and believe that the strong messages in the National Planning Policy Framework and planning guidance should be retained.

We are also showing strong leadership and commitment to design through our housing programmes by encouraging good design through our support for the
development of large sites such as at Ebbsfleet, promoting good design through our Starter Homes programme, involving design experts to ensure that the Government’s estate regeneration programme improves the design quality of homes and the local area and encouraging industry-led innovation through the government’s support of the Housing Design Awards.

3. What are the pros and cons of recent changes to permitted development rights which have increased the potential for office to residential conversions? What tools are available to mitigate and manage any potential negative aspects?

Permitted development rights play an important role in the planning system, providing flexibility, reducing bureaucracy and allowing the best use to be made of existing buildings.

The permitted development right for the change of use from office to residential has been successful in achieving what it was intended to do – simplifying the planning process to encourage more conversion proposals to come forward. The policy delivers much needed additional new homes, while making the best use of brownfield sites and reducing the pressure to build on greenfield land.

Since April 2014 there have been nearly 4,000 permissions under the temporary right. The British Council for Offices estimates that the right has resulted in 7,600 homes.

These new homes are additional to the range of measures we have announced to support affordable homes to buy or to rent. We expect local planning authorities to continue to plan for affordable housing to meet local need.

To support our aim to deliver one million new homes by 2020 we announced in October 2015 that the temporary permitted development right for the change of use from office to residential would be made permanent.

The right allows for the local authority to consider whether transport and highways impacts of the development; contamination risks on the site; and flooding risks on the site.

Local planning authorities have planning powers to make an Article 4 direction to remove the right where it is felt that it is necessary to protect the amenity or wellbeing of an area. This can be in respect of an individual building or an area.

It is open to Parish Councils and Neighbourhood Forums to discuss with the local planning authority the scope to bring forward an Article 4 direction in respect of individual buildings or groups of buildings in their area. Evidence gathered as part of the Neighbourhood Planning process can support such discussions.
4. What levers are available to the Government to promote healthy design and outcomes within the planning system? What levers are available to local authorities – and to what extent will central Government ensure that health is given an appropriate level of priority within local planning?

The link between planning and health has been long established. The built and natural environments are major determinants of health and wellbeing. The importance of this role is highlighted in the promoting health communities section of the National Planning Policy Framework.

Our planning guidance also highlights the range of issues that could be considered through the plan-making and decision-making processes, in respect of health and healthcare infrastructure and recognises the importance of close co-operation between planning authorities and health professionals to deliver each other’s objectives.

In order to support action on health through the built environment, Public Health England has published or co-produced a series of guides, evidence briefs and reviews that recognise the role of the built environment and has been working with NHS England on the Healthy New Towns Programme.

The move of public health teams into local government is an opportunity to improve the health of local communities and address some of the most pressing health issues. This new context provides a strong base for good practice in the integration of health, planning and design, as well as engagement with the local community.

5. Given the increasing role played by viability assessments, can the system of developer planning obligations still deliver enough affordable housing, and supporting infrastructure, to meet the needs of communities?

- Statistics which illustrate trends in affordable housing provision within planning approvals since the introduction of the NPPF.

- Statistics which illustrate trends related to the introduction of Section 106B, allowing the review of affordable housing obligations, in the Growth and Infrastructure Act 2013.

The provision of affordable homes remains a high priority for the Government. In our previous Affordable Homes programme we exceeded expectations delivering 16,000 homes above our target and we have already allocated £1 billion towards our commitment to deliver 275,000 affordable homes by 2020. This will be the fastest rate of affordable housing building in the last 20 years.

We recognise that the supply of affordable homes can be achieved in various ways. The Housing and Planning Bill will require local councils to sell high value vacant
properties once they became vacant, and once sold to use the proceeds from these sales to build a more affordable property on a one-for-one basis. In addition to building new replacement homes cash raised from these sales will also fund the Right to Buy extension discounts.

A ‘Right to Build’ in the Housing and Planning Bill will also help increase housing supply and diversify the housing sector by giving people the right to be allocated land with planning permission for them to self-build or commission a local builder to build a home that is tailored to their specific needs. We are committed to doubling the number of custom-built and self-built homes in England by 2020. The Bill will also give over 1.3million housing association tenants the right to buy their homes.

Our ambitious package of housing programmes, including the Help to Buy scheme, have already helped more than 100,000 households buy a home. In a further move to support aspiring homeowners we introduced in March 2015 a new national starter home exception site planning policy to provide more discounted, high quality homes for young first time buyers. Our manifesto committed us to build 200,000 Starter Homes by 2020, exclusively for first-time buyers under 40 at a minimum 20% discount on market value. We are bringing forward a major package of planning reforms through the Housing and Planning Bill and national planning policy changes (which we are currently consulting on until 22 February); and providing targeted funding to deliver this commitment.

In August 2015 we announced a £36m Government funding to pave the way for the first wave of Starter Homes; deliver top-quality designs and show aspiring young homeowners the different types of properties they can come to expect from the scheme. This will help to accelerate Starter Home delivery, leading to hundreds more homes being built for young first time buyers over the next three years.

Our initiatives which help support home ownership will not only help buyers get onto the property ladder, but will also accelerate further output across the industry enabling both affordable and market homes to be built.

Infrastructure investment underpinning economic and housing growth plays a critical role in shaping the built environment. National planning policy is clear that Local Plans should be supported by evidence to establish what level of infrastructure is needed to support all the development proposed for the area and how it will be delivered. It is for each authority to assess whether adequate infrastructure exists or can be created to support whatever development it is minded to approve. We have already achieved much to ensure that the necessary infrastructure is provided for in new housing: 66% of authorities have an adopted Local Plan in place.
We do recognise that some large strategic sites still need Government support to deliver the necessary infrastructure. Our large sites programme has unlocked sites with capacity for over 100,000 new homes. We have supported the Ebbsfleet Development Corporation to support delivery of a garden city of up to 15,000 new homes in Kent – making the most of the first high speed rail line in this country. And we have been working with local leaders to support the housing potential around the new High Speed 2 stations. We have also provided capacity funding for new garden towns and communities at Bicester, Basingstoke and in North Northamptonshire with the potential to deliver at least 40,000 new homes.

We do need to use the planning process to ensure funding for infrastructure comes forward and capitalise on the community infrastructure levy. There are now 102 charging authorities – including the Mayor of London and over 200 authorities in total making significant progress on bringing forward the levy. We are currently reviewing how the Levy is operating and how it can better allow us to better support the Government’s housing and growth agenda.

The National Infrastructure Commission will meet the need for a coherent, overarching and independent process for assessing the UK’s long-term infrastructure needs. The Commission will have a mandate to examine all sectors of economic infrastructure. It will consider the potential impact of infrastructure decisions on housing supply. This will support a more structured and efficient way for infrastructure needs and priorities to be reflected in planning policy.

**Statistics which illustrate trends in affordable housing provision within planning approvals since the introduction of the NPPF**

We do not hold information on the level of provision within planning approvals. The below table shows all section 106 nil grant completions in England over the last three years. We do not have comparable data for further back than this. However, they may serve as useful illustration. The year-on-year change will have been driven by the improvement in market conditions and the overall increase in house building over the same period – so it would be inappropriate to present these changes as a result of the Framework.
New build affordable housing delivered through Section 106 (nil grant completions, England)

Statistics which illustrate trends related to the introduction of Section 106B, allowing the review of affordable housing obligations, in the Growth and Infrastructure Act 2013

We do not collect information on renegotiations, and there have been under 50 appeals under section. The below table shows the number of residential units on ‘stalled’ sites, which the developer has described as “shelved/on hold”, since December 2013. It is not possible to say how much change is due to section 106B. The numbers of units on sites with permission, and the number of additional units completed have increased, and generally market conditions have improved, over this period. It would therefore be inappropriate to present these changes as mainly a result of section 106B.

6. First, do you believe that if we are going to carry on with viability assessments there should be a standard format with, for example, an agreed acceptable maximum level of profit margins and market information so that everyone knows what the parameters are?

The National Planning Policy Framework is clear that to ensure scheme viability, the costs of any requirements likely to be applied to development, such as requirements for affordable housing and infrastructure contributions should, when taking account of the normal cost of development and mitigation, provide competitive returns to a willing land owner and willing developer to enable the development to be deliverable.

Source: DCLG analysis of Glenigan data on residential development
Competitive rates of return can vary between projects to reflect the size and risk profile of the development and the risks to the project.

The Framework and national planning guidance sets out the policy principles relating to viability assessment. There is also a with a range of sector led guidance on viability methodologies in plan making and decision taking which is widely used by the development sector.

7. Secondly, is it important that developers know right at the beginning what costs they are going to have to meet? Of course, this Government got rid of the Code for Sustainable Homes and the requirement for zero-carbon homes by 2016, so developers are not now putting money aside to invest in sustainability, which is also a welcome government requirement. Without building requirement updates, how are you going to make sure these viability assessments have any legs? Will there be a standard format and are you going to update building regulations?”

National planning policy continues to have an important role to play in setting standards for resilience, sustainability and design. We have a well-respected and effective set of Building Regulations which ensure health, safety and welfare in buildings. These cover fundamental aspects of building performance including structural safety, fire safety, energy efficiency, public health and accessibility, and apply to both residential and commercial buildings.

The Building Regulations are kept under review and we have a research programme which supports this process. Current projects include work on fire safety, ventilation and accessibility, and we are considering what other areas of work we should be undertaking in this Parliament.

Furthermore, the Energy Performance of Buildings Directive requires all new buildings to be nearly zero energy from 31 December 2020, and public buildings to be nearly zero energy from 31 December 2018. In order to meet those commitments, the Government has said that it will keep the energy efficiency requirements in the Building Regulations under review.

The review of housing standards focused on keeping the best and most important of the technical standards for new homes that local authorities used to apply through the planning system and moved them into a new form of “optional” building regulation. These will only be applied where there was a local plan policy based on evidenced local need, and where the viability of development is not compromised.

Policies for seeking planning obligations should be set out in a Local Plan, Neighbourhood Plan, or in relation to London, the London Plan, to ensure that these have been tested through public consultation and independent examination.
Where authorities charge the Community Infrastructure Levy, applicants will know up front the level of levy that is liable for their development.

In the Autumn Statement of 2015, we made a commitment to bring forward proposals for a more standardised approach to viability assessments.

8. Some information about the Government’s proposed reforms to compulsory purchase arrangements; in particular, the Committee is keen to know whether the proposed changes will offer greater potential for local communities to benefit from development (and potential uplift in value) of the sites in question.

Phase 1 of the government’s programme for compulsory purchase reform is mostly in the Housing and Planning Bill. These changes are largely focussed on process improvements, not compensation. Phase 2 of the Compulsory Purchase Order reform programme will extend beyond further process improvements. While I cannot pre-empt the outcome of consultation on a paper which we will be publishing shortly, I can confirm that as part of this second package, the Government is considering and will be consulting on how to ensure that compensation in relation to compulsory purchase can be assessed in a way which is both clearer and fairer, for example, ensuring that the public purse will not have to pay for the uplift in land values caused by public expenditure on associated infrastructure.

(Key: NP -Neighbourhood Plans, CRtB - Community Right to Build Orders, NDO – Neighbourhood Development Orders)

- A list of pre-conditions regarding land permissions
A list of requirements that may have to be met before an applicant can implement a planning permission is outlined below. Whether these requirements apply will depend on the specifics of each case.

- Discharging any pre-start conditions e.g.
  - Remediation of site contamination
  - Archaeological investigation
  - Approval of landscaping or drainage scheme
  - Approval of building materials

- Obtaining non-planning consents e.g.
  - Traffic regulation orders
  - Species licenses
  - Listed building consents

- Off-site infrastructure works e.g.
  - Utilities
  - Flood defence scheme

- Completion of any legal agreements e.g.
  - Section 106 (of the Town and Country Planning Act 1990) agreement for planning obligations
  - Section 278 (of the Highways Act 1980) agreement for highways improvements

14 January 2016

Examination of Witness

Brandon Lewis MP, Minister of State for Housing and Planning, DCLG

Q330 The Chairman: Good morning. Thank you very much for coming. I know how hectic it has been, and as a result it has been hectic for us too, so we are both in the same sort of position. We welcome you most sincerely. If we do not manage to cover all the points that you think we should in the curtailed time we now have, I hope you will write to us or get someone to write to us. Also, I think we are probably going to request to see you some time in late February, if that can be organised, because there are lots of unjoined-up issues – but we will see how we get on today.

This is the final evidence session of the Select Committee on National Policy for the Built Environment. You have in front of you a list of the interests that have been declared by members of the Committee. There is an additional interest from Lord Inglewood.

Lord Inglewood: I have just been appointed president of the Ancient Monuments Society and feel that I should declare it.

The Chairman: Congratulations. We are being broadcast on the parliamentary website and a transcript of the meeting will be taken and published on the Committee website. You will have the opportunity to make corrections, where necessary, to the transcript.
How does the Government’s policy agenda, particularly the deregulation of planning, help to support better outcomes in the built environment? How does it seek to balance the need for new housebuilding with other priorities?

Brandon Lewis: In opening, thank you for inviting me to give evidence and to contribute today on the work you are doing on the national policy for the built environment. I also appreciate your patience with us, particularly today as my right honourable friend, the Secretary of State for the department, is making the local government financial settlement Statement. Obviously protocol dictates that I should be there, so I am happy to deal in writing with any questions we have not covered by the time I need to leave just before 11 am. I note your comment about February, and in principle I am very happy to come back and give evidence in the future.

The Chairman: Thank you.

Brandon Lewis: On the question you asked, we do attach huge importance to improving the design of homes and place. I have spoken personally on this on the Floor of the House of Commons and actually more widely at conferences, because I think we need to make sure that we move away from what has sometimes happened in the past: we see very nice homes being built, but ultimately they are housing estates, and we need to get back to building communities. I have visited far too many developments—I have them in my own constituency—where there are some very nice homes that people enjoy and love, which is great, but people leave their house, get in their car, go to work, go to do their social engagements, get back in the car, go home, go indoors and never meet their neighbours. If, on the estate, there is a piece of open ground, at some stage somebody at the council has put a sign on it saying, “No ball games”, “No children”, “No looking”, “No touching”, et cetera. We have all seen those. Actually making sure we are getting back to building proper communities—and that is happening—is really important. There is a big onus on local authorities and developers themselves to play their part in doing that. I want to make sure, through a locally led planning system, that communities have the power that they need to make sure they can reflect those kind of local aims, desires and, quite rightly, needs.

Since 2010 I would make the case that we have made significant progress not only in speeding up and simplifying the planning system but in putting local areas back in charge of those kinds
of things through their local plans and, I would argue more powerfully in this regard, through neighbourhood planning, which is really starting to get a grip across the country. 125 areas have now gone through a referendum in that process and some 1,600 areas are still going through it at the moment.

What we have done as well is made a range of reforms to the process that I think are giving these kinds of results. Over 240,000 homes were given planning permission last year through a locally-led system. What people are doing, because local communities are more involved, particularly through neighbourhood planning, people are actually contributing by giving their views on how to bring communities together and how to make sure that any development is contributing to their communities and not becoming an adverse impact. I think that is the way we go forward.

Ultimately central government has its part to play. We have a very loud voice and I think we should use that voice, but it is also for local authorities and developers themselves to take responsibility to make sure that they are building and masterplanning. We have a role in masterplanning obviously in areas such as Northfleet, Ebbsfleet, Northstowe and elsewhere, with the garden city developments and new settlements generally. But local places should also feel that they have the power to do that, so that we will end up building communities not just for the residents but for the people involved in the process, so that they can look back later and feel very proud of creating a community. There are some very good examples of that coming through now.

Q331 The Chairman: We have had two site visits where we have seen that: one in Elephant and Castle and one in Birmingham. They are very impressive, because obviously the people on the ground want exactly what you want.

Brandon Lewis: I am sorry to interrupt, but I think that is a really important point. Whether you are looking in London at Elephant and Castle, the Packington estate in Hackney, or City Mills, there are some really good examples of where regeneration work is doing that. Equally, if you go out of London whether it’s Poundbury, or to Didcot and the new garden town we announced there, there are some really good examples of where people are getting involved and creating proper community structures.

The Chairman: We are going to Poundbury once we have finished our report.
Brandon Lewis: I am a big fan of that.

The Chairman: You said that 125 communities are doing that, or at least that they are planning it.

Brandon Lewis: One hundred and twenty-five have now passed a referendum and are done and finished, and there are about 1,600 going through the process.

The Chairman: How many others are there? When you give figures like that, we want to get some sort of idea of what percentage of areas might end up being finished.

Brandon Lewis: At the moment, of the 125 that have gone through, every single one that has gone to referendum has been approved. I can confirm these figures for you in writing, but the approval rating for neighbourhood plans is about 88%, and that is on a percentage turnout in the higher 30%, touching 40%. Most local councillors—and I have been one myself—would really like those kinds of figures of touching 40%, with an 88% approval rating. That is really good, bearing in mind these are happening not at the time of another election but generally these are happening every week, where you would expect turnout to be very low. Actually it is much higher than a local council by-election anyway. That is good news. The 1,600 covers about 6.2 million people around the country, so there is still a long way to go.

We are using the National Association of Local Councils, again in those 125, and parish and town council organisations to spread the word and getting those that are working with us doing roadshows around the country to go out and talk to areas about why this is a good thing—it is not the easiest thing an area will ever do, but it has weight in law so it has to be robust, but it is worth doing and it is not necessarily as difficult as people might think—to encourage more areas to do it.

Q332 The Chairman: Finally, because we have to rush this session, where did the idea of a referendum begin? How did it crop up? Has there been a willingness on the part of most councils to have a referendum, because I guess it is the councils that will have to run one? What has been the response from Mr and Mrs on the street?

Brandon Lewis: From the very beginning, neighbourhood plans have had to have a referendum. Without a referendum they are not binding. That was about making sure that the entire local community was involved in the neighbourhood plan and had a chance to have its say. Generally when we talk to areas doing neighbourhood plans or areas that have done...
them, we find that they get more people involved than before. Planning tends to involve people. If somebody is talking about building in their area, people take an interest. They are getting more people involved in their villages and areas than they have had before. That is a good side benefit as well. The referendum means that everybody is involved. So everybody in the relevant community gets a say on that plan, so it is absolutely the community’s plan. The local authorities do run it. We have had one or two councils—and I mean literally one or two—who have not been keen to let a particular parish get on with its neighbourhood plan and have delayed the referendum by one and two years. In the Housing and Planning Bill, we are taking powers to deal with that so that a local authority cannot prevent a neighbourhood plan going forward in an unreasonable way in the future.

The Chairman: That is very useful. Thank you very much.

Q333 Lord Inglewood: Might I turn to a topic that no doubt you are thinking about a lot: housing? It is slightly startling that there is a significant gap between the number of homes for which planning permission is granted and the number that are actually built. Do you have any thoughts about that and, in particular, any thoughts about how you might speed up the process from permission to construction?

Secondly, we know that there are problems in finding sufficient sites in urban areas on brownfield and so on, which in turn appears to be threatening the green belt. Are you as resolute in defence of the green belt as previous Governments have been?

Brandon Lewis: Yes, is the short answer to the last part of the question. In fact, I think we have gone further. Certainly towards the end of the last Parliament we strengthened the guidelines on the green belt. We also need to be very clear that green belt has remained at around 13% of the country in total, and to remove any piece of land from green belt a local authority has to prove exceptional circumstances and it has to do it through a very proper process, which means consulting local people. The amount of green belt that has been used over the last year period is 0.01%, so it is a very, very small amount. But overall, it has stayed pretty steady. It remains a very important part of our planning structure. It prevents urban sprawl and it provides a lung around communities. So whether it is green belt, or indeed a green wedge in some areas—obviously some parts of the country do not have green belt—it has a very important part to play in keeping the identity of areas quite sacrosanct.
One of the things that we are doing about the gap at the moment—I have been working on this for a while now and will continue to do so with the Campaign for the Protection of Rural England—they have identified a huge amount of brownfield land and so have we: we have made a pledge to get 90% of that into planning permission in this Parliament. Through the Housing and Planning Bill, we are making brownfield land easier and more attractive to develop on both by having a brownfield register and indeed planning permission in principle, both of which are in that Bill, which will come to your good selves in due course to discuss and look at. All of that will make brownfield land that bit more attractive and easier to develop.

Lord Inglewood: Sufficiently or just a bit more?

Brandon Lewis: Significantly. The change of planning permission in principle and having a brownfield register that is transparent, clear and in the public domain is a substantial difference, particularly planning permission in principle, where you move away from having a piece of land where it might be said, “Look, you might be able to get planning permission, if you are lucky with the council, on this brownfield land that everybody is happy to have developed”, to knowing that you can build houses there. The debate on your plan is then what the houses will look like rather than whether you can build. In terms of access to finance there is quite a big shift.

Lord Inglewood: Do you think it will drive forward the process of turning consent to construction?

Brandon Lewis: That is the other side of it. Coming on to your opening query about the gaps between consent and construction, I think that is a really complicated area and I think there are several things going on. What I am going to say now is not an exhaustive list, but it gives a flavour of the larger issues there. We have had in the last year a record number of homes getting planning permission—over 240,000—but we are still building out almost 100,000 less than that. I think there are a few things going on. One of those is that some of those planning permissions will be very large sites where 2,000 homes are given planning permission, but obviously they are not going to build out 2,000 homes in a year. I want to see build-out rates increase from the average of 48 per site per year, but I do think that even I wouldn’t imagine that we are going to get to 2,000 a year. That is one part of it.
That is added to by the fact that within that the 242,000-odd homes given planning permission are on less sites, which means that we are getting more larger sites, which expounds that problem. One of the things that we are doing, and that I have been doing at various conferences, is talking to local government about making it more aware, particularly in its local plans—indeed, neighbourhood plans have a part to play as well—of identifying more small sites, because they get built out quicker and are normally more appreciated by the local community as well.

**Lord Inglewood:** Is there the capacity?

**Brandon Lewis:** Yes, there is. One of the challenges we have is because developers prime business model means that they will tend to build out, on average, 48 homes a year on any given site, so if there is a site of 900 homes with one developer, it will take 15 years. If you have three developers building 300 each, they will do it in five years. Therefore, local authorities need to look at that. I visited Didcot last week. That is a site where over 400 homes were built out in a year, but it has four developers on the site competing with each other to build in a high-demand area, so it can be done. We need to encourage more of that. We also need more small sites. We also promised and said in the Autumn Statement, and in the productivity plan that we published last summer, we want to look again at the planning process, not policy but the planning process, because one of the other challenges is that you can get planning permission but you can then spend a year or two discussing and debating a Section 106 agreement, pre-start conditions and various other bits and pieces. We need to look at condensing that so we still get the right result but do it without too much slowing down of bureaucracy. There are various things going on in there and they are things that we are very very focused on. Equally, it is about us as a Government releasing land. That is why we have such a big public land-release programme going on now that we announced in the Autumn Statement.

**Lord Inglewood:** So you are expecting to be able to get the supply and demand equilibrium in balance?

**Brandon Lewis:** My aim and my desire is to see the 240,000-plus permissions going up but also to see the percentage of build out for the year going up. As I say, a whole range of things need to happen for that. Some of those are within central government control, some of those
we are talking about to the development industry because they are in its control, but there is also a very big chunk of that, in terms of how we allocate land, in local government control.

**The Chairman:** Could you give us a list of those additional requirements? You must have one.

**Brandon Lewis:** The pre-conditions and things like that?

**The Chairman:** Yes.

**Brandon Lewis:** It is probably not an exhaustive list, because every time we create one a developer will say this council has given them something else to do. We can give you a flavour.

**The Chairman:** That would be very interesting and useful. Lady Young, you wanted to come in on the back of this one?

**Q334 Baroness Young of Old Scone:** I wanted to explore what the safeguards are going to be for the speeding up of release of small-scale brownfield sites. I understand that there are still going to be conditions at some point in the process, or perhaps I should ask you the question whether there are going to be conditions at some point in the process to look at things such as energy efficiency, the impact on infrastructure, flood risk, biodiversity impact, those sorts of issues? Do they come as part of the technical assessment, which is the second stage, or do they come somehow in this process of them being put on the register? I am sitting in the bank manager’s seat and thinking, “Why am I going to be more reassured if these same hurdles still have to be crossed?” At what point in the process are they going to be crossed and have we a guarantee that they will still have to be crossed?

**Brandon Lewis:** Yes is the short answer, but, to give some more flavour to that, we are not going to be adding any more bureaucracy or red tape to the process. If anything, I want to try and speed it up. But in terms of making sure the land that comes forward for the planning permission in principle will be driven by the local areas, not from the centre; it will be the local council that comes forward with a piece of land that it wants to get into production more quickly. It will nominate this land. It will be driven by it and it will be identified through its brownfield register, or, as it goes forward, it may do it through its local or neighbourhood plan as well. It is very much the case that the local community will say, “For these reasons, we are happy with this piece of land”. I am not going to prejudge how they would assess that, because that is for the local community, but they will have done some element of work to decide that land is appropriate for it.
That does not change the fact that they will still need detailed planning permission, so the
details around the infrastructure, what the homes will look like and whether they have the
right flood protection and that kind of thing, will be done as part of that process. It still makes
quite a significant difference, because, at the moment, even if land is identified in a local plan
and a neighbourhood plan, if a small developer wants to build five or six homes and wants to
get planning permission, they have to go to a lender. At the moment, it costs on average, I
think, £24,000 per plot to get planning permission. So if you are a small developer building
out five or six homes, that is a substantial investment of money to get planning permission
and even if that land is identified in a local or neighbourhood plan, it does not mean in
principle that you will be able to build. You can still be turned down flat on building anything
at all. When trying to get finance, you are going to a bank or a lender and asking them literally
to gamble on planning permission. So no matter how good your business model is, you are
initially taking a very substantial gamble, which is why we have seen a 75% fall in the number
of small developments; that and the financial crash, which has obviously made lending even
tougher. I think we will find this is quite a significant change in the ability to go to a lender
and say, “I know I can build five, six or seven homes here; what I have to work out is some of
the detail of what they will look like. So my business case will have that worst and best case
scenario”. It is a significant change, but the protections regarding detailed planning will still
be there.

Baroness Young of Old Scone: I would find it extremely useful, and I am sure the Committee
would, if we could see an explanation of what stage you would anticipate each of those
factors that I outlined being taken into account, because I am still not clear how, as your bank
manager, I would be reassured if, at the detailed planning permission stage, somebody could
still say, “I am terribly sorry. This is in a flood plain and is not protectable, so it cannot go
ahead”.

Brandon Lewis: Obviously if it is a flood plain without the right protections, it is unlikely that
the local authority would have put that in as a planning-permission-in-principle area in the
first place, but that would be a matter for them locally.

The Chairman: Thank you very much indeed. Lord Freeman?
Q335 Lord Freeman: You have partially answered my question in response to the last one. Evidence given to us by the small housebuilders is that a major constraint is that the clearing banks will not lend them money. What is the solution? Is it the Housing Growth Partnership?

Brandon Lewis: There are a few things. I would not underestimate the problem of a small developer going to a bank to borrow money to gamble, which effectively is what you are doing. I have encountered a lot of situations where very successful small builders have had banks turn them down, not because they do not like their business plan but purely because, until they have the planning permission in their hand, they haven’t got a product. Planning permission in principle is a substantial move in the direction of being able to say, “Look, I might be able to build a development that is going to benefit my bottom line and my profit and loss by X or Y, and it could be anything between those, but within that business plan that is where I am at, and I know I can build something. What I don’t yet know is the detail of whether it will be Tudor, modern, Norfolk-style, etc”. I think that is a very substantial change for lenders.

However, there is more than that. In the Housing and Planning Bill we are making it much easier and we are going to continue to promote self-build and custom housebuilding. That is a huge opportunity for small builders. It is why the small builders’ membership organisations are very keen on it: because obviously self-build and custom housebuilding means very rarely that you physically build it yourself—and I certainly would not trust myself to do that—but that you will use a small local builder. Advanced construction techniques, which we are looking to promote, work very well for the small construction companies, because they can buy, bring in, assemble and finish. Also, in the early summer of this year I extended the Builders Finance Fund, which was predominantly lending to medium-sized and larger builders, and brought it right down so that it is now available to small builders as well and obviously there is also the British Business Bank and other things. We are looking at all these things, and my colleagues and I at the Treasury are meeting builders regularly to make sure that we can do something about that. The fact that it costs £24,000 on average per plot to get planning permission is probably a large part of the problem.

Lord Inglewood: Does that include the costs of those that do not get planning permission, averaged out?
Brandon Lewis: Yes.

Q336 Baroness Whitaker: As you have indicated, it is not merely a matter of getting the houses built; it is what kind of houses they are. I would like to ask you about three interacting developments. First, in the light of the removal and revision of national design codes—my colleague, Lady Parminter, will ask about the sustainability aspect—how can national policy ensure that new developments are well designed? Then there is your consultation on the NPPF, which does not, to my mind, seem to say very much about neighbourhoods. Finally, there is the transfer of responsibility for architecture to you. We very much welcome what you said about enabling better communities, but how can these three interacting developments, not all of which appear to be conducive to good design, ensure that more uniformly higher standards prevail in order to build whole neighbourhoods where people can thrive and their economies can prosper? How do you see all that?

Brandon Lewis: Taking the last point first, I would hope—time will tell and you can quiz me on this or take a view on it in due course—that the transfer of architecture from the Department for Culture, Media and Sport to my portfolio is a positive thing, because it makes a very clear statement that the quality of architecture in the delivery of homes is important. I actually think there is also a separate point, which I made at the Royal Institute of British Architects just a couple of months ago, that developers themselves need to be more aware of the fact that good quality design does not necessarily cost more money. There are some very good examples of this. The Chairman mentioned Elephant and Castle a few moments ago, and I mentioned City Mills in Hackney. Both are good examples of where I would make the following case Part of the challenge with the quality of design is that beauty is in the eye of the beholder, and we will not all agree on what we think good quality design is and what attracts us. But if you look at some of the buildings that were taken down in Hackney, which I would argue were immensely ugly, concrete tower blocks from the 1950s and 1960s, and, with the greatest respect to the architects who designed them, I don’t think they did architecture any great favours, are now being replaced—Elephant and Castle is another good example of this—by mid-rise and low-rise developments, street scenes are being brought back and density has been increased substantially and that is thanks to really good quality masterplanning and design. So I have been making the point to developers that they should
invest a little more in architecture in some cases to get good quality design, and not only in London and those kinds of densities; if you look at areas such as Cambridge, Countryside Properties has a pretty good reputation for the way it does environment. It designed a development about 10 years ago in which it gave up space where other developers had wanted to put more houses and did not. Instead, Countryside Properties put in more greenery, wildlife and environmental measures, and it is a fantastic, award-winning example of what can be done. Developers can benefit from that because it increases the value of what they are doing and increases their reputation so that customers will want to buy from them. We can probably all think of developers around the country whose reputation is such that we want to buy from them.

On the development side, I think there is a thing for us to do on an educational aspect. I appreciate that not everybody agrees with this, but I think there is a danger that if we try to dictate good quality from the centre, we will end up with something far too uniform, and often with unintended consequences. I would rather encourage, motivate and embarrass those who get it wrong and do some really bad things, but, equally, this comes back to my opening remarks about moving this to the local. What is absolutely appropriate and beautiful in the City of London or in the heart of London would not necessarily work in a Norfolk village, and what is brilliant in a Norfolk village would not necessarily work in Birmingham or, potentially, Nottinghamshire. We have to make sure that the people in those areas have control over what is right for them.

I also think that sometimes we underestimate the power of the nudge, as they call it. The Committee is going to see Poundbury. For me, that is one of the best examples of good masterplanning. I like the architecture, and different people have different views on that, but I have not heard anybody argue against the concept behind it. Cranbrook, which is not too far from there, is similar. The masterplanning has created residential, commercial and retail mixed use. People are walking to the shops. There is no restriction on cars and it is very easy to drive and park, but because of the way it is masterplanned you are naturally more likely to walk around, and because you are walking around, not only are you healthier and fitter but you get to know your neighbours and you have a community spirit going on, and it really works. That has not come about because somebody in an office like mine in Whitehall has
said you must do it that way; it has come because that local area and the developers there have gone forward and developed in that way. I think we need to drive that kind of local approach.

The NPPF consultation, and the NPPF more generally, reinforces that, because it drives these decisions locally. What is appropriate in both design and masterplanning will differ, in whatever area you are, so it is right that is done in the community. I think I have gone through the three areas.

Q337 Baroness Whitaker: The removal of the design codes will mean the removal of general design principles. Is it your contention that local authorities in small places with not much capacity are better off if there are not some general design principles?

Brandon Lewis: There is the London design code and some of the combined authorities do this, but I would challenge the underlying issue around councils and their capacity. Local authorities have increased their reserves from £13 billion to over £22 billion now. They have done some very good work in some cases around shared management and shared senior administration. They have not scratched the surface of that in their planning departments. I used to lead a small district council and I am an MP for an area with a very small district council. I started trying to do this when I was leading my council and we did not quite finish it when I retired.

I would be the first to say that actually it is untenable for small district councils to have stand-alone planning departments for a couple of reasons, not only financial and what it costs to run, but in an area such as Norfolk where there are a number of small local authorities, it seems to me much more logical to bring them together in one or two single units you get a couple of benefits. One is a cost saving, because we are finding across the country that shared management arrangements save up to 18% on average, but you also get a better resource, because you cannot argue for Great Yarmouth, my area, that you could afford or would be able to recruit specialists in heritage and various other things. If you have a wider group you can have the odd specialist within it and keep them busy.

Equally, you have a better career offer for your planners. When I was leader of Brentwood, we were on the edge of London and the Thames Gateway. It was not about money, but I could not keep a really good planner because they moved to London or the Thames Gateway where
the action is, rather than being in Brentwood where people might extend their house a few feet. You get a much better offer for the employees as well. I think that is absolutely the way forward. Very few councils have done this yet, and I think they need to. They also need to understand regarding where they put their resources; they need also to understand that their planning department is their economic regeneration department. I say that on two levels: either the council is working its money and its planning around the best interests of its community and it wants a well-planned, well-designed community and environment, in which case it needs a good planning department, or the council is effectively run by its Section 151 officer, who wants to keep the council’s coffers full, in which case you need business rates growth, the new homes bonus and council tax, all of which need a good planning department. Whichever point of view you come from, councils need to have good focus on a good-quality planning department.

The Chairman: That is a very comprehensive answer, as indeed all your answers have been.

Q338 Baroness Finlay of Llandaff: I think that leads very neatly to the question I wanted to ask you. You have outlined the problem of the shortfall in resources in the planning sections of councils. What do the Government plan to do to improve the situation along the lines that you have outlined: bringing the resources together to avoid the gaps becoming wider? Linked to that, is there a case for the full devolution of planning fees to local authorities? If you can hold on to those thoughts for a moment, I want to go back to the green space question, people walking and all the health issues that are now so very clear in our society, with lack of exercise, obesity and environmental pollution being major causes of mortality and morbidity and a huge drain on the NHS coffers. There was a paper out this week about cancers and environmental factors being probably much greater than anyone had ever estimated before. How do you plan to marry up at central government level that health agenda with planning for where people live, and make sure that those walking routes and cleaner air routes and so on are there for them?

Brandon Lewis: In terms of the planning fees there was an increase in planning fees in 2012. I said recently on the Floor of the House of Commons in the Committee stage of the Housing Bill that I am going to have a look at some proposals that were put forward by members of the Committee on whether we can have some more flexibility in planning fees, linked
particularly to better process and speed and a sort of fast-track system. I would not go any further than saying what I said in Committee: that I will look at that. I have promised the Committee that I will come back to them on Report in the Commons, so, if you bear with me, I am going to stick to that format. You will also appreciate that we have the local government financial settlement Statement in a few minutes’ time, so I would not want to prejudge what is going to be put forward on the Floor of the House. Generally with planning fees, the reticence has always been around making sure that we keep planning cost effective. As I say, councils still have substantial resources that they can choose to allocate in that way anyway. I am sure there are no local authorities out there—and I say this with only part of my tongue in my cheek—that would use the planning fees, if it had complete freedom over them, either to price development in its area out of the market or to line its coffers, but we have to look at all these things. There is a balance for us on that. If you do not mind, as I say, I am looking at the other side of it at the moment, and I will report back on that before the Bill comes to your Lordships’ House.

On the environmental side, obviously I am not a Health Minister and my less-than-athletic build may hide the fact that I enjoy doing triathlons from time to time, but I think you make a very good point. It comes back to the point I made earlier that we need to be looking at this. Some of the research that was done—again, if you are visiting Poundbury I am sure they will take you through this—and I know this from when I was the Minister looking after high streets, there is some research that shows that on average people will not walk more than five minutes from home to a shop, and if it is more than five minutes they will get in a car or use public transport, and once they do that they will not necessarily therefore use the closest small shop; they will go to a big development, a big shopping area.

That is why I am quite interested in looking at how we get more footfall and more people living in and around our town centres. This needs some help and support. It is good for footfall but obviously also has the benefit that people might walk to their shops and get a bit more involved. The moment you are walking around, human nature dictates that you walk past someone and you might nod and smile, and the next time you walk past them a few days later you might actually say hello, and suddenly you are getting to know people.
This works in various ways. I saw a development in Plymouth built by Redrow where cleverly, but simply, rather than putting car parking in courtyards round the back out of the way, which creates dark areas, they had put the parking with some garages on the street. The way it was laid out was relatively attractive, but it also meant that as neighbours were going out to get to their cars, they saw each other. Little things such as that can start to create a community.

I accept fully that a well-designed area will help to improve health, but it can also improve community, and, as a Minister at the Department for Communities and Local Government, that is key for me as well. The problem for us at the centre is as soon as we start trying to go too far with how it must be, we start to get unintended consequences. Again, we have to trust local people to work out what is right for them, and neighbourhood and local planning is the right way forward to do that.

Q339 Baroness Rawlings: Thank you very much indeed for your very clear explanations. As you are the Minister in charge, how do you see, come the end of February/March, Lord Adonis’s report, the Housing and Planning Bill and our report working together? How will you take the proposals further?

Brandon Lewis: I cannot prejudge what will be in your report, but I think the three things could be very complementary, not least because the Housing and Planning Bill is only part of the work. I used the phrase on the Floor of the House on Tuesday that it is “part of the work” to see that more homes are built in this country, and to make sure that we are building good homes that are the right homes, for the right people, in the right places, at the right tenures. That work is ongoing. The housing market is always developing. The case I would make is that we have possibly the most complex housing market in the modern world, in the sense of the amount of niche products we have. That is a good thing, because it means there is a big range of offer out there for people, but it is always developing and changing, so we have to keep looking at it. Whatever this Committee’s report comes out with, we will look at and work with, and, particularly if there are some things in there we could take forward, I think we should be looking at that. We should always be looking to improve. We should never look back and think we have finished the job.

Lord Adonis’s work is hugely important from both sides. First, I want to make sure that we are maximising the opportunity for creating homes in places that have good access to transport
infrastructure. I do not think we have gone far enough in this country with density, particularly around transport hubs. London is a very good example of that. We are one of the least dense, lowest-rise cities in the world for one of the most popular, arguably the most popular, city in the world. This is true right around the country. Even in my own constituency the train station is quite a long walk from any residential accommodation or the high street, which seems to me a crazy situation, bearing in mind that no bus goes to my train station either. Integrated transport has not quite reached Great Yarmouth. If we want to see those places regenerated, some retail and commercial development in and around the stations, as Crossrail is proving, could work. It is also partly why the Hong Kong-Shanghai railway company is the only profitable railway company in the world: because it works as a property developer as well. We need to look at that, and I know my colleagues at the Department for Transport are very keen to look at it and at how we learn going forward from what Crossrail is doing on that kind of model. We also need to make sure that we are building homes where we can put the right infrastructure in place.

Public satisfaction with housebuilding has gone up by about 50% over the last few years, and I put that down to a couple of things. One is people feeling involved in the process, particularly through neighbourhood plans and through local plans. It is also through making sure that the infrastructure is there. I do not think the nimby thing is as bad as we sometimes think it is. We discredit people on that. Where it exists, it tends to be for genuine reasons such as the fear of inappropriate development, which is usually about bad quality of design or lack of infrastructure. I think that what Lord Adonis is doing to make sure that the infrastructure is there for the country, and for my interests directly for housing, making sure that we link the two things together, is really important.

Q340 Lord Clement-Jones: Minister, I have a two-tier question, and I am sorry that it is a bit of a package. You have placed a lot of emphasis on local plans, particularly in the context of housing. Is local plan-making delivering its objectives overall? Are any measures needed to restore the primacy of the plan-led system? I am thinking particularly of your ideas about extending planning consent in principle and so on. You have also mentioned that local authorities should not plan in isolation, and that brings us on to spatial planning. Does the duty to co-operate provide an adequate mechanism for strategic and spatial planning? I think
you have recognised the need to improve the operation of the duty to co-operate. Then, of course, we have the question of the role in the built environment of regional spatial frameworks in London, Greater Manchester and so on.

**Brandon Lewis:** Yes, I think I got to three. In terms of local plan-making and having primacy, particularly when you take into account initiatives coming forward such as planning permission in principle, I think planning permission in principle will further enhance the local aspect, because the areas that will be covered by planning permission in principle are not going to be set by me or anybody like me in a suit in any office in Whitehall; they will come from local people. Initially, it is about those brownfield registers, which will be done by local authorities. It will be land that is allocated and notified through the local plan or a neighbourhood plan, both of which are done locally. Even if in 2017, through the powers in the Housing and Planning Act, as it will be by then hopefully, or in the Bill as it is now, if we intervene where areas have not done a local plan, I have no intention of writing a local plan and giving it to the community. We will be facilitating the local community getting its own local plan. It will still be a locally driven plan. That further endorses it and, hopefully, gives even more encouragement to areas to want to do a neighbourhood plan, to look at these things and to have that local control, and if anything to take the control away from the developers. If you do not have a local plan and you are reliant on the NPPF, the developers are in the driving seat saying, “This is where we want to develop”, and the community is having to take a development control system. So my logic is that we move from what has been a development control system for a few decades, and councils looking at how they can say no, to a plan-led planning system. Terry Farrell used a brilliant phrase: that we move through local plans to a plan-led system, and with neighbourhood planning to an active plan-led system, which I thought was quite a good way of describing it, in a way Terry can do better than I can.

On the issue of isolation and the regional side, as a Government we got rid of regional spatial strategies, and I have no desire or intention to go anywhere near bringing them back. The difference with what is happening in London, and indeed what Manchester is looking to do, and what other areas may choose to do, is by coming together and looking on a wider basis as an area region, or whatever the structure is, it is driven by them locally. It is not me or an
inspector somewhere sitting with a map and a red pen; it is coming from that local area, working together to develop something for their area. I think that is a very sensible thing for them to do, but what is important is it is them doing it, which matters.

In terms of the duty to co-operate, it was always very clear, and the Planning Minister at the time, who is now my Secretary of State, was very clear at the Dispatch Box, if I remember correctly—and as I sat on the Localism Bill Committee, I remember these debates—that it is a duty to co-operate, not a duty to agree. We come back to the fact that we have to be adult enough and grown up enough to expect that local authority leaders—councillors and their senior officers—will actually take that responsibility seriously and work together to fulfil the duty to co-operate. Equally, I am a realist, and I appreciate that in some parts of the country some councils will find it harder to work together than others, but generally it is working. We will certainly get involved in trying to bring parties together and to get them talking to each other, if we can, where there are real issues, but it is generally working. The evidence of that is that we have seen more than double the number of local plans published, up to 82% or 84%, with 67% or 69% now adopted, and, as I said before, if areas do not have them adopted by 2017 we will look to take the power to start getting them done.

Having said that, I am also very aware of at least one local authority leader, when I quizzed him about why they do not have a local plan and have not even started one, who said, “I really like the NPPF, and I am happy to make my decisions based purely on the NPPF, and my community is happy with that and we are very pro-development, so I don’t need one”. That might be a very valid argument. I think we need to be aware of people having that view as well.

Q341 Lord Clement-Jones: Obviously, you have quite a lot of carrots in place for the combined authorities, and they have responded pretty well, except for one. Are you planning to use carrots for encouraging the duty to co-operate? Do you have any levers that you can use to get that co-operation?

Brandon Lewis: We do in the sense that if an area is shown not to have fulfilled its duty to co-operate, it could fail its local plan, and inspectors have failed local plans based on the failure to fulfil the duty to co-operate. Whether that is a carrot or a stick is probably in the eye of the beholder, but there is quite a good motivation there, and that has worked.
Q342 Baroness Young of Old Scone: You are proposing a housing delivery test. Will that mean that local authorities become more subservient and anxious to move ahead with things that perhaps local people are less comfortable with simply in order to avoid being penalised under the housing delivery test?

Brandon Lewis: No. The intention comes back to Lord Inglewood’s query about the gap between permissions that are granted and the build-out rate. In some areas at the moment, local authorities are giving planning permission for some very large sites and saying, “Right we have done our five-year land supply”, but actually they have not, because these sites take so long to build out. The idea is to make councils think a bit more about the sites that are coming forward, particularly as they allocate them in their local plans, and whether they are deliverable and are the sites that people will want to develop and can develop, and probably to encourage them to look again at the small sites that we want to see brought through, because they are quicker to build out and are better for local people and small builders. It is about getting councils to be a bit more aware of getting things that are developable.

Q343 Baroness Parminter: The evidence that we have been getting on viability assessments is that their increasing use is leading to public goods such as affordable housing being squeezed out because developers are saying they can no longer afford it. I have two straightforward questions. First, do you believe that if we are going to carry on with viability assessments there should be a standard format with, for example, an agreed acceptable maximum level of profit margins and market information so that everybody knows what the parameters are?

Secondly, is it important that developers know right at the beginning what costs they are going to have to meet? Of course, this Government got rid of the Code for Sustainable Homes and the requirement for zero-carbon homes by 2016, so developers are not now putting money aside to invest in sustainability, which is also a welcome government requirement. Without building requirement updates, how are you going to make sure these viability assessments have any legs? Will there be a standard format and are you going to update building regs?

The Chairman: Can I interject? I know that you need to be away in one minute, so if you cannot answer it in that time maybe you could write to us.
Brandon Lewis: I will give the speeded-up version. The short answer to the first point is no, because, again, I think that starts to move away from the position that local areas will have different local needs and different things are viable in different places. That kind of uniformity is potentially quite counterproductive and might have unintended consequences. However, I agree with the point that it is healthy for developers coming into an area to know what it will cost to build in that area.

One of the reasons we are doing a review of the community infrastructure levy - and I am interested in looking at how that interacts with Section 106 - what I like about the community infrastructure levy is the developer knows upfront what it costs to build in that area. The problem with the community infrastructure levy is it works when you have lots of small and medium-sized sites; it is not so good when there is one big site because the money could be spent anywhere and you could still need infrastructure on that one site. For that you need the flexibility and the focus of a Section 106 agreement, but that is not very transparent. You get planning permission subject to 106, you spend several years negotiating it and it is down to the quality of negotiation between a developer and a local authority. This is an area I am very focused on, first, because I think it slows down planning quite dramatically, and I want to fix that, and some of that is in the Housing and Planning Bill, and, secondly, because you are then caught up in the vagaries whereby some local authorities are better than others at negotiating. We need to look at that, but I am not going to be able to say to you today I have the answer to that.

The Chairman: Thank you very much indeed. It has been a real rush through, but you have been fantastically generous with your time and your answers. If you think of anything else, please let us know. Let us keep in touch during this period because it would be helpful for us regarding the Bill and our report.

Brandon Lewis: I am happy to and I really appreciate the chance to come and speak to you today. Thank you for persevering with my timetable as well. I really do appreciate that.

17 December 2015
Department for Communities and Local Government and Department for Culture, Media and Sport - Oral Evidence (QQ13-28)

Members present
Baroness O'Cathain (Chairman)
Lord Clement-Jones
Baroness Finlay of Llandaff
Lord Freeman
Lord Inglewood
Earl of Lytton
Baroness Rawlings
Baroness Whitaker
Lord Woolmer of Leeds
Baroness Young of Old Scone

Examination of Witnesses

Gill Graham, Head of Heritage, Department for Culture, Media and Sport, Steve Quartermain, Chief Planner, Department for Communities and Local Government, Ruth Stanier, Director of Planning, Department for Communities and Local Government, and Bob Ledsome, Deputy Director, Building Regulations and Standards, Department for Communities and Local Government

Q344 The Chairman: Good morning, ladies and gentlemen, and welcome to this evidence session of the Select Committee on National Policy for the Built Environment. You have in front of you a list of the interests that have been declared by the members of the Committee. The process is that a transcript of the meeting will be taken and published on the Committee website. You will have the opportunity to make corrections to the transcript where necessary. Could I begin by asking each of you to briefly introduce yourselves to the Committee, please, starting on your right, my left?

Gill Graham: My name is Gill Graham. I am head of heritage in the Department for Culture, Media and Sport, and I have been doing this job since the end of last year.

Bob Ledsome: Good morning. My name is Bob Ledsome and I head the building regulations and standards division at the Department for Communities and Local Government.
Steve Quartermain: Good morning. My name is Steve Quartermain and I am chief planner at the DCLG, a post I took up in 2008 after a career in local government.

Ruth Stanier: Good morning. I am Ruth Stanier. I am the director of planning at the Department for Communities and Local Government.

The Chairman: Thank you very much indeed. You have had a complete list of the questions, and I am going to ask question number 1. What are the Government doing to prepare the country for the big challenges in built environment policy such as migration, ageing, climate change and growing resource demands and any others you can mention? There seems to be a huge menu. Who would like to start?

Ruth Stanier: I will take that question, thank you very much, my Lord Chairman. The work that we do in government is very much focused on seeking to promote high-quality built environments where people will want to live and work. In doing this work, we are acutely conscious of the need always to be forward looking in our approach. This is about getting things right for the years ahead.

My starting point on this is to talk about the planning reforms that have been put in place under the last Government and that we are continuing to take forward. As I am sure you will be aware, the last Government undertook a fundamental review of the planning system and put in place in 2012 the new National Planning Policy Framework. This sets out the three dimensions of sustainable development: the economic, the social and the environmental. It is very clear that these need to be considered together and that the role of the planning system is very much about looking for solutions that deliver gains across those three.

To turn to the specific themes that you raised in your question and to go through those briefly one by one, on migration and ageing the Framework is very clear that local planning authorities are required both to assess and critically—and this was the big innovation of the new Framework—to plan to meet the future housing and other infrastructure needs of all sections of the population, thinking very carefully about the different needs within the population, including those of ageing people. This work needs to involve looking at a range of evidence, looking at the future, household projections and, crucially, consulting very closely with local communities.
The Government is also very much focused on seeking to improve the housing offer for older people, to increase the supply and choice of housing of all types and to make sure that a range of attractive housing is available, particularly for those ageing people who want to downsize to more suitable accommodation.

Thinking now about the issue of resource demands, similarly the Framework sets out very clear requirements for councils, in drawing together their Local Plans, to look very carefully at the evidence on future requirements for things like water and energy. I also see from the background evidence you have been looking at that the issue of food security has arisen, which again was an issue that we very much highlighted and specifically mentioned in putting together the new planning Framework, which includes strong protection for the best quality agricultural land in this country.

Finally and briefly on climate change, local planning authorities are similarly required, in their Local Plans, to plan proactively to mitigate and adapt to climate change. That really means avoiding new development in areas that will clearly be at increased vulnerability in the future, and managing risks in other areas that are not quite so exposed through adaptations such as green infrastructure, which again is very much promoted through the Framework. Building regulations also have an important role to play, and in the last Parliament energy efficiency requirements were improved by 30% for new buildings.

That is just a quick run through of the key issues. These are very significant challenges but ones that we are very mindful of in our work.

The Chairman: Can I ask a supplementary of my own? In your list, you put a lot of emphasis on ageing. Do you have a similar amount of emphasis on sole inhabitations: houses with solo people in them? The dynamics of the population are quite different than they were, say, 30 years ago, and we are looking at a timescale of 30 years hence. Many more people are living on their own or with two people, the fractured family syndrome. People are living much longer, which is the ageing issue.

How are the priorities, in your mind, between migration, making up the gap in the housing stock – we do not have enough houses for people – and what comes next? Is it dealing with the end of life issues or with the whole-lifetime issues of people starting off in maybe a flat,
then having a three-bedroomed house, then having another flat, a second home or something? Where do you think the big number one priority should be?

Ruth Stanier: That is an extremely good question. Clearly across the whole range of the population there are many different needs. As you say, that is changing over time. In planning policy terms we are quite careful not to skew priorities. The way that the Framework is set out it’s very much saying to local authorities that they are required to assess need right across their population and look at that in quite a variegated way to avoid a one-size-fits-all that just thinks about the overall numbers. Within that, the way we drafted the Framework was to be quite careful not to put particular emphasis anywhere. Having said that, ageing is such a big challenge, such a big change in the demographic, that Ministers naturally pay particular attention to it, and we have supplementary housing initiatives to support areas like that.

The Chairman: Yes. Of course, all the other points that you made about energy conservation, for example, are very important too in terms of people’s income and disposable income. Lord Lytton, you wanted to come in.

Earl of Lytton: Very quickly, my Lord Chairman. Are planning authorities possessed of the resources—and I mean that in the broadest terms—to do all this investigation and study within the sort of timescales that the Government are clearly looking at with regard to local plans and that sort of thing? Secondly, there is an awful lot of concentration on the new, what we are going to do now, which is all going to be compliant and singing and dancing and sustainable, but what is new is a relatively small proportion of what exists at present. I and many other members of this Committee are very interested in the 95% of the rest of the stuff that already exists and what happens there. Do you have any observations on that?

Ruth Stanier: I will take the first part of the question. One of my colleagues might want to come in on the second. Resourcing for local planning authorities is absolutely a matter that we keep under very careful review, conscious of the current constraints. In the last Parliament we uplifted planning fees, which was of some assistance.

Over the last few years, where local authorities have been keen to progress their local plan making sure they have put resources into that area and very good progress has been made, including going through all the evidence work to support that. We have now reached a point
where 82% of councils have at least a published Local Plan and 64% now have an adopted plan in place, which is good progress but is clearly, as set out in last week’s productivity plan, an area where we need to go further.

I do not know, Steve or Bob, whether you want to take up the second part of that question.

**Bob Ledsome:** With regard to the existing stock, as members of the Committee may know the building regulations are primarily focused on new buildings, but there are some requirements in the building regulations that will affect retrofit activity to existing stock. If renovation work is being undertaken and the energy measures in the building are being upgraded, there are standards that would need to be applied through the building regulations.

**Lord Clement-Jones:** I get the impression that quite a lot of this is about inviting local authorities to respond to the here and now. What is the balance between being predictive about future trends, population movement and so on, and responding to the here and now?

**Ruth Stanier:** The National Planning Policy Framework approaches this by asking local authorities to plan for the next 15 years, and it is quite explicit about that. It is asking them to take into account household projections produced by the Office for National Statistics and to think about both current and future needs. I think that forward-looking aspect is covered in the strategic framework, but you are absolutely right: we need to keep focused on making sure that that is how the work plays out in reality.

**Baroness Finlay of Llandaff:** Just a short question. I was listening to you and wondering what mechanisms there are for getting feedback from the users of new building projects, whatever they are, both at local authority level and at government level. There may be some very important and constructive comments that, unless you elicit feedback, you may never discover, particularly from specific groups such as the elderly, those with disability needs, those with young children, where features in buildings might be a problem that could be easily remedied.

**Ruth Stanier:** It is a very good question, and one that we should probably reflect more on. In the department we are on the receiving end of a great deal of feedback from a very broad range of people on things that have not worked well or design that is causing concern. I know that elsewhere in the department the team that looks specifically at housing for older people
has sought to ensure that it has the views of older people using different types of housing and that that is fed into policy development. I think it is a good question where we could do more.

**Baroness Finlay of Llandaff:** You may be missing out on good feedback.

**Ruth Stanier:** Yes, indeed.

**Baroness Whitaker:** Do you have any idea of how much retrofitting that from the point of view of sustainability ought to be done but has not been done?

**Bob Ledsome:** Energy efficiency in particular is primarily led by the Department of Energy & Climate Change. It has done a lot of work to assess what it would class as the technical potential for retrofit and improving energy efficiency, particularly with regard to the existing stock, and an assessment of the extent to which that technical potential will be realised through policy measures that are in place. That process underpins the work that the Government do, led by DECC, on carbon budgets, taking account of the advice of the Committee on Climate Change.

At the strategic level, at the policy level, the Government probably have a reasonably good idea about what needs to be done, for example in terms of further retrofit activity, to achieve the climate change targets that are set in the Climate Change Act.

**Baroness Whitaker:** Perhaps you could send us some trend information for the past few years.

**Bob Ledsome:** We can certainly provide some further information, yes.

**Baroness Whitaker:** Thank you.

**Q345 Baroness Young of Old Scone:** Because I failed to do so at the last meeting, Lord Chairman, I will declare my interests. I am a vice-president of the RSPB, president of the Wildlife Trust for Cambridgeshire, Bedfordshire and Northamptonshire, the former chief executive of the Environment Agency, and chancellor of Cranfield University, which has strong interests in the built environment. I wanted to explore with Ruth Stanier the 15-year horizon. Scotland has taken a 20 to 30-year horizon. Do you think we are being too close to our noses?

**Ruth Stanier:** Again, that is a very interesting question. From memory, the Framework does not say that it must be 15 years; it does allow flexibility. Where councils are looking to plan for an even longer time horizon that is something we would very much support. I think there
is a trade-off between absolutely needing to be forward looking but not going so far into the future that it is practically not feasible to put a Local Plan in place that is going to be useful beyond a particular point. To some extent, we graduate that at the moment by seeking more detail in the first five years and less moving forward. But I think it is a point that we should keep under review.

Baroness Young of Old Scone: Even though these built environments are going to last for 50, 60, 70, 150 years?

Ruth Stanier: Yes. I suppose the Local Plan primarily sets out where new development will be provided over that period, but I completely take your point that once it is built there is a much longer period of time thereafter.

The Chairman: This is just an observation. It is almost essential, is it not, for something as important as the environment, with so much finance tied up in it and every single person in the country worried about it and worried about where they are going to live and where they are not going to live, that you take a long timescale? Otherwise, if it was shifting every five years, as it always used to do in earlier exercises in strategic planning, it is just impossible. You have to have a bit of imagination. Also, it encourages people with imagination to think of other ways of doing it and with other material and things. It encourages that, I am sure. It is just an observation.

Ruth Stanier: Thank you.

Q346 Lord Freeman: My question relates to how government co-ordinates different departments dealing with what is almost a housing crisis, the need for a substantial increase in the rate of house building, and meeting the criteria of a quality built environment. We know that architecture and design policy has recently moved to the Department for Communities and Local Government from the Department for Culture, Media and Sport. What benefits do the Government hope to achieve from this, and what changes should we expect to see? More broadly, how is built environment policy co-ordinated across government? I note that the implementation task force that has been set up now includes a number of different departments and Ministers. Could perhaps both departments in particular comment on the advantages of better co-ordination?
**Gill Graham:** There are strong synergies between architecture, design and sound planning and housing policy. DCMS will, of course, retain a close interest in this, given our responsibilities for conservation, the historic environment and creative industries. I think CLG now has a clear role in delivering design quality, including the oversight of the architecture profession, but we will be working very closely together to ensure that heritage is considered at all stages.

**Steve Quartermain:** I would like to add to that from the DCLG’s point of view. We welcome the opportunity to try to align good architectural practice and efficient, effective planning service, but also the outcomes, because planning is all about outcomes and getting things to happen. We see the decision to move it to DCLG as an answer to your question, which is recognising there needs to be co-ordination across the Government to implement good design and to look at the built environment and how it is being viewed in policy terms across government. I think that we stand well placed to lead on that. Indeed, Ministers have responded to the new brief by starting to talk to people who are involved in it. Only this week they met RIBA, they have agreed to meet the PLACE Alliance, they are talking with Farrells and have been to the Farrell reception. They are getting briefed on what more they can do to try to co-ordinate the delivery of good architectural practice in all the government policies. I think that things such as the housing taskforce, the design advisory group that was established before the election, which they are looking to revisit and reinvigorate, are signs that we recognise the task and we think the department is fit for it.

**Lord Freeman:** Could I press you on that? I appreciate that different Ministers might ask different civil servants within departments to co-ordinate activity, but could it be and should it be a taskforce set up by the Cabinet Office with various Ministers meeting regularly to co-ordinate activity?

**Steve Quartermain:** I am not entirely sure that I am best placed to answer that question. I think that the importance of the task is recognised. Quite how it is delivered and how Ministers align behind the policy to make sure that it works is obviously for Ministers. I do think that we should recognise that the importance of it is embedded in what Ministers want to achieve. They want to achieve a quality outcome, which links back to some of the
comments that Ruth made earlier. Our objectives and what we are trying to achieve are clearly set out: high-quality design and high-quality places. It is important to say that it is not just about what buildings look like; it is how places work. It is really important that that is recognised in all the stuff that we do. Whether we are delivering large-scale development on public sector land, trying to support garden cities or trying to support local planning authorities in producing their Local Plans, the bar is set high. Whether that should be a Cabinet Office thing to be honest is probably not for me to say, but I recognise its importance and I think that Ministers recognise the importance of it too.

**The Chairman:** Sorry, can I just interject? I can see a new Minister for silos, an abolition of silos, because that is really what we are talking about. Everybody out there who is not in the Civil Service and doing all this great work in the departments is saying, “Why can we not have somebody who will able to answer that question and do this?” It is really silo management, and it has crept into every activity in this country, every economic activity, in the last 10 years or so. I think you and I are starting from the same point and think, “Get rid of it, because it is a waste of time”.

**Steve Quartermain:** Get rid of—?

**The Chairman:** Of the silo mentality.

**Steve Quartermain:** Absolutely, Lord Chairman, I could not agree more. But in doing away with silo mentality there is also the question of recognising that with power goes responsibility. One of the things that we are trying to do is get people to recognise that the responsibility is not somebody else’s and that you cannot turn around and say, “Can you give me the answer to that?”

**The Chairman:** Good point.

**Steve Quartermain:** They have to have responsibility for themselves.

**The Chairman:** You finish. I rudely interrupted. Lord Inglewood wants to come in.

**Lord Inglewood:** We know that in this country we have some of the best architects in the world and some of the most interesting and exciting contemporary buildings in the world. But if you look across the nation’s record as a whole over the last 50, 70 years, you would, from the evidence of your eyes, be hard pressed to suppose that we had had a policy of promoting
good architecture and design. As far as I know, it has never been government policy to promote bad architecture and design. Against that background, I put it to you that it is not a matter of co-ordination; it is not a matter of shifting responsibility from one department to another. I have to declare an interest in that I was the Minister responsible in the old Department for National Heritage for design and architecture.

Lord Clement-Jones: So you are the guilty party.

Lord Inglewood: The thing you have to do is fire people up to positively want to build good buildings. That is something that, whatever department it is in, it is very difficult for government to do. I put it to you that we are never going to have a great increase in good, well-designed buildings, well-designed places, unless and until the people who are responsible for the individual sites are fired up and buy in to wanting to do that and know what they are trying to set about to achieve.

Steve Quartermain: My Lord Chairman, I tend to agree. It is not only government that does not promote poor design. If you talk to any of the architects, they do not want to do it either. Every architect will say that they are trying to produce good design. I do think that there is a difference between what I might refer to as iconic sites and iconic buildings and big schemes. What we are trying to achieve is the volume house building, the environment that people live in day by day. It is great to walk into an iconic building and appreciate it—

Lord Inglewood: But some of the iconic buildings did not start out self-consciously to be that.

Steve Quartermain: Possibly not, but I do think that the challenge is getting public acceptance of good design. One of the things I know our Ministers are particularly keen on is trying to change public perception and public views about good design. If people were more confident that the development that was going to take place in their vicinity was going to be of a high-quality design, they might be more accepting of the development in the first place. Our Ministers are very keen that we try to address that. One of the ways we have been doing that is though our neighbourhood plan process: trying to get people to get engaged with neighbourhood planning at a local level to direct and control what their neighbourhood looks like and have an opportunity to influence design at a local level—a bottom-up approach. We have seen that that has been working and that a lot of people have been involved with
neighbourhood plans. That public acceptance of “good design where I live” is really quite important.

**Lord Inglewood**: How do you get house builders and such like to positively want to deliver that, rather than pile them high and sell them cheap?

**Steve Quartermain**: My Lord Chairman, I am sure you will have the opportunity to ask a volume house builder that in due course. I do think that we have seen, particularly with neighbourhood plans, that where people are confident that they can have some say over the design quality of the houses that are built, they have been prepared to allocate sites for houses and, indeed, more houses than they might have been expected to have allocated through the Local Plan process from the local authority.

They must have confidence that they can have a say and, to answer your question, if house builders are going to see opportunities to develop they must engage with neighbourhood planning, because that is where the allocations are going to come forward. If they want to build, they need to engage with the communities that are going to live in the houses that they are going to sell.

**Lord Inglewood**: Just to be clear, are you suggesting that there should be a direct correlation between whether or not a particular site is used for housing and the particularity of the design details that are proposed for it?

**Steve Quartermain**: I am saying that there are opportunities for that to occur through the neighbourhood planning process.

**Lord Inglewood**: But not necessarily on brownfield sites, from last week onwards, is that right? I am not trying to be difficult. I am just trying to—

**Steve Quartermain**: On brownfield sites there is the opportunity to set out very clearly what the expectations are for the development that takes place. Within brownfield sites you can very clearly set out the scale, the size, the height, the numbers, the amount of public open space, the access, the transport. That can all be set out in advance: “If you are going to develop this brownfield site, this is what we expect to be on the site”. The powers are there to do that. It goes back to what I was saying earlier about giving people the power and the
responsibility to do it. We believe that there are lots of tools in the toolbox that people can use already, to answer your question.

The Chairman: We hope that by the end of this inquiry we might find even more.

Steve Quartermain: Indeed.

Q347 Baroness Whitaker: Still with co-ordination and firing up enthusiasm, I would like to move on to a broader picture and ask you how land use is planned for at national level. We have had a look at the Scottish national spatial plan and it has paragraphs called “Vision”, a really interesting thing that I am not aware we have. Do we need a national spatial plan for England, or indeed for the UK as a whole? In your answer or answers, could you also touch on how big infrastructure is woven into our national planning, not just housing and the local communities?

Steve Quartermain: I will perhaps start and others can help if I go astray. The Government is absolutely committed to a bottom-up approach to planning, so they have not seen a national spatial strategy as appropriate for England. We know that the Scottish have one and so does Wales. In fact, the Scottish one won an RTPI prize only last week, so we know that they exist. From our point of view, we think that a bottom-up approach is more appropriate, with the duty to co-operate that we introduced in the Localism Act about trying to get people to deal with cross-boundary issues through dialogues that can exist, either through local economic partnerships or through the combined-authorities approach. Authorities should talk to each other, and again I come back to my earlier point about giving people responsibility and they should know what to do. The wider infrastructure issues can be dealt with through the LEPs, through communication with other authorities, and again I draw from my experience in local government. When I was a director of planning in environmental services of course I talked to my neighbours and to my fellow chief planners. Who would not? It would be nonsense not to.

There is, of course, the national infrastructure plan, which deals with the big stuff, and the Government made it very clear that they do need to understand that development will need infrastructure. The other thing that they did in the manifesto was make it clear that communities need to understand when infrastructure is going to arrive so that they know that
they are going to get the infrastructure that is required for the development. That again is an issue that we are taking forward.

The answer to your question is, no, the Government does not think it needs a national spatial strategy. They think that the planning vision can be delivered through Local Plans and communities, either through neighbourhood communities or district unitary authorities, and that the duty to co-operate and their mechanism for people to engage in dialogue on these things will be effective.

**Baroness Whitaker:** Is there not then a weakness that the bottom-up approach will produce inconsistency nationally and perhaps prejudice against very small groups such as nomadic travellers, gypsies, and that the duty to co-operate is not very easy to enforce? I do not know how much it happens. There have been some comments that it is not very widespread, but perhaps you can give us better information.

**Steve Quartermain:** There will always be a view, and people say to me, that there should be a national spatial strategy, and that is a legitimate view to hold. It is not the view that the Government holds. They would certainly not accept that the current approach would be prejudicial to any particular group. Any decision-maker has to have regard to the public sector equality duty, and that applies to local authorities too. People need to have regard to the needs and lifestyle of minority groups—you mentioned travellers—in their decision-making. They cannot shirk that. The bottom-up approach does not exclude that. In fact, I would argue that that fine-grain approach ensures that they are looked after.

**The Chairman:** Can I just intervene there for a moment? In your opening statement, Ms Stanier, you mentioned agriculture en passant. I would have thought that would fit very nicely into Lady Whitaker’s question about a national spatial strategy. The more you think through the benefit of the British countryside to those who live in it, you realise that we are always concentrating on urban housing when we look at housing in the round but there is a huge other area of sub-urban—and I do not mean suburban—in between small market towns and smaller rural places that seems to get missed out. Is there an argument for national spatial planning where they could have a certain proportion of greenfield sites that are made over to allotments? You would then hit the food-for-our-own-resources type of thing, elderly
people getting exercise, growing things, being involved and improving the quality of life. If they live in good surroundings where you can see trees and fields, it makes a hell of a difference. That goes back to the national spatial plan. I would like a quick word from you on that, if possible.

Ruth Stanier: Very briefly, I can completely see the point you are making. The approach that the last Government and this Government is taking is very much, as we have been saying, set out in the National Planning Policy Framework and in national polices on those really quite small number of matters that are genuinely of national significance where clear national protection is required, including agricultural land, areas of outstanding natural beauty, national parks and so on. But as Steve has been saying, it is very firmly the view of this Government that you get the best planning outcomes where the power is with local communities to decide how they use the land in their area.

The Chairman: Yes. I am sorry, I should not have hogged that, but it was just eating away at me when I was hearing about the national spatial plan.

Baroness Young of Old Scone: I would like to ask for some information that may not be readily available, but it would be interesting to know how many countries of our approximate size and density, not Brazil and not Australia, do not have a national spatial plan.

Steve Quartermain: We can provide that.

Baroness Young of Old Scone: That would be extremely useful, thank you.

Steve Quartermain: Would a European comparison suffice?

Baroness Young of Old Scone: I would quite like to look at Japan as well if we could. We need to look at the densely packed countries, because that is where it is most germane. If you have acres of space like America you do not have to worry about plonking things down because you always have more space, but we do not.

Q348 Baroness Finlay of Llandaff: I wanted to ask you about the policy evidence, the evidence underpinning policymaking. Last week we heard from Professor Mark Tewdwr-Jones about a serious absence now of research projects that are evaluating the impact of policy. Could you tell us about the research capacity that exists within government departments on
built environment policy issues, and, with that background, also whether there is indeed less capacity for research and evaluation of policy than there was previously?

**Ruth Stanier:** I will take this question. We do have, within the department, a very strong team of analysts who support us on the development, implementation and evaluation of policy relevant to the built environment. We also, as a department, have a research budget. Obviously we need to be extremely careful in how we allocate that to secure the best possible value for money. However, we are proceeding with a number of relevant research projects. One that I would particularly cite is the research that we fairly recently led looking into the community infrastructure levy and how that is working, very much to inform the review of the levy that we are committed to undertaking this year. That is just one example of how we use research and evaluation to inform our ongoing policymaking.

We also have dedicated research funding for building regulations that I am sure Bob would tell you more about if you are particularly interested in that, and we fund research work by external bodies.

We increasingly seek to link up very closely with relevant academic institutions to make sure that we are helping to influence the work that they undertake. In the interests of not falling into silo thinking, we do very much work with other government departments. One specific example of that would be the work that we do with Defra and the Environment Agency in their significant research programme looking at flooding, coastal erosion and risk management. They have a £2.5 million budget for that annually, just to give one example. Clearly we are currently working in a relatively constrained fiscal environment, but to my mind we still have adequate analytical and research capacity. It is extremely important to us.

**Baroness Finlay of Llandaff:** I was interested in the comment about the power being with local communities in decision-making and where that falls down. This year one of the Bevan Prize awards went to a group in Hackney, London, who are looking after people with TB and have found that the most important thing was to get them into proper housing, and that all efforts to get the TB under control failed until they were in proper housing, partly so they were not coughing up TB over other people and were in an environment where they could also have a more ordered lifestyle to take medication and so on. I was wondering how much
of that research is going on into both physical and mental well-being aspects of people in these different built environments, particularly in relation to Public Health England, or whether they are working quite separately.

*Ruth Stanier:* This is maybe an area where we could usefully provide some further information to the Committee. I would say that Public Health England is represented on the planning sounding board that I chair and make a very useful contribution. They have presented to us on health inequalities and we have discussed with partners how we can make the links between the health agenda and the planning agenda, which has been very helpful.

I am also very conscious of the specific issue that you raised. A few years back I led work on homelessness policy and I know that there has been an ongoing programme of evidence collection in that area. But we should see whether there is further information that we can provide to the Committee on this.

**Baroness Finlay of Llandaff:** That would be very helpful. Thank you.

**The Chairman:** If any of the rest of you have similar information that would expand our knowledge, that would be very useful to us.

**Bob Ledsome:** I thought I might just mention a piece of work on the building regulation side that we have been funding with colleagues in Defra and DECC, and indeed the Environment Agency, in relation to another potential health issue: overheating. That is a potential future risk that is rapidly emerging and is an area where we have undertaken work and are continuing to undertake work.

**The Chairman:** That would be fascinating.

**Baroness Finlay of Llandaff:** Is there one point where research evidence is collated and available—a literature body of research in the built environment? Is there a kind of definitive group of publications, or are the publications of research within the silos of the original disciplines from which people have come?

**Ruth Stanier:** That is a very interesting question, and again we could probably usefully reflect on whether we can point the Committee towards the most useful source. In terms of support that we receive on analysis and evidence within the department, the team of analysts I was describing provide regular digests for us of relevant research across the piece. But I am sure
that your Committee may well welcome further information on what is publicly available and how it is brigaded.

**Bob Ledsome:** Research reports that the department undertakes are published. That is part of the process, but I think there is a broader issue about how effectively that knowledge is disseminated as opposed to documents just being published.

**Baroness Finlay of Llandaff:** Yes, dissemination, because otherwise they just gather dust and people do not know about them. But where advances are happening, if they are not disseminated they will not get put into practice.

**Q349 Earl of Lytton:** I have a question for Mr Ledsome. Quality is obviously important in looking forward, yet many of the quality controls in new building are effectively self-certified schemes of one sort of another and they come under various types of construction warranty, of which probably NHBC is the best known. It has certainly come to my attention that there are increasing concerns about the quality that is produced under these schemes. Are you able to comment on that? In particular, how are you monitoring outturns in that respect?

**Bob Ledsome:** Perhaps if I could digress I will explain very briefly how the building control system operates. A building inspection can be undertaken either by local authorities or by what we call private sector approved inspectors, which would include the NHBC. When an organisation such as the NHBC, the National House Building Council, is undertaking that function it will be inspecting as a third party; it will not be self-certification. There are some types of building work where self-certification arrangements apply but the relevant installer firm undertaking that sort of work has to be a member of what we call a competent persons scheme and will have to have passed various tests to be eligible to join that scheme. We receive correspondence within the department with issues around quality, so no one would deny that there are not problems.

The way the system operates is that there are the building control arrangements that can range in the first instance from developers putting plans into the local authorities and local authorities having the opportunity to check that plans are compliant with the relevant requirements. Local authorities will inspect the work, as will the private sector approved inspectors. Alongside the work that is done on building regulations, which are obviously
constrained by the scope of the building regulations, there are other mechanisms in place such as the warranty arrangements. The NHBC issues warranties and covers about 80% of the market, which provides protection for homeowners if there are problems that they discover after they have moved in. There are a range of mechanisms in place. Clearly the Government look very carefully at issues that arise, and if we need to make changes to the building control arrangements and the building control system, that is something that Ministers would want to consider.

**Q350 Baroness Whitaker:** How does the building regulation regime fit into the idea of place making? The success of either new housing or commercial development is not just the building; it is how it relates to the whole place—to the transport, to the facilities, to all sorts of other things. How do the building regulations latch on to place making?

**Bob Ledsome:** The building regulations are very much focused on the building, so the first part of the process is what the Local Plan says about the development in that particular area. Then there is the planning application that goes into the local authority for determination of the configuration of the development and how it is going to fit into the location. The building regulations come in once planning permission has been granted and say, “These are the building standards to which that building needs to be built”.

I should say that the building regulations start from the basic premise that this is about the safety and health of people in buildings or who are affected by buildings. Over time the scope of the building regulations has extended into sustainability issues, for example, but the building regulations do not regulate the aesthetics. Some of the design considerations that are obviously very important in new development are not regulated by the building regulations per se, although they are matters that would be taken into account by the local authority when it considers the relevant planning application against the Local Plan.

**The Chairman:** And some of the heritage issues.

**Bob Ledsome:** Indeed, if it is a heritage building, a listed building or conservation area.

**Baroness Whitaker:** Do you then consider that the design aesthetics are an extra, an add-on, and not part of the function of a building?
Bob Ledsome: No, I did not want to give that impression. If I did, I apologise. I was trying to make the point that issues around design aesthetics are matters that are considered through the planning system, not through the building regulations. They are considered but through the planning system rather than the building regulation system.

Q351 Lord Clement-Jones: We have already touched on this to a degree in the questions on how the regulations and so on operate, but the Farrell review—we are still on quality here—raised some very interesting qualitative criteria. The question is whether there is a government view about some of the issues that Farrell raised. For instance, do they have a view about the quality of new housing and commercial developments in general? Going beyond the details of regulations, are they satisfied that they are sufficiently sustainable, resilient and lasting? Are we doing well enough, not just in terms of how the regulations operate but in terms of a government view about place making, which of course is very much the Farrell phrase?

Steve Quartermain: Perhaps I can assist a little further. This slightly links back to Lord Inglewood’s comment earlier that some people have built schemes that may not be seen to be high design but have met building regulations because they have been built. Building regulation is not going to be the thing that necessarily drives the high-quality design but it can do, and there is a relationship between the two. For example, the way in which drainage is dealt with and sustainable urban drainage schemes is an integral part of a design in the way a place works. Place making is not necessarily understood by everybody. As Ruth said at the very beginning, it is about creating places where people like to live, work and relax.

Lord Clement-Jones: So it is not a very useful concept in that case?

Steve Quartermain: No, I do think it is a useful concept, but I think that the challenge is trying to ensure that people recognise that there is no utopian place. What matters is the place where people live and it is very much an individual thing. It is about local issues. That is why, linking back to my earlier answer, the Government think that a bottom-up approach to planning will capture that feeling about place: “What does my place feel like? How should it grow?”. I would argue that the Government are very clear on what they expect to be delivered through place making. The National Planning Policy Framework says very clearly that we are
looking to secure high-quality design. There is a whole section, paragraphs 56 to 68, that talks about design. It is one of the core planning principles in the NPPF that local authorities should do and it is a plan-led system. That is the vision thing; that is where you get that vision about what a place should be like. We would argue that we have a very clear and coherent policy position on how people should be addressing the creation of place, the way in which places should grow and the quality that we expect to be delivered through the planning framework.

**Lord Clement-Jones:** That is the framework. Do you think you have kicked the tyres enough at other levels in terms of regulations and so on to ensure that that is implemented?

**Steve Quartermain:** I would never sit back and say that we can be complacent and that we have done everything that we need to do. We have set the bar high, and in order to drive the achievement of that we need to work across the place, which again links to why we are pleased that the architectural policy has come to us, because we think we can make those links into place-making delivery, the building regulations, how developers interact with the planning system. There is always more that we can do, and the challenge, having set the bar high and having asked local authorities and set a duty on them to deliver this through their plans, we are talking to the architects, the developers and the house builders, is to try to ensure that it is implemented. In fairness, in many areas it is, and it would give entirely the wrong impression to say that the new build is all poor, because it is not. There is a lot of really good building out there. We are in award season now, with a lot of awards—there was one earlier this week, there were the RTPI awards last week—and they are recognising that this can be delivered.

**Lord Inglewood:** To what extent do you think design and a sense of place are subjective, and how much do you think they are objective factors? For example, if you were going to build a new Parliament building and somebody put in an application for a building like this, how would it meet those criteria?

**The Chairman:** I am afraid that is off piste, really.

**Lord Inglewood:** No, but this is the objective/subjective thing.

**Steve Quartermain:** I think it is a combination of the two. Design is not just appearance; design is about functionality. A lot of architects will argue that you need to design a building
from the inside. How a building is going to work is absolutely crucial. But I would argue that you can look at other buildings that have been built for public service purposes that are functioning extremely well and look good from the outside too. You can combine the subjectivity, the aesthetics, the appearance, with good functionality. I do not believe that is an unattainable goal. I definitely think we can do it.

Lord Clement-Jones: But generally, just to underline this, you are satisfied that the criteria are laid out sufficiently, that people know what they are meant to be doing, that the Farrell criteria are laid down sufficiently clearly so that judgments can be made about new build?

Steve Quartermain: The evidence I would use to answer that question is the fact that we can point to places where this has happened. If it can be achieved through the planning system, and the viability and economics of it means that great places are being delivered, the answer is yes.

The Chairman: Would it be inappropriate of us to ask you to be able to give us a list of places that you consider manage to do that? I am a bit worried about this, because I do not think we would want to publish it unless you have given an endorsement to these places.

Steve Quartermain: I always avoid trying to endorse or indeed directly criticise any particular scheme, which is why I pointed to the award season. Other people are judging these things at the moment and there are a lot of awards—

The Chairman: Yes, but is there something that we could look at? We are probably going to go on a couple of visits, and it would be good if you could direct us into something that would match the criteria that Lord Clement-Jones mentioned. We will visit everything, even if it is a sweet shop.

Steve Quartermain: We can give you a list of people who have been considered for the awards and then you can choose which one you want.

The Chairman: It would encourage lateral thinking.

Q352 Baroness Finlay of Llandaff: You have portrayed a view of having confidence that concepts of place are being put in and rolled out, but what levers do you have in areas where that is not happening, where planning committees are not giving due consideration to issues not only around the shorter parts of the acronym PLACE but around the broader concepts of
place and the effect on the people who live and work there? What levers do planning departments have if people constructing buildings then alter what they put up after they have their planning permission through?

**Steve Quartermain:** There are two elements to that question. Local planning authorities are empowered, and indeed the NPPF empowers them to refuse obviously poor design. They can do that. At an appeal, if the evidence is there that a decision can be defended, we can expect that decision to be upheld. In fact, the Secretary of State himself has refused a scheme entirely on design grounds. It was just a poor design and the Secretary of State refused it. So the powers are there but the evidence needs to be there to support why that decision has been taken.

On the ability to control schemes after they have been approved, clearly there are permitted development rights for particular housing schemes that go with new houses, and people are entitled to extend their house—it is a national right. If a local authority feels that the concept and the design of the whole place does not warrant that and that it would be a bad thing, they can remove those permitted development rights by condition.

**Baroness Finlay of Llandaff:** I just wonder what levers it has if permission has been given to construct one thing and then what is done is completely different.

**Steve Quartermain:** The permission is usually conditioned; they need to build what they got approved. If they want to vary it, they can go back and ask for variations to the condition. If they build something that is entirely different, they can enforce. There are breach-of-condition notices and a number of other tools in the toolbox with which they can take action. If someone has built something that is different from what they got approved, there are tools in the toolbox and action can be taken, broadly, in enforcement terms.

**Q353 Lord Woolmer of Leeds:** You have touched, in answer to earlier questions, on some of the Farrell issues, but what are the Government doing in response to the recommendations of the Farrell review?

**Gill Graham:** Obviously this is now a CLG lead. However, the Committee will be aware that following the publication of Sir Terry’s report, Ed Vaizey challenged the sector to prioritise those recommendations as the ones that it wishes to take forward and to take a key
leadership role in the implementation. Subsequently, a number of industry leaders, panellists and experts have agreed to act as champions for certain themes and recommendations within the review. These champions have either developed or are in the process of developing papers and positions. We are looking forward to hearing how our colleagues in CLG will work with them when they report back, and to understanding from that how government can take forward actions from those.

**Lord Woolmer of Leeds:** What is your preliminary assessment of the recommendations in the review? In other words, do you feel that some of the recommendations have some real merit in them and are worth exploring in more detail and taking forward, or have you simply said to other people, “Have a look at it.”? Have you formed a first sift of your view of the recommendations?

**Steve Quartermain:** We welcomed the Farrell report. It was a valuable contribution to the debate. We are working with the champions and, as Gill said, we are looking forward to seeing what they do. The sector has been challenged and they have risen to that challenge. We are talking to people such as the PLACE Alliance, which is taking forward quite a bit of the Farrell challenge, and our Ministers are talking to them. From our Minister’s point of view, as I said earlier we are in the place where we are gathering information and talking to these players to help inform what our next step is. As I said, the Minister went to the Farrell reception last week and I know that he has meetings lined up to talk to them. For us, we are at the beginning of a sort of new approach and we will be looking at the Farrell review as part of that approach.

**Lord Woolmer of Leeds:** Do you have a timeline that we could look forward to in order to know when we can expect to see clear outcomes?

**Steve Quartermain:** I was always told to try to keep my answer succinct, so no.

**The Chairman:** That speaks volumes.

**Lord Woolmer of Leeds:** Finally, do you anticipate the need for any further research into important issues that are raised, or are you leaving it to external parties to discuss and come up with further responses?
Steve Quartermain: I think that will come out of the dialogue that we are having. It will depend on what comes back. We are clearly open to that challenge, and if we need to do more work we will do so. The appetite for Ministers to engage positively in this is very clear.

The Chairman: It seems to be top of the pops at the moment. You cannot open a newspaper any day—or maybe it is just because I am involved in it—and not see something about housing, the environment, place making and things like that. That is good, because it means that the great British public are going to get energised eventually.

Q354 Baroness Young of Old Scone: This is quite a significant report and very thoughtful. Are the Government planning to give an account of which of the recommendations they do not agree with, or are we just going to see it massaged out of the script?

Steve Quartermain: I am not sure that we are going to see anything massaged out. The Government have given a response already and I do not think there is any anticipation that there will be a further response. Where we sit at the moment is taking forward the recommendations that are in it in a meaningful way. That is not necessarily us producing another paper telling people what we think of it; it is engaging with the sector and trying to take forward the things that are in the Farrell report that can be taken forward. We are action, not words.

Lord Clement-Jones: Is the proof of the pudding the buildings that will emerge in the next few years?

Steve Quartermain: Indeed.

Q355 Baroness Rawlings: We have in front of us a rather depressing graph of how house building has been declining quite badly since the 1960s. What is your view for this consistent failure for the targets in recent decades, and do you think current policy can buck the trend? I will, if I may, add my supplementary at this stage so that it can work with the main question. If you buck the trend, how will enough energy be provided for all these new houses that we desire when we had quite a big announcement this week that there is going to be a severe shortage of energy and possible cuts this winter? Cuts such as these are far more serious than in the past, because so much is now driven by electricity—you cannot even make a landline
telephone call without electricity, and there are lifts and all the other things—and this affects the elderly especially.

I return to what Ms Stanier was saying earlier on about energy efficiency: that it is now at 30%, and that there is great improvement and we are getting to carbon budgets and climate change targets. In view of all this use of renewables rather than what we had before with coal, nuclear and future shale, is the price of all these carbon budgets and climate change targets going to work when we have these severe cuts and if we are going to be building all these new houses?

Ruth Stanier: I will do my best to try to answer those points. I will start with the question about how we deliver enough homes to meet the country's needs. Clearly this is a very significant challenge, which as you say has clearly proved difficult over recent decades. We are very clear about the framework that needs to be in place to deliver the homes that the country needs. To achieve that we first need there to be enough permissioned land in the system. We then need there to be enough supporting infrastructure. We then need a diversity of developers, both large and small, who together have the capacity, skills and bricks to put the housing up. Finally, we need enough demand to ensure that the market operates effectively.

The Government’s approach is very much about seeking to get every part of that system operating in a way to get us to the housing ambitions that we have. There are a number of reasons why perhaps we can be at least somewhat optimistic. If we look at the trends in planning permissions, the latest published data showed that in 2014-15 261,000 new homes were granted planning permission. The trend has been very positive. That has in fact increased by over 60% since 2010 and we are now at a point that is higher than where we were before the economic issues some years back. So clearly permissions are at a level, even allowing for some kind of natural dropout, where we should be seeing new housing coming forward.

That is very positive indeed, and that is why in the productivity plan announcements last week we will now be looking to focus very much on ensuring, first, that up-to-date Local Plans are in place to support the continuation of that positive trend. We know that where Local Plans
are in place, those plans provide at a level much closer to the projected need than in other areas, and we also see more housing delivery in those areas. The second area that we are focusing on is very much the end-to-end planning process, right from thinking of schemes to enabling them to start on site. Even once you have permission, there is a problem in some areas about getting the condition sorted out quickly, and we are continuing to very much focus on addressing that.

In terms of ensuring that the right mix of developers are in place, the Government is continuing to pursue a number of initiatives, and indeed new initiatives, to promote home ownership and to support small builders in financing and in ensuring that unnecessary burdens are removed, as well as in supporting the private sector and building for rent.

In terms of the demand, the final part of the framework, Help to Buy, remains in place. We are absolutely seeking to tackle these issues head on.

The final point in relation to the first part of your question is to draw your attention to the really significant shift over recent years in local public attitudes to house building, which I think has been a really important constraint in the past. The latest research data shows that local support for house building has doubled in the last four years from 28% in 2010 to 56% now. We think that neighbourhood planning has contributed to that. I also think that we are all worried about where our children, and indeed grandchildren, will be living. So there is an important shift there that we think will be very helpful.

Clearly your point about energy is a very important one. We work closely with the Department of Energy & Climate Change on these issues. As I set out at the beginning, there are clear requirements in national planning policy that energy requirements of new housing must absolutely be considered as part of the local plan process. The recent announcements do raise concerns. My understanding is not that there will definitely be problems but that if we have a particularly cold winter and there are high energy requirements at particular times, there could be issues. But as I say, we work closely with DECC on these matters.

**Baroness Rawlings:** That is before all these houses are built, let alone other things.

**Bob Ledsome:** I would like to expand on that last point. When the Government set out the carbon budgets over the coming years, they clearly take account of the economic impacts of
setting carbon targets at particular levels, both at the macroeconomic level but also thinking about what it might mean for energy prices and therefore energy bills, and therefore obviously the impact on homeowners and their fuel bills. Those matters are taken into account.

**Steve Quartermain:** I would just add that we talked earlier about infrastructure and a national infrastructure plan. There is a national policy statement on energy that very clearly sets out, looking forward, the future energy needs for the country, which are linked to the major infrastructure regime. It identified the gap, which is taken into account in projections of the need, and that is why it sets out in that framework what energy requirements are expected to be delivered. There is recognition that as the growth takes place—particularly as some of the energy providers drop off, because not all of them are still going to be there—there will be a need for new investment in the future.

**Baroness Rawlings:** I am not an expert on that, but Lord Ezra, who is, was always asking questions in the House, inevitably about the fact that we do not have enough reserves and have enough only for a very short time if there is a heavy demand. That is why I wonder, with all this new demand, whether we will be able to cope. That is all.

**Q356 Lord Woolmer of Leeds:** Which government department is currently responsible for analysing the reasons for market failure in not building enough houses? Which government department is responsible for the research and producing evidence on which to take policy forward? Secondly, all the evidence that we have had to date shows that private building for private owner-occupiers has never reached the level that we are now saying we aim to achieve and that the level of house building that we want to achieve has always been achieved when it has by a significant contribution of social or local authority housing. I noted in your observations to us that you made little or no mention at all of that balance. My question is again: to what extent is housing policy going forward built on research and analysis? If so, what has that research and analysis shown to you about the need for contribution from social and local authority housing, for rent as well as for private occupation?

**Ruth Stanier:** The responsibility for housing policy research and analysis fits very squarely with our department, the Department for Communities and Local Government, and absolutely our
analytical teams, with our policy teams, undertake analysis of this issue. To address your point about the contribution of affordable housing, I think you are quite right to pull me up on that. I should have mentioned it as part of my response. Clearly affordable housing is a very important part of the mix. The last Parliament made a significant contribution to the overall levels of housing delivery, so absolutely that needs to be part of the mix.

**Lord Woolmer of Leeds:** The department has undertaken research on this, has analysed it, and has drawn some conclusions about the next 15 years. It has taken a view based on research and evidence of the contribution that you must expect to come from social housing?

**Ruth Stanier:** The analysis that has been undertaken is very much in the context of the framework I described right at the beginning of my answer: how all the different parts of the system, from permissioned land through to diversity of developers through to demand, need to work together in order to get housing built. I would not say that we have set out any single prediction as to what the precise mix should or could be going forward. There could be a range of potential mixes going forward, and we do a lot of work looking at the potential scenarios, the potential amounts that different providers may be able to bring forward, and what drivers we have to encourage that.

**Lord Inglewood:** Could I follow that quickly and say that you have indicated that you anticipate that for the future, because not everybody has enough money, there is a requirement for social housing and let accommodation? Have you any kind of back-of-an-envelope sense of roughly what percentage of the whole that might be, taking the country as a whole?

**Ruth Stanier:** Do you mean now or going forward?

**Lord Inglewood:** Well, both. In the landscape.

**Ruth Stanier:** I do not feel that is a question I can give a clear answer to today, but it is one that we can certainly take away and come back to you on.

**Bob Ledsome:** It might be worth just recording that the Government had a manifesto commitment to build 275,000 affordable homes over this Parliament, so clearly that is an ambition that this Government have set for themselves that I think is relevant to the discussion that we have been having.
Lord Inglewood: The affordability comes in two forms: it is either afford to buy or afford not to buy and live in.

The Chairman: How would that be split? Would it be associated public authority, local authority buildings, private buildings or what?

Bob Ledsome: I am afraid that I cannot give you that split.

The Chairman: Good. Okay, thank you.

Baroness Young of Old Scone: Could I ask for another piece of information, as we are getting some information, which is the percentage of planning approvals currently granted for housing that never get built, and whether that is increasing or reducing?

Ruth Stanier: I can briefly answer that. It is something that we have been looking at quite closely recently. Over recent years there has been quite a constant trend that shows that of all the permissions that are granted, roughly 20% of them will subsequently be re-permissioned when people decide that the scheme they originally applied for is not exactly the scheme they want to build. So there is some natural churn that is not necessarily problematic. In addition to that, our analysis suggests that some 10% to 20% of planning permissions seem to fall out and not reappear. We are doing some further internal work to try to understand more exactly why that happens.

The Chairman: Is there any one major reason why? Is it that people decide that they want to hang on to the land bank?

Ruth Stanier: We think that the possible reasons—although we do not yet have clear evidence for this—are, first, viability issues: a scheme where permission is sought and then subsequently it becomes clear that it is just not viable. Potentially some permissions are also sought primarily to secure book value, land value, uplift. We think there are a range of reasons.

Q357 Earl of Lytton: We have heard a lot about the Government’s wish to procure the delivery through the local plan system. My question is: are the Government satisfied with the design and delivery of local plans as they are coming out at the moment? Put another way, with the benefit of being able to see the ones that have come out, is the national planning policy framework a sufficiently good tool of analysis for the purposes of local plan preparation
as opposed to an undeniably beneficial list of aspirations, if I can put it that way? Would you care to comment on how things are happening with the local plan delivery at the moment?

**Steve Quartermain:** As Ruth Stanier said earlier, we know that there has been an improvement in the delivery of plans, so the system is working and over 80% are published and 64% adopted. But we recognise and people tell us that it can be a complex and lengthy process. It slightly links back to what I was saying earlier about communities: sometimes a plan can take so long to produce that by the time you have actually produced a plan and are making planning applications and decisions on it, the community has shifted and churned and you have different people living in the community when the plan and the decision were made, and they think, “What is all this about?”. It is about trying to get plans delivered more quickly, trying to look at where the complexities are and seeing whether we can make them simpler. Local planning authorities think that it is much more risky than perhaps it is in certain instances. They produce piles of evidence for things and we think, “Do you need all that evidence?” Sometimes you do, but perhaps sometimes you do not. We are going to try to look at the process and see whether we can streamline it and make that plan-making process quicker.

You are absolutely right in that the NPPF sets out very clearly what a Local Plan should do. It sets out the core principles, and indeed what should be in a Local Plan. You could argue that it is very clear what people should be doing, and there are times when you think, “Why is it taking people so long?”. Even with over 80% of local planning authorities with plans published, there are still nearly 20% who have not published a plan since 2004. We need to try to ask why that is and what we can do to drive them to deliver a plan. If that means looking at the ways in which we can streamline it, then what we have committed to is doing just that.

**Q358 Baroness Whitaker:** Mr Quartermain, you encouraged public participation earlier, which was very welcome. What do you think is the earliest stage at which the public can come in on the local plan? You talked about changing public perception and all that kind of thing.

**Steve Quartermain:** Day one.

**Baroness Whitaker:** How do you hope they would do it?
**Steve Quartermain:** People would normally engage the public with an issues and options paper that tried to explain the issues that we are trying to address and the options that we have to address them. Most local authorities will engage in a public engagement process, and I think there is evidence that they are getting more imaginative about how they do it. It is not just a public exhibition or a notice in the paper. Certainly on neighbourhood planning, we have heard evidence of people holding discos and getting the young people involved. That is one of the biggest challenges. A lot of the stuff that we are looking to develop is for an ageing population, but it is also the young people who are going to be living in these houses by the time they are built in five years' time. They are the ones who are in higher education or at school at the moment. Trying to capture their views is really important, and we have seen people be quite imaginative about how they do that.

**Baroness Whitaker:** If you know some good examples, could you let us have them?

**Steve Quartermain:** We will indeed.

**Q359 The Chairman:** Can I now have the last question? What would you like to see as the result of this inquiry that we are doing, a report into the future of the built environment? Are there glaring omissions that we have not mentioned today? If any one of you were in my position, what question would you be asking? I am asking each one of you to give me your question.

**Ruth Stanier:** I think you all asked some extremely pertinent questions. To my mind, one of the most useful outcomes of your work could be to give more prominence to, more of a push behind, this critical issue that you were rightly interrogating us about: how we get that really good quality design out there; what will it take. As I hope has come across, we are very passionate about it, but it is not something that government can do alone. Who are the key characters? How do we make it happen?

**The Chairman:** We are passionate too, by the way.

**Steve Quartermain:** From my point of view, I think it is the recognition of the importance of planning as a means of delivery, which you might expect from the chief planner. Planning is a delivery mechanism; it is the thing that makes things happen and changes people's lives. It is looking at the way in which we can embed that into the players, the people who use the
planning system, because ultimately it is about outcomes and where people live. That is the challenge: how we stop the planning system being seen as a regulatory thing that you engage in when you want either an extension or to stop an extension next door and to see it instead as a vision thing that says, “This is about shaping where we live”.

**Bob Ledsome**: My comment is also related to delivery but at a slightly different angle, which is the effectiveness and the ability of the industry to deliver what it wants to deliver, if I can put it like that. There will be good design, excellent designs, that we would all support, but for some reason or other that is not quite what happens in practice. I think there are some really interesting issues about why that is the case, not that people are wilfully ignoring good design but whether there are some constraints and factors in the system that sort of inhibit that. That would be quite an interesting area for study.

**Gill Graham**: From my perspective, from heritage and the historic environment, you have touched on some really important points. Today’s fine architecture is tomorrow’s heritage, and it is what we are going to be concerned about tomorrow. I would be interested in challenging us on how we consider the historic environment in terms of planning and how that planning can reuse historic buildings and regenerate them, particularly in city centres. That is a challenge and it is one that I would encourage you to challenge with us.

**The Chairman**: On behalf of all the Committee I am sure I can say thank you very much indeed. Thank you for giving your time and answering some probably very pleby sorts of questions. On some you have made us think, and that is the purpose of them, so thank you. You will be getting a transcript, of course.
Department for Culture, Media and Sport and Department for Communities and Local Government - Oral Evidence (QQ13-28)

**Design Council CABE – Written Evidence (BEN0177)**

**About this paper**

1. This paper is a written evidence contribution to the House of Lords Select Committee Inquiry on a National Policy for the Built Environment. In this paper we set out the role of the Design Council and how we work to support the delivery of high quality places where businesses want to locate and people thrive.

**About the Design Council**

2. Design Council is an independent enterprising charity that champions great design to improve lives. Our work places design at the heart of stimulating business growth; helps to transform our public services and enhances places and cities. We advance new design thinking, encourage debate and inform government policy.

3. In 2011, we merged with the Commission for Architecture and the Built Environment (CABE) and now offer direct support to help all those in the planning process to deliver better quality development.

4. As an advisor to government on design, Design Council Cabe offers policy advice and are commissioned to deliver direct support to help meet key government objectives. In particular, we work closely with DCLG sitting on its Housing and Planning Sounding Boards. We also sit on the Government’s Design Advisory Panel. Importantly, we work across government on a range of priorities to deliver better quality places. For example, we are currently working with BIS to identify how investment in the built environment can create the right conditions to stimulate innovation and local growth.

5. Advising, influencing and inspiring, we work to create well-designed, inclusive buildings, places and spaces.

**Policymaking, integration and coordination**

Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policy makers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

6. The National Planning Policy Framework (NPPF) sets out a clear policy framework for decision-making, supplemented by the Planning Practice...
Guidance (PPG). These, alongside up-to-date Local Plans should provide the policy and structures for coherent and consistent decision-making.

7. Further devolution and the advent of combined authorities will provide a further mechanism for joined up local decision-making across functional economic and housing market areas. City regional decision-making should include housing and planning powers to provide greater consistency with Local Enterprise Partnership (LEP) geographies and to accurately reflect travel to work areas.

8. Our Councilor’s guide to Urban Design set out the important role that councillors’ play in the delivery of high quality well designed places and buildings. In order to tackle the major housing challenge that we face there is a need to take difficult decisions, but this accountability has to be linked to a package of incentives to encourage politicians and ultimately their electorate to accept new housing.102

9. Comprehensive and compulsory training for councillors’ is crucial in order for planning committee members to take the bold and difficult decisions that will be needed to deliver housing, infrastructure and major regeneration projects at scale across the country.

How well is policy co-ordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and co-ordination be improved?

10. The role of a Chief Architect, in our view would not aid co-ordination. Bringing policy functions together whether there is synergy, such as the formation of the Cities Unit or Government Property Unit provides a flexible, agile means to address strategic “place” issues across all the aforementioned areas.

11. No one government department has the ability to, or should, influence decision-making in places across the country. This co-ordination has better results when done at city-region level and through cross Whitehall co-ordination and locational leads, as per BIS Local and the above mentioned units.

12. Organisations such as Design Council Cabe, Historic England and the new National Infrastructure Commission provide useful delivery support mechanisms to ensure integration and co-ordination occurs and is continually improving.

**National Policy for planning and the built environment**

Does the NPPF provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

13. Greater weight should not be given to certain elements of the NPPF over others. It is important that the National Planning Policy Framework (NPPF) chapters and sections retain equal weight so as not to prejudice the determination of individual applications or the production of Local Plans which must rest with the Local Planning Authority.

14. The Planning Practice Guidance (PPG) online tool provides an effective means for ensuring that policy is kept up-to-date to reflect practice and to ensure that there is an annual update of the guidance. This mechanism should be allowed to bed down before further amends are made to the system. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element of national policy?

15. It should be for Local Planning Authorities and Combined Authorities to determine their priorities based on evidence at a city region level. It is unclear what weight a “National Spatial” plan would have alongside the existing NPPF and PPG. It is also unknown how a “National Spatial” plan would sit with the context of the existing LEP network, their Strategic Economic Plans and plans that Combined Authorities will be required to produce.

Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

16. Local Plans need to have a clear spatial vision fifteen years, looking ahead to ensure that they plan robustly for future change in their area. Most Local Plans clearly set out this long term timeframe, although to assess housing supply, this is on a somewhat more limited time frame of five years. Infrastructure Delivery Plans (IDPs) robustly produced with a sound evidence base must clearly set out costed and prioritised plans for the planning and delivery of strategically significant infrastructure in order to provide certainty to infrastructure providers and developers.

Buildings and Places: New and Old

What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinate at central Government level required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?
17. The Productivity Plan sets out clear measures to increase housing supply, including further reforms to the planning system. The Government should set out a clear housing supply strategy, building on recent announcements around “Planning in Principle” and “Starter Homes”. This new strategy should be clear in what numbers could be achieved over the course of this Parliament and how this clearly meets demographic need. Such a strategy should make a clear commitment to achieve high quality design in new housing and better quality places whilst setting out the various mechanisms that will be used to deliver such as Design Review, as set out in the NPPF.

To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place making? How can more be made of these national assets?

18. The historic environment adds commercial and economic value to places across the UK. People spend more in their local economy after investment in the historic environment. Historic England research has demonstrated for every £1 invested in the historic environment directly contributes an additional £1.60 to the local economy over a ten year period.

19. Historic England is critical to the success and enhancement of our historic assets. CABE and latterly Design Council Cabe have a long history working with Historic England. As separate organisations with separate remits, responsibilities and priorities we both deal with the built environment, we often touch on the same projects, for example when we assess planning applications, comment on planning or other policy, or through our training programmes and publications. We liaise frequently, have a good working relationship and look to work jointly wherever it is appropriate. For example, we collaborate through the Urban Panel and on joint guidance on tall buildings and building in context.

20. Within the context of the upcoming Spending Review it is critical that support remains for Historic England beyond its existing settlement to optimise the benefits derived from our historic assets.

Skills and Design

Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills to adequately consider the built environment in a holistic manner? How could we begin to address any skills issues? Do Local Authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?
21. As local authorities face increasing pressures and demands on their resources, it will be important for new models and more efficient ways of working to be developed. The Local Government Finance Settlement and outcomes of the CSR will have a major impact on local planning authorities over the next period.

22. Our City Design Programme has, for over two years, provided consistent and flexible design support and advice in various towns, cities and boroughs to provide cost effective support and resources to authorities. The efficient and effective manner in which this programme operates also helps to generate revenue for the authority and acts as CPD training for officers as well as comprehensive and integrated design and planning training for elected members. It de risks the development process and creates certainty for applicants and developers.

23. See Appendix for further information about our Cities Programme.

Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

24. Government must set the benchmark. In line with the NPPF, all publicly funded development projects should seek to achieve good design and be subject to proven mechanism such as Design Review to do so. CABE, and latterly Design Council Cabe, has been at the forefront of promoting well designed development for over fifteen years and has a long track record in advising on major schemes from the London 2012 to Crossrail to Nationally Significant Infrastructure Projects (NSIPs).

25. National leadership is important, but as set out previously, local authorities and city regions should have in place their own arrangements drawing on best practice as each city has different needs requirements and pressures.

26. Our Cities Programme, has been a step change in the tools and techniques on offer to promote high quality design and ‘place-making’, This new approach has been endorsed by Rt Hon Greg Clark MP, Secretary of State for Communities and Local Government and we are now working with officials to see how more towns and cities could benefit from the Programme. See Appendix for further information.

**Community involvement and impact**

Do those involved in delivering and managing our Built Environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve
consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

27. Neighbourhood Planning has provided a good platform by which to bring community groups and Parish Councils into the planning process, for them to shape and develop their own plans and to be positive about development that is well designed and in context of their area. Indeed, evidence has demonstrated that achieving good quality is important to communities and can speed up the delivery of new development - over 73% of people say they would support the building of homes if well-designed.  

28. Initiatives such as the NHS England Healthy New Towns programme provide an opportunity to understand and plan more cohesively for the future health needs and requirements of communities. This programme is a good example of the benefits of bringing together, healthcare and local authority partners to raise the ambition for new development.

29. Our work with Bournemouth Borough Council through our Active by Design programme is a good example of how communities can successfully influence and enhance their built environment to improve health and well-being. For further information see appendix.

How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

30. The Neighbourhood Planning process has been effective in democratising the planning process further. The main issue is around involvement and engagement in Local Plans which is a long and time consuming process. This is an area that could be examined to improve public participation and inclusion.

---

103 National Housing and Planning Advisory Unit (NHPAU), 2010
Appendix

Design Council Cabe Cities Programme

Context
Cities across the country are not reaching their full potential constrained by insufficient infrastructure and a lack of affordable housing, amongst other key constraints.

To tackle this challenge the Design Council Cabe has developed an innovative new system of support for cities blending local knowledge and world-class expertise to help bring forward necessary development to stimulate local economic growth.

Piloted with Oxford City Council, our new Cities Programme not only offers a means to unlock stalled developments and deliver new homes and infrastructure; it offers the opportunity to create, at pace, good quality places where businesses want to locate and invest and where people want to live and visit.

Benefits
Design Council Cabe works with all parties engaged in delivering development to support growth: local and central government and the development and construction industry. The Cities Programme can:

- create confident, high-quality prosperous places
- help to deliver long-term sustainable economic growth
- provide certainty for investors and developers
- ensure necessary new homes and infrastructure are brought forward at the right time, in the right place and are of better quality
- build confidence in the local authority
- identify opportunities and challenges earlier in the process to enable stakeholders to create better results

How it works?
To meet the needs of every place, we provide:

- multi-disciplinary design panels selected to meet the specific needs of each city
- design support and review throughout the early stage design and planning process
- strategic specialist expertise to assist in the shaping of policy
- expert advice to maximise the impact of policy implementation
- training to build capacity, knowledge and expertise within the Local Planning Authority
Building a database of knowledge to inform continuous improvement of services for the benefit of the city

How is it funded?

Our pilot with Oxford City Council has demonstrated that our Cities Programme can be funded through planning fees. However, through our conversations with local leaders we know that where land values are lower and viability more challenging, they are less likely to participate in the programme.

Case Study – Oxford City Council

Oxford is home to one of the world’s leading universities\textsuperscript{104} and, as a centre for technology research, is a key part of the UK’s knowledge economy. There are 1,500 high-tech firms in Oxfordshire, employing 43,000 people.\textsuperscript{105} The city’s labour force has the highest proportion of graduates anywhere in the UK, other than Cambridge.\textsuperscript{106} The city is also famous for its rich heritage and built environment.

Managing a successful, growing city while maintaining its character and enhancing its reputation for world class design requires careful consideration. A city’s built environment can either facilitate or hinder local ambitions for growth. The quality of the built environment in Oxford is crucial to delivering economic growth, but many sites are very sensitive with myriad constraints and challenges. Development must be of a quality appropriate to an internationally renowned city to reinforce its reputation and sustainable growth.

The City Deal for Oxford and Oxfordshire has set out clear ambitions by unleashing a new wave of innovation-led growth to maximise the areas world-class assets. These include “big science” facilities such as Harwell Oxford Campus and the Oxford Innovation Campus. Public and private funding will combine to invest in a network of innovation and incubation centres in Science Vale Oxford (Oxfordshire’s Enterprise Zone), to develop major sites in Oxford, and to enable the growth of small and medium-sized enterprises.

Through the City Deal, it has been recognised that the region has not reached its full potential and has been constrained by insufficient public transport, an at-capacity road network and a lack of affordable housing, pricing employees and businesses out of the market.\textsuperscript{107} The City Deal therefore identifies transport improvements and the

\textsuperscript{107} The Oxford Innovation Engine: Realising the Growth Potential (October 2013)
provision of high-quality housing as fundamental to the delivery of sustainable economic growth.\textsuperscript{108}

To help meet these challenges, Oxford City Council commissioned the Design Council to provide design support services across the city to blend world-class expertise and local knowledge to help bring forward necessary development faster to support local innovation and stimulate economic growth. The Design Council has worked with nearly every local authority in the country and has a track record of successful projects at every scale, from communities delivering their neighbourhood plans to Nationally Significant projects including London 2012, Crossrail and the new Thames Tideway Tunnel.

Oxford City Council and the Design Council are bringing together Councillors, officers, developers, investors and other key stakeholders to debate and set a benchmark for design in the city. This approach, building on the solid foundations of an adopted local plan, is enabling Oxford to set out a clear vision for the city and have a clear strategy to deliver their ambition. In turn, this helps to provide the climate for investors to be confident and secures a vibrant, prosperous future for the city.

Other towns and cities are also set to benefit from this approach in stimulating local innovation and growth. The Design Council is sharing knowledge and lessons learned across local authorities now delivering local growth to support other councils with limited resources in tackling the challenges of bringing forward the right type of high-quality development, in the right place at the right time.

Oxford’s case demonstrates how to secure quality development that supports local priorities. The city has a bright future, and is very well-placed to flourish and grow in an innovation-led economy. However, it also has major challenges to overcome in order to achieve its potential, many of which directly related to the built environment. With the highest average house prices of any city outside London\textsuperscript{109} and poor transport links between Oxford and Science Vale, the city needs to tackle major housing and infrastructure constraints to enable long-term growth. This requires a strategic view of the scale of potential development, looking beyond individual planning applications to take control of the city’s longer-term future. Design Council support will help the City Council develop the confidence it needs to demand high-quality solutions and to ensure they can be delivered.

Oxford is proving that investment in the built environment and a proactive approach to planning can stimulate local growth by providing certainty for investors as well as

\textsuperscript{108} Oxford and Oxfordshire City Deal (February, 2014)
\textsuperscript{109} Centre for Cities (2014) Cities Outlook
helping to provide high-quality affordable homes and critical infrastructure investment across the city.

**N.B. This case study was originally prepared by the Design Council in 2014, at the request of the BIS Knowledge & Innovation Directorate for inclusion in the coalition government’s new Science & Innovation Strategy.**

**Testimonials**

“A proactive approach to planning and development is the key to unlocking the potential of all our cities and is at the heart of what this government is trying to achieve. Oxford has always been a city of innovation, with world class reputation and I am delighted the City Council is building on this tradition by working with the Design Council to develop a holistic new approach to deliver their ambitions for locally-led growth. I encourage other cities across the country to look at how they could use, and benefit from, the Design Council new cities programme to help deliver housing and infrastructure, at pace and as set out in their city deals.”

Rt Hon Greg Clark MP, Secretary of State for Communities and Local Government:

"Oxford was selected to bid for the City Deal because of its continuing growth potential, and its contribution to the national economy. Our focus is on creating employment and economic growth in the knowledge economy, supported by housing and infrastructure."

‘Oxford City Council is seeking to be a world class city for all its residents, and high quality design in every aspect of the built environment including its public spaces is a key component in creating an environment of which we can be proud of, and in which people are happy to live. The work of the Design Review Panel has already made a substantial contribution to the quality of some key regeneration schemes in the city, in the short period since it was established, and we are indebted to the Design Council for the excellent support work and professional skills that have been provided to the Panel and the City Council.’

Councillor Bob Price, Leader of Oxford City Council

“I didn’t have a clue what it was about at the beginning, it sounded interesting and I just felt encouraged to participate and to help have a say on what happens in West Howe. I got more confidence being involved and I understand things more as a result. Our day trip to Southampton was a real eye opener on how different areas have different ideas on regeneration. It’s not always about the money – it’s about what the community can do too. I think the residents are encouraged that there is going to be improvement. Volunteering this last 5 months, and especially the ambassador role, I feel like I fit in this community now. I’ve never felt like I fit in somewhere before. It has given me a lot more confidence and I feel stronger – I can’t wait to see what each new day brings.”

Examination of Witnesses

David Tittle, Chair, Design Network, and Chief Executive, MADE West Midlands, and David Waterhouse, Head of Strategic Development, Design Council CABE

Q84 The Chairman: Good morning. I have already officially welcomed you outside, but here I hope it is warmer; it is jolly cold in those corridors. It is very good of you both to give up your time, and we are looking forward enormously to your evidence. You have in front of you a list of the interests that have been declared by members of the Committee. In addition, a transcript of the meeting will be taken and published on the Committee website. You will have the opportunity to make corrections to that transcript where necessary. Could I begin by asking each of you, for the record, briefly to introduce yourself to the Committee? I am going to do it alphabetically, so Mr Tittle before Mr Waterhouse; I was going to call you David and Goliath, but I decided not to.

David Tittle: My name is David Tittle. Most of my early career was in business or business advice, but about 15 years ago I went to work for the Civic Trust. That projected me into the built environment. Since then I have been a trainer, an advocate, organiser and adviser on design issues, and I have a qualification in urban design. For the past eight years I have worked for MADE, a charity based in the West Midlands dedicated to improving the built environment, and I became its chief executive. I am chair of the Design Network, which pulls
together organisations like MADE across England. I am also a trustee of Civic Voice, the national organisation for civic societies.

David Waterhouse: I am David Waterhouse. I am a chartered town planner with over 10 years’ experience in urban planning and regeneration. My early career was spent in local government, followed by the Town and Country Planning Association, where I ran its policy function. I then spent a period in DCLG, where I was responsible for the housing market renewal programme and advice on eco-towns and the Growth Points programme, under both Labour and coalition Governments. For the past three and a half years I have been head of strategic development at CABE, merged with the Design Council, working with cities and authorities up and down the country to support them in identifying solutions to improve the quality of all major developments. We work with many authorities, providing a variety of review, policy, peer-to-peer support and training. In addition, I am on the board of the Town and Country Planning Association and an academian at the Academy of Urbanism.

The Chairman: I am sure that around this table you see many old friends, not old in age but of long standing.

David Waterhouse: Yes.

The Chairman: Is the emphasis always on cities, not smaller towns or, say, market towns, because they need to be better than they are at the moment?

David Waterhouse: Yes.

The Chairman: Also, a lot of them will have to expand if we are to fulfil anything like the targets for housing.

David Waterhouse: Absolutely. Our work is very broad brush across towns and cities. We have delivered major programmes of work for neighbourhood planning programmes up and down the country, working in towns and villages, market towns and, critically, in historic towns where there is also a real need to integrate new and old sensitively.

Q85 The Chairman: Indeed. I am sure our specialist adviser would make that point, too. The first question is: who should be responsible for providing national leadership on design in the built environment? To what extent have the changes to CABE since 2011 resulted in the loss of leadership at national level, or has it?
**David Tittle:** On the first question, government needs to set general objectives, direction and priorities for the built environment. That needs to come from the centre of government rather than any particular department, because it crosses the responsibilities of all departments. The industry needs to respond to that, and professional bodies, charities and think tanks need to act as that collective memory and provide a challenge. There has been a loss of leadership since the old CABE disappeared. In our view, out in the field, away from the architectural press and the sort of discussions that go on at high level, what is missed most about CABE is that leadership: the bringing together of knowledge, the publications, and the guidance and training that used to come out, rather than design review. To a certain extent, the Place Alliance and bodies like ours at Design Network are stepping into that role. We have run several national conferences, and the Place Alliance grew out of one of those. People are coming to fill the vacuum, but it is a little patchy and unco-ordinated.

**The Chairman:** Does that mean that in your situation you are reactive to people saying, “Well, it would have been so much better if we had x, y or z as we had before”, or do you actually go out and peddle for business, or for the opportunity to give advice to people?

**David Tittle:** We are certainly peddling for business and trying to be as proactive as we can, not only in reacting to what government are doing and to what is happening out there in the market in development, but also, as much as we can, in drawing knowledge together, learning lessons and talking about how things could be different.

**The Chairman:** Can I give you a case in point? Yesterday, we had a very good visit to Birmingham City Council, which was quite revelatory—from my point of view anyway. What would you do in circumstances where 10 years ago you saw what Birmingham City Council was about to do and the situation was as it is now for your organisation? Would you have rung the chairman of Birmingham City Council, or gone up there? What would you have done? Would you have asked for papers? Would you have asked, “What are you planning? Can we give you any help?”.

**David Tittle:** Yes, that is what we do all the time.

**The Chairman:** That is what you do now, so if, say, Sheffield wants to do it, that is what you do.
David Tittle: Yes. One aspect of the Farrell review that I like very much is the way it talked about the industry and the professions in a particular area needing to be more civic, needing to help out the public sector in these times of austerity. To take Birmingham as a point, traditionally it always argued that it had a very strong in-house team and did not necessarily need outside expertise.

The Chairman: Yes, I can understand that.

David Tittle: We always talked to them and said that a little bit of challenge was sometimes helpful, but they had a point; they had a very good team. Some of them were our friends and colleagues, so we knew how good they were, but that is no longer the case. A lot of those people have gone.

The Chairman: We know that.

David Tittle: They need help with capacity. What we have been doing in Birmingham is going round to talk to all the major firms of architects and principal developers, saying, “Let’s get together and put a proposal to the city. Let’s talk about how we can take that message from the Farrell review: we are here to help you”. We are doing that in Birmingham and also in Coventry.

The Chairman: Coventry needs it.

Lord Inglewood: You described Birmingham and its pomp in glowing terms. How representative is that of the wider picture?

David Tittle: I think it is very mixed around the country. A lot of it depends on happenstance: the politicians, the particular officers and the chemistry. A city that did very well 10 years ago at turning itself round is Sheffield. We took people to Sheffield to examine it and asked, “How have you managed to do this?”. I think it was the different principal agencies pulling in the same direction, all appreciating the importance of place. Yorkshire Forward was the one RDA that I think really got the importance of place and worked on transforming places, but that also needed a good local authority. In those days we also had urban regeneration companies. You need to have a good one of those working with the local authority. If all the agencies are pulling in the right direction and you get the right politicians and officers, magic can happen.

Lord Inglewood: But how often does it happen?

David Tittle: Not as often as it should.
Lord Inglewood: Is the general picture poor? I am not asking for names—no names, no pack drill, you will be glad to hear—but do you reckon the general picture is materially less good than it should be, or not?

David Tittle: It is less good in the sense that—I know others have said this to you in previous sessions—the attention to everyday places and to detail is not what it should be. Every city has prestige schemes—prestige developments and public realm schemes that they can take lovely photos of, put in their brochures and take to MIPIM and say, “Come and invest in us; we’re wonderful”. Of course, they should do that, but then you go round the corner and see a place that still has masses of surface car parks, is highway-dominated, has poor buildings, is difficult to find your way around and so on. A lot of our country is like that, but the good developments show what we are capable of and that we have the skills.

The Chairman: There is obviously a huge gap at the moment. That is the gap you could get yourselves into to fulfil your aspirations. Mr Waterhouse, you have been silent about this. What are your views on the question?

David Waterhouse: I agree entirely with David Tittle that national government and its delivery agencies—the Homes and Communities Agency and the Planning Inspectorate—have a clear role to play at national level. However, life has moved on since 2011. I have travelled to all core and key cities up and down the country, indeed to many small historic towns, and the picture is very mixed. But the advent of devolution, city deals, local growth deals, the pooling of funding from national government and focusing it in one location and the current wave of combined authorities that are coming forward provide a good opportunity for joined-up working at local level. Each place is incredibly different and varied. I was in Manchester earlier this week, where, under very strong civic leadership, the Manchester Place initiative, which is the housing regeneration company kick-started by the city council and now rolling out across Greater Manchester, provides the opportunity to bring together planning and housing and the funding associated with that, as well as health and well-being and all the aspects that make places.

There are a number of good initiatives happening up and down the country. Rather than seeing it as a loss of leadership at national level, we firmly believe it is about locally led bespoke solutions for each location. I take the example of Oxford, where we have been
working for over two years. It has a very constrained set of circumstances, given the policy environment, its green belt constraints and the fact that it is an internationally renowned city in many respects. None the less, it is not all dreaming spires; there are major inequality issues. The challenge we are seeing in places like Oxford is a depletion of in-house resource and competencies, allied with major pressure from developers and applicants wanting to invest in the city. There is a huge opportunity for Design Council CABE and the Design Network to support local ambition. That is what we have to focus on.

Q86 Baroness Andrews: You have answered most of my questions, so this is a bit reflective. In the days when you and I worked together, we had a very clear government policy about regeneration. That regeneration was driven by the revival of inner cities, so the place-making, although we did not call it that at the time, was essentially evident in what transformed the city centres, not just in Birmingham and Manchester but in Sheffield, Newcastle, Nottingham, Bristol and many different places. I entirely take the point that we are in a new situation and we have new vehicles, but we still do not have that overall clear instruction from government that regeneration is really important, that there are some better ways of doing it than others and that this is what is required to be done. First, do you think it is still something that government ought to be prioritising in the messages they send? Does it matter that government as a whole does not have that sort of clear strategic policy anymore? Secondly, the Manchester Place initiative writes itself, because of Manchester’s power and its ability in terms of resources and back story to bring everybody together. How do you get a place initiative articulated in less competent authorities like Stoke-on-Trent, for example, or in smaller ones? Oxford is a good example, because by definition it will have that sense of itself, but there are places that do not have a very strong sense: for example, Burnley—the old industrial towns that have so much less confidence and, frankly, fewer resources. That is the big challenge for us.

The Chairman: They were not at the conference in Birmingham yesterday.

Baroness Andrews: I am sure they were not.

David Waterhouse: To take Baroness Andrews’s first point on strategic regeneration capability and where that sits at national level, the national planning policy framework has a very strong role to play, but I think it is also down to local authorities having some direction
Design Council CABE and Made West Midlands – Oral Evidence (QQ84-93)

from central government, if I can put it in those terms, to enact what the NPPF says. Paragraph 62 very clearly sets out the need for, and the value of having in place, comprehensive design arrangements. Yes, the policy is strong, but it is about the enactment and delivery of it, and there is a role for the Planning Inspectorate as well.

The Chairman: But do you think the national planning framework could look at the overall strategy of planning for the whole country and then say as a guideline, for example, that in relation to our heritage 35% of the emphasis on planning should be regeneration? I am covering Lady Andrews’s point; if they are going to fall off the cliff in terms of not being appreciated, and they get all these sparkling new all-singing and all-dancing places in the middle of Birmingham, Oxford might find itself not being able to do so because people were not putting much emphasis on heritage and the regeneration of our existing stock.

David Waterhouse: The key point is to have in place a robust and up-to-date local plan based on robust evidence. That evidence base has to look at the pipeline of development; it has to comprehensively analyse housing market requirements, and it absolutely has to look at the investment community and understand what its ambitions are, because places happen as a result of multitudinous built environment professionals, but also as a result of investment. That is the critical thing.

Perhaps I could address the point about other locations that have more challenging circumstances: Hull, Stoke-on-Trent, Middlesbrough—places we worked in together. That is where the real challenge lies, because land values are lower and you get applicants and developers cherry-picking the most profitable and valuable sites. There is danger of a two-tier planning system emerging, with the first tier being the Oxfords, the more progressive authorities and the larger authorities with strong civic leadership, and a second tier of locations which, for a variety of reasons, have major challenges. It is a risk and it needs to be considered strongly at local level and drawn to the attention of government.

The Chairman: Government has a role to monitor it, and to nod or not nod.

Baroness Young of Old Scone: Can I ask about new settlements? They ought to be the opportunity to get it right, but we see some where you would rather boil your head and eat it than live in them.
David Waterhouse: Indeed. One interesting location, where we are working very closely at the moment, is the new settlement of Cranbrook in East Devon. That is the result of Exeter city and its adjoining authorities agreeing very clearly through the planning system not simply to extend, expand and potentially damage a very historic settlement—Exeter—but to take the brave decision to plan for a new settlement on a railway line to the east of Exeter. There the challenge lies first in the scale of the development. It is a greenfield site of eventually 7,000 units, and all the facilities that go with that. I would argue that phase 1—900 units built, on the ground now—is very much worth visiting and understanding to see how that has happened. It is fair to say that the quality is variable, because of the finance system and the developer system that apportions bits of land to different developers and different housebuilders. That is where you do not get a sense of cohesion in terms of place, but you get a standard type of housebuilding.

Opportunities exist in Old Oak and Park Royal, a major development corporation that has just been established in west London, to think about this from the outset. Indeed, we are working very closely with the development corporation to embed design and design thinking from the outset across policy and across every major development that comes through in that key location in west London. When it is completed, the station there will be a third busier than Waterloo is currently.

Lord Inglewood: I want to ask David Waterhouse about something he said which struck me as interesting, and I want to clarify it. If I understood you right, you said that it is much easier to develop sites that are expensive than those that are cheap. I am inferring from your remarks that that is because the expensive ones probably have characteristics that mean they are likely to be commercially viable. Is that right? Paradoxically, the more expensive the land, the more likely it is to be developed.

David Waterhouse: Perhaps I would not characterise it in such black and white terms, but places that are successful and have inherently high land values will attract further development and investment. It is riskier in places that do not have a legacy of good quality development at scale, or indeed high land values, for example the Stoke-on-Trents—I do not wish to pick on Stoke-on-Trent all the time, but places that are somewhat divorced from the economic mainstream, if I can call it that.
The Chairman: Stoke-on-Trent is beautifully placed and something wonderful could be done with it.

David Waterhouse: Quite.

The Chairman: I quite like the place—Ann of the Five Towns.

Q87 Baroness Whitaker: My question is mainly for Mr Waterhouse. It is good to see you again. To depart from the local, CABE did some national work that was fairly important. I remember very interesting research on sustainability and something very pioneering on the importance of beauty to well-being. It also carried out education and training functions, most particularly advocacy. Is there still a need for those? How should they be delivered, and who should do that?

David Waterhouse: The education and advocacy role is something that Design Council CABE as one organisation very strongly believes in. We, as government’s adviser on design, have a very clear and strong role in producing research reports; indeed, next week on the terrace of this House, we are launching our economic value of design, and we would be delighted to see members of this Committee there.

Baroness Whitaker: What resource do you have for that research?

David Waterhouse: We have an in-house research and policy team who work collectively with government departments: BIS and DCLG.

Baroness Whitaker: Is that the Design Council as a whole, or is it specific to CABE?

David Waterhouse: It is one organisation; it is a shared function. Economic value of design in its broadest sense, but also economic value of design in the built environment, is very strong in making the arguments that we are perhaps all struggling with somewhat. CABE did a huge amount of good work on the economic cost of bad design in the built environment. That was quite a seminal report. That work and the ongoing research we undertake is very strong, but that is at national level. At local level, it is also critical to provide advocacy, CPD support and training for very challenged officers who have huge amounts of pressure and volumes of planning applications. I was astounded to hear recently that the city of St Albans is one of the busiest planning departments in the country, all temporary staff. In a historic city with such intrinsic value, that is quite shocking, given that it is in the economic mainstream. The support, training and CPD for officers, which we have been embedding in Oxford, with officers and
critically with elected members and the leader of the council, is vital to upskilling and providing confidence to authorities.

**Baroness Whitaker**: But CABE and the Design Council do not have the resource to cover the national need in that area. How could that be better done? We have come across a dearth of capacity in some planning operations.

**David Waterhouse**: Absolutely. In our conversations with cities and local authorities, it is really about setting up a clear model to enable development schemes to come to CABE for review and policy assessment, and for that mechanism to provide funding for other discretionary services, such as policy support and training, because we all know the local government finance situation in which we find ourselves. That will obviously change post-spending review in November, but I cannot imagine it will become any rosier. It is about providing support to local planning authorities, and the mechanism we have for doing that is a very comprehensive city or borough panel where we charge applicants, and that funding is retained by the authority to pay for those discretionary services.

**The Chairman**: Mr Tittle, do you have views on this one?

**David Tittle**: Yes. We provide similar services; we argue that they are best managed at local level, which is where we differ from CABE. For example, in the West Midlands we have subscriptions with a number of authorities with which we work closely to give them support around major sites. For example, Tamworth has three areas of urban extension, and we undertook workshops on each of those to give guidance to the officers. On Tuesday I was helping Great Malvern. We were talking to stakeholders about the public realm in Great Malvern town centre to improve the performance of Great Malvern.

On new settlements, if I had not been here today, we would have been reviewing a new settlement in Stratford-on-Avon district near the Jaguar Land Rover and Aston Martin plants in Gaydon. It has some very good designers working on it for the two landowners there. The challenge we face in a settlement like that is that a historic village or small town in Warwickshire has developed in a certain way that works, and we think of it as charming and so on, but you are not allowed to build that sort of place today, largely because of the way the highways authority operates, and the way you relate to main roads and so on. We are challenged all the time in that relationship to existing roads—connectivity and so on—which
means that it is quite difficult to create a new settlement that we can enjoy in the way we enjoy older places.  

Baroness Whitaker: To conclude this part of the argument, do neither of you think that anything more should be done in this area? For instance, would the appointment of a chief architect be useful?

David Tittle: It would have a marginal benefit. If government proposed it we would certainly support it. We had a discussion with the former chief construction adviser about the role he had played as a go-between—a conduit between government and industry. We could see that was a useful role. I do not think it is sufficient to make a huge difference; it would be useful. David pointed to the more important thing, which is to do with making sure that people are taking up design review services and so on, and strengthening the planning policy in that respect.

The Chairman: You raised a point about the Midlands where you are not allowed to build vernacular villages just because of the motorcar and the highways. What sort of influence do you have to bring to bear on the national planning framework about making the point very strongly that part of the place thing is that we could have more of these because it is so lovely to see in an area? We visited a mixed housing development yesterday in Birmingham. You could see social housing, rented housing and bought housing, but again there was the highway. That is inevitable, but it seemed to be a much happier space, even though there were very few trees, than having rows and rows of prefab-looking buildings. What influence should you or others have over the national planning policy framework to say, “Look, highways are not the No.1 objective”?

David Waterhouse: I was going to add that the capacity of local authorities is very constrained. One of the benefits that I hope we bring, alongside others, is that we have our in-house capacity, but we also have an unparalleled national network of 500 built environment experts, some CABE enablers, some CABE commissioners, design associates and experts in design across the field. They work with us in places, so it is about building capacity and strength in local authorities.

Returning to your point, Lord Chairman, about the weight of advice within the planning system, the NPPF sets that out very clearly; indeed, we are specifically written into the
national planning policy framework, as we are in national policy statements on infrastructure. In cities where we have a long-term strategic relationship, our report is a material consideration in the planning system and is appended to all committee reports that go to elected members for decision. That approach retains local accountability and local democracy, but places importance on an independent expert panel who are embedded within the cities. That is a useful way of bridging the potential gaps.

**Baroness Rawlings:** I have two points I would like to bring up—one about traffic and one about aesthetics. What you say about economic value, good quality in the new settlements and all the trouble that is taken with buildings and green space, which one respects, is very interesting, but I should like to hear your views on certain areas that worry me regarding design and aesthetics and, on the second part of the question, practicality. One involves the built environment. You have all these lovely houses, but suddenly you get monstrous bollards down the street to which nobody has given any thought at all. Tremendous trouble is taken with buildings, but street furniture can absolutely destroy lovely places. There are terrible waste bins. They can be beautiful without spending a huge amount of money. I understand the need for security, but they are put in rotten places. The other day I saw a street completely filled with bottle banks. You could not see any of the houses at all. These were huge, hideous things. You have taken all this trouble worrying about the aesthetics and doing it properly. That is one side. The other side is traffic, which the Chairman just mentioned. You make a lovely environment in a place, and it is clogged with cars, buses, bicycles and lorries and everything comes to gridlock, let alone the pollution. Pollution from static traffic is everywhere now; it is not just London. The aesthetic side is wonderful—taking trouble and everything else—but very often some of these little, and not so little, areas are overlooked. I would like to hear your views.

**David Tittle:** That sort of decluttering issue is incredibly important. With my Civic Voice hat on, we have been very keen on that. We have some civic societies out doing street audits. In Coventry, we have people sticking things on each bit of clutter to highlight it and so on. I look upon these things as a design challenge. There are things that we need in the public realm, but design is about making those things work together for everybody’s benefit. The public realm need not look so cluttered; things can be combined and some things are not necessary.
A lot of signage is unnecessary. There are some very good examples around the country where people have decluttered the public realm. Sometimes the difficulty in the public realm is that nobody is in overall charge. People have said that in places maybe we need a tsar who is in charge of the streets. It has been said there are about 20 agencies that can interfere in the public realm. This is nothing to do with the planning system; they are all things that do not need planning permission. Things just pop up. We had an instance in Coventry. When the Olympics were coming, we got some money and were able to do a fairly simple scheme to declutter our main public square, Broadgate, to make it a really nice public space. Then some people from the communications department in Coventry came along and put up white flagpoles, with messages about adoption and so on. As soon as you declutter, somebody comes along and clutters. It is terribly difficult. If you are doing things to the highways often people say, “We don’t need bollards or guard rails”, and suddenly they appear. Suddenly they are part of the specification and they appear. It is quite a battle to keep the public realm decluttered. It is always easy to talk about joined-up thinking, but it is very hard to do. Somebody needs to be in overall charge with the authority to make things happen.

**Baroness Rawlings:** It needs to be sympathetic with the environment and encourage people.

**David Tittle:** Yes.

**The Chairman:** Once more, we are getting into a time pressure problem. Why do you just look at Coventry and places like that? Why do you not just get on Eurostar and walk from Arc de Triomphe to Défense and see what they have and have not done there? How do the French manage it? Is it just because Pompidou said, “Knock it down. I’m going to have yet another grand project”, and they do not care? Do we have any sort of information about how they do it? It is probably very simple if you make a street furniture tsar.

**Q88 Baroness Parminter:** Can I invite you to say a bit more about the design review approach, specifically the effectiveness of the market, as it is now, in design review services? Is there a need for greater co-ordination, or indeed a case now for national guidance?

**David Waterhouse:** Design Council CABE has a very long and robust history in this field and with the built environment professional bodies: the Landscape Institute, the Royal Institute of British Architects and the Royal Town Planning Institute. It continues to publish and update
design review principles and practice, which is the standard by which the Design Network and Design Council CABE carry out all their work. The concern with the change in the marketplace since 2011 must be around the quality and diversity of some of the panels, and the fact that that quality is not always necessarily delivering the public good, which both we and the Design Network very strongly believe in. We undertake in all our work to create and shape better places for all. It is a lofty ambition, but it is very much for the public good. That is perhaps some of the challenge that we see in other panels being set up for commercial gain or benefit in places around the country. There is variation in the quality. At the end of the day, it has to be about certainty and consistency for all in the planning process, providing high-quality schemes, with consistent, independent and objective advice. That must be the overriding ambition.

Setting the design review statement in the national planning policy framework was a strong move forward, and we are very supportive of that. The associated planning practice guidance is also perhaps not used as strongly as it should be. This emerged from Government following Lord Taylor’s review 18 months or two years ago. Indeed, as adviser to government we were involved very much in the drafting of the design section of the planning practice guidance. It is an online portal that provides supplementary guidance to the national planning policy framework and is updated on an annual basis, so it is constantly kept up to date, which I think is an important point. It is perhaps not used as often as it ought to be by local authorities in preparing their local plans, or indeed in establishing design arrangements.

David Tittle: I would perhaps disagree that quality is the biggest issue with design review. We have concerns with some local panels around the country, particularly in the south. There are two big issues for me. The first is take-up, as we have said before. Even in London, we think about 20% of major schemes are subject to design review. Outside London, it is a much lower figure, so there is not consistent treatment and application of design review in major developments.

The other issue is to do with whether people take notice of it. Does it really stick? One of the frustrations is that often schemes come into design review too late, and lot of work has been done on them. I can understand that people do not want to spend more on fees totally to
change their schemes. We are always urging people to come earlier, but it does not necessarily happen.

Getting people to design review on a regular basis and getting it built into the culture of developing a larger scheme would be really helpful. I commend the approach taken by Newcastle-under-Lyme council, which has put design review in its planning validation checklist. If you put in a major application—a reasonable-size application—in Newcastle-under-Lyme, you have to have a design review letter and a report saying how you have responded to it. It does not solve all problems. Some schemes still come in just before they go to planning, but it has certainly helped. If national policy was to recommend that approach, it would really transform things.

Baroness Andrews: Precisely on that point, if we can dig down into the market failure, what are the levers we could consider that would have the greatest impact? We used to have a planning aid system that was a huge benefit to weaker local authorities. I know it is about money and skills, but is there a case for restoring something like that? Alternatively, David Waterhouse mentioned elected officials and the work you do with them. Given the loss of permanent skilled planners, should you be spending more time on elected officials’ training? For example, you have lost your statutory consultee role and yet you are written into the NPPF. Would it be more effective if you still had a statutory consultee role so that you could push these things? Finally, what can you do about developers? What are the incentives? Are there financial incentives or planning incentives that can be built into the relationship with developers to pick up the inability to know about you, to find you and get you to help?

David Waterhouse: If I can use Oxford again as a case example, the long-term strategic relationship that we have built with the city council has proved beneficial to elected members, officials, developers and applicants wishing to invest in developing the city. There it has been about embedding in the system. We are written into PPAs—planning performance agreements—so that every major and medium-scale scheme at pre-pre-application stage comes through a CABE review panel. We have developed a pool of expertise with the city council so that its expertise is tailored to the types of developments coming through the pipeline—university student accommodation, extra care housing and specific types of
development. That has proved beneficial to applicants, because they want speed and certainty; that is all they care about. With that system in place, they know that is how business is done in Oxford. The leader and the cabinet member for planning will say to an applicant, “If you don’t go through this approach, you will get a very rough ride at planning committee”. That takes strong civic leadership, and buy-in politically and at senior officer level, but it has certainly proved highly beneficial in the case of Oxford. That all came about as a function of some poor decision-making in the city, so there is always a trigger that pushes people into thinking about this.

To take the statutory consultee point, that carries with it certain resource requirements and burdens. We would see it very much as working with cities to look at their individual needs and requirements, rather than something that is too top-down. I can quite clearly see pros and cons each way.

**Lord Inglewood:** Are the best schemes reviewed? Forget about the second-best schemes. Do the really good ones go through the review process, or are the people who are putting them together so expert and committed that they do not need it?

**David Waterhouse:** Are you talking nationally?

**Lord Inglewood:** As a generalisation.

**David Waterhouse:** As a generalisation, as I have cited for Oxford, all schemes come through. The important thing is not just the large schemes but the smaller-scale ones that, because of their location, are sensitive or will set a policy precedent. If you have perhaps lots of extra care housing coming down the pipeline, it is very important to get that right because there will be another 12 schemes of that type coming along. It is also important for the smaller and medium-size schemes to come through a review process.

**Lord Inglewood:** But are the best schemes that you see the product of the review process, or are they people who are sensible, because they are good guys?

**David Tittle:** Sometimes it is a bit of both.

**David Waterhouse:** I would agree.

**David Tittle:** The best people to come to design review—the people we really like—are those with good schemes but who listen and want to improve them. Those are the best developers. It is not just the big names. In the West Midlands we have Accord Housing, a social housing
developer, who produce some very good stuff in-house, strangely without architects. They come with these good schemes; they listen to us, and we end up with even better schemes. The difficulty is often the awkward schemes. Where local authorities do not have a consistent approach to design review, it is the difficult, awkward schemes that they eventually send to design review. They say, “Ah, this is difficult. We can’t get them to change. Let’s use design review”. That is how they end up coming to us too late. We see them when there has already been quite a difficult battle with the local authority. Sometimes we back up the local authority—more often than not—but it is still quite late.

The Chairman: It is a bit like the way we organise a Committee investigation or inquiry. We ask people to come and give us evidence. We do not think we know all the answers; we probably know none of the answers, but it is crazy that people do not try to look for the best advice, and encourage just by conversation.

Q89 Lord Woolmer of Leeds: I have three questions. You have commented already on a number of them, so only add anything new. Are the parts of the national planning policy framework that deal with design sufficient and appropriate? What impact in practice has the framework had upon design standards? How effectively have the policies set out in the policy framework translated into improved practice in local authorities? Only add rather than repeat.

David Waterhouse: We would advocate that now is not the time for a wholesale review of the national planning policy framework. The planning system has had so much change, tinkering and amendments, and applicants and local planning authorities want certainty. Let the system bed down, operate and work. That would be my key point: do not re-amend or re-alter the planning system yet again.

David Tittle: I have canvassed colleagues around the country. Our view is that practice has not improved as a result of the NPPF. The things that the NPPF has to say about design are good and, all other things being equal, they would have had a positive impact. The fact that they say them in fewer words is a good thing. The problem is that other aspects of the NPPF and of government policy have led to difficulty in producing local plans and undermined the confidence of planners, such that the feeling is that decisions about the built environment are
being made by the inspectorate or in the courts. So much is going to appeal and so many local plans are being challenged legally, and so on.

Baroness Andrews: That is a very important point. Are you saying there is more planning by appeal these days than there is by design? The Committee has not yet talked to the Planning Inspectorate. My sense is that, because of the huge pressures on development, local authorities find themselves in the courts more often than not, or under appeal, because developers know that in the NPPF there is such emphasis on development. Therefore, what you say is coming about is being driven by those sorts of imperatives. Am I right in that?

David Tittle: That is broadly true. I do not think it necessarily needs to be so. The NPPF explicitly says that you should refuse poor design. If people have the confidence and can make the arguments, they can not only do that but win appeals. The problem is that confidence has been undermined and people are very nervous about it.

Lord Woolmer of Leeds: Specifically in what ways has confidence been undermined?

David Tittle: There is the feeling that developers will go to appeal. If you look across the range of volume housebuilders, who are doing a lot of development, particularly outside cities, some will take a more collaborative approach and try to do the right things; others simply say, “If we can’t get this through, we’ll get it through at appeal”.

Lord Woolmer of Leeds: But has it not ever been thus? Is this something that has resulted from the national planning policy framework approach?

David Waterhouse: The important point is for local authorities to have an up-to-date evidence-based local plan. That is the problem we are seeing at the moment. Roughly half of local authorities across the country have a robust local plan in place that is capable of being defended at inquiry or through the judicial process. Unless you have a clear framework in place by which to make decisions on individual applications, you are planning in a vacuum.

Baroness Andrews: Why are local plans so slow? What are the extra factors that have slowed them down even more?

The Chairman: If you are just Joe Bloggs out in the street and people ask you, “How do you think all this is going in this country?”, you say, “The main thing is that we have to get 400,000 more houses. We need more houses”. They do not care; they do not realise just how important it is, particularly long term, to have this sense of place. Our specialist adviser did a
wonderful presentation on this at the beginning of our inquiry, which made me sit up and think, “Of course we need houses”, but with this headlong approach the developers are ruling the roost, because they are delivering the houses.

**David Waterhouse**: Yes.

**Baroness Whitaker**: In answer to your question, Lord Chairman, could we also explore why local authorities are so slow? I am very conscious of how it works in my own nearest town, Newhaven. It is lack of capacity, not lack of intention. It is simply that there are not enough bodies working on it with the right background.

**David Waterhouse**: Absolutely. Talking to and working with local authorities of varying scales up and down the country, there is a huge lack of capacity and skills; for example, certain grants from government for planning capacity that were delivered have stopped. There are real challenges to the competency and confidence of senior planning officers in taking decisions. That is a real problem. I go back to the example of St Albans, where all staff are temporary, so you have no consistency of decision-making and no understanding of the history of planning in that location. That is also a critical point.

I welcome the recent announcement by government to work with local authorities to put in place a local plan. None the less, that is by 2017. Development does not stop; development continues and will continue at pace.

**The Chairman**: This is a very important issue. Mr Tittle, do you have anything to add?

**David Tittle**: Capacity is obviously a huge issue, but there is a whole range of issues. The changes made by the previous Labour Government started to slow down the process, such as the bringing in of local policy frameworks. A lot of people were working on that process when there was a change of government, the NPPF came in and things changed. People were used to working with the regional spatial strategies; those were abolished and they had to find new ways of working. In some cases, that gave the politicians a bit more confidence to interfere more and that set plans back. Some authorities and other agencies thought they had it all done and dusted and then they were subject to legal challenge. In some ways, the whole culture of plan-making has become an interminable process. That is the problem. Over the past decade, or maybe 15 years, it has become systemic; it has become cultural that we take ages to produce plans. I was very concerned about this. In particular, before the election, at
Civic Voice we were trying to produce a manifesto. One of the very clear things we said was that every place should have a plan, so I started going round and asking planners I knew. I ended up sitting next to somebody from the inspectorate who was in charge of planning. I asked him how long realistically it should take to produce a local plan. He said two years. I think that is reasonable—two years maximum. You plan for 18 months and allow six months for eventualities. It also has a big impact on people’s ability to engage with the local plan. It is quite difficult to get citizens to engage with the local plan, but if they have been doing it for 12 or 15 years, it is really difficult to get them to engage. You think, “Oh, what’s going on now? Didn’t I talk about that 10 years ago?” I applaud the recent initiatives by the Government to try to speed up the process. It is unfortunate that they are doing that by saying, “We will intervene”. If they need to intervene they should, but we also need to deal with the systemic problems.

The Chairman: They also need a time limit, because they cannot carry on for 13 years or so.

David Tittle: Absolutely.

Q90 Baroness Andrews: I am beginning to wonder whether this question is redundant. What should the decision to move ministerial responsibility for architecture and design from DCMS to DCLG mean in practice? My sense is that it does not matter. Essentially, you have been saying that unless we have clear planning policy, delivered at local level, it does not really matter what the Government themselves are saying or doing if they cannot actually help that process—or am I now being very cynical?

David Waterhouse: I would agree. However, the move of responsibilities from DCMS across to DCLG where planning, housing and regeneration policy, such as it is, sits has to be helpful in bringing all of that together. We work strongly with DCLG and its agencies, so I hope it is a beneficial thing. Indeed, Greg Clark, the former Cities Minister and now Secretary of State, has been very supportive of design in its widest sense. Having him as Secretary of State is a beneficial approach, and having architecture within his wider portfolio must be a good thing.

Baroness Andrews: How many people in DCLG have responsibility for design?

David Waterhouse: Overarchingly, two officials and a director would have oversight.

Baroness Andrews: Essentially, we have three people in DCLG who are responsible for ensuring that good design feeds into housing, infrastructure, housing renewal and supply.
The Chairman: The whole thing.

Baroness Andrews: Everything. That is very helpful. My next question was what role should DCLG be playing in promoting high standards of design? I think you have answered that.

The Chairman: Mr Tittle, do you want to add to that?

David Tittle: I had heard that nobody had specific responsibility for design, but maybe David takes a different view.

The Chairman: You are encouraged that there are three.

David Tittle: That is encouraging. As I said before, joined-up thinking is easy to say but hard to do. Moving people into the same department may help, but it may not. People do not necessarily talk to each other more if they are in the same department. Sometimes people from different departments can talk to each other better. It has to be a good thing; it has to be potentially helpful, but the devil is in the implementation.

Q91 Baroness Parminter: The Government have announced that they are going to form an infrastructure commission. Its remit and composition have not been agreed as yet. Do you think it is important that on that new body there should be somebody with responsibility for design of the built and natural environment?

David Tittle: Absolutely. I would say so. Yes.

Lord Inglewood: I preface my question by saying that when I was a Minister in the then DNH I was responsible for architecture. My comment about your comments is that you have been telling us what a good thing design review is. I think there is a case for having a Minister outside DCLG doing just that. I remember looking at some PFI schemes and, my goodness, they were dire.

David Waterhouse: Yes.

Q92 Lord Inglewood: I would particularly like to look at another aspect, which is that responsibility for heritage remains in the DCMS. In the context of where we are now, what is your view about that?

David Waterhouse: We have a very long-standing relationship with Historic England, as it now is, working on many programmes, such as tall building guidance and the urban panel, which is a joint panel of Design Council CABE and Historic England, looking at cities and providing diagnostic advice and support to them. In the last year, we have worked on their flagship
annual Heritage Counts report. We have a very strong relationship with Historic England, and it has a clear role to play. Support for it must remain, certainly beyond the current settlement that has been agreed, because that potentially poses a risk to it going forward. In terms of its responsibilities lying within DCMS, from a civil servant perspective, cross-Whitehall working and regular joined-up thinking between DCLG and DCMS is absolutely critical and is something that I know happens. I do not know to what extent and over what period it happens, but there must be continual collaboration between the two.

**Lord Inglewood:** Is there not a risk that because it is a much bigger department the DCLG always rolls over the DCMS?

**David Waterhouse:** That is certainly not my experience. DCMS punches well above its weight in certain instances. In my experience, which may be a couple of years out of date, it is a very powerful and well respected department.

**David Tittle:** Not everything is solved by bringing people together. The very first question was about leadership. We talked about the need for leadership from national government and it needing to come from the centre. The danger with responsibility for place quality and design quality being seen to reside with DCLG is that it becomes too focused on the planning system. The planning system is very important, but it is not everything. The issues we talked about before about street clutter and so on are largely outside the planning system, so it is important that transport, the public procurement of buildings and so on are government policy, not just departmental policy.

**Baroness Andrews:** To pick up what Mr Waterhouse said about the fact that heritage remains in DCMS, it is slightly isolated, but it always has been. The key impact on what happens to our historic environment has been through the planning system. The fact that we now have Historic England as a separate statutory body with a very firm focus, particularly in relation to the issues raised by Mr Tittle about Civic Voice and historic towns, gives more power and focus. Although it has lost that immediate connection, Historic England itself is in a relatively strong position within DCMS to punch above its weight again. Do you agree with that?

**David Waterhouse:** I would agree. Going back to what all this is about—places and towns up and down the country growing and changing sensitively—our experience working with Historic England officials at regional and local level is that we have a very strong relationship
in the towns and cities where we are working. That has to be a beneficial approach. I welcome it. Historic England is in a strong position, but in the spending review and beyond it, there will be a very challenging picture for all government agencies and local authorities. We must be mindful of the fiscal envelope and the challenges within which we are working at central and local government level. That is critical.

**Lord Inglewood**: There is also a fiscal envelope around the people who are actually managing, owning and running the buildings. Surely, that is at least as important as some of the things you are talking about in the context of the policy framework and the administrative and legal context in which all this is carried on.

**David Waterhouse**: I would agree absolutely.

**Q93 Baroness Young of Old Scone**: In design terms, is public consultation and participation in the decision-making process happening? Is it a force for good, or is this stuff so complex that the public get it wrong?

**David Waterhouse**: The advent of the neighbourhood planning system—there are over 600 neighbourhood plans at varying stages in the system—has been very beneficial in bringing communities and parishes together to understand what they value about their area and place, and what that means for growth and change in their location. Our experience of working with neighbourhood planning groups up and down the country in rural and semi-urban areas, and indeed in urban areas, in north London, has been that they feel they have more control and understanding of what happens in their area.

In a recent good example, we are working with DCLG on a very important programme led by the tenant management and empowerment team at DCLG, which is called community-led design and development. That is about tenant areas and tenant management organisations intensifying their areas through a very clear process, to ensure that design is used right from the beginning in changing, intensifying and reusing assets and new-build development. There are very interesting new models of co-housing of various types, bringing new entrants into the housing market, which bring with them communities of interest. We should not see communities as just one thing; there are many different communities—business communities, residential communities and communities of age—which we should also think about.
Baroness Young of Old Scone: Remind us how many communities have gone for a neighbourhood plan out of the totality that could.

David Waterhouse: David may be closer to this than I am.

David Tittle: It may be in the 20s\(^\text{110}\) that have gone through the whole process.

Baroness Young of Old Scone: Twenty.

David Tittle: Yes, but obviously there are a lot along the way. It takes a long time. Part of the problem is the complexity and difficulty of neighbourhood planning. Neighbourhood planning has been a positive thing and it shows what can be done. One of the big issues I have with it is inequality. If you rank neighbourhood plans by the indices of deprivation and look at those in the bottom 25%, there is a handful. We have a notable one near us in Balsall Heath in Birmingham, which is just coming to referendum, but that is one of the few exceptions in a more deprived neighbourhood.

As regards community engagement, the position is rather like the one we talked about earlier as regards design generally. There are some exemplary cases of community engagement, people working with communities from scratch with a blank sheet of paper to design new places, new developments, urban extensions and so on. Aside from those good examples, the overall picture is very poor. It is often tokenistic and manipulative. We talked about the difficulty of engagement in local plans, but engagement around particular schemes is often very poor. People use PR consultants rather than people skilled in community engagement; they know what they want before they start, and so on. That definitely needs to change. There needs to be better encouragement. The key to it is independent expertise. Where we have been able to get involved with communities in engagement, we have been seen as someone who brings independent expertise. Because we are a charity, communities trust us. If there are issues, they do not feel they are being manipulated. If you bring together the expertise people have about their place—because they know their own place—but also expertise about places in general, it is a magic combination.

Q94 The Chairman: Very early in this inquiry, the Committee had evidence about the concept of the open room, where it was down to the level of streets and housing estates, and people

\(^\text{110}\) Note by witness: There are 57 adopted neighbourhood plans as of August 2015.
were made to feel they had something to offer. In both of your experience, is that general or is it spectacularly a one-off?

**David Waterhouse:** In the recent Farrell review, a recommendation set out the concept of urban rooms. There are good examples in Pennine Lancashire. I am aware of Newcastle and a number of other places developing this, which provides a forum for people to come in, to understand and explore what makes their place unique and special. I concur entirely with David about independence and the honest brokering role that the Design Network and Design Council CABE can play in bringing together different parties in the planning process. That independence and objectivity is critical.

**The Chairman:** It also gives local people much more confidence that they have had a say, no matter how big or small.

**David Waterhouse:** Yes.

**Baroness Whitaker:** Mr Waterhouse described a very good policy in the DCLG of how to empower tenants, but on the whole it is very common that they are consulted too late. As Mr Tittle said, they are consulted by PR companies when the local planning authority just wants to vindicate its prior conception. What is the mechanism for bringing in local people right at the beginning to work out what their local identity ought to be? Urban rooms are fine, but how are we to enable them to happen?

**David Waterhouse:** One of the key points about the tenant-led development programme is that there is already a groundswell of support within the existing community that they want to do something. They are not happy with whatever it is in their area.

**Baroness Whitaker:** It has to be fertile soil.

**David Waterhouse:** There is a real bottom-up approach. In the locations we are working with—Hull, interestingly, York and some inner-London examples—there is an understanding that they as tenants in an area are not satisfied with the quality and type of housing stock they are in, and they want to grow and change. There has to be something innate to make it happen, but it is then about objective independent workshops, advice, consistency and working with the local planning authority, because it cannot happen in isolation. It is certainly an interesting area, but something where there is huge opportunity.

**The Chairman:** It sounds very exciting.
Baroness Young of Old Scone: Could we impose upon you to scribble some notes and send us your views, if you have any, on how far the design review process has delivered on the green environment and green space issue and its wider benefits to health, climate change and resilience, as well as amenity and aesthetics?

The Chairman: We normally ask those questions, so thank you for asking that, Lady Young. Can I thank you both very much indeed? It has been fascinating. You can see how energised the Committee is. We could go on for ages, but we have a lot of other things to do. Thank you for coming and giving your time and expertise. We wish you all success in doing what you obviously share with us: the objective of improving things and making people happier where they live, work and play.

David Waterhouse: Thank you.

David Tittle: Thank you for inviting us.
This image shows the proportion of people buying or owning property between 1983 and 2012 (columns) by age (rows). The green band is the generation who were able to get a mortgage & buy, those older or younger than them mostly could not (BSA survey data). Prices have risen because the government has been trying to get them to rise. At the end of 2014 the campaigning organization ‘Priced Out’ calculated that the government-sponsored new-build Help to Buy programme had helped raise average prices by £46,000 in 18 months – or 27% – resulting in an additional 258,000 renters being priced-out of buying a home as
compared to the 31,000 buyers helped by the scheme. Some three and a half million people who would have normally been able to buy a home are now trapped in private renting.\textsuperscript{111} The unexpected Conservative majority win in the 2015 general election, secured with a unprecedentedly low 25\% of the electorate (possibly the lowest proportion ever to secure a majority) – has resulted in a further boost to housing prices which had been rising precariously, and faster and faster for two years already. The market is beginning to look like a run-away train...

During 2013 housing prices in London rose by around £40,000 for an average flat or house that was sold as compared to the previous year. This brought the cost of a typical London home sold on the market up to just above £475,000. This rate of increase continued through 2014, as times accelerating, except in the very centre. By 2015 average London prices were over £500,000 but Oxford house prices had risen to be an even more expensive if compared to local Oxford salaries and wages. By early 2015 the mean price of housing in Oxford was 16.1 times average Oxford wages and salaries.

Homelessness is rising. Fewer people are able to secure social housing and less and less money is being spent on the upkeep of that stock. Private landlords spend less doing up their properties while house prices rapidly rise out of the reach of most people in most areas. But it could become worse. In the US an extra million children became homeless between 2006 and 2013. The highest ever US rate of child homelessness was reported in the run up to Christmas 2014.\textsuperscript{112}

Fewer and fewer people are able to get a mortgage. In the UK stricter tests have been introduced to try to prevent banks and building societies lending as recklessly as they did before. There have been repeated warnings to borrowers that at some point interest rates will have to rise. Up is the only direction in which they can go. The US Federal Reserve is now hinting that they will raise interest rates soon.

At least a third of mortgagees would struggle if interest rates were to rise by just a couple of percentage points.\textsuperscript{113} The further house prices in the South of England climb the greater that proportion will grow as new entrants become more stretched. People who are a safe bet at one point in time can easily lose their jobs, split up or become ill. Add a slight rise in mortgage interest rates and anyone already struggling to pay the bills quickly gets into arrears.

\textsuperscript{113} The Daily Mail’s report of this mistakenly called mortgagees ‘homeowners’, as if they owned their home outright having paid a mortgage off: Boyce, L. (2014) A third of homeowners would struggle if interest rates rose by 2% - and only a handful have prepared for higher costs, Daily Mail, November 10\textsuperscript{th}, http://www.thisismoney.co.uk/money/mortgageshome/article-2828375/A-homeowners-struggle-rates-rose-2.html
Private renting in the UK is generally appalling in comparison to private renting on the continent as there is so little regulation. We have become used to such low quality service that we consider poor quality as normal quality. In November 2014 the House of Commons Library reported that 213,000 private tenants had been evicted in the last year after asking for basic repairs to be carried out. A further half a million tenants did not dare to complain about any faults due to fear of eviction. A majority of landlords, some 56%, say they have evicted tenants.114

By July 2014 it had become clear that a third of all privately rented property was being rented out in poor condition; that tenure was both the most expensive and lowest-quality sector of housing in the UK. It was also growing rapidly, passing the 4 million households level in 2014, having overtaking social renting in 2013.

When the Financial Times (FT) confronted the landlords with the facts, the National Landlords Association said that ‘...the rented sector continues to mature into a functioning and positive market that is serving renters well [and] costs in the sector have remained static...’. The FT then pointed out that private sector rents take up 40 % of tenants’ gross income according to the annual English Housing Survey. For those who own their homes, the figure is 20 %, while social tenants paid 30 %.115 In 2014 most landlords were laughing all the way to the bank.116

In October 2014, just three months after the FT report, rents in the private sector were revealed to have risen to a new all-time-high of £770 a month for the average property in England, £1162 in London.117 A month earlier they had been £761 a month. A year of such rises would result in a 15% price hike in rents.118 Even without that, rents are rising faster than inflation, while tenants’ wages still lag behind it.

In November 2014 Citizens Advice published figures showing that there had been a 20% rise in households seeking help over eviction, even among those up to date with their rent payments. Two in five of these households had dependent children. They also revealed that London renters are three times as likely to report problems with vermin than are tenants

116 Rent doesn’t all go on the landlord’s mortgage and upkeep costs. £770 a month pays the interest only on a £200,000 mortgage at 4.6%, £1162 a month covers the costs of a £300,000 property. The longer ago the landlord bought the property, the smaller their mortgages will be and the greater their profit. However, many landlords have been relying on rising prices to make them bigger profits.
118 1-(770/761)12 = 15.2%, annual rises to August 2014 had been 2.4% but they accelerated in September 2014 (see above), Press Association (2014) Rents rise to all-time average high of £761 a month in August, The Guardian, September 19th, http://www.theguardian.com/money/2014/sep/19/rents-rise-all-time-average-high-august-uk
elsewhere in the UK.119

At some point landlords can’t or won’t be allowed to squeeze yet more out of their tenants in higher rents. The housing benefit bill will have to be cut. People won’t take jobs in London if the wages won’t pay the rent. It will most probably be social forces rather than market forces that bring about the end of escalation. The lobby in favour of a change in the law to extend tenancies to three or five years, rather than two months, is growing and represents millions of people. In contrast, private landlords are a small group who attract less and less sympathy during hard times.

Almost two hundred years ago, in his *On the Principles of Political Economy and Taxation*, the Economist David Ricardo argued that, in the long term, economic growth would disproportionately benefit landlords.120 That view fell out of favour but modern day economists are finding that the landlord advantage appears to be true again today; suggesting that without intervention we are looking at an enormous property bubble being driven by rapidly rising land prices forced up as landlords and investors speculate wildly.121

In the autumn of 2014 there was little sign of a slowdown in the UK housing market. There were plenty of warnings of a slowdown, but very little evidence of prices falling. By September prices fell slightly in most regions, but they usually do in that month. In London prices had risen by a remarkable 18.4% in just one year.122 That annual percentage increase had itself been rising all year; but no one can tell you what it will be in a few months from now. It could crash; it could grow even higher; it is unlikely to remain the same. As prices began to fall in central London in February and March of 2015 the latest budget is designed to try to hold them up through to May 7th.

On 23 October 2014 shares in the London-based estate agents, Foxtons, fell by 20% in just a matter of hours. They fell because Foxtons said that they did not expect to make as much money next year as they had in 2014. Many investors wondered whether this might be signaling the start of a wider property crash. Foxton’s fortunes have suffered again very recently and again there is chattering among the informed. Annual price rises of 21% were reported in London last year. Four years of such housing inflation and prices would more than double. Everyone in the business knows it has to come to an end, they just don’t know

120  Some 500 year ago, in 1516, Thomas Moore suggested the solution to ensuring good housing for all would be that “At every ten years’ end they shift their houses by lots. They cultivate their gardens with great care, so that they have both vines, fruits, herbs, and flowers in them; and all is so well ordered and so finely kept that I never saw gardens anywhere that were both so fruitful and so beautiful as theirs.”
when. Rumours abounded that the housing bubble in China had burst but, rather than learn from the experience, the Chinese and many other investors began looking even more earnestly for what they thought was a safe haven in London.

Journalists write about ‘luxury’ flats being built across the capital. By these they mean flats that might look great in brochures being sold at prices that could never be supported by rents, in areas where no infrastructure has been built to support the new local communities. Those building the flats are only concerned with selling them on to the next wealthy overseas investors who, in turn, are concerned only with doing the same again in a year or so, until someone is stuck holding the unsellable ‘asset’.

But what happens when the bubble bursts? UBS forecasted in October 2015 that it will ‘soon’, but forecasting bubbles is a precarious business. It is sensible to suggest that overstretched landlords with too many new mortgages will go to the wall, many investors will be burnt, but new private landlords entering the market may simply buy up more property cheaply, out-bidding potential first time buyers, since landlords are offered better mortgage terms. The world is awash with ‘investor money’ looking for a home.

Many national newspapers now regularly report on the woes of the young upper-middle classes unable to rent a property with a living room. In one report a public relations account manager shares a home with an accountant, a filmmaker, a barrister, a solicitor and an advertising executive. All six of these otherwise well-off people have to share with each other, and only have a kitchen as communal space. Even with promotions and pay rises these young adults should expect to be living in cramped accommodation for some time. London’s population is set to rise by a million in the next few years. At the very same time the leaders of the Labour and Conservative parties in the run up to the May 2015 general election tried to explain why they had two and three kitchens, respectively in their London homes.

The estate agent Savills predicts that between 2014 and 2019 across England and Wales the number of households privately renting will increase by 1.2 million, owner-occupiers will fall by 200,000 and social renters fall by 50,000. Half the fall in owner-occupiers is predicted to take place in London. Private landlords are predicted to buy the equivalent of all the new build flats and homes in London, and a further 100,000 currently mortgaged or owned homes, and some 10,000 currently social rented properties.

---

125 Savills Annual Housing Seminar Slides, November 17th, party reported as ‘Private rental home numbers to rise 1.2 million in five years as home ownership among the under 35s falls to one in six households’ November 6th, http://www.savills.co.uk/_news/article/55328/183957-0/11/2014/private-rental-home-numbers-to-rise-1.2-million-in-five-years-as-home-ownership-among-the-under-35s-falls-to-one-in-six-households
Looking forward, the Joseph Rowntree Foundation extrapolates and suggests that by 2040 private rents will rise by more than twice as much as incomes, resulting in a majority of future private renters in England living in poverty. Social renting, currently the tenure of one in seven people, will house only 10% of the population by 2040. It will be even worse if 220,000 homes a year are not built by the 2030s and if another £20 billion a year is not spent on housing benefits as more poorly paid families come to rely on the state. All of this is just if current trends continue, not following a further downturn. In the last six years, two thirds of all new housing benefit claimants have been middle-income earners.

How do politicians react? The Conservatives keep inflating the bubble, most recently by measures such as changing inheritance tax rules in their last budget, but before then with their last coalition budget by announcing that upon reaching retirement age pensioners can purchase property with their pension pots rather than take an annuity. Only the most affluent pensioners will be able to do this but the policy was presented as if it would apply to all. The Tories need house prices to rise until at least the day before the general election of May 2015. They stated that if they won an outright majority, they would end the building of what little social housing is now constructed by abolishing the 20% levies local councils are allowed to charge on new developments for new roads, schools and affordable housing provision.

Nick Clegg did not mention housing in his speech at the 2014 Liberal party conference, although he did claim that his party would build ten garden cities by incentivizing local communities to ask for building around their homes by offering them an express train service.

Labour published the Lyons review, which suggested changing the law so that local councils should have real powers to ensure that if land has been allocated for development in a plan, it is actually delivered, including the ability to levy a charge where delivery has not occurred (and there is no good reason for the failure). The review also proposes the possibility of Compulsory Purchase Orders being applied to acquire land at close to existing use value – in other words at agricultural prices.

However, building 200,000 new homes a year will not lead to Utopia, unless they are in the right places, owned and rented out the right way. At some point someone has to acknowledge that the reason we have to build more homes is due to immigration.

127 An extra 350,000 households earning between £20,000 and £30,000 a year according to National Housing Federation research, Sherman, J. (2014) Families on £30,000 drive rise in house benefit claims, The Times, October 2nd, http://www.thetimes.co.uk/tto/news/politics/article4223998.ece
Immigration we are lucky to benefit from. ‘Lucky’ because it is conditions out of the UK’s control, such as a favourable time zone, the spread of the internet and the spread of the English language which draws so many young, productive and daring people in.

With net immigration comes a necessity to build. Without building new homes people can be held to ransom. When held to ransom they strike out in all directions, including blaming immigrants. But it is not immigrants that are the problem – it is the ‘investors’. Economist Aditya Chakraborty found the appropriate analogy: “I can think of one other aspect of everyday life where this has happened recently: food. Over the past 10 years, wheat and other staples have become a financial asset class, to be speculated in by Goldman Sachs and Barclays. The result has been misery and even starvation for the poor of the Third World. For the poor of London, the financialisation of property spells homelessness.”

In London at the end of 2014 the New Era housing estate was fighting for its life. The New Era estate is in Hoxton where ‘investors’ have recently been making millions buying and selling homes. The Conservative MP Richard Benyon had been persuaded not to buy the flats in partnership with the US private equity company Westbrook partners and evict the tenants, despite the potential boost to his £110 million family fortune through charging ‘market rents’. This turnaround was achieved by public petition where 300,000 people registered their disapproval. The authors of the petition then turned to try to influence Westbrook partners not to raise the rents and in effect evict the tenants, when Westbrook took over as the new sole landlords.

Private landlords, of which Westbrook is just one among many, have in aggregate brought up so much formally owner-occupied and social-rented property that their wealth will have growth by £109.5bn in the year to April 2015. This is due to the rising value of their existing property and the increases in the rents they charge. The total value of all landlords’ property holdings in Britain will exceed £1 trillion by mid-year 2015, with 41% of those holdings being in London. Just a few years earlier their wealth had been many times lower.

Outside London there are still a few areas where house prices are lower than in 2008, where private rents have collapsed and homes may have to be demolished, and where living conditions are rapidly declining not due to overcrowding but under-use. By October 2014 it took 3.5 average homes in the North East of England to buy one modest home in London, four years earlier that divide had been 2.5 times. By late 2014 the estate agent Frank Knight

was predicting that the gap would only grow wider.\textsuperscript{133}

In his December 2014 autumn statement George Osborne announced an £800 million cut to stamp duty on the purchase of properties. All his previous budgets had concentrated on measures designed to raise housing prices and the cost of housing, committing more spending or guarantees in that area than any other. George was determined that prices should increase, at least up until election day 2015, and for far longer than that if more and more people are forced to rent.\textsuperscript{134} His 2015 budget was simply more of the same. And the reaction to it by many voters showed how many young people living outside of London do not realize that they too will soon be priced of of buying a home as the price rise wave ripples out of the capital cities. It is currently moving through the Home Counties. The election result of May 2015 and the budget that followed have caused the house price wave to grow in height.

Only the extremely well off will be able to buy a home in future in South East England. Most people will have to rent and enrich a landlord. Just under 80\% of people think it is harder to buy a home now than it was a generation ago, even in the hardest times of the recent past. \textit{Over 80\% of people think the main political parties won’t deal with the problem effectively.}\textsuperscript{135} This is what chaos and instability looks like. This is precarity in housing. For a majority of young adults they face the equivalent of zero hours contract at work – the 2 months notice to leave a property should you landlord wish you out. Just eight weeks to find a new home. You can’t just build – you have to regulate the rental market to common decency. Rent regulation works in Germany. It has recently been enhanced in Berlin. Before rent regulation we had slums – then some economists had some awful mistakes and assumed rent regulation created slums.

Just allow building on it’s own and you will get new slums. Look to where people in Europe and well housed and learn from them.

Examination of Witnesses

Mr Michael Cassidy, CBE, Chairman, Ebbsfleet Development Corporation

Q95 The Chairman: Welcome, Mr Cassidy, to this evidence session of the Select Committee on National Policy for the Built Environment. You have in front of you a list of the interests that have been declared by members of the Committee. A transcript of the meeting will be taken and published on the Committee website. You will have the opportunity, of course, to make corrections where necessary. I begin by asking you to briefly introduce yourself to the Committee, Mr Cassidy, for the record.

Michael Cassidy: I am Michael Cassidy. I am Chairman of the Ebbsfleet Development Corporation.

The Chairman: And a lot else besides! Thank you very much indeed.

Q96 Lord Freeman: Good morning. I declare a very modest conflict of interest in the sense that, as Minister of Transport in the early 1990s, I went to Ebbsfleet on the instructions of the Deputy Prime Minister, as he then became, to look at precisely what the opportunities were. What progress has been made at Ebbsfleet since the establishment of the Development Corporation? Let us not go any earlier than that.

Michael Cassidy: Thank you very much for this opportunity. I was appointed as the Chairman-Designate in August last year, although our powers did not begin until April of this year. I spent the first six months pretty much solo, meeting all the relevant parties, seeing the site
and liaising with the local authorities, who are a big part of our organisation. In the early part of this year I set about selecting and appointing a Board, which is now fully in place, and the key executives. I had quite a large team seconded from the Department for Communities and Local Government in the early stages to help me; that has now been replaced by our own team, who are based near Ebbsfleet, actually occupying Gravesend Police Station—not the best location, but that was available as a short-term let.

During the course of implementing this delivery period, we have set about instructing master planners to help us set out the site opportunities. We have appointed a global firm called AECOM, and it has already started its work programme. We have a set of consultation sessions next Tuesday, which is when the public will first hear from AECOM what its process will be. Obviously, on the business side, we have been putting together a business plan for the Department, which has been received and understood. Last week there was a very significant event for us: the Spending Review, which of course we all concentrated on very heavily. I am pleased to say that the Chancellor set aside £310 million for us—exactly the figure we asked for—so we enjoy good political support following a period when it clearly stalled. As part of the Spending Review Statement we also have Enterprise Zone status for part of our site, which will give obvious tax benefits. That is essentially the work programme to date.

**The Chairman:** Are you very optimistic about the future of Ebbsfleet—that it will all come right and there will not be any problems; will it be another example of what happened to housing and built environment in this country with the London Olympics?

**Michael Cassidy:** I suppose I have to be optimistic; otherwise, I should not be in the job. We certainly now have the resource to carry this programme forward.

**The Chairman:** You have no problems at all?

**Michael Cassidy:** Well, I will now list the obstacles, as that is clearly part of what you would like to hear about. The topography of this former quarry site is extremely demanding. It is 1,000 acres of very uneven ground, with level changes of 20 metres or more. When I first went round it, somebody said to me, “You know, Michael, all you have to do is push that hill into that lake and flatten it out,” but you are talking about a huge investment to do that. Although I am very grateful for the £300 million, I believe it will cost more over time. We must
prove that we can deliver very quickly, but obviously with quality in mind, and I will probably go back to the Government to ask for more. I am prepared to put that on the table right now: £300 million is great, but probably not enough.

Amongst the other challenges—and perhaps one of the main reasons why this has stalled since the great station was finished, with huge ambition, about eight years ago—is that, given the context at that time, which was pre-recession, the planning permissions were loaded with very significant Section 106 obligations. The two main landowners, Land Securities, our biggest quoted property company, and Lafarge Tarmac, a very big aggregates group, chose for commercial reasons not to set about large-scale housebuilding because at certain points it triggered these Section 106 payments. In themselves, those are not an obstacle in most developments, but if the size of the obligation is too much, developers just wait until house prices justify it. For example, £50 million was set aside for three schools, two junior and one secondary, and £50 million was set aside for highway improvements. And so it went on and, frankly, it was not economical for them to build. In the period since 2007-08, only 360 houses have been built. Obviously, that is a huge disappointment, which we are there to reverse.

Then, there is the design element. You will all be aware that garden city principles embrace the idea of town living in a country context, but the planning regime in this country is not terribly helpful in driving quality in the end product. It can drive volume by giving generous consents, but there is very little in planning law that enables anybody to say, “Those are just not good enough for this garden city; do better.” You cannot prevail on that, so you have to do it by encouragement and by assisting with the resources available.

**Lord Clement-Jones:** How are you overcoming those Section 106 problems now—with new planning consents?

**Michael Cassidy:** One of the benefits of being a development corporation is that we have become the planning authority for the area. Another is that we have compulsory purchase powers. Those are the two legs of our purpose in life. It is my belief that we can reopen all those Section 106 agreements but we are not going to do it without a quid pro quo; therefore, in the next weeks and months we are going to have to sit down with the owners and negotiate a change in the conditions. Let me give you an example: in return for us picking up the burden
of one of the schools or highway improvements, they will agree to build faster and to greater quality, so a trade-off has to go on with each of their sites.

**Lord Clement-Jones:** Who do you mean by the owners?

**Michael Cassidy:** The original developers, Land Securities or LaFarge. Redrow Homes own one small patch, so it is technically a landowner as well, but they will each have to address where taxpayers’ money can be productively employed to achieve the Government’s aims.

**Lord Clement-Jones:** So you are quite optimistic that, with your additional money, bargaining counters and powers, you are going to be able to make far better progress?

**Michael Cassidy:** Yes. Without speeding up very considerably, we are simply not going to share the costs with the owners, and that would be a very poor outcome. An idea emerging now is that we need to encourage mortgage providers to give a longer commitment period. At the moment, they only give six months when they offer a mortgage, and therefore—guess what?—the housebuilders only build to a six-month programme. If we can persuade mortgage providers to double that to 12 months, the supply chain for the next period will open up.

**The Chairman:** What is the downside on that move from six to 12 months?

**Michael Cassidy:** The downside is only for the banks, et cetera, providing the loan. For us it is all a win, because the housebuilders will then open more marketing sites, so where that might mean two per chunk at the moment, it could become three or four, which is terrific in terms of driving volume. I do not know how successful that initiative will be but we will certainly have an attempt at it, because I do not believe it has been tried anywhere else before. It is a different approach to the problem, rather than just bashing them over the head and saying, “Build more”, to which they can say “No.”

**Lord Clement-Jones:** One final question: what are the challenges in the other forms of infrastructure—transport and so on—and can you meet them?

**Michel Cassidy:** There are very considerable challenges: for example, the Bluewater shopping centre is next door and, particularly in the run-up to Christmas, the road system is completely clogged. This is also complicated by the Dartford bridge, which, as you probably know, is not an easy obstacle to overcome. It is great to have it, but it does get chock-a-block. The A2, a magnificent highway going through north Kent, simply does not have the capacity at the Bean...
and Ebbsfleet junctions to take our traffic alongside that going to Bluewater. That is without even talking about the proposed Paramount theme park, which I can give you more detail on. That will put huge pressure on the highway system. Although the Highways Agency has committed to spending money in 2019-20, that may not be soon enough as the traffic builds up.

**Q97 Baroness Andrews:** It has been a very long and protracted development and a lot of things have changed while it is being thought through. What else in the planning system has changed since Ebbsfleet was first designed that has made it either easier or more difficult? The key factor, of course, is having your own planning powers as a development corporation, but are there external NPPF issues which bear down on that? Secondly, it is such a big and complicated site that the challenges of master planning must be enormous. How confident are you that you can sustain the balance of interests, for example, as we just heard, on the demography, building an environment which is friendly for an ageing population and not simply being driven by starter-home requirements?

**Michael Cassidy:** I suppose the major change in planning is the alteration in the approach to Strategic Plans. It has often been said that garden cities would get some boost from being included in policies as part of the strategic planning, which traditionally has not happened. That has changed to some extent, and co-operation is now called for between adjoining boroughs or areas.

**Baroness Andrews:** With whom do you co-operate?

**Michael Cassidy:** We start with a phenomenally useful relationship with Dartford and Gravesham, and the upper-tier authority is Kent, obviously. They are early supporters of the work of the Corporation and they sit on our Board, so I am quite confident that we will be able to develop that relationship. My main conclusion is that I do not feel the planning system is an obstacle at this point. At the present time there is 10 million square feet of unimplemented planning consents, so it is not as though there is a shortage of planning capability to deliver this.

In terms of the other difficulties and complexities, I agree this is an extremely challenging context, not only because of the topography but because of the marketplace and having to make these attractive homes for all-comers. I think that obstacle is melting away over time.
because of the strength of house prices in south-east England. It would be strange indeed if we were not able to sell houses on this plot, and the list for the current phase is fully accounted for, so I am not worried about demand. A basic house might cost £275,000; in London terms, that is modest, therefore Ebbsfleet is going to be very attractive for people wishing to move a short distance out because they find London too expensive. Ebbsfleet station is only 17 minutes from St Pancras, so for those who have to travel to work, it is an attractive location. I might mention fares in a minute because they are too expensive, but that is a side issue. I am confident that the basic demand for houses in Ebbsfleet is there, and that the layout and facilities will be sufficient to attract all types of occupiers. It is our purpose to make sure there is a considerable risk of missing that market—in other words, this may not go on for ever, so let us try and build the appeal of the site for the short term.

**Baroness Andrews**: How much control will you have over the quality and design of what is built—for example, in relation to people over 60 who want to downsize out of central London and move to Ebbsfleet?

**Michael Cassidy**: Dartford is the plan-making authority. We do not have plan-making powers, but we are content that under the Dartford Plan, it has design guidelines that developers have to meet under their planning consents. We are trying to build on that with our own set of design objectives, but we have to negotiate those into the arrangements. We are already doing that with, for example, Persimmon, the builders of the next phase; it is very happy to be talking to us, although it wants to be convinced that our changes make sense. My objective is that we should have a good mixed set of dwellings here so that there is appeal right across the market—not just starter homes, although the Government have a considerable priority for starter homes under their present policies. I would also like to encourage the private rental sector at Ebbsfleet, because in that 12 million square feet of consents there is nothing for private rented accommodation. To me, that is part of the modern marketplace—that people moving to a starter home in this sort of location might want to rent for a while.

**Q98 Earl of Lytton**: You answered the question I originally wanted to ask about the take-up rate of the new build, but I am particularly interested in this concept of where the Ebbsfleet model sits in the construct of the new towns of the past and the Poundburys of the future. How do you settle how you are going to deal with that? We have had information about the
criteria for a garden city, but how do you see that durable USP that is going to form the societal as well as the economic glue of Ebbsfleet?

**Michael Cassidy:** Let me first draw one important distinction. One of the advantages that the New Towns Act provided is that it put land ownership as well as planning in the corporation’s hands. It makes a phenomenal difference if you can drive it with planning permissions but also through covenants or other ways of enforcing community-style commitments. We do not have the land ownership and it is not proposed that we should obtain it. The Board at Ebbsfleet considered options during our early period that included obtaining the land ownership, but we put those to one side because of the cost and because it is our belief that the present Government would not favour spending hundreds of millions on the land as their first choice. So, we are going to adopt a partnership approach, as I described, whereby we have an agreement with the land owners as to how this will proceed.

That is a big contrast with all the early garden cities, because there is a so-called legacy of land ownership, which then helps to resource future growth because you hope to capture some of the land value increase as a result of having built a city there. We cannot do that, so we are going to have to deploy our resource within the constraints of being a planning authority, but I believe we can still achieve what is necessary based on that. I expect this location to meet all the yardsticks of a recognised garden city. There will obviously be generous open spaces; up to a third of the land will be set aside for open space, play areas, allotments and so on. It certainly meets the test of connectability because of the railway; it has its own fast-track bus service, which will enlarge further. So when it is finished, 10 or 15 years hence—that may be optimistic—it will be recognisably a garden city and not just another housing estate.

**Baroness Rawlings:** You mentioned earlier about the roads being absolutely blocked. I was looking on the map to see exactly where that was. The train service is very good—17 minutes from London—but is anything being done about access from the north, the other side of the river? With the A2, you have to go along and then back up.

**Michael Cassidy:** Indeed. It has been recognised for some time that the Dartford bridge has been a victim of its own success and is regularly hugely congested. The Government have proposed a third river crossing, and they have offered three alternative sites. This has been out for consultation for a year and a half. It is said they will make an announcement in the
next year. It has also been reported that there is a preference for the easternmost site, which would cross from Thurrock to Gravesend, who are not too happy about it. Otherwise, you would have to put it bang next to the existing Dartford bridge, which has obvious problems, or there is the middle option, going straight through our site, which I think has been abandoned now. So yes, there are plans and it has serious Government support.

**The Chairman**: No tunnels underneath?

**Michael Cassidy**: There is no sign of a tunnel proposal. Maybe that is cost-related. During the time I have been involved in this, there has been absolutely no discussion of that, so I assume it is off the agenda.

**Q99 Lord Inglewood**: Significantly, in your response to Lord Lytton you touched on a number of the things I was interested in. If we stand back form the Ebbsfleet site-specific project and think about development corporations as a more general phenomenon—which seem to me to be a form of benevolent dictatorship—what application do you think they have in more general terms? What are the particular pluses and minuses when looking at the question of the built environment overall?

**Michael Cassidy**: The biggest advantage is that development corporations operate across boundaries, so you can put them in place where there is more than one local authority involved, and they can prevail because planning powers pass to the corporation. Clearly, it is very satisfactory if there is wholehearted agreement on the part of the other authorities involved. It becomes hellish if one or more of them are against what you propose.

**Lord Inglewood**: The component local authorities sit on your Board.

**Michael Cassidy**: Three are ex officio members of the Board and they make a full contribution. There are some areas where there will have to be discussion and agreement; in other words, it is not always unanimous—I have just mentioned the case of the river crossing, where it clearly is not—but for the most part we are working together. The three involved see it as being consistent with their own objectives anyway, but if I were to be asked how I would apply that in other parts of the country, I would have to express a reservation. Each garden city needs to be considered in its own context and I am certainly not advocating that this is necessarily a solution for all possible cases. It has to be carefully chosen, holistic, and, as we are, one complete site rather than fragmented, and it has to be in co-operation with existing
authorities. You will know that the Thames Gateway initiatives have not been at all successful over the past couple of decades.

**Lord Clement-Jones:** Was there adequate co-operation at the outset of Ebbsfleet?

**Michael Cassidy:** That is the story that I received. When Eric Pickles was Secretary of State, he was extremely keen under his localism agenda to have local authority support, so when I came in, that had already been achieved.

**Lord Inglewood:** Are there any disadvantages with development corporations—any particular problems that you would not have if they did not exist?

**Michael Cassidy:** I do not believe so. It is about competence and delivery. An individual development corporation can lose its way if it is wrongly led or if it simply has the wrong priorities.

**The Chairman:** It is back to leadership, is it not?

**Michael Cassidy:** Yes. There is nothing in the model that has deterred me from taking on this job. I see it as fitting with other situations I have been involved with in the City of London, where we have been able to make considerable change through the planning system and it has resulted in spectacular growth. I will try to apply those ways of thinking to this in a different context, but building on ideas I have developed over the years about partnership working across boundaries.

**Lord Clement-Jones:** You are touching on a question I wanted to ask at the end, about lessons for the future development of large sites, which, as we have heard during the course of this inquiry, prevent major problems. You obviously say you have to treat each site on its own merits and ensure you have co-operation with local authorities, and so on. Do you have any broad lessons in mind in terms of how you would proceed in future? In some respects, you would not have started from here with Ebbsfleet, but now you are moving forward because you are doing things differently from the way they started.

**Michael Cassidy:** If you kindly ask me back in two years, I will tell you.

**The Chairman:** Our inquiry closes in March.

**Michael Cassidy:** It would be premature for me to draw those sorts of conclusions. I am already aware of certain challenges in the delivery area but I am not overly depressed about that. One works within the context of government and co-operation across borders, as I
described. That may or may not work but at the moment, given the Chancellor’s announcement, I start with a positive stance and I believe we now have the resource to deliver on it.

The Chairman: That is very encouraging, and it does work, of course. We went on a site visit to Birmingham, around New Street, looking at what they are doing for HS2. The way in which people with enthusiasm and very bright leadership skills are getting on with it is very impressive.

Michael Cassidy: It can be done. Manchester has done it too. It takes political will and expert leadership. I am very confident in the quality of the Board I have been able to appoint. They represent very different sectors, but they are extremely relevant to what we are doing here. All of that is working well. I just need to make sure I can develop the delivery team in an extremely achievement-focused way.

Q100 Baroness Andrews: Are you concerned, Mr Cassidy, about other issues of capacity—for example, lack of aggregates, lack of construction skills, lack of project management skills, and lack of good planners in your local authorities? We have seen a loss of planning capacity.

Michael Cassidy: That is an extremely good point, and the next priority for me within the organisation is to recruit skilled project managers. This will be, first, a construction project—quite a complex one—and, secondly, a big master planning exercise. We have AECOM, as I said, but we do not yet have the project management skills we will need to deliver on this. The market is tight because construction is very strong at the moment and there is a skills shortage, which everyone is now very aware of. I am hoping to address that by having some of the housing units provided by more industrial means.

Baroness Andrews: Prefabricated?

Michael Cassidy: In other words, dealing off-site with construction and then delivering to site, perhaps even from far-flung factory locations, in order to speed up the house building. We do not have that at the moment; it is all being built with traditional house building, on-site work. There is no prefabrication.

Lord Inglewood: Are you having project management involvement from the development corporation’s perspective because of the partnerships? In the ordinary way, you would
probably find that the planners would plan and the developers would develop, but that is obviously not quite how you are going to do it.

**Michael Cassidy:** No, because we have to show that we can deploy our £300 million with value for money in mind and not be wasteful with it. Therefore, the project management skill is in organising the contracts, tendering—

**Lord Inglewood:** My point is that you are taking a step beyond what many conventional planning authorities would do because of the nature of what you are doing and why and how you are doing it.

**Michael Cassidy:** Yes, that is totally right. That is the main distinction. Planning authorities can only facilitate; they cannot actually drive and deliver. Therefore, the purpose of our constitution is to change that from being a permissive authority to an authority that is driving towards a given outcome.

**Lord Inglewood:** You are a kind of Joe Chamberlain figure in Ebbsfleet!

**Michael Cassidy:** I leave you to judge that.

**Lord Clement-Jones:** You will tell us in two years’ time whether that is a good model.

**Michael Cassidy:** Yes.

**Baroness Rawlings:** Is that a formula that could be followed elsewhere?

**Michael Cassidy:** I would certainly hope so, but I am not accepting invitations to speak advocating this until I know that it works.

**The Chairman:** Wise man.

**Q101 Baroness Young of Old Scone:** In the context of leadership, you talked about design standards and the fact that the local authorities had design plans, and you were developing your own but they would need negotiation with developers. How ambitious will you be? For example, will you be insisting on zero-carbon homes?

**Michael Cassidy:** As I said earlier, there are limitations on the prescriptive powers, not only of planning authorities but of development corporations. Therefore, I am approaching this as a negotiation, not as something we can deploy our statutory powers to achieve and insist on. That is the way the legislation was framed, and it is quite deliberate. We approach it with the confidence that with £300 million, we can obtain favourable results. For the next year, that trade-off is what we will primarily be engaged in, and it has to be subtle, commercial and
consensual. It is up to you to decide whether you think that is enough, but that is all I am given and that is what I start with.

**Baroness Young of Old Scone**: There is not a risk of a race to the bottom?

**Michael Cassidy**: We have already taken steps in discussion to make sure that does not happen. There has been some expression of disappointment locally about the quality of the first phase being inadequate. That is now recognised; even the landowners understand that criticism. There is quite a lot of moral pressure, and a convincing case is being built for the quality to improve.

**Lord Clement-Jones**: What is interesting is you had a figure for the resource devoted to the Corporation but then you decided you needed more, and you got your £300 million. What gives you the confidence to proceed now you have £300 million, and what is the difference between that and the original £200 million?

**Michael Cassidy**: The Chancellor’s original statement was made without actually knowing what it might be spent on. He said £200 million in his Budget the previous year, and we made a case to push that to £310 million over the last few months. There are various things that we have an ambition to achieve with the difference. The site has very poor basic services: there is no foul water drainage; it is all cesspit drainage, which is completely unsatisfactory. There are difficulties to do with the highway approach, as I described earlier; we can address some of that. There are the site difficulties of being a former quarry; there is a very large landfill hill, which is right opposite the station exit and therefore very much in the way. We seriously looked at moving that landfill. We had estimates ranging from £150 million to £500 million to do that, so we have unfortunately had to put that to one side. That landfill hill will be a green open space where you can fly your kite, but probably not much else. There is really basic provision that we think we can usefully deploy that difference to achieve, where the developer will not do it.

Q102 **Baroness Andrews**: I think you have answered my question, which was going to be about garden cities and principles, but I would like to ask one short question about community building. The fear with new developments is that one does not actually build in the character of the likely community—the community dimension. How are you addressing that?
Michael Cassidy: There are two thoughts that come to mind. One is that we have to recognise that there are existing communities just outside our boundary which need to be brought into our ambition; otherwise, resentment will build up. We will have a programme of community involvement across those borders, so that it is a community development which builds on existing communities: Swanscombe, Northfleet, Southfleet.

Baroness Andrews: They are separate communities, are they not?

Michael Cassidy: They are, and they are quite distinct, and there may be some areas of difference that become obstacles, but we are allowed to use some of our resource outside our boundary if it builds our consequence, and we will do that. We have already launched a community scheme between now and next March whereby local existing groups can bid for resource from us. We will probably do that on a matching basis, so that if they achieve some funding, we will match it. In that way we will have summer fairs, external retail opportunities—I do not want car boot sales, but something which the community wants which helps to build that. The second way we will address this is by drawing on one of the successes of other garden cities: establishing a trust process whereby the community owns the ongoing trust, so that even beyond the period of our development corporation, there will be an entity which keeps faith with the principles.

Baroness Andrews: How interesting.

Michael Cassidy: That is where Letchworth works extremely well.

Baroness Andrews: Such a trust would not have planning powers?

Michael Cassidy: No.

Baroness Andrews: So how would they maintain those principles?

Michael Cassidy: That would have to be discussed as we come to the end of our phase, say 15 years hence, but there is a possibility of resource coming out of the residue of whatever we have built up. Secondly, there will have to be a service charge levied that will provide the wherewithal for ongoing community ventures. That is essential to keep the character.

Baroness Andrews: What about community buildings? Do you prioritise in your master plan the building of places where people can get together from an early stage of the community house building programme?
Michael Cassidy: Yes. Fortunately, there is one already there, which is one of the products of this quiet period since 2007. That is where we have our board meetings. It is a community centre at Springhead. It has quite strong church backing, being a community church as well as being available for other activities. I have noticed a lot of the things you would expect to see in a village hall going on there alongside our board meetings, and I am encouraged by that. There are proposals to extend that type of facility throughout the area—the sort of things you would expect: an ambulance station, a police post, allotments. In the finished masterplan there will be a review of that type of provision because we believe it is essential to the garden city concept.

The Chairman: And a playground where elderly people can watch children play?

Michael Cassidy: That is already in place with the first phase. You will see, I think, a series of village greens—that is the best way I can describe it—each of which is their own cluster, but there will be a complete community feel alongside all that.

The Chairman: It sounds fine. I was thinking of the read-across from the various witnesses. In Birmingham the Corporation have an estate with social housing and rental housing. Also, they are selling houses and using the profits from that to plough back into other parts in that area. Have you thought about that?

Michael Cassidy: In the context that I referred to, where there is a split between the ownership and the planning, it is difficult to achieve that, because you cannot impose conditions that relate to ownership in a planning permission. It is part of our consensual approach to try to achieve that through other means. On affordable housing, which is very important in our planning, 30% of the housing has already been set aside, which is the Dartford experience, and we have happily adopted that. There is a 10% social provision, which is being put out to tender. Circle Housing is one of the interested parties. It is peppered throughout the landscape in the villages; in other words, it will not be ghetto-ised. I have seen that at Kings Hill, near Maidstone, which is a very good example of how you can mix the two without actually noticing the difference. I believe we can achieve that.

Q103 Lord Inglewood: One of the characteristics of the way the planning system in general works in this country now is that there is a great deal of public participation, not from elected councillors but from the wider public. Clearly, if you are building a new town it is slightly
different, in that the people are not living there, although there will be some. Have you run into criticism for not having enough public participation? I know you consult. Are you finding there is no difficulty?

_Michael Cassidy:_ We firmly intend to achieve that. We have full public access to our Board and our Planning Committee. We carefully choose the timing and the notice to ensure a very good public turnout. We regularly have up to 20 people at our board meetings.

_Lord Inglewood:_ That is members of the public?

_Michael Cassidy:_ Press and so on. I do not think there will be an issue with how we are organised because that is just good local government procedure. Where I think there is discussion and where we are trying to improve our contribution is the degree to which we actually ask the public questions and invite them with a serious intention to meet and influence a lot of them. That starts next Tuesday with an all-day set of sessions—some of them drop-in opportunities, some presentations—some which are deliberately directed at local authority and community groups. We fully intend to enlarge that area of activity, which, for example, will include a comprehensive mailing of 300,000 leaflets. We believe there will be a lively interest in helping us frame the policies. That is what we are there to do. Incidentally, there was an occasion in this quiet period when a proposal for a white horse was put forward for a hill alongside the A2; a competition was run at Bluewater shopping centre for the preferences of the public, and 75,000 people voted.

_The Chairman:_ Yes or no?

_Michael Cassidy:_ They chose from three or four options. I have reservations in taking on that project at the moment because the price is £20 million and I do not think I can justify that, but if somebody would like to come forward with a smaller horse—

_Lord Clement-Jones:_ Or a public donation.

_Michael Cassidy:_ On the model that was approved, the nose of the horse was as high as Nelson’s Column, so the scale is like the Angel of the North—a great thing—but I am pausing on that at the moment.

_The Chairman:_ Perhaps you could put that on top of your hill.

_Michael Cassidy:_ Yes, it would be nice to have a noticeable feature for all that traffic coming from the Tunnel. I would love to have that but not at that cost.
The Chairman: Perhaps Sir Antony Gormley will do it for nothing, just for the publicity!

Michael Cassidy: At the moment, coverage and understanding has improved. We have had a lot of interest from the press. There will be a detailed piece in the press in the near future. Radio 4’s “Today” programme were very generous to us last month.

Lord Clement-Jones: That is what prompted us.

Michael Cassidy: Thank you. You probably did not listen from 6.30 but they gave us four slots through their morning programme. That was quite well received and I have had good responses since that.

Baroness Young of Old Scone: Going back to your 30% affordable, 5% social housing figures, we have heard from a number of other planning authorities where the viability test is ruled in and they drop dramatically to less than 15% affordable from quite high levels. How confident are you that you are going to be able to maintain those levels?

Michael Cassidy: It depends on the demand for that particular provision. The experience in Dartford is that they can fulfil 30% affordable; there is a sufficient waiting list to require that. We are learning from their pattern; we are not trying to re-invent that. I believe in order to develop a balanced community, it is important to keep in mind those targets and not to try to defeat them. In other words, we do not have a rigid vision that this will all be free market, owner-occupied semis or detached homes. We have to broaden our scope here and appeal to the entire marketplace.

Q104 The Chairman: Thank you. Finally, does there need to be a clearer expression of garden city principles in the national planning policy, and what should the Government’s role be in taking forward garden cities in other locations?

Michael Cassidy: I have thought about this in the run-up to today, and I have firmly come to the view that it would be wrong to have something too prescriptive in national legislation to apply across the board to all garden cities. Our situation is unique in its own context. I have seen proposals elsewhere in the country which do not directly resemble us and, personally speaking, I am more than happy to work within the existing framework and not suggest reforms or adjustments, certainly not in the early days of our existence. However, I am very keen that a design code approach should be encouraged wherever possible. That is quite hard with the present legislation, but if it is to be in any area, it would be that of garden cities—let
me not prescribe this across the board—which would certainly benefit from additional powers to require design quality.

The Chairman: Thank you very much indeed, Mr Cassidy. It has been a riveting session. Thank you for coming here, and I hope you have got something from it.

Michael Cassidy: It has been a real pleasure. Thank you for being so patient and attentive. You will probably be aware that we are more than happy to arrange a site visit.

The Chairman: That would be lovely. Thank you very much indeed.

01 December 2015
1. The national policymakers should set the objectives for national development and a framework within which they can be implemented. This has been done through the NPPF. Implementation of those policies needs to be done at a local scale, as otherwise the volume of cases would be prohibitive and the ability to consider local conditions would be lost. Local authority scale is about right for implementation rather than parish council, since smaller scale involvement tends to result in less rigorous and knowledgeable decisions. Even local authority councillors tend to lack sufficient ability to understand more complex planning cases and often make deeply flawed decisions.

2. Badly. The dominance of the Treasury has recently resulted in some extremely damaging reversals of very sensible and popular policies, such as zero carbon homes. The established hierarchy of certain departments means that those with little relevant knowledge or interest can overrule lower-grade departments with specialist and pertinent skills. Giving those that know what they are talking about greater influence to interpret overarching policy could result in more sensible governance.

3. Not really, the NPPF is broad and often uncertain. Some factors – such as developers being allowed to create land banks that take supply allocation out of the Local Plan and so render it void – have resulted in unintended consequences that have been quite damaging, at least in some cases. Lack of expertise in local authority councillors leads to some undesirable outcomes. Aspects that should be strengthened include the consideration of ecosystem services that will be altered by the development and consideration of impacts to future users/occupiers over the development lifetime (such as flooding).

4. A spatial element is not essential to national policy such as the NPPF, but it should contain strong provision for such spatially explicit implementation plans at the local level. This has been done fairly well, although there have been some harmful unintended consequences, as noted above.

5. The main, national policy should be looking at least 50 years ahead. The implementation plans at local level should look mainly out to 15 years, but with some consideration out to 50 years.

6. Government should ensure both quantity and quality of housing supply to private owners and housing association. Right to buy policies are likely to be harmful to both. Deregulation will result in poor quality housing built in inappropriate locations (such as flood plains or areas providing valuable ecosystem services). The greatest benefit to housing supply with minimum impact to society-wide wellbeing would be to move economic activity into the north of England. Tinkering with quality standards of new developments and relaxing planning regulations will have comparatively little impact other than to degrade the overall quality of housing stock. Some permitted development rights of commercial and agricultural buildings are sensible, although ‘small beer’ for overall housing numbers and affordability.
7. There is a wealth of international experience. The government should use this to formulate policies that will promote best overall outcomes, rather than focus narrowly on specific regulations. The latter grabs headlines and may win votes, but does little to solve systemic problems. Sustainable and resilient development needs to consider how people want to live now and how people will need to live in 50 years. It must incorporate green infrastructure, energy generation and use, changing transport modes, future work patterns and zero carbon lifestyles. Existing housing stock and policies are entirely incapable of meeting this challenge. Failure to alter policies so that existing stock is made efficient and resilient will result in significantly higher costs in the future (including health costs and deprivation). There must be good incentives for retrofitting efficiency measures to existing stock (such as insulation), as well as policies or systems that make it easy to do so.

8. No comment.

9. Few professionals can think holistically and few are asked to do so. Large development should be able to coordinate discussion between professionals to create holistic thought, but in practice this appears to be the exception rather than the rule. The skills gap could be addressed by requiring a higher level of CPD that involves much from different but allied disciplines, such as architects having to learn about renewable energy, transport and wellbeing. Local authorities do not have the people or budget to access sufficient skills, but they are also bad at making the most of the creativity in their local population.

10. No. More research on theory and case studies is necessary to inform policy, which should be based on evidence rather than political posturing. Unfortunately, this has not as yet been tried.

11. No. Generally each development is considered individually and little attention is paid to wider effects. Developments should not be guided by the latest political agenda or fad, but rather from studying other areas around the country (and globe) that work both well and poorly. Looking at the wealth of environments that already exist will give a good insight into what we should create (and not create). It is especially useful to look at thriving communities that have grown over time with little regulatory guidance, as these demonstrate intuitive structures of human habitation that promote wellbeing.

12. There are many and huge barriers. Poor public knowledge is a problem, both of what is being planned and what such plans mean for them and their environment. The planning system has neither the time nor resource to consult widely and effectively. The lack of expertise of councillors results in poor and unpopular decisions that reduce confidence in the system and so discourage participation. It can be expensive, time consuming and difficult to challenge decisions. Fixes to these problems will be difficult, especially whilst budgets are so tight.

13. Land prices are a problem to housing numbers, quality and affordability. Allowing development on low-quality agricultural land only if locally popular, they improve
ecosystem service delivery in several ways and are sold at a profit proportional to build cost would address all these problems whilst improving biodiversity and wellbeing. I am currently researching such a project for community housing, should you wish to learn more.

13 August 2015
Memorandum from EDF Energy in response to the House of Lords Select Committee on National Policy for the Built Environment’s Call for Written Evidence

About EDF Energy

EDF Energy is one of the UK’s largest energy companies with activities throughout the energy chain. Our interests include nuclear, coal and gas-fired electricity generation, renewables, and energy supply to end users. We have over five million electricity and gas customer accounts in the UK, including residential and business users.

Policymaking, integration and coordination

Q1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

1 EDF Energy believes that the decisions that shape England’s built environment are taken at the right administrative level. We believe that the current planning system has provided stability and investor confidence for large energy infrastructure developers, through the dedicated process for planning consents for nationally significant infrastructure projects (Planning Act 2008 Nationally Significant Infrastructure Projects). By frontloading the planning application process and enabling early stakeholder engagement, we believe that the risks of protracted planning inquiries and delays have been significantly reduced.

2 We believe that it is essential that Government policy on planning remains stable and clear. This is because the consenting process needs to be predictable, timely and transparent to allow the private sector to come forward with confidence to invest in very large infrastructure projects and reduce the risk of any projected capacity shortages, and the host communities to be able to engage effectively and have a say on developments in their local area.

3 We also believe that the interaction between national need and local policy needs to be clearly expressed in guidance and understood by local authorities and their partners. This is to ensure that technologies critical to decarbonisation, such as onshore wind, are given fair assessment. The reason for this is that the development of policies which devolve more decisions to the local level will have the effect of elevating local opinion over national need. This is also a concern as it may have the effect of recreating the system in operation before the Planning Act 2008, which often resulted in protracted planning inquiries and delays for essential nationally significant infrastructure projects.
4 We welcome the Chancellor’s announcement to establish an Infrastructure Commission, to be chaired by Lord Adonis, to plan infrastructure projects including transport, housing and energy. We believe that this will provide a strategic national steer and investor confidence for energy infrastructure developers.

Q2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

5 In the electricity sector, there is a clear recognition of the need to drive infrastructure investment to deliver the policy goal of a secure, affordable and low carbon electricity generation mix. To achieve this, EDF Energy believes that there are two areas of the policy framework where it is essential that integration and co-ordination are maintained.

6 The Coalition Government, with cross-party support, implemented fundamental reforms to the electricity market. Electricity Market Reform (EMR) provides a framework to deliver the policy objectives of decarbonisation and security of supply in an affordable way. This reform needs time to work by bringing forward new electricity generation infrastructure.

7 The Planning Act 2008 (as modified by the Localism Act 2011) introduced the National Policy Statement (NPS) framework to guide decision making on Nationally Significant Infrastructure Projects (NSIPs). The Energy NPS framework provides a stable policy framework for planning which is an important factor to build investor confidence to invest in new projects.

8 It is important to maintain the current planning framework which provides the means to balance the national need for low carbon and sustainable energy infrastructure projects with the views of local people. If local opinion is elevated above national need, this will reintroduce the risk of protracted planning inquiries and delays.

Q3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

9 EDF Energy recognises the fundamental importance of a robust and predictable planning system in delivering sustainable development. We believe that the current planning policy framework is stable and provides adequate certainty and investor confidence. We also believe that large scale investment in electricity infrastructure is required to ensure security of supply and meet our climate change targets. It is important that the transition to a low carbon economy is progressed efficiently to ensure that the competitiveness of UK energy supplies is maintained, while also ensuring the stability and affordability of energy prices.
It is essential that the right decisions are made when developing and protecting the built and natural environment. However, decisions need to be taken at a nationally strategic level to secure investment in large-scale low-carbon electricity generation and promote the transition to a low carbon economy incorporating a diverse energy mix.

We believe that the Government’s statutory energy and climate change objectives can be met through the National Planning Policy Framework (NPPF). This is because it defines the UK’s national economic, environmental and social infrastructure needs. It also clarifies the planning priorities for all development under the Town and Country Planning Act (TCPA) regime. We support the overarching principle of having a “presumption in favour of sustainable development”. However, we do believe that more emphasis should be given in the NPPF to the role of energy infrastructure within the TCPA regime, and as a crucial component of the Government’s growth agenda.

We believe that there were significant benefits to streamlining and rationalising the old suite of planning policy documents. However, we are concerned that there are some instances where useful detailed guidance for developers and local authorities, for example that in Planning Policy Statement 22 (“Renewable Energy”), have been omitted.

We feel that local planning authorities and community stakeholders already have opportunities to question and analyse major infrastructure projects through the nationally significant infrastructure planning process. This gives scope for the positive and negative impacts to be weighed as part of the decision making process undertaken by the Planning Inspectorate (PINS). It is important that, in cases where developers may need to make applications for associated development as part of the same project under both national and local planning processes, the national need of the main project is a material consideration. We believe that the NPSs should be a material consideration under the TCPA regime, and that this should be stated explicitly in the NPPF, in line with the wording in the designated NPSs (e.g. paragraph 1.2.1 of the Overarching NPS for Energy (EN-1)).

Q4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

EDF Energy believes that a number of aspects of planning policy already deliver a spatial perspective and we are not aware of a significant gap in policy in this respect. Before introducing a further spatial element to national policy, it is essential that any perceived policy gap is defined, with clear supporting evidence. The NPPF calls upon local planning authorities to produce Local Plans which, once all Plans are in place will deliver a cohesive picture of land use across the country, including identifying areas where renewable energy projects are particularly encouraged.

We believe that rather than introducing further changes to the NSIP and TCPA regimes Government should focus on assisting all local planning authorities to produce robust Local Plans in full consultation with their local communities, and within a specified timescale.
Q5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

16 EDF Energy believes that planning for energy infrastructure requires a longer-term view. It would be prudent for those developing planning and future built environment policy to consider the infrastructure necessary to deliver the UK growth plans. Investment in electricity infrastructure is urgently required to replace existing generation plants. This is required to ensure security of supply and meet our climate change targets. The UK will need to achieve very substantial progress in decarbonisation of electricity generation by 2030 if it is to achieve the legally binding target to deliver an 80% reduction in greenhouse gas emissions by 2050, as established in the Climate Change Act 2008.

17 It is important that the transition to a low carbon economy is progressed efficiently to ensure that the competitiveness of UK energy supplies is maintained, while also ensuring the stability and affordability of energy prices. We believe that planning for the UK’s energy needs out to at least 2030 would deliver a stable long-term policy framework which would attract investors.

Skills and design

Q9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

18 EDF Energy believes that there is a strong need to reinforce and adequately fund planning resources. This is because a lack of resource has, on occasion, hampered some local planning authorities in responding in a timely way. Sufficient experienced and knowledgeable planning officers are needed to manage and deliver the planning authorities’ wide-ranging duties and responsibilities under both the local planning and Nationally Significant Infrastructure Project (NSIP) regimes.

Community involvement and community impact

Q11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?
19 EDF Energy believes that the front-ended NSIP regime allows for meaningful and early engagement with local communities and their representatives which can help developers enhance their designs to accommodate local suggestions / address local concerns.

06 October 2015
The Edge is a voluntary built-environment think tank and is multi-disciplinary in a landscape remarkable for the number of single-discipline institutions it contains. We stand for being:

- Interdisciplinary: bringing built environmental professionals together, inclusively along with others who share their concerns.
- Open and creative: working across all disciplines with competitors and collaborators.
- Strategic in approach: encouraging accessible and shared knowledge and seeking to connect place, practice, policy and research.
- Visionary: in identifying the issues and in promoting effective and urgent responses to both local and global challenges.
- Professional: developing a broad-based ethic of responsibility to social and environmental demands based on an equitable global framework.
- Business-like: furthering the skills and capacity of the UK construction industry to promote prosperity and deliver a better built environment.

These characteristics provide a successful working model for interaction, which we believe is more widely applicable. It is a framework that has directed our thoughts when addressing the timely and pertinent questions that the committee have posed.

The following responds to the Select Committee’s questions as posed.

Policy making, integration and coordination
Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

Built environment decision-making needs to be made at a range of levels to address the national (long-term / visionary), regional (strategic) and local (local need / capacity) concerns. Policy leadership can be more influential at some levels than others in resolving conflicting drivers. So current concentration on scaling up housing output requires a clear national level steer on design quality and sustainability from DCLG, the Secretary of State and the Chancellor to mitigate potentially significant negative impacts on current and future generations from poorly designed housing. Similarly addressing national climate change or urban heat island challenges necessitates energy efficiency decisions beyond the level of individual buildings, with Local Authorities’ local decisions on master planning or provision of green spaces interacting with regional planning for say renewable energy infrastructure.

1.2 World class places in 2009 was the last policy attempt to identify cross departmental actions to improve the built environment. Many of the recommendations still hold true and new policy could helpfully reconsider:

- Ministerial Design Champions to embed quality across the whole of Government
Establishing consistent quality standards (this was achieved for housing in the 2014 housing standards reviews but would be equally helpful for green space and heritage)
Providing training for local leaders / local government helping them to understand and prioritise quality of place, and supporting local authorities in the long term process of delivery of high quality places

Empowering local people to have greater influence over the quality of local areas.
Recommendation 1: A long-term national policy vision should be developed through a process of public consultation that allows for regional and local interpretation and delivery. Politicians should compete with the means to deliver a shared vision and not with alternative visions.

How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

2.1 The urban environment is the location where all these concerns interact, and the success and financial sustainability of individual transport or energy infrastructure projects depends on consideration of all the other factors. Yet integration of these areas (and communication) across Government departments is still poor. The lack of clarity and direction about how the built environment is designed and managed becomes critical when addressing the combined challenges of climate change, demographic shifts and economic austerity and the broad impact of the UK’s ageing population.

2.2 Routinely monitoring policy impact, gathering and sharing information / data would improve coordination (particularly while new policy is being worked through, as in the case of the Neighbourhood Planning pilots), enabling policy makers to develop and deliver better policy in the future. While various research bodies and academic institutes exist, the lack of a single agency to gather evidence and learning on Built Environment delivery (similar to the independent ‘What Works’ networks centres for key areas of health, education, crime reduction, and local economic growth) is an ongoing weakness.

Recommendation 2: In place of the Chief Construction Advisor a stronger more influential position of Chief Advisor for the Built Environment should be created, responsible for coordinating and championing high quality, energy efficient design and placemaking.

Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

3.1 The current planning system is still readjusting from the upheaval of the NPPF with ongoing production of Local Plans being prioritised over implementation. There is insufficient guidance on establishing long-term visions or on balancing the pressures of
development against preservation of nature or heritage. Sustainable development is only given lip service in the NPPF and yet even the Governor of the Bank of England called for urgent engagement with sustainability when speaking at Lloyds on 29 September 2015.

3.2 Planning policy guidance is now far simpler but has become divorced from the complex realities of delivery. Many improvement mechanisms exist to facilitate a simpler, faster planning system at the same time as improving quality; but many policies are poorly understood or in a process of transition (for example Local Authorities running CIL and S106 in parallel) implying that greater skills and resources are required to motivate and facilitate policy application. Guidance is insufficient without powers and incentives for implementation.

Recommendation 3: The NPPF should be allowed to bed down and prove itself before any further radical overhaul, but the immediate priority should be the development and provision of the skills and resources to enable the current planning system to be efficient and effective.

Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

4.1 Spatial consideration of policy is extremely weak at both national and regional scale. A more informed spatial perspective would improve forward planning of large-scale cross-regional projects (such as transport connectivity), but also provide more considered delivery of smaller projects. Clear regional plans might ameliorate the current failure of the Duty to Cooperate, and the realistic spatial identification of locations where development is most suited facilitate local interventions in a less piecemeal and reactive way.

Recommendation 4: Clear regional plans should be put in place that fill out the next level of detail of the national vision and help inform local planning and decision-making.

Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

5.1 Planning and delivering built environment projects is a slow complex process, with differing solutions needed to respond to the range of timescales. Monitoring and adjustment of policy is essential across timeframes. Many current problems are the result of historic policy decisions (say Right to buy and the shortfall in social housing), which have taken decades to play out. Infrastructure obviously needs long-term thinking. Yet a single road map over 30-40 years may be unrealistic, and fail to take advantage of rapid shifts in technology and other opportunities; we need swift actions (capitalising on progress in construction, energy efficiency and sustainability) that can build towards longer-term targets. So while Garden Cities / large scale settlements are long term projects taking 25-30 years to deliver greatly needed new homes, we also need 3-5 year programmes continuing to infill and build out sites to increase density in existing towns and cities. Both these shorter term or longer term housing investment programmes must be accompanied by
post-occupational evaluation on their social, economic and environmental impact and the results feed back into the planning system.

5.2 One point of consensus is the need for forward certainty and a shared plan that extends beyond short-term economic and political cycles. At the same time, however, embedding a culture of thinking ahead in a manner that accommodates the fact that we sometimes cannot be certain of the future is important if we are to be prepared for its arrival.

Recommendation 5: Long term planning combined with on-going monitoring and responsive policy stewardship needs to be instituted to allow 5, 10 and 25 year programmes to react to continuous feedback and be alive to changing circumstances

Buildings and places: New and old
What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

6.1 There has been substantial discussion of the challenges of housing supply and alternative solutions proposed; see Lyons, reports by KPMG / Shelter, HAPPI2 and others. All of these identify similar interventions needed; to hasten land delivery, increase skills, and encourage funding investment and community engagement to overcome resistance to planned expansions.

6.2 It is essential that the new homes built are not only cost efficient to construct but also energy efficient and sustainable, providing affordable, easily maintainable homes, which will need to work well for 100-200 years. To do this the construction industry must be supported by government to provide the training and employment practices needed to re-establish a skilled labour force amongst the major volume house builders and also smaller scale local developers.

6.3 Government must take proper regard to demographic changes underway (the increase by 250% of ‘over-60s’ between now and 2050), intervening where the current market won’t provide suitable homes for this group, but addressing a need which would outpace demand for Starter Homes.

Recommendation 6: New housing providers should be supported as they enter the market and the construction industry must be encouraged by government to provide the training and employment practices needed to re-establish a skilled labour force amongst both the major volume house builders and smaller scale local developers.

How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be
able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

7.1 The physical resilience and adaptability of the built environment is only a partial step in achieving sustainability. Too often Government takes a limited view of resilience as hazard/ risk management, with the aim of a place ‘bouncing back’ to a pre-shock equilibrium. This ignores the dynamic social-economic resilience derived from empowering communities – aiming for social and environmental adaptation not just mitigation. The inherited urban landscape often had a degree of redundancy, facilitating adjustments as needs and circumstances change. We don’t have the luxury of this, and so need to make better use of existing stock and built assets.

7.2 The evidence to inform decisions to refurbish or demolish buildings exists but is often overlooked (See UCL’s meta-review). We need a national plan, supported by legalisation and practical programmes, to urgently improve and upgrade existing buildings, which must perform better. The benefits are broad; every £1 spent on retrofit is worth £3.20 to the nation in terms of carbon reduction, jobs and improved comfort of occupants with less need for healthcare. Reinforcing this message would incentivise inward investment into the retrofit sector.

Recommendation 7: A renewed focus, supported by legalisation and practical programmes, must be put in place to improve and upgrade the performance of existing buildings over a period that matches the timetable of the 2008 Climate Change Act and successive carbon plans.

To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

8.1 The case for the current value and contribution of the historic environment to the UK economy via education, the heritage sector or the tourist industry, has been well made, but policies are needed to make more of their potential through renewal and reuse. The aim should be not preservation but re-invigoration to ensure that historical places and spaces retain an on-going significance and usefulness. Further research and development of techniques is required, ensuring that new technologies can be applied to old buildings improving their energy performance while conserving their quality and distinctiveness.

Recommendation 8: Local Planning Authorities should be required to set out clearly the assessment process for classifying elements and buildings against which interventions are judged as causing “substantial harm” or “less than substantial harm”, in line with national guidance. At present differing interpretations cause confusion and act as a stop on low-key energy efficiency measures.

Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could
we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

9.1 The Edge’s recent 2015 report Collaboration for Change identifies the potential benefits from professional collaboration on construction industry reform, on climate change and on building performance to achieve the transformational efficiencies that a holistic vision for an area can give.

9.2 The separate professions each work hard to develop their distinct skills bases. But more integration is needed, with training on working together in a collaborative and ethical way. Inter disciplinary training should start at university prior to professional membership and be a requirement throughout professional life. The Collaboration for Change report makes recommendations for the institutions’ members to develop their competence and enrich ‘professional guarantee with cross disciplinary insight’.

9.3 The Chairman of CIC has accepted the challenge of uniting these distinctive viewpoints with special reference to ethics, education and the performance gap. Among the other responses there is a group of ten Institutions, with the support of the Edge, who are working on disseminating the results of Built Environment research faster and more effectively.

9.4 For Local Authorities to manage their environment they need to demand accountability for what is actually delivered. This entails enforcement of policy standards, sanctioning failure to perform, and incentivising disclosure of actual performance in use. Economic austerity constrains Local Authorities’ ability to attract, retain and develop suitably skilled staff. Good examples of creative and ambitious Local Authorities exist – often working in partnership beyond the public sector (see Cambridge, Bicester or Lambeth) but lessons learnt from these front-runners must be disseminated, and adapted to the circumstances of the local areas where they can be reapplied.

9.5 As well as rolling out lessons on what works, new thinking is needed. But despite individual examples of innovative rethinking of construction processes (see for example Innovate UK’s programmes) these innovations fail to flow down through the whole industry, not achieving the impacts claimed.

Recommendation 9: The professions should be treated as essential partners in the move to create more successful, sustainable and resilient places that work socially, environmentally and economically. The professions should be encouraged to work closely together to help both develop and then deliver the national vision.

Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

10.1 The Farrell Review reiterated the message that the tools and techniques for high quality design and placemaking are familiar, accessible and achievable. Under the
Commission for Architecture and the Built Environment an effective programme of design review was set up and spread around the country. Now Design Council Cabe provides an excellent design review process in London and is building a network of panels (eg Oxford, Old Oak Common, Birmingham, etc). Over the past five years the Cambridgeshire Quality Panel has overseen the masterplanning and detail design of all the major developments around Cambridge and in the surrounding market towns as a critical friend in support of the planning system to good effect. The PLACE Alliance, as a broad reaching consortium of delivery organisations, practically engaged with delivering better places should be supported.

Recommendation 10: National leadership and encouragement should be provided though policy frameworks as much as design quality standards. The National Infrastructure Body and should go on to consider not only traditional infrastructure and housing but the low carbon built environment as a whole.

Community involvement and community impact
Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

11.1 There is an increasing body of evidence on what is needed for user health and wellbeing in the built environment. Mechanisms for measuring the effect of physical interventions on residents’ wellbeing and the social value generated by community participation in regeneration projects exist but could be used more widely. Gathering this kind of evidence on community impact aids decision-making, and can be used to monitor changes in health over time.

Recommendation 11: Ensure that feedback on outcomes from previous projects and interventions is used to inform future ones and that there are effective ways of incorporating lessons learnt into developing practice.

How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

12.1 Local involvement is desirable from an early stage, if residents are presented with realistic options, but must be balanced against the risks of premature engagement before a commitment to act has been made. Community participation in regeneration projects is essential to understand priorities and to get under the skin of real local problems. The successes of the Neighbourhood Plan process show the positive outcomes that can be achieved by engaged and enthused local residents. However, even using mechanisms to increase user participation and representation (online consultations etc.) this is patchy. Many communities do not have the capacity to help shape their surroundings. Familiar
barriers are time, resources, lack of belief that a community’s voice will be heard and taken seriously, and the competing relevance of other barriers; the negative impact of welfare reforms are immediate, the possible benefits of a better built environment and distinct and uncertain. Communities need to be enabled over the short term (smoother acceptance of change, enriched schemes) and the long term (increased local commitment, sustainability health or wellbeing).

Recommendation 12: Ensure time and resources are provided on all projects to ensure effective public engagement and user participation.

Financial measures
Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

13.1 The key decisions about our built environment are currently being made by housing land being sold to the highest bidder. Some financial mechanisms that encourage good design and placemaking as well as delivery are already available, but need reinforcing, such as:

Clearer mechanisms for funding initial infrastructure though Local Authority borrowing (perhaps against future CIL)

Preventing housing viability assessments being distorted by negotiable and non-negotiable elements (that is S106 being played off against CIL)

Greater use of compulsorily purchase powers for land acquisition

Promotion of Community Land Trusts as ways of disconnecting land costs from the housing price, making them affordable to households on low incomes.

13.2 Other mechanisms or novel approaches to explore including:
New investment vehicles to bring new private sector finance for mixed tenure development
A social housing investment trust to attract small-time investors
Preferential permissions for schemes that perform well at Design Reviews.

13.3 This mix of new and familiar ideas illustrates that the policy challenge is less the search for novel fiscal measures than a clear sighted understanding of existing mechanisms might be adjusted to respond to current and future circumstances. Financial measures inevitably have shorter lifespans than the Built Environment they fund. A long term National Policy for the Built Environment could provide a clear and framework against which the success of funding programmes would be devised and judged.

Recommendation 12: Ensure time and resources are provided on all projects to ensure effective public engagement and user participation.
Robin Nicholson - Convenor of the Edge.

06 October 2015
1. Why do design standards in the built environment fall short of objectives? Should there be a stronger unified code for design standards at national level?

I interpret this as the ‘standard of design’ and there are a range of answers - one of the most cogent is Nikolaus Pevsner’s analysis that “The English will spare no expense to get something on the cheap” an approach that makes getting good design so hard that it often only smuggled into projects despite the funder’s wishes.

THE EDGE IS INTERESTED IN STANDARDS OF PERFORMANCE OF THE BUILT ENVIRONMENT, both buildings and infrastructure. Design is too loaded a term to be useful in this context and tends to be portrayed only in Manichaean terms or, worse, solely as an output of creativity and invention.

- The construction industry’s task is to find solutions to multi-faceted problems, often by bringing together a team of specialists to develop a collective response. A key part of the challenge is in the definition of the problem, setting the objectives and the outcomes required.
- Design aims to deliver specific outcomes in relation to predefined intent sometimes with added unexpected extras (both good and bad). We have two problems - very poor definition of intent through BRIEFING AND CLIENTING AND A LACK OF FEEDBACK from previous projects.
- The standard of design is often judged in the abstract and in comparison to our relatively scant knowledge of other similar projects
- Quality thresholds are possible and useful but are often specific and measurable such as the space standards in the 2014 Housing standards review or the insulation standards in building regulations.
- Process standards have also been introduced in recent years and these include scrutiny under the planning system, design review etc. – which we may get back to.
- We already have a set of national standards, mainly in the building regulations but also embedded in a range of other regulations and guidance. What has largely stopped is the desire to incrementally step them up in the light of evidence and improvements in skills and technology. This is something we need to recover.
- Standards are there to define a base level of provision and to stop the race to the bottom. Unfortunately they can also encourage widespread adherence to lowest standards and do not encourage many to go above and beyond (CfSH?).
- Guidance is useful to enable a collective understanding and to speed the process

The Edge takes the view that construction professionals need to find ways to enhance and develop higher standards than the legal minimum in both their built
output and their working practices. But for this to happen it needs to support and encouragement of government.

2. Is the system of design review panels proving effective, and should more be done to promote them?

The system of design review and the value of ‘challenge’ in the system is a good one although quality is variable. We cited the example of the Cambridge Quality panel in our evidence. Lesson from the CQP include:

- Panels need to play the role of the independent (and fearless) critical friend to planners and developers etc. alike
- Importance of early reviews of proposals
- They need to focus on place more than on individual buildings
- Important role of masterplans
- Panels need to be cross disciplinary
- It is important to follow up, review and learn five years later
- Panels need to be paid to be valued

But DRPs should not be seen as a patch on a dysfunctional and under resourced planning system. Panels should aim to improve propositions, occasionally head them off at the pass but not act as the gateway to consent.

Where do we need DRPs most? Middlesborough?

DRPs should be accompanied and supported by project enabling.

3. What other measures can be taken to support cross-disciplinary working on design issues among built environment professionals? Is there a case for multi-disciplinary teams at local authority level?

Cross-disciplinary working within teams of professionals on individual projects works well and will be enhanced by the use of shared technical platforms such as BIM. The problems of inter-disciplinarity are at an organisational level, in siloed institutions and particularly in the education system.

If there is a problem it is one of a lack of continuity, as teams from one project will rarely work together on another – with the loss of their combined learning.

The Edge’s recent report on the future of the professions, COLLABORATION FOR CHANGE, authored by Paul Morrell, strongly recommends that the institutions learn to work together as the norm through focusing on 6 areas that can only be addressed through joint working:

- Develop a joint code of ethics – to enable clarity in a tough market both at home and overseas
• Educating for a future in the design/construction/property industry that will be more flexible and will accommodate many different roles, skills and responsibilities over a working life.
• Jointly developing an evidence and knowledge base for professional expertise in the industry – perhaps sharing a research base – something we call The King’s Fund for construction - and getting new research into practice far more quickly.
• Addressing reform of the industry to offer clients and society a much better deal from the industry.
• Closing the performance gap between what is promised and what gets delivered
• Formulating a detailed response to the challenge of climate change

PROFESSIONALISM AND PROFESSIONAL ORGANISATIONS PROVIDE AN EXTRAORDINARY RESOURCE to society in a role that is outside both public and private sectors. But professional bodies need to reform and government needs to develop a new and robust relationship with them that expects and values a significant contribution to the public good.

At present Government’s default position is to seek (expensive) advice from one of the big four management consultants (Ernst & Young, KMPG, PWC, Deloitte). The Edge suggests that they would be better renewing the grand bargain with professional bodies.

On local authorities – they have a good track record of multi-disciplinary team working (Croydon) where an individuals skills and abilities are often rated more than their professional job title. Also in large firms. The problem here is far more of under resourcing to allow professional teams to work well and career progression.

SJ: Information from Liz Kessler, who led the EC1 New Deal for Communities: the fact that in her role she could work across the local authority’s departments meant that she achieved what she did...no single department could have done it and the NDC was the mechanism for co-operation. Unfortunately they did not do sufficient before and after analysis to confirm the multiple benefits achieved.

4. How can design aspirations be better coordinated nationally across service areas and departments? Should there be a stronger national duty to secure sustainability?

The need to learn from past experience is key in order to improve in future. That learning needs to be shared across not only the public sector but the private sector as well. We need to have the confidence to be transparent and open with information in the recognition that it will enhance our reputation and help both the commissioners and providers of the built environment to achieve far more.

There is ALREADY A VERY STRONG NATIONAL DUTY to achieve sustainability in the form of the Climate Change Act and various international treaties. It is the detailed regulation and incentive structure that is dysfunctional. So many schemes aimed at
achieving lower energy and carbon have recently been suspended or cut back that there is no longer any confidence in investing in the sector. A new long-term plan for the journey to zero carbon emission buildings that is an essential part of the Carbon Plan needs to be formulated jointly by government and the industry.

Performance contracting

There is a very Good Model For Achieving This In The Jointly Sponsored Zero Carbon Hub. Unfortunately another victim of government mind change.

5. How might the appointment of a chief built environment adviser improve design and sustainability? How else might the government improve leadership on design matters?

A Chief BE advisor would become the main point of contact and conduit between government and the industry. The track record of the Chief Construction adviser is good, as is the longer-term role of Chief Scientists. A CBEA would on one hand ensure that the message to and from the industry was co-ordinated and clear and on the other hand ensure that government’s multi-departmental thinking was coherent, long-term and doable. The role would need to be supported more than that of the CCA. MEMORY

Government leadership on good design became well formulated in CABE’s statutory years. But CABE’s shrinkage has left a vacuum behind it, both in government and in other bodies that provided advice. Part of this role might be taken by a CBEA but other bodies need to develop a knowledge and leadership role as well.

Government should consider re-instituting ministerial design champions

6. How can sustainability standards best be delivered and maintained in new and existing buildings? Should there be prescriptive minimum standards or regular reviews based on performance?

We need to see how buildings are performing and Display Energy Certificates are the most straightforward way of achieving this. They are supported by the property industry so why not?

Information on building and infrastructure performance needs to be available and transparent to researchers, practitioners and members of the public alike. Only then will we understand how to make improvements.

The current compliance-based system relies on computer modelling and relates little to the reality of energy use or carbon emissions from buildings.

There are already prescriptive standards but since regulatory upgraders have been effectively scrapped there is now no planned route to the zero carbon buildings the UK has signed up to in the EU and at Paris. There is not only a performance gap there is a gaping policy gap.
Regular reviews and revisits are essential to ensure and keep buildings working as they were designed

7. Is the education system for planning and the built environment in need of improvement, and what initiatives could be undertaken to enable this?

There is a need to educate for a career working across the industry and starting in with a good understanding of how the other parts contribute to it working. The silos need breaking down.

Several universities are working on this but are finding it hard going without institutional will.

As a result of C4C the CIC is pushing ahead with both industry and educational reform with the support of the RICS.

Numerous studies have shown that the current model of silo-ed education - for building trades through to built environment professionals - leads to poor quality outcomes. Building projects need a synthesis of skills and education must provide a common language and a greater empathy with others' contributions. For example, Zero Carbon Hub's analysis of the Performance Gap in housing identified industry's energy literacy as a key requirement for the delivery of good energy performance - this would require education to provide a high level understanding of climate change, of the role of building performance in reducing emissions, and of how the collaboration and interaction of the range of actors in the design, build, and user roles is needed to achieve successful outcomes. Education is the key, and could start in schools!

Educating for the industry will be the Edge’s next major cross-industry inquiry.

03 January 2016
The Edge and Urban Design Group – Oral Evidence (QQ308-329)

Members present
Baroness O’Cathain (Chairman)
Baroness Andrews
Lord Clement-Jones
Lord Inglewood
Earl of Lytton
Baroness Parminter
Baroness Rawlings
Baroness Whitaker
Baroness Young of Old Scone

Examination of Witnesses

Simon Foxell, The Edge, built environment think-tank, and Barry Sellers, Urban Design Group

Q308 The Chairman: Welcome to this evidence session of the Select Committee on National Policy for the Built Environment. You have in front of you, Mr Foxell and Mr Sellers, a list of the interests that have been declared by members of the Committee. A transcript of the meeting will be taken and published on the Committee website. You will have the opportunity to make corrections to the transcript, where necessary. Could I begin by asking each of you to briefly introduce yourselves to the Committee, please? This is for the purpose of making sure that we allocate the right answers to the right people for our transcribers. Mr Foxell?
Simon Foxell: I am Simon Foxell, I am an architect and I am here to represent The Edge, which is a built environment voluntary think-tank of senior and relatively young members of the construction-industry professions and a range of others.
The Chairman: Not just architects?
Simon Foxell: Not just architects at all, but engineers, surveyors, builders and various other property professionals, and we have been in existence for about 20 years.
The Chairman: Thank you. Mr Sellers?
**Barry Sellers:** Good morning, Chairman. My name is Barry Sellers and I am here representing the Urban Design Group, which is a charitable organisation dealing with the built environment. I am an urban designer and a chartered town planner and my day job is working in a local authority for the London Borough of Wandsworth, primarily dealing with Nine Elms and Battersea power station, and the design review panels.

**The Chairman:** My goodness, Battersea power station. There is a book about it, is there not?

**Barry Sellers:** There is, yes.

**Q309 The Chairman:** I think you sent us one. Thank you. I will start straightaway with the first question. Why do design standards in the built environment fall short of objectives? Should there be a stronger unified code for design standards at a national level?

**Simon Foxell:** To preface this, it is important to understand what the design standards are, who is setting them and whether they exist. We may be talking instead about the quality of design and effectively how that can be raised, and there are a very wide range of answers to why that may be a problem to establish in this country. One of the most cogent answers to this question was Nicholas Pevsner, the architectural historian, who wrote that the English will spare no expense to get something on the cheap, and often, because of that tendency, good design has to be smuggled into projects, despite all the standards that exist.

The Edge is particularly concerned with partly moving away from issues of good/bad design, which are a very Manichean idea, to the performance of the built environment: how well it does what it is being asked to do, how well it achieves it and what is being claimed for it. The process of design really needs to start from the setting out of a good set of intentions for what is required of it, a good briefing process and a good client process in order to lead to a response to that, which is finding the right solutions to the challenge and then, at the other end, measuring whether we have achieved the objectives and the intentions, so it is a twofold thing. We are falling down very frequently on the good briefing for projects and being really clear about what we are trying to achieve out of them, and, on the back end of that, we are also falling down on the performance of meeting those objectives and particularly on actually finding out whether we have performed or not and feeding that back into the process, so learning the lessons from the process of design. There is a tendency in this country, once infrastructure is complete, to hand it over to the user and not to revisit it.
If there is an issue here that we need to emphasise, it is the need for stewardship of projects right through the process of design through to delivery and often revisiting those projects on a frequent basis thereafter, to make sure not only that they are still performing in the way they were asked to perform but that we are learning the lessons from them that can feed into future projects.

**Q310 The Chairman:** That is very interesting. You made the point that at every stage in the process you should get involved in it, but you also said that handing over the project to the user at the end is not the best idea and there should be a continuing relationship. Surely it should be a relationship, which I suppose there is, right from the beginning of the project so that, when it is handed over, there are no surprises?

**Simon Foxell:** There is now a process that has been instigated by the industry and has been taken up by the Government called Government Soft Landings, which encourages this process of making sure that the users are brought in early so that they understand what they are going to get, a process of commissioning and briefing them afterwards, and a series of revisits to those projects later on. Government Soft Landings are still a minority pursuit, but it is very encouraging that it exists, and the Government wish to make it mandatory on all their larger projects.

**Q311 The Chairman:** If you were in our position of making recommendations on the built environment, would you suggest that we should think very seriously about whether there should be not a statutory but a really strong recommendation that the user should be involved right from the beginning? You would then be able to regulate their attitude towards cost-cutting where it is essential.

**Simon Foxell:** It is very important for the full team of designers, contractors and, potentially, users to be involved all the way through in order to have a good consultation process, but also not to rush into design. Good design is often achieved through good preparation so that the issues are studied and the right questions are asked—whether this is a problem and the answer is that a building or a different response is being requested—in order that the right solutions can be arrived at. Frequently, at the moment, the preparation period for design, and even the design period itself, is being radically shrunk so that there is no time to be asking the
right questions of projects and to get the ground rules right. At the moment, for new schools projects, from inception to completion of the design process, there is a period of six weeks.

**Baroness Andrews:** Is that a change in the law or a change in the guidance?

**Simon Foxell:** In that particular case, it is a change in departmental policy, yes.

**The Chairman:** That is outrageous.

**Baroness Andrews:** How much time? Six weeks? It used to be 13 weeks.

**Simon Foxell:** It was a much longer period, which varied from project to project down to a departmental target.

**Baroness Andrews:** It is a target?

**Simon Foxell:** It is. The design team is obliged to meet that target. On the other side, the team that gives the permission for it to go forward often takes much longer.

**The Chairman:** Can we ask Mr Sellers to come in on that one?

**Barry Sellers:** Perhaps I can talk about housebuilding and design, and things like that. In recent years, the Building for Life approach was introduced, which set out a number of criteria to evaluate housebuilding projects and has moved towards more of a self-certification, traffic-light system of appraisal. A lot of that came about as a response to the Design Council/CABE analysis that a lot of the quality of the housing in our country that is being built was not really up to the standard they would be looking for. Certainly the Building for Life approach has been challenging; it gives us a checklist for builders to subscribe to in the way to move things forward.

The other area, of course, is in London where we have the Mayor’s housing design guidance, for example. That is always very useful for developers and architects to look at in preparation for putting together a framework for different developments on different sites. Whether that is something that you would look to nationally is another question, because obviously it is very particular to London in that sense, but questions are often raised in the UK that some of the sizes of some of the rooms in our houses are a bit smaller than some of those in Denmark, for example, so we need to look very carefully and we cannot keep making rooms smaller because we need to have certain standards for that sort of thing. Of course, we have building standards for safety, for example, in the way in which we procure the design and construction...
of houses, which is important for meeting certain critical standards, so the BS standards are very, very important to have.

Regarding urban design, we have national planning guidance on the website, and it is useful to issue guidance nationally to evaluate developments.

**Q312 Lord Inglewood:** Mr Foxell, a very quick point. Talking about the time you are “allowed” to design a school, in very general terms what would be the optimum period? You can go on looking at the design too often. What do you, as a professional architect, reckon that process should take in order to get the right answer?

**Simon Foxell:** It is necessary for it to be an iterative process, so that it goes from initial studies, through sketches, through to a more detailed design. In that process, it is important to be in consultation with the users, possibly with the community, and others. It is often the answers that come back that will change the speed. If the answer is, “Fantastic, move on”, then the speed accelerates. If it is, “We still have problems with this. Go back and think about it again”, it is going to take longer, but that time is well worth spending to actually get it right and to get it right to people’s satisfaction. I am not answering your question exactly, but a three-month period would be an adequate time generally to design a building with an adequate consultation process built into it.

**Lord Inglewood:** But what you are telling us seems to me to be a scandal, if it is correct: that, for the sake of a relatively few weeks, we are creating a lot of suboptimal buildings at very great public cost.

**Simon Foxell:** It is in part in order to drive through standard building types without too much objection from the people on the ground.

**The Chairman:** I agree with Lord Inglewood that that does seem crazy. If something is worth doing, it is worth doing well.

**Simon Foxell:** Indeed.

**Q313 Baroness Whitaker:** Mr Foxell mentioned “stewardship”. For the sake of clarity, who or what is the steward? Is it a committee? Does this need to be more clearly stated in guidance?

I have another question on the objectives for the built environment. You said that we should interrogate our projects: are they doing what they are asked to do? Are they usually asked to
do the right things uniformly—for instance, the implications of a more social nature, transport, accessibility to employment and amenities? Are those normally uniformly fair? So, two questions: on stewardship and the right things.

Simon Foxell: One of the things we have discovered is that this is very much a team effort and there is no single person who takes responsibility for everything. It is much better when it is a collaborative process and people from the outset from many different disciplines add their expertise into it. That includes not only the technical side, the professionals, but the money, the users and so on, and they all need to take on aspects of stewardship.

Baroness Whitaker: Should this be more clearly stated: that a group is necessary to safeguard it?

Simon Foxell: In some cases, it is important. The Edge has been doing a lot of work on the nature of professionalism in the industry, and from our point of view one of our critiques is that professionals need to take more responsibility for the long-term success of their projects, monitoring them afterwards and learning the lessons from them, but also that clients should expect them to do that and be prepared to let them, which is often a barrier.

Baroness Whitaker: So do you think this might be lodged in guidance?

Simon Foxell: I think it should be both lodged in guidance, particularly for buildings that the public sector purchases, but also the professional institutions should encourage their members, as part of their code of conduct, to take a much greater aspect of stewardship in the works they produce. There was a second bit to your question?

Baroness Whitaker: Are projects being asked to do the right thing? You said they should be asked whether they have done what they were asked to do. Are they asked to do the right things?

Simon Foxell: Again, it gets back to the question of preparation and the preparation of a brief. It is not something that an inexperienced client can do on their own; they need expertise to do that well, to ask the right questions, to develop an incisive brief that sets out a series of objectives and targets and so on. There are quite a lot of professional advice systems that exist to help that happen. We are notoriously bad in this country at developing full and well worked-out briefs, which are much more the norm in the process elsewhere in Europe. Various efforts have been made over the years, but we often fall back again into cutting out
that process at the beginning because it is seen as time-consuming and potentially an expense that can be spared.

Q314 Earl of Lytton: Good morning, gentlemen. Mr Foxell, you mentioned something about the lack of data coming out of our existing built environment, and that mirrored something that was raised a few days ago in the all-party group on the built environment, which I happen to be involved with, where what you might call “post-occupancy evaluation” on new homes, for instance, is extremely limited and is very often done between six and 12 months after somebody moves in. It looks basically at the consumer bits of the property. It does not look at the wider environment and there is nothing at all longer term—at five years, 10 years or 15 years, that sort of thing. Is there a gap here in our information? Should we be nudging our specialist adviser, who has access to all his very bright students at UCL, to look at that as a research project?

Simon Foxell: You pick up on UCL, and I sit on the steering group for the Centre for Energy Epidemiology there, which looks at buildings. Even though there is a relative shortage, UCL is a shining light in this area, and it is doing a lot of studies on buildings in use, particularly the energy aspect of them. There is a tremendous problem with actually getting that information out to practitioners; it tends to get published in specialist journals that exist behind pay walls. It is a very difficult conduit through to the practitioners on the ground. It is something again which The Edge has been working very fully on, trying to speed up the gap between research in the academic community and research all over the built environment and practitioners, which is currently assessed at being about nine years for specialist knowledge to get from one to the other. We are working with 10 different construction professional institutions on various projects to try to speed that up. One is a digest of recent research that will go out to all practitioners. There is also trying to get them to work together to have a research base that sits between the institutions that is really working very hard on trying to make sure that the world of research gets communicated well to practitioners who have an extreme shortage of time for picking up new knowledge.

Q315 Lord Inglewood: I would like to ask a very specific question, which really requires a pretty short, specific answer. Do you think the system of design review panels is working?
Simon Foxell: In general, where they work well, they work very well. They are a fairly luxurious process in that they are affordable for major projects in areas that have a good number of people who care about that environment, and they are very good at challenging projects to improve them, so there is a process of dialogue that happens with an expert group that can often draw out the issues where projects could be better or they are not performing as well as they might. It is difficult to see how you could implement them for all projects across the country. There are certainly areas of the country that would struggle to provide a good panel locally that knew the area, and they are probably the areas that need such panels the most. What they should not be seen as is a patch on a failing planning system, trying to make it better, which is often how they get used, and they are certainly not a gateway for planning permission itself. They may try to say that a project is simply not good enough to get permission, but that is only guidance within the system. The problem with the current planning system is that it is vastly under-resourced for producing good, well thought through and timely decisions.

Barry Sellers: I run a design review panel at Wandsworth. We have 60 built environment professionals covering a range of skills from architecture to landscape architecture, structural engineering, urban design and planning. They are called upon to review schemes at pre-application level, and over the three or four years we have been running the panel we have found it very effective. It operates primarily at the pre-application period, so it is helping to challenge the development in that early stage prior to the application being submitted. It also enables the developers and the architects to understand some of the issues, which perhaps they have not always covered in their entirety at that stage, and it is a very useful way to get a better quality out of development, because they are always trying to ensure that their issues are properly addressed as part of that application process.

The success of it really has to be the timing of the design review panel as well, because it needs to be fairly early on in the process to enable the actual feedback from the chair of the panel to the developers and the architects as a way forward. At the same time, it is very flexible and we respond very flexibly to the developer’s timetable of developments so that it does not hold up their development in any way. These are just for schemes of 50-plus units, generally speaking. Overall, when it comes to the planning application being submitted, we
find that the planning committee can refer back to the scheme that was done by the design review panel and see how the scheme has changed from pre-application to the actual application. They can measure the improvements that have been done from the pre-application level to the actual application submitted, so it is quite useful advice from that point of view.

**The Chairman:** Is it regarded as useful by the people who have used it?

**Barry Sellers:** The developers find the constructive feedback from fellow professionals very useful. We find that the politicians find it very useful, because they often sit as observers on some of the panels to understand some of the arguments, some of which are very complex when you are dealing with built environment issues across our range of areas, and it is very helpful for them to understand some of the issues, how those conclusions have been arrived at and how that development is being taken forward.

**The Chairman:** That seems the ideal forum to make sure that we get the best.

**Barry Sellers:** Yes, it is a way of ironing out a lot of the issues before the application. If you couple that with a planning performance agreement and you slot the design review panel within that, then the developers, as part of the PPA, are given a document whereby they can say, “Look, here’s the start of the process, here’s the decision time. We know we’ve got that length of time within which we can get a decision. We know that here’s a design review panel who have gone through that process, here’s the application and we know what is at the end of it”, so that they get a clear-cut decision on it.

**Simon Foxell:** It is really important that they happen early on in the process and that the guidance is given while the scheme is still fairly fluid, as it is difficult to change it much later. It is also very important that such panels look at the place where these projects happen and try to establish the better quality of place. Finally, such panels should be as multidisciplinary as possible not only to produce the architectural design but to influence the way they work from a service point of view, the landscape issues, the environmental qualities of the buildings and so on.

**The Chairman:** The happiness factor for the people who live in them.

**Simon Foxell:** That is what we are trying to aim for. The other aspect of them is that when they were first introduced, they often worked with a parallel service known as “enabling”,
which was getting in usually a single individual early in the project to take responsibility for upping the game and for raising the aspiration of projects, taking them through the process and really helping them to be given a push forwards that would ultimately create a better project and would sometimes aid them through the design review process.

Q316 Baroness Parminter: Just as a point of clarification, does the design panel process seriously address sustainability as well as the quality of the place so that those decisions can be looked at in the round, because clearly there can be tensions?

Simon Foxell: A good panel would absolutely do that with the right kind of people on it. It is challenging to look at a project in a very short period of time and make a firm judgment on issues such as sustainability, which are in part technical and in part really understanding the complexities of a project and how it works technically, but a good person who has seen a lot of buildings can aid that enormously.

Q317 Baroness Whitaker: You have both emphasised now and in your very helpful written evidence the importance of cross-disciplinary working. What other measures do you think can be taken to support this among built environment professionals? Is there a case for more multidisciplinary teams at the local authority level, and, if so, how should it be achieved?

Simon Foxell: For the past two years, The Edge has been leading a major study and a commission of inquiry into the professional world. Earlier this year we produced Collaboration for Change, a report written by the former chief construction adviser, Paul Morrell, which is very much about collaboration through the professions. It has to be said that collaboration on individual projects already tends to be very good; teams come together and tend to work well across those teams to produce complex design projects.

Baroness Whitaker: Is this at the instigation of the planning authority, or do the developers do it?

Simon Foxell: It is from the developer/client point of view. One of the challenges is that those teams rarely stay together and the next project will probably be a different team.

Baroness Whitaker: So you mean that after it is built, there is not that continuing group to look after it.

Simon Foxell: It is partly that, but it is often that a similar project will have a completely different team, or it may have one or two members from that one, so there is a lack of
continuity in the process of trying to learn the lessons from one project and taking them on
to the next, and the working relationships that can deliver effective projects are often broken
up and reinstituted at the next one.

Q318 Baroness Whitaker: What is the remedy for this?

Simon Foxell: It is very much about finding ways of building teams that can go through. I think
that is in part a problem with the current procurement process: that it encourages bidding on
an individual basis from project to project.

Baroness Whitaker: This would apply to the public sector, including national government
procurement very substantially?

Simon Foxell: The private sector is much, much better at doing this, yes.

Baroness Whitaker: They are already good at it?

Simon Foxell: The good ones are good at it.

Q319 Baroness Whitaker: How is it possible, and I hope Mr Sellers will answer too, to make
this a national pattern?

Barry Sellers: I work as part of a multiprofessional environment at Wandsworth. In Nine Elms,
for example, there are groups set up to deliver civic projects.

Baroness Whitaker: Who are they set up by?

Barry Sellers: They are set up by the council, Lambeth and the Mayor of London, so you have
developers on those panels as well. It looks at delivering developments across both boroughs.
We also have Transport for London involved, because we have the new extension of the
Underground line coming forward, and that collaborative approach is so essential. What is so
important about the whole process is the way in which the front-loading of infrastructure
investment has enabled the delivery of a strong vision of Nine Elms being a very pedestrian
site and a friendly place as opposed to being car-centred.

Q320 Baroness Whitaker: This infrastructure relates mainly to transport?

Barry Sellers: One of the groups I sit on is a public realm group, for example, and that group
will look at the delivery of the linear park, the open spaces, the highways, working with
Transport for London on creating a new urban boulevard, for example, for Nine Elms Lane.
We are also working with advisers there. Transport for London commissions advisers to look
at the way in which the highway can be reconfigured and remodelled to create a better place
for the people who are going to live there and the businesses that will be there as well. I think it is important that you have so many different people collaborating together in that particular environment.

**Baroness Whitaker:** I have to say that when I have wandered around the Nine Elms development, I have wondered whether it is going to become a neighbourhood or not. Do not take up too much time on this, but does that come into the calculation as well?

**Barry Sellers:** Among the guidance that is available is the public realm guidance on materials, for example. There is a materials palette across the public realm which each developer will have bought into, so if you are doing different developments on different sides of the road, rather than one doing one specification and the other doing something else, there is that coordination, which is very, very important.

**Baroness Whitaker:** Would you recommend that as a model?

**Barry Sellers:** I think you could look at that as a model for, say, city extensions elsewhere in the country, provided that you are going to front-load the public transport investment decision-making process, because rather than having multi-storey car parks on the ground, you get 10% of the car parking, so it becomes a very pedestrian-friendly environment and so sustainable.

**Baroness Whitaker:** This has perhaps also happened at the end of the Jubilee line at Stratford East and around there.

**Barry Sellers:** I think you can look at that and apply that process to other regeneration areas in London and elsewhere certainly.

**Simon Foxell:** Generally, our experience is that local authorities internally work very well together and they are good at seeking advice and there are some shining examples.

**Baroness Whitaker:** In the major conurbations, you mean.

**Simon Foxell:** Usually, where there is enough of a job to do. Croydon is moving forwards in a very inspirational way at the moment, with internal teams working in a multidisciplinary way for the overall betterment of the Croydon area, leaving behind the professional differentiation and playing to individual people’s strengths as an overall built environment professional rather than with the various labels on them which they may have been trained as. One of the challenges in the professional sector at the moment is the silos between the
professions, and the real challenge is in trying to break those down so that there is a career structure for professionals that allows them to move within the sector, much in the same way in which they are currently able to do within a local authority environment.

**Baroness Whitaker:** This is up to the professional institutions?

**Simon Foxell:** It is up to the professional institutions, but it really does require a degree of push from the Government to get them to perform better and to perform more collaboratively together. This is particularly so on difficult questions like designing for climate change, which are very multidisciplinary issues, like closing the performance gap, which we have already discussed, and trying to reform the overall industry so that it provides a far better and more effective offer to individual clients.

**Q321 Baroness Whitaker:** Would what you have just described make this collaboration more effective for smaller towns? The big cities seem to have got hold of the idea, but there are a lot of small towns that are not being well regenerated.

**Simon Foxell:** I think there is that capacity, so long as people’s strengths are played to. The professional sector and the organisations within it represent a very important source of advice and independent judgment that is often ignored within communities. It is not either the public sector on the one hand or the commercial sector on the other and it is capable, sometimes with encouragement, of providing very good, well-founded advice and experience, but it needs to do that as a collaborative piece of work and, to some extent, for the expectation on professionals to be upgraded again after several decades of demolition of the professional ethos.

**Barry Sellers:** It is important, taking smaller cities, for example, that there is a way in which they can collaborate together. For example, the Urban Design Group has been working on an initiative on urban places as healthy places. We have been working with Place Alliance on this particular initiative because healthy places is something which actually falls between the gaps, whereas actually it goes across departmental services, so it is working with national health, transport and urban design to deliver healthy places, so it is combatting things like obesity. It is so important that, as service providers, we can actually look at our fellow professionals and have a method of working together to deliver a better environment for people in the future.
Q322 Baroness Whitaker: What is that method? That is what we are seeking.

Barry Sellers: The methodology is a question of having the guidance in place, first of all, on how to deliver what a healthy place is and then to look at the mechanisms for working. Now that health has come within local authorities, there is an opportunity for that part of the local authority to work with the transport providers, working with the planning authority, and to deliver expectations for future generations in the way in which that environment can be put together, creating a healthy place. Hopefully, Nine Elms will be that place in the future because it will be a walkable place. There is evidence to suggest that the people who live in places where you can walk and cycle and get public transport are fitter and healthier than if they are living in a car-dependent suburb where you need to rely on a car to go back and forwards to work and do your shopping. We need to think nationally about how we encapsulate those ideas and put them into practice.

Q323 Baroness Parminter: You have just mentioned the word ‘nationally’ and I just wanted to ask you whether you felt that our design aspirations and our sustainability needs could be better co-ordinated across government and then cascaded down?

Barry Sellers: Certainly nationally. We have a National Planning Policy Framework, but we do not have national spatial planning, as they do in Scotland, for example, and some other countries. There may be a way through the National Infrastructure Commission, as an example, to set out not in heavy guidance but fairly lightweight guidance, such as, “Here’s an opportunity to focus on where developments should occur to link high-speed rail and where new developments should be co-ordinated”, and then developers will have clarity. If you are going via the high-speed rail from London to Birmingham and there are stops in between, those stops become the focus of new developments that can be very sustainable because you do not need a car to get about there and you can plug into it straightaway. It is the same with linking airports to rail transport and future developments. It is about co-ordinating that. It does not need a big document, just something that is thought about in the co-ordination of the different expertise involved.

Q324 The Chairman: This goes back to your point, Mr Foxell, that everybody needs to be regarded as worthwhile. Engineering was not regarded as a great profession for a long time;
everybody called them plumbers and so on. Everybody’s skills should be built on and held in greater respect.

Simon Foxell: And they are often essential to actually getting a good result. Picking up on the question about sustainability, we have some very strong, high-level targets that we need to achieve in this country through the Climate Change Act, the various carbon plans and so on. What is currently very difficult to see is the route map to getting there, partly because a lot of the things that have recently been put into place have also been taken away again. In the previous session, there was discussion about the Code for Sustainable Homes, which has now gone. Our ability to deliver to higher standards is very challenged if they do not exist. Equally, the progression of the building regulations to up the game incrementally seems to be in abeyance at the moment; there is no plan for improving it in a regular fashion. This makes some of our job very difficult and it is being left to individual offers from the construction industry to do better, but without a framework for doing that.

There was a buildings day in Paris at COP 21, and I know that our Government have promised that we will deliver some very stretching targets, which include making all our buildings in this country carbon-neutral by 2050, but we do not currently have a means to get there. It is not so much a question of a lack of joined-up thinking but of making sure that there is a plan for progress in this area. I do not think there is a lack of willingness in that from the construction industry; it is simply that no one is prepared to do this on their own. They need to do it together. We know that we can deliver better projects at the same cost that we deliver them now, but we can only do that if it becomes the norm to achieve that. A better project at the moment, if it is a stand-alone, is significantly more expensive.

Q325 The Chairman: In a lot of our sessions since we started work on this Committee, the issue of skills and apprenticeships has come up. They are relevant in this area where you are saying that they break up instead of staying together.

Simon Foxell: They are relevant completely across the piece really of training. The training of professionals needs to focus on this area to really make sure that they know what is going to work based on evidence of what is apparently working at the moment, which is a very big issue, and there is not very much evidence around this, as we discussed earlier. It is also about the skills of the people on site. It is difficult to build a sustainable building if you do not know
the basic principles: the need to make them airtight, the need to achieve good ventilation and so on. Skills on site are also lacking, and many of the mechanisms for improving them have been recently taken away.

Finally, all the aspirations of clients, developers, insurers, in the background of building projects, need to increase rapidly so that they insist on these things and have a framework for doing this, so they can point out a good standard and say, “That is what we want to achieve”, which might be a standard that is well over and above the current building regulations but something that is collectively understood by the industry as delivering what is required so that we can all move towards it.

**The Chairman:** Thank you. Mr Sellers?

**Barry Sellers:** Looking at the skills in the built environment, I studied architecture, urban design and planning, which covers quite a multitude of areas in the built environment, and often there is duplication when you are studying those areas. The Farrell review identified the possibility of a shared vision for professionals when they are coming in to study various disciplines. That is quite an important example of where you have a whole range of built environment professionals who can perhaps start off with a foundation course almost at the beginning, and then when they move up and increase in specialism they can go on and do other courses after that.

**Q326 Baroness Rawlings:** How might the appointment of a chief built environment adviser improve design, and should they be elected or appointed? Secondly, how might the Government improve leadership on design matters? I would like to hear your view of the old-fashioned way; do you think competitions work, like the one they had for the Palace of Westminster?

**Simon Foxell:** If we can start on the idea of a chief built environment adviser to the Government, our recent experience of such individuals has been very strong. The role of the chief construction adviser, which is now coming to an end, has been very effective; it has introduced new thinking into Government and raised the standard that Government is demanding. The chief construction adviser introduced mandatory building information modelling for all government projects over a certain size, which is pulling the industry together and has been a conduit for all sorts of discussions about better-performing buildings
from a carbon point of view and so on. The idea of a built environment adviser is that that gets broadened out to encompass the whole of the industry, because the industry works together, even though it has so many different aspects to it; construction was always only one part of it. It is really to act as a conduit between a large industry, which is a very substantial part of the economy of this country, and the Government in a way that enables a much more effective conversation to happen from both directions.

Also, one of the critical things of having someone who has been around the block is that they have some experience and a memory of whether this has been tried before and know the kind of lessons that need to be drawn to help the Government make effective policy, rather than it being done without that ability to reflect on whether a particular idea has been tried before and whether it is going to be successful. Probably all of us who work in the sector know that the Government comes up with the same idea roughly once every 12 or 15 years, and a good built environment adviser would be able to say, “Move on. Go for something that actually will work”.

**Baroness Rawlings**: Appointed or elected from within the sector?

**Simon Foxell**: I think it needs to be a collaborative appointment from both the Government side and the sector side. I am not sure how an election would work. I think it is the tricky thing of finding the right, very effective person who can work with both sides of the industry, commands their respect and is essentially known to them. We have had two chief construction advisers who have managed to achieve that and that was probably a fairly delicate system of finding the right person and then persuading them that this was not going to be too poisoned a chalice.

**The Chairman**: But, in fact, if it is a major job like that, it would almost certainly be advertised anyway.

**Simon Foxell**: Yes.

**The Chairman**: It would be in all the public journals, et cetera, and there would probably be a lot of competition for it.

**Simon Foxell**: Certainly the first time round, less so the second time.

**Baroness Rawlings**: And the competitions?
**Simon Foxell:** Competitions work well if there are enough of them so that they are a regular part of the system and they are not overloaded with expectation. In this country, we have relatively few, particularly compared with countries such as Germany, which use them as the standard form of procurement, which often means that for major competitions you get 100 or 200 entries. Each one of those costs somewhere between £10,000 to £30,000 to deliver, and the waste in the sector is considerable, so without it being a normal part of life it is almost impossible to say that it is a cost-effective idea. There are obviously ways around that: having local competitions, sometimes deliberately targeting competitions at younger professionals to bring them on and to invest in them rather than some of their older peers. I would probably recommend for nationally important projects going down that route just because you want to open up the field as much as possible. If you had almost all public sector works and a lot of the private sector going down that route, it would reduce the number of participants to a sensible number and then it would work, but, as it stands at the moment, it is a tricky one.

**Barry Sellers:** On the first point about a chief built environment adviser, certainly the UK is recognised as having some of the best architects and designers in the world, and to have someone in a leadership role within the Government would be very, very helpful, partly to help to drive a national spatial plan, for example, which I referred to earlier, and to look at the route map for sustainability over the next 20, 30 or 40 years. We have to think of our children and our children’s generations. The population in the UK has been increasing tremendously over the last 10 years, and in London it has gone up by a couple of million, and I think we need to look at how we are going to live in the future, which very much needs a sustainable approach.

On the second question of competitions, I certainly like competitions, but I hear from some of the smaller practices, for example, that there are barriers to some of the competitions in that you need to be a certain size, have certain insurance and things like that, which precludes the smaller practices from entering those competitions. I would like competitions to generate ideas, because that is what is important, and certainly we have people who can generate those ideas in this country.

**The Chairman:** And the involvement of the public as well, which is quite useful.

**Barry Sellers:** Absolutely.
Q327 Baroness Whitaker: I like the idea of the chief built environment adviser being also something of a futurologist, as we do not have capacity for very long-term thinking. Would his or her duties include promulgating good advice to all local authorities that cannot access the top-level stuff which the major conurbations can access?

Barry Sellers: With the spatial role, for example, you have the concept of the northern powerhouse, which is a whole area on which the local authorities can collaborate together. I think it is very useful to set out what that can mean over the next 10 to 15 years, because there are opportunities there, with HS2 and HS3 coming forward, to begin to think differently about the way in which we develop the development patterns, for example.

Q328 Baroness Whitaker: The person could also ensure that all planning authorities knew of those developments. Would that be a function?

Barry Sellers: It would be a function whereby there would be a spatial framework within which they would work and they could set up their own ways of working. My own local authority is working with Richmond at the moment, and we are coming together as two local authorities, but there are opportunities for other local authorities to come together to deliver particular projects, and they can point out particular people in those areas who have the expertise to deliver those particular projects.

Simon Foxell: On the guidance issue, they very much need to co-ordinate and then produce it. They need mainly to commission a certain amount of good guidance that aids the sector, and that does not necessarily mean that they have to do that work themselves, although they would probably need to have enough of a team to be effective and to do the work. During CABE’s most successful years, it produced the most amazing amount of very useful guidance for all parts of the sector which is still relied on.

Baroness Whitaker: Case histories of where it worked?

Simon Foxell: Partly case histories, partly “how to” guides for clients to achieve good design, and research projects that actually looked at where value was provided, or where it was not. We are lacking that being refreshed at the moment, so yes, there is definitely a gap there. They would not need to work much more collaboratively with the many others in the sector to make sure that this was not just government advice coming out but was good, widely accepted industry best thinking.
On the regional point, I think it would be very useful if the northern powerhouse, for example, had a built environment adviser with a degree of clout who could look at the bigger picture of how that developed and how to achieve high standards, and not necessarily rushing in to do things cheaply when they could be done so much better with a degree of forethought.

**Q329 Baroness Young of Old Scone**: We have talked a bit about the removal of the national sustainability standards, and things like zero-carbon homes and the Code for Sustainable Homes going, which really talks to the issue of new build, but we have a huge property stock that is not achieving sustainability. Advise us on what you think needs to be done to get a head of steam on retrofit.

**Simon Foxell**: The most important thing is that we have good information about what is happening at the moment. Display energy certificates, which were about to be used, were vital information on how sustainable almost every building of any scale was, and at the moment they are only being produced on very few major public sector buildings. Real information on our building stock is essential for understanding not only what is going on and learning lessons from it but how to improve it. Improvements can only happen from a basis of reasonably good knowledge. There are a lot of theoretical improvements out there based on modelling that may or may not be good, and until we get feedback from the housing stock or the rest of the building stock, we will not know whether measures are cost-effective and are actually doing what they are said to do. Restoring the idea of display energy certificates, which the property industry is very keen on, is essential.

Beyond that, we need new programmes of upgrading existing stock, but at scale rather than relying on probably individual housing owners to upgrade one property at a time. That may mean that taking a street, an estate or a town at a time would be a very effective way of achieving it, not only because you can do it at scale but because the community together can go on the journey of learning how to live in upgraded building stock, how to make it work effectively, how to share that experience and to do so as a community rather than picking off certain individuals who might be keen and others who are unable to do anything because they are too poor or whatever.

**The Chairman**: Have you any knowledge of any town in this country that has actually done that? I see a head nodding in the public gallery. There is one that comes to mind which I had
the joy of seeing last summer, and that was King’s Lynn, which is obviously a very old town, but the necessity to increase the flood barriers was such that it generated a whole lot of enthusiasm, as it was explained to me, for making the place really good.

**Simon Foxell:** The main movement towards this is the Transition Town movement, which is very much a bottom-up movement for improving the sustainability and liveability of whole towns or sometimes parts of towns at a time. Some of the best examples of whole-area improvement are happening on the continent rather than here, where there are very substantial programmes that move through similar building types at speed, learn very well how to do it and do it at huge cost-effectiveness.

**Baroness Young of Old Scone:** Who drives them? Is it local authorities or the national Government?

**Simon Foxell:** Often local authorities. Sometimes there are major landowners who happen to own a large building stock who have been prepared to do that, and they are often done in combination with the energy companies on the basis that they need to be involved in the deal because the money that was going to them is going to go somewhere else.

**The Chairman:** Before I let you go, if there are any subjects you think we should have addressed or questions we should have asked or any information, and I am sure there is an awful lot, which we should further examine—bearing in mind we only have a few more weeks of work on this before we start drafting the report—we would be very grateful to you just for a scribbled note or even an idea or a few bullet points that you do not think we have covered adequately, although we could have covered it in other sessions, of course. You obviously have open minds, and you have been very generous with your time and your explanations, so thank you very much on behalf of the whole Committee.

Edinburgh College of Art, University Of Edinburgh – Written Evidence (BEN0058)

Edinburgh College of Art, University Of Edinburgh – Written Evidence (BEN0058)

This submission is from Professor Catherine Ward Thompson, Director, OPENspace Research Centre and Research Professor of Landscape Architecture at Edinburgh College of Art and the University of Edinburgh.

This submission draws mainly on two recent and ongoing research projects undertaken by Professor Ward Thompson’s team:

Inclusive Design for Getting Outdoors (I’DGO) A longitudinal study into the effects of living in ‘shared space’ residential streets on older people’s activity patterns, wellbeing and quality of life.

Mobility, Mood and Place (MMP). A three-year, multi-disciplinary study, led by OPENspace, exploring how places can be designed collaboratively to make pedestrian mobility easy, enjoyable and meaningful for older people.

Questions

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

If an older person cannot get out and about locally, they are at risk of becoming ‘a prisoner in their own home’. Research by Inclusive Design for Getting Outdoors (I’DGO) has found that the design of Britain’s gardens, streets, neighbourhoods and open spaces affects older people’s ability to age well and live independently by supporting, or preventing, access for all.
People who don’t find it easy or enjoyable to get outdoors can spiral into poor physical health, less social contact with others and a reduced quality of life overall. With the cost of sedentary behaviour estimated at £8.3bn per year, (Chief Medical Officer’s Annual Report, 2009. Department of Health, 2010.) this places a further financial burden on the NHS and Local Authorities through increased admissions to hospitals and residential care homes.

Key messages from Inclusive Design for Getting Outdoors:

The desire to get out and about does not diminish in older age, nor does the variety of activities people like to do outdoors. If older people live in an environment that makes it easy and enjoyable for them to go outdoors, they are more likely to be physically active and satisfied with life and twice as likely to achieve the recommended levels of healthy walking. The same is true for those who live within ten minutes’ walk of a park.

The pedestrian experience is vitally important to older people, who are most often on foot when out and about. For the many who find it difficult to get around, it is often due to the poor design, provision, installation or upkeep of neighbourhood features, especially footways.

Lesser-quality environments are often considered by older people to pose an increased falls risk, especially by those with vision, mobility or other impairments. They can heighten fears about crime, nuisance and traffic and make going outdoors less enticing; reinforcing feelings of loneliness or entrenching the challenges of socio-economic deprivation.

Inconsistency, between types of road crossing and tactile paving, for example, can make older people uncertain about features that are designed to be enabling. Providers’ adherence to guidelines may improve this outcome, as might public awareness-raising as to what is supposed to be used where and for what purpose.

Measures to make streets less car-centric improve older people’s perception of supportiveness and safety but, neighbourhood-wide, it is good paths, accessible open space,
safe crossings and plentiful seats, toilets and greenery that really make the difference.

Design and materials need careful specification, with consideration given to UK weather patterns.

The more types of residential outdoor space an older person has, whether private or shared, the greater their satisfaction. In terms of wellbeing, the smallest things can bring the biggest benefits, such as having one’s own patio, space to socialise or simply a green view.

Supported by their environment, most people aged 80+ living in the community can expect to continue to go outdoors daily, engage in a range of activities and maintain quality of life into oldest age.

Research by Mobility, Mood and Place (MMP) has highlighted the importance of the home environment in supporting more active, less sedentary lifestyles amongst older adults.

Stairs, space within the home and the form and location of facilities, fixtures and fittings were found to be critical in informing opportunities for low to moderate intensity physical activity. Details proved key with, for example, a particular approach to the provision of handrails (double handrails) being particularly important for movement. We note, however, that building regulations are moving away from a focus on prescriptive detail to a focus on ‘performance’. The possible implications of this should be further investigated.

**Skills and design**

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

In our experience most of the professions in general and architects in particular do not have the right skills and training to consider the built environment in a holistic manner. Training for these professions is still based on the need for award winning innovative designs. Inclusive design remains as an ‘add on’ rather than a core element that would allow the professions to
design inclusive environments built for whole life use and incorporating the needs and desires of the local community.

To address this issue inclusive design should become a core element of the training of these professionals and should be the key fundamental underpinning all development. Local authority officials should also receive training in inclusive design with the concept embedded in all planning decisions.

We also note the frequent absence of training in community participation. The purpose, benefits and techniques for involving diverse groups in planning and design decisions should also become a core element of the training of these professionals.

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced? High quality design and place making can only be considered high quality if it is accessible to all i.e. inclusively designed. Leaders in national and local government and within the built environment professions should promote this message. National awards should naturally have inclusive design embedded within them.

**Community involvement and community impact**

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

All too often, the people who use environments day-to-day are left out of the design process. For older people, this can feel particularly alienating. The MMP project, led by the University of Edinburgh is developing co-design techniques that bring together researchers, designers-in-training and older participants to envision places, from homes to public spaces, which are
inclusive, enabling and inspirational. These co-design techniques will be captured in a toolkit that can be used by decision makers and developers to support creative and meaningful community involvement in planning and design decisions.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

It is routinely found that participation in planning decisions is concentrated amongst advantaged individuals and groups. Early findings on neighbourhood planning, including our own research, indicates that participation in this initiative is also concentrated amongst certain advantaged groups, namely affluent, rural, civil parishes. Access to resources (social, cultural and economic capital) and the design of the scheme itself seem to explain this situation. Neighbourhood planning arguably creates an easier pathway to participation for civil parishes. To facilitate wider involvement, a goal should be to minimise the potential for the design of any future community planning regime to advantage certain types of areas over others. Areas with plentiful resources seem better able to develop neighbourhood plans quickly and independently. Any future community planning regime should recognise this issue and set aside at the outset (and for the duration of the scheme) adequate resources to support less advantaged areas.

Creative engagement techniques might have a role to play in encouraging a wider variety of people to participate in planning and design decisions. Traditional engagement methods can appear rather staid and exclusionary with participants often requiring some knowledge of planning policy and understanding of planning terms to meaningfully engage. In our study MMP we are investigating the appeal to older adults of a range of creative and playful techniques including modelling, discussion, walking tours, mapping and presentations. Members of our research group have also explored the potential in mobile engagement hubs, specifically a repurposed bus, and arts-based methods including theatre and illustration. We believe such techniques and forums have significant potential and should be incorporated into more public engagement exercises.
Financial measures

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

For further details about the background research that formed this response please refer to our website http://www.openspace.eca.ed.ac.uk

05 October 2015
Dr Laurence Carmichael, Co-ordinator, WHO Collaborating Centre for Healthy Urban Environments, Dr Ann Marie Connolly, Director of Health Equity and Impact, Public Health England, and Dr Matt Egan, Senior Lecturer, London School of Hygiene and Tropical Medicine

Q330 The Chairman: Good morning and thank you very much for giving up your time and travelling here to appear before us. You are very welcome indeed to this evidence session of the Select Committee on National Policy for the Built Environment. We are coming to the end of our witnesses—we are fairly near the end, but it has been very intense. We have learned a huge amount, and I am sure we are going to learn even more today. You have in front of you a list of the interests that have been declared by members of the Committee. There is an additional one for Baroness Young, who has just been appointed Chairman of the Woodland Trust. A transcript of the meeting will be taken and published on the Committee website. You will have the opportunity to make corrections to that transcript where necessary. Could I begin by asking each of you to briefly introduce yourselves to the Committee? This is for the purpose of the transcript, so we can know where people are coming from.
Dr Carmichael: I am Dr Laurence Carmichael. I am the Co-ordinator of the WHO Collaborating Centre for Healthy Urban Environments at the University of the West of England, Bristol.

Dr Connolly: I am Ann Marie Connolly. I work with Public Health England, where I am the Deputy Director in the Health and Wellbeing Directorate. I lead on health equity, place and mental health.

Dr Egan: I am Matt Egan and I am a senior lecturer at the NIHR School for Public Health Research at London School of Hygiene and Tropical Medicine.

The Chairman: You are all very welcome. I am sure we are going to get a lot from you.

Q331 Baroness Parminter: We are really keen to tease out the impacts of the built environment on health. As an overview, does national policy at the moment set a proper framework for health issues to be accounted for in decisions about the built environment?

Dr Egan: Impacts of the built environment on health are quite varied. It can influence health by shaping people’s behaviours, both in terms of physical activity and in terms of the things that they might consume. It can influence people’s health directly, let us say, if we are talking about housing and problems associated with it. It can also influence people’s health through what academics call psychosocial mechanisms: the way that people feel about the place that they live and how that then gives them as individuals a sense of self-esteem and well-being and influences the way the whole community works. From those mechanisms, there is a very wide range of health impacts that could possibly be determined.

Baroness Parminter: Could I ask a supplementary as you respond to that? Are there sufficient data to enable national policy to take those health impacts seriously?

Dr Connolly: I agree; they are all relevant elements of the built environment. They are mixed and quite complex, but there is strong enough evidence on issues such as making areas walkable and connected, particularly when you have mixed-use. That is about helping people to be able to walk or cycle from home to work or from home to shops, and connecting the impact on people’s mental well-being to walking through better sets of green space and access to green space, and through good-quality housing. We know what makes for good-quality housing. We know that certain things that can be designed into local areas, such as helping people access staircases rather than elevators, designing streets in grid patterns...
rather than culs-de-sac and making the right sort of pathways so people have incidental social contact with each other, will help make connected communities.

The National Planning Policy Framework is quite strong on some of these elements. It has a health chapter that focuses primarily on healthy communities. There are potentially also strengths from the supportive elements of the other sections of the planning framework, such as transport, housing and the design of local areas. They are all supportive, but the elements within there are implicit rather than explicit. There is some additional guidance in the national planning guidance on health that supplements it, but how that gets translated into local areas is another step.

**Dr Carmichael:** As far as the built environment and health are concerned—my colleagues have covered this—there is almost a direct impact, especially on environmental health. There is evidence that, if you are going to walk alongside a trunk road, there are pockets of air quality that are really bad for health. The advice is to avoid these pockets of really bad air quality on your commute. That is a more direct impact. Another impact of the built environment is on behaviour: trying to encourage people to walk, take active travel and benefit from a communal environment that is good for social capital and that kind of thing.

The other aspect is the impact of the built environment on deprived communities. The Marmot review used ONS statistics to show that, in deprived areas, people pile up the risk factors on their health. They may live in areas that are prone to flooding, that are quite polluted near trunk roads or that have no access to really well-maintained green infrastructure. They may live in toxic streets, where you have betting shops, hot food takeaways, alcohol establishments and sub-prime lenders. There are values there—it is freedom and entrepreneurship—but we need also to provide environments that are going to encourage healthy behaviour in deprived communities.

In terms of the planning process and whether it is there to take health into account, Section 8 of the NPPF is about healthy communities. It is all good sense, but it is really a small section, so it leaves it to local authorities to develop their local plan, to try to assess the local needs in terms of health outcomes, and to try to promote the neighbourhood planning system taking on board local health needs. It does not say much more than that, really. The problem is that
there is a sting in the tail, in that the NPPF mentions also this issue of viability. We know that local authorities have to deliver against housing targets. Paragraph 173 of the NPPF leaves it to local authorities to negotiate with developers; national policy does not really put too many constraints on the sustainability and health outcome principles. There is an issue. Local authorities rely on big developers to develop and to deliver their target housing.

We ran an ESRC seminar series and one of our colleagues, Margaret Douglas at Glasgow, mentioned that we have a mechanism to assess the impact of urban development on bats, newts, flora, fauna, areas of outstanding natural beauty and trees, but we do not have this for protecting the health of our children. We do not have this holistic approach to health outcomes. We might measure air quality, but we do not measure how our children have access to green infrastructure to play.

Another thing is the monitoring system for local authorities. Back in 2010, we did some research for the National Institute for Health and Care Excellence. There were indicators that local authorities were requested to use in their annual monitoring reports, which really clearly linked with health—access to half-hourly bus services; access to green infrastructure that would get Green Flag awards—but all this has been scrapped, so we do not have the mechanism to monitor how well local authorities are developing on health at the city or the local authority level.

Q332 Baroness Andrews: Thank you very much for a very comprehensive start. It seems to me that we have an awful lot of evidence about the combination of factors that make for a bad environment, and we are beginning to understand some of the policy choices that would be effective in responding to those, whether it is providing more green infrastructure or whatever. My question is a big one; in a sense, you have partly answered it. How difficult is it to start from the premise that we need to build healthy communities and not simply respond to what we have at the moment? In this respect, it is such good news that Public Health England is taking such a proactive approach to this, which is the first time we have ever seen this. What are your priorities and where can you have most influence in changing attitudes towards planning for health rather than mitigating bad health, chronic conditions and disease?
**Dr Connolly**: As a starting point, our role is also to protect and improve the health of the nation. We do that in partnership with lots of other people. It is to set out the big health issues, and then to say, “What do we need to do?” with lots of other people. A key part of that is what we do in our work with local government to help promote the integration of health with planning and to join up health and planning. When the responsibilities for public health moved to local government, it was a new opportunity. Lots of local authorities are doing very good stuff, but there are many others that need to develop. Our role is to identify all the key and pressing health issues—whether it be the rise in diabetes, the rise in obesity, the insufficient level of physical activity, or people living in poor housing—and how to join that up, but also to develop the abilities and skills of our public health professionals to join up with the planning professionals to provide the right sort of information and data through the health and well-being boards and the joint strategic needs assessments, and to start showing leadership on this with the other parts of local government and move up the importance of health within that wider planning process. It is about the planning priorities of that local area and whether they sufficiently support the health aims of the area. That is where the challenge lies.

**Baroness Andrews**: What do you do when the CCG does not speak to the housing department? I have found hardly any evidence that they do.

**Dr Connolly**: In the last year, we have worked at national level, to start with, to develop a memorandum of understanding on housing and health. We have done that with the National Health Service, the Department of Health and DCLG, and some of the leading bodies on housing, to get some shared agreement about the areas we all need to be working on together. Our next challenge is to try to replicate that at local level, and to support the local levels to have equivalence of that—it may not be called an MoU—and to have a joined-up partnership on housing and health. It is in everybody’s interests—the health service, local people, local government and the housing sector—to do so.

We have over the last few months also published, jointly with other organisations—for instance, the Chartered Institute of Environmental Health and some of the housing organisations—documents, advice, tools and guidance for local areas about how to take a
much more proactive stance. Those are tools that can be used whether you are an environmental health officer, a planner, a public health professional or an NHS professional. We see that as a starting point rather than the end game, but it has not historically happened in the past, joined up with the NHS. It is about how we help support a future where that can happen.

The Chairman: Have you found any reluctance to follow that?

Dr Connolly: We have further to go in helping the NHS staff and commissioners, some of our public health professionals, who are busy with other things, and our housing professionals to find the right shared understanding of what the co-benefits might be and the language in which to speak to each other. Different professional groups have different ways of thinking about the world and use different evidence, and we are trying to lift their heads above the day job and the norm so that they ask how they can think about this differently and work differently in partnership.

The Chairman: They are probably all working all the hours God sends anyway, and to try to make more room for something like this is difficult.

Q333 Baroness Young of Old Scone: The forum for this sort of discussion should be the health and well-being boards. Perhaps you could give us your perspective on how well they are working in this area. Also, there was consternation a while ago about the fact that the public health directors, when transferred to the local authorities, were often not on the top table, whereas the director of development and the director of planning almost certainly will be. Is that a real problem?

Dr Connolly: The picture is pretty mixed across the country, but the public health responsibilities and teams are much more bedded down now. Certainly, the director of public health will always be on the health and well-being board, so there is a great opportunity there. It will be mixed as to how many have taken up these considerations at the health and well-being board. There are some examples of where that has taken place, such as Medway and Kirklees. There are some local authorities that have been doing this sort of work for a long time, such as Bristol, Stockport and Newham. They have already been thinking about how to
join up the considerations of planning and local place, but it is not uniform. Again, it will come down to what the local priorities are.

One of the tools is about how we support local areas to incorporate some of the data and the knowledge into the joint strategic needs assessment, which informs the health and well-being board. Some areas are already doing that, or at least some elements of it—Barnet, Norfolk and so on. There are lots of good examples. We can support and facilitate that as Public Health England nationally and through our centres, but ultimately it will be down to those local areas to decide which things they wish to prioritise, and our job is to support, particularly for public health, good partnerships to enable that further.

**Baroness Rawlings:** Can I ask a quick question of Dr Carmichael on impact assessment and air quality? Where one comes into conflicting ideas, when for health reasons one wants to encourage walking and bicycling, for example, but the air is just so polluted because of stationary traffic that it is toxic, how does one deal with that? To give just one little example, right here on the embankment there is stationary traffic spewing out these toxic fumes and for the cyclists or pedestrians it is horrific. It must be in other places. How do you balance that?

**Dr Carmichael:** It is very difficult, because transport planners have different priorities to environmental health experts. It is really acting on different fronts at the same time. In a way, it may be easy to promote adaptation mechanisms while the air quality and transport issues are not dealt with. There is some research encouraging people not to use trunk roads for their commute but to use side roads to avoid heavy traffic. I know this is not a solution, but action has to be taken on different fronts. We still have to encourage people to walk and cycle, because there is an obesity epidemic.

**Baroness Rawlings:** But they will be killed by the fumes.

**Dr Carmichael:** Yes. That is why we have to make sure that there are enough green corridors and that local authorities are protecting and maintaining their green spaces and making them accessible in areas of deprivation. We know that there is far less availability of green space in areas of deprivation. There is no one solution; it has to be tackled on different fronts, at different levels.
**Dr Egan**: It seems to me that these can be framed as tensions, and they are in certain places, but in other cases we know that a way of encouraging people to be more active in their transport is to have a more pleasant environment in which to walk, including in an urban centre. In urban centres that are aesthetically poor quality or poor in other ways, you are less likely to get active travel. I agree there is a tension between these things, but they can also be framed in a way such that one aim supports the other.

**Lord Inglewood**: That all sounds to me entirely sensible, but we heard from the previous witnesses—I do not think you were here—that one of the problems in bringing brownfield sites forward for housing is the cost of all the remedial work to the polluted ground and the cost of infrastructure, set against, if the thing is to be sold, the price that is realised. How do you bring about the coming together of the resources and the aspirations to enable delivery?

**Dr Carmichael**: We need to engage with developers at an early stage. In this country, they have the master planning. It is talking to developers to make clear to them exactly what the objectives are—these aspirational solutions—and to make sure they understand, if they deliver really healthy environments with green infrastructure and walking and cycling, it probably adds value to the development itself.

**Lord Inglewood**: Certainly, if you can persuade them that what they are selling is going to be worth more if they do certain good things, that is a way to start. They are pretty cynical, hard-nosed people, these developers, are they not? They may not be persuaded.

**Dr Carmichael**: It may also be the inclusion of mechanisms such as health impact assessments, again at pre-application stage, to facilitate a discussion with the private sector. It needs to be local authorities that adopt these policies.

**Dr Connolly**: We regularly hear that sort of question, but there are, first of all, some examples of eco towns. The NHS has called for tender for people to apply to be NHS healthy towns, which is about health-promoting towns. They expected about 30 applicants and about 120 have applied for a small number of places. There is interest and enthusiasm. Secondly, we probably need to do more and better to be able to describe small changes that can be helpful. Not everything is additional expense. It may be about the layout of the area, which may just
be different; it may not necessarily be more expensive. We need perhaps to promote better examples of that.

On healthy transport, Transport for London has a public health expert advising it. It has produced a report on health and transport for London and is now producing a supplementary document on how to assess areas more carefully and find the most cost-effective ways of providing healthy public transport, which is active transport and physical public transport as well.

**Q334 Lord Woolmer of Leeds:** You have answered quite a lot of the issues raised by that question, unless there is anything you want to add, which I would be very happy to hear. As a supplementary, all that we hear is that built environment professionals are under enormous pressure. There are fewer and fewer, public services are being squeezed, and they have less and less time, and yet people, including you, quite rightly want them to do more. Is there a conflict in practice between what you want to achieve and the professional resources available on the ground to make a difference? In the light of another big cut that is coming in local government, is that going to be even more difficult?

**Dr Carmichael:** Over the years, there has been a lot of regulation and legislation around sustainable development. Maybe planners and developers also see the health agenda as something on top of all this regulation around the sustainability agenda. We should try to do an audit of what in sustainable development is also good for health. Instead of putting the environment at the core of our development, it is putting people’s health at the core and finding out that a lot is already being done but maybe there are other adaptations that have to be delivered. It is not so much having more resource but the different use of the resources.

**Dr Connolly:** I do not doubt that there is pressure on resources, and we certainly hear from our colleagues that there is pressure on local planning departments. The only thing we can say is that, as our public health departments have funding for doing public health that will slowly get smaller as well, in a way that is an added incentive for the public health departments to talk more closely and to join up and be a little more efficient. We would like to have good models; if the NHS healthy towns can find some, that will be good. If you can
find more default options, that is quite helpful as well. You start to learn from good models that you can do it this way more easily.

**Dr Egan**: Yes, it is about finding where planning and health interests co-align. Certainly in disadvantaged areas, that is often very likely, because a lot of disadvantages are housing disadvantages. It is the same people. It is about looking for examples of successes—even in austere times, there are examples of successes—assessing them with a reasonable degree of rigour, and using them to inform other local authorities to do likewise.

**Baroness Andrews**: Yesterday we heard about the cut in public health that has come out of the Autumn Statement. I am just wondering, Dr Connolly, whether you have any notion of the priorities that you would want to save at all costs and not cut.

**Dr Connolly**: It would be difficult for me, because every local area has very specific health issues. I would certainly want to see every area being able to promote good physical place, because that will help on lots of different problems. Physical activity and green space would probably be two key areas one would want to promote, because there are opportunities for the whole of the council’s responsibilities to be able to support that.

**Q335 Lord Woolmer of Leeds**: Do you think elected representatives are equally enthused and motivated as I think you think, at least in good examples, the professionals are? In other words, do local politicians share your desire to implement these objectives?

**Dr Connolly**: As I mentioned before, it is probably variable across the country. There will be a mixture of local politicians. It may be the chair of the health and well-being board or the chair of the planning committee; they may be the two councillors. A public health person locally may wish to discuss, consider, engage and inform about the potentialities from this. As I say, we have had great examples of some councils where there are highly enthusiastic councillors who have really embraced their health responsibilities or who want the planning function to support a good place for their local communities, but it varies.

**Lord Woolmer of Leeds**: The important thing is to enthuse the local politicians and get them engaged, rather than starting with the professionals.
Dr Connolly: I would say it is both. You cannot necessarily enthuse your politicians if your local chief planner or your local director of public health are not also enthused and should be given the sort of information they may require. I am not sure which would come first.

Baroness Finlay of Llandaff: I just want to go back to something you said earlier. You mentioned grid systems and culs-de-sac. If I heard you correctly, you were advocating a grid system rather than developments with lots of culs-de-sac. Is that correct?

Dr Connolly: There seems to be some evidence pointing towards a grid system allowing people a greater degree of movement between home and other services, and making them more likely to do it by walking or cycling, as opposed to the divides that some layouts can create for where they live. If you are trying to promote active travel, some elements of it seem to help.

Baroness Finlay of Llandaff: In some ways it seems counterintuitive for the young family, where you do not have the through traffic, and for old people, where you almost create a natural little hub community. Loneliness, we know, literally shortens people’s lives.

Dr Connolly: It is a mix of elements that can come together. There are different models of it. In Salford, for some time, they have had “home safe” streets, where they prioritise families and people over cars. They allow children to run around in the streets, rather than cars having priority. You can redesign local areas so that there are pleasant ways to walk between areas and so it is a mixture of green but also safe areas for people of all ages to walk through. There is mixed evidence about what creates engaged and connected communities as well; it differs for different age groups.

Baroness Finlay of Llandaff: May I pick up on your comment about health impacts in planning applications? What would you see essentially included in those? I could see how an application could be made to sound great for one group in society and completely ignore another group. There is also some evidence that balanced living is better for people than “age communities” are. I do not want to use the word “ghetto” but I cannot think of another one at the minute.

Dr Carmichael: The health impact assessment is quite a democratic principle. It is not just experts or planners or healthy planners carrying out the assessment but also local residents.
There must be some local evidence put into the assessment. In the States, for example, in San Francisco they used health impact assessment to avoid displacement of the local population and they changed the master planning. The problem at the moment is that the environmental impact assessment we have only looks at environmental health on large applications; it does not necessarily look at the combined effects of all small developments. It is mainly expert-driven and it does not look into physical activity and mental well-being.

However, the health impact assessment does not have a methodology that is robust enough and can be integrated easily into the planning system. Developers might say, “Well, you have anecdotal evidence from the local population”. On appeal, how would that stand? It is a voluntary instrument at the moment. Some local authorities are using it to assess large developments, but it is really for large developments, maybe of 100 or 200 units.

Baroness Finlay of Llandaff: In that local population, would you be including people such as health visitors and district nurses—stakeholders who go across different bits of that community rather than only seeing the view from their own window?

Dr Carmichael: Exactly. It is like any democratic process; you need to give the voice to people who do not usually have a voice. There needs to be a really well-developed consultation mechanism. That is difficult, because people will see the health of their local area from their own perspective, as you say, so how do we validate this knowledge? More research needs to be done, but it is one area. This depends upon the European referendum, but a new European directive, the EIA directive, says we should look at human health in the environmental impact assessment. That is coming up in 2017 and could give local authorities the ability to look into a holistic approach to health outcomes, not just environmental impact.

Q336 Baroness Andrews: The Chairman has allowed me to pre-empt my question, which was to come later and links into Lady Finlay’s argument about how you plan for an age-friendly society, whether it is young, old or whatever. One of the things I am particularly concerned about is the failure to plan for the obvious demography of an ageing society, which comes with a lot more complex health conditions, so we have elements of prevention and then we have elements of responsiveness. That should be reflected, I would argue, in an attitude of planning that is about lifetime homes and lifetime neighbourhoods. To what extent do you
think we are more intelligent than we were, say, 10 years ago about the implications of an ageing society? How can the work done by your sorts of professionals with the planners reflect that? The healthy towns are a possibility, but what else do we have to do urgently and how do we prioritise that big set of priorities?

Dr Carmichael: It is thinking in terms of different scale as well. With lifetime homes and neighbourhoods, it is engaging with the young generation of planners and architects and trying to bring this mainstream into their education—into university courses, really. Then we have the issue of dementia-friendly environments. Unfortunately, one person in six over 80 has dementia, and at the moment there is no cure and it is terminal. The problem is that the legibility of the built environment for people with dementia does not favour younger generations, because you have to make sure that there is good signposting and that the colour scheme is appropriate. It does not help integration of different communities, but, when it comes to ageing, we have to encourage intergenerational environments.

I remember a place in Rotterdam where there was a big housing development but they brought the tram and the school before any housing was built, ironically, and put the old people’s home around the school so the various generations could keep cohabiting. That is really important, because the last thing we want is to create ghettos, which are not very good at all in helping us integrate.

Dr Connolly: You are right about the need to recognise the ageing population. People are living longer, which is a good thing, but they are living longer with various levels of disability and poor health. It is something around 15 years for men and 18 years for women in not good health, so we need to look at both prevention and the longer term. There are good examples. As you say, Holland has lots of great examples of better ways of thinking about designing. The Canadians have been looking at cities that are called “8-80”, which are designed for eight year-olds and for 80 year-olds. These are concepts we could help embed a bit more.

Our own CABE Design Council had a Building for Life set of criteria. There are multiple dimensions to that, but quite a lot of our existing developments do not reach those. Again, we have tools, but it is about promoting them and about how they are used in local areas so
that people can think through all those elements. I do not think it is that difficult; it just needs the next step of embracing it and thinking about it.

**Dr Egan:** I have one additional point about the most disadvantaged neighbourhoods in the country, where large numbers of people do not get to be old. In that sense, concern and targeting of an ageing population should be downscaled through the ages for those populations, where in effect late 40s, 50s and early 60s is old. Whatever targeting needs to happen, it should not be standardised across the country. Also, some of the most disadvantaged neighbourhoods have quite exceptional demographics, often with very high numbers of young people. We found this in the GoWell study on regeneration in Glasgow. We think one reason why social cohesion does not work in the way that it often does in other sorts of neighbourhoods is because there are such exceptionally high numbers of young people. There is a possibility, which is worth looking into, that an ageing population might start to redress that balance, providing there is active support for making sure that those exceptional demographics do not remain in place.

**Baroness Andrews:** Sure, but it also makes the case for saying that when you are planning for health and you are planning for housing, you have to plan for the local demography. What is not clear is whether local authorities are taking into account the nature of the local demography. The argument would be, if you had a national housing policy, you would not simply be building starter homes; you would be enabling older people to move out of extra-large family homes into safer, right-sized homes, which would then free up the large family homes for families. All that has a health impact, does it not?

**The Chairman:** You also have to consider the people themselves. The people who live in these big homes do not want to move, in a lot of cases. A lot of people want to downsize, but a lot do not.

**Q337 Lord Clement-Jones:** I am very interested in the practical examples, such as “8 80 Cities”. How widespread is knowledge of those sorts of practical schemes, projects or whatever you might call them? Does there need to be much more promulgation of that kind of best practice in this context?
Dr Connolly: I would suggest so, and to a wide range of different professionals—clearly, the health professionals, but also planning professionals; some will know about those, because that will be part of their training, and others will not. Some architects will be aware of those and building professionals—the engineers, the builders and so on—a lot less so. It is about joining up those who know how to build and know how to design, and finding some of the incentives—

Lord Clement-Jones: Who is in pole position? Are you in pole position on this in terms of spreading the gospel? These are very interesting schemes and yet, it appears, not that widely known.

Dr Carmichael: In working with local authorities or different stakeholders or organisations, it is interesting to see that there are lots of guidelines—BREEAM and Lifetime Homes, WHO—but they are not linked up. It is really trying to pool the resource that already exists. Within our remit, we need to support the WHO Healthy Cities Network at UK level. I have suggested to them that they need to talk to NHS England and this Healthy New Towns programme. We are discussing now how we can disseminate the information. This NHS Healthy New Towns is a great opportunity. As Ann Marie mentioned, they expected only 40 applications and they got 120, so there is a cry for help.

Lord Clement-Jones: Yes. We are looking for practical, effective outcomes.

Dr Carmichael: Exactly. Looking at these various sites that were brought forward, in some of them you can see that the local authorities have integrated the partnership in terms of commissioning groups, stakeholders, local authorities, planners, designers and developers, and they do not need the help of NHS England, to be honest, but some of them do not even know what help they need. There are very different environments and integration in the country.

Lord Inglewood: Does health sell houses?

Dr Connolly: The health system or the NHS?

Lord Inglewood: No, not the NHS. If you build a healthy home, do you get more money for it?

Dr Connolly: I do not think anybody has ever sold them on that basis, so I am not quite sure, but there will be other criteria.
Lord Inglewood: That may be the answer.

Q338 The Chairman: Yes, but, on the other hand, that probably is the answer. Some of us went to Birmingham and visited a housing site that was run by Birmingham City Council. At one stage they said that they had houses for elderly people, which had gables and two storeys. I said, “What about the two storeys?”. It was pointed out that they had designed into the ground floor either a cloakroom or else a lift up where you could get into a bathroom or a shower room upstairs. I thought that was great, and then I suddenly realised that for years people have been designing healthy interiors for elderly people, making sure that the plugs are in a place not down underneath the bed and so on.

This concept of clean air and green and walking and taking exercise for your health is really relatively new. It was 20 years ago, probably, that we all began to recognise it, whereas the housing people were there before us. I wonder just internally if we can get back to Birmingham and see what motivated that particular development. Within it, they had big blocks and social rooms and young people living in flats. It was completely multifunctional, and there were wide spaces too, which was great.

The question I was going to ask is: do local planning authorities take adequate account of health provision in their plan-making and development control functions? I suspect they do not take any, but do you think they are playing their part, or are they recognised as being a very important cornerstone to all this and that people would have to become more clued up about it?

Dr Connolly: As I say, the picture is very mixed across the country. There are some who have embraced this easily. It may have come from the health side, where the director of public health has engaged with the planning department for some time. There are good examples from across the country, but it is not uniform. This is also about when the opportunity arises for the right type of engagement. You can have different points of time: when the local plan is being developed, but that only gets done every five years or so and they are at different stages of cycle; when there is a major development, and, again, that sometimes happens; and when there are sometimes local Neighbourhood Plans, which brings things down very much more locally, which is an emerging theme. There are opportunities.
We worked last year and the year before with the Town and Country Planning Association, running a series of workshops across the country, bringing together different professionals, under the banner of “Reuniting Health with Planning”, and then specifically on healthy weight environments. A lot of learning came out of that about how we need to do more about joint learning, being clear about language and sharing understanding, and about the nature of evidence. We as health professionals tend to use and focus on a different type of evidence base than the planning professionals or the architecture professionals. It is trying to join those up, both in undergraduate training and in postgraduate professional development. We need better shared learning and shared skills development to be able to do that well.

The Chairman: That is very useful. Should there be a list of points that you have to tick before you get permission to build anything anywhere?

Dr Connolly: It could be helpful, but you would have to use it sensibly. In Newham, they used a checklist from the Healthy Urban Development Unit in the post-Olympics development. In Stockport, they also have a set of criteria for when they think the planners should bring in the public health people when there is a specific development—some triggers to start getting health advice.

The Chairman: You have mentioned two specific areas. How do we get the rest of the areas throughout the country doing that too? How would that become general knowledge, so to speak?

Dr Connolly: It is about, as I mentioned, training and development. It is also about publicising, honouring and giving prestige to those who are doing well so that others may want to emulate that.

Dr Carmichael: It is about joining up the resources that are already there, because there is a lot out there—TCPA, RTPI, Public Health England, NHS England, WHO—and making sure that people showcase good urban development.

Dr Egan: The academic sector can help with this as well. We have an opportunity, say, within public health to work with both planners and public health to understand the different cultures of evidence they both have and find some way to help them with common ground, which the School for Public Health Research do as well.
Q339 Baroness Finlay of Llandaff: I am not going to ask you to answer this now, because time is going on, but it would be really helpful if you could write in and provide us with what might be an outline of the metrics to use for a health impact assessment that would drive up some of the standards of decision-making. There are pockets of good practice and there are pockets of appalling practice. The good practices will be good almost whatever you do, but it is how you get the bad practice up. On the issue that a healthy environment sells somewhere to live within a private market system, I can see that, if you have young children and you are buying somewhere, you would prefer to not be on the highest atmospherically polluted road and you would want to know a bit about it. There are energy impacts on housing now. A framework of those metrics would be helpful, as would the metrics that are used for these healthy towns. How valid the decisions are depends on the metrics.

Linked to that, what are the shortages of knowledge and understanding over health issues among those who are working to build the built environment—the professionals involved? You have already alluded to different thought processes, different priorities, and so on. It may be that that is a question you would want to add into the metrics I am asking you for.

Dr Carmichael: There is already a joint statement—it was made in 2012 or 2013—between the Faculty of Public Health and RTPI urging providers of training to create a shared knowledge base. On the Masters in Public Health Part II, we gave some case studies around the built environment, but that is not enough; we really need to integrate this knowledge base. In a way, we also have to train the trainers. We have our architects, our planners and our public health people, and all are set in their methodologies and approaches to problems and problem solving, with their own knowledge bases. We are almost asking people to be outside their comfort zone.

That is where we come from. In a way, we are trying to juggle different concepts: public health, based on rigorous medical evidence, and then a social science perspective or lens of the world, which might be value-laden. We have to make public health practitioners understand how the planning system works, and the other way round as well. It has to be both ways. It is not just planners understanding public health evidence. There is a lot of, not
lobbying, but work to be done to translate the evidence from public health into user-friendly evidence for planning.

The Chairman: And having respect for each other’s skills, which is very important.

Dr Carmichael: Yes.

The Chairman: Thank you very much indeed. It has been very useful. I shall be looking at more green trees in more places, and culs-de-sac versus grids. It has been really kind of you.

26 November 2015
NATIONAL POLICY FOR THE BUILT ENVIRONMENT:

Response

Especially in relation to questions 11 (health), 3 (NPPF) and 9 (skills)

ELECTRO-MAGNETIC EXPOSURE

A. The significance of electro-magnetic exposure for the built environment
B. Key elements in the built environment to reduce electro-magnetic exposure
C. The built environment for the elderly and people functionally disabled by electro-magnetic exposure
D. Availability of information on the built environment and electro-magnetic exposure

Appendices:
(i) Table of biological built environment standards for electro-magnetic exposure
(ii) List of authorities requiring biological built environment standards for electro-magnetic exposure
(iii) Table of sources within the built environment of significant electro-magnetic exposure
A. The significance of electro-magnetic exposure for the built environment

Electro-magnetic exposure in the built environment is now an established factor for potential harm to the well-being of all people.

(i) Children, the sick, pregnant women, the elderly and people functionally disabled by electro-magnetic exposure are in special need of an appropriate the built environment. Professor Dominique Belpomme, of ARTAC, Paris, a leading expert on this environmental hazard, estimates that by 2035-2060 some 10-50% of the population will be functionally disabled by electro-magnetic exposure, depending on the growth of levels of electro-magnetic exposure. Current built environment standards relating to electro-magnetic exposure, therefore, will be of considerable significance for this element of the population. Lack of appropriate control now will increase the numbers who become functionally disabled by electro-magnetic exposure in the future and increase costs in rectifying the built environment in the future.

(ii) All people need appropriate limits on electro-magnetic exposure within the built environment, since this exposure is now a significant part of the total electro-magnetic exposure and the built environment exposure from static locations is some of the electro-magnetic exposure most easily controlled. Its location should be kept as far as possible from sleeping and resting areas.

(iii) Nearly all the built environment in the UK now has man-made electro-magnetic exposure. This is about a million billion times higher than the natural radiation at relevant frequencies and is assumed to lie behind increasing incidence of cancer and neurological illnesses. All this man-made radiation and field exposure is now classified as a 2B carcinogen and should therefore be treated as a controlled substance as regards the built environment.

The built environment especially needs levels of electro-magnetic exposures appropriate to the following two categories of vulnerable people.

Category 1.
Children, the sick, pregnant women, the elderly, people with compromised immune systems, people sensitive to electro-magnetic exposure, and people functionally disabled by electro-magnetic exposure.

Category 2.
Adults, who are young, healthy and lack genetic or immune system deficiencies.

At present UK limits for electro-magnetic exposures, and thus for the built environment, are set for Category 2 only, based on acute (6 minute average) heating-only effects on healthy young adult males.

The built environment should also be compliant with the international biological low-level exposure limits set by the BioInitiative Report of 2012 and other authorities, appropriate for Category 1 persons, who require protection from non-thermal low-level long-term electro-magnetic exposures (see Appendix, table (i), for appropriate levels).
B. **Key elements in the built environment to reduce ambient electro-magnetic exposure**

There is increasing evidence of serious health concerns from wireless transmitters and wiring using a 2B cancer and neurological agent.

Key requirements for future developments in the built environment in relation to ambient electro-magnetic exposure include the following.

1. **Built environment standards to eliminate or reduce electro-magnetic exposure from mobile phone masts**

   All mobile phone masts should now follow best practice and be located at least 500m from human habitation. This means the NPPF should be updated to follow recent advances in scientific and medical knowledge and in best practice.

2. **Built environment standards to eliminate or reduce electro-magnetic exposure from WiFi routers**

   All WiFi should be phased out and replaced with non-cancer and non-neurologically-damaging communication. This should include interior built environments such as schools, hospitals, shops, railway stations, airports, and exterior open spaces such as streets, shopping malls and parks, as well as dwellings, hotels, restaurants, work places, shops and entertainment venues.

3. **Built environment standards to eliminate or reduce electro-magnetic exposure from ‘smart’ meters**

   All ‘smart’ meters for utilities, such as electricity, gas and water, should have wired or cabled data communication, both for the WAN (Wide Area Network) and the HAN (Home Area Network).

   Although the UK government does not require the use of wireless radiation for utility smart meters (House of Commons statement, 29th November 2011), if a utility risks using wireless carcinogen communication for a ‘smart’ meter, then:
   (i) Locate all wireless ‘smart’ meters outside the property and not within a dwelling, such as a hallway, entrance, garage or cellar, where even higher levels of radiation are needed.
   (ii) Locate all wireless meters >5 metres away from the bedrooms or sleeping quarters or from sitting/living rooms.
   (iii) Locate banks of meters 20 to 100 metres (depending on the number of meters) from blocks of flats and apartments.
   (iv) Locate meters so that another dwelling is not in line between the meter and the nearest mast or WAN (Wide Area Network) access point.
4. **Built environment standards to eliminate or reduce electric and magnetic fields, especially in bedrooms, sleeping quarters, work areas and living areas**
   (i) Locate electricity meters away from sleeping areas.
   (ii) Locate wall sockets and wiring away from areas likely to have beds positioned close by.
   (iii) Locate automatic garage door radio systems so that they are not immediately under bedrooms.
   (iv) Design mains circuits to avoid ring mains encircling the bedroom.

5. **Built environment standards to eliminate or reduce radio frequency exposure in a dwelling by replacing wireless radiation with cables**
   Eliminate the need for wireless HAN (Home Area Network, proposed for use with ‘smart’ meters) or WiFi for internet distribution and inter-communication within dwellings, offices, schools, hospitals and public areas indoors and out, by requiring wired cabling for data communication to each room within the premises.

C. **Built environment standards for accommodation designed for (1) the elderly and (2) people functionally disabled by electro-magnetic exposure**

1. **Built environment standards for elderly and sick people**
   Because elderly people are more vulnerable to electro-magnetic exposure, frequently rest in one place, and often have compromised immune systems, it is especially important that very low levels of electro-magnetic exposure are achieved in the built environment near old people’s accommodation. This includes the appropriate standards for the design of the wiring layout and restrictions on monitoring systems, using passive systems only, and not those emitting constant radiation.

2. **Built environment standards for people functionally disabled by electro-magnetic exposure**
   There are particular needs for appropriate built environment standards for those severely functionally disabled by electro-magnetic exposures. If these built environment standards are not implemented, then vulnerable persons can either be excluded from the built environment and have to live in caravans or tents in remote areas (as is the case at present in the UK) or become ill from the built environment. About 80% of people sensitive to electro-magnetic exposures are also sensitive to chemical exposures. Some countries, therefore, have built environmentally friendly or ‘green’ housing with regard to man-made environmental pollution from both electro-magnetic and chemical exposures. ‘White zones’, areas without man-made electro-magnetic exposure, are also a partial solution for those functionally disabled. The UK government was asked by the EU Parliament in 2009 and the Assembly of the Council of Europe in 2011 to provide such radiation-free areas for electrosensitive people, but it has yet to do so.
D. Availability of information on built environment standards and electro-magnetic exposure

Electro-magnetic exposure ratings (power density, electric fields, magnetic fields) in each built environment should be available to residents, workers and visitors. Some countries already undertake such monitoring and make the results publically available, as for chemical and particulate air pollution or water quality. This knowledge about radiation exposure levels would help people, especially those diagnosed by doctors as particularly susceptible to this radiation, to make an informed choice about the suitability of the housing, employment premises and public areas and facilities for their needs.
APPENDICES

(i) Table of biological built environment standards for electro-magnetic exposure

(ii) List of authorities requiring biological built environment standards for electro-magnetic exposure

*All these fields are class 2B possible cancer agents.

**Some people are adversely affected at levels below these biological limits.

(ii) List of authorities requiring biological built environment standards for electro-magnetic exposure or recognising adverse effects from non-thermal radiation

(a) The BioInitiative Report of 2012 summarises the current scientific majority view based on the weight of evidence; Seletun 2010 also gives international standards.

(b) The ICNIRP in 2002 warned governments to provide non-thermal limits at low levels of electro-magnetic exposures suited to subgroups of the population, such as
children, elderly, and vulnerable groups with compromised immune systems and functionally disabled (Category 1 above).

(c) The World Health Organisation in 2005-07 declared that symptoms of sensitivity to electro-magnetic exposures are real, an environmental intolerance, and not a known psychological disorder.

(e) The Supplement to the Standard of Building Biology Testing Methods SBM-2008 (7th edition, 2008) classifies electro-magnetic exposure levels for housing standards into Nil/Slight/Severe/Extreme levels of concern, all biologically based on current scientific evidence as reviewed by experts. ‘Slight’ is for sensitive and ill people. ‘Severe’ is unacceptable and requiring remediation. ‘Extreme’ is for immediate and rigorous action.

(f) The EU parliament in 2009 voted that the current levels of electro-magnetic exposure based on heating limits, as used by the UK government, were obsolete and should be replaced by biological ones and that sensitivity to electro-magnetic exposure should be recognised as a disabling condition.

(g) The Council of Europe in 2009 voted that individual governments should provide ‘white zones’ with housing free of man-made electro-magnetic exposures.

(h) The World Health Organisation’s IARC (International Agency for Research on Cancer) in 2001 and 2011 classified extremely low (power-line) frequencies and radio frequencies as possible cancer agents (2B). Leading scientists now say there is sufficient evidence for both frequencies to be classified as class 1, certain, cancer agents, making them inappropriate for use in any housing at levels above biological limits.

Michael Bevington,
Electrosensitivity UK

05 October 2015
Energy UK is the trade association for the energy industry. We represent over 80 members comprising generators and gas and electricity suppliers of all kinds and sizes as well as other businesses operating in the energy industry. Together our members generate more than 90 per cent of the UK’s total electricity output, supplying more than 26 million homes and investing more than £13 billion in the British economy in 2013.

Making efficient policy decisions in the energy sector requires a ‘whole systems’ approach. In practice this means assessing the interaction between different solutions, for example supply (generation) and demand (efficiency, demand management), as well as between the energy, heat and transport sectors. Under the Nationally Significant Infrastructure Project regime 26 energy projects have been consented, with a further 44 in the pipeline, and yet only a handful are being built. Despite the very significant cost of obtaining development consent, wider energy policy uncertainty is affecting investor confidence. Therefore planning policy and the built environment cannot be treated in isolation.

Our response below focuses on those questions which have direct relevance to the energy sector in respect of the built environment, but should be viewed against the need to ensure cohesive policy making across all sectors of Government.

Policymaking, integration and coordination

1. **Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?**

Energy UK believes that the decisions that shape England’s built environment are taken at the right administrative level, albeit as we note above in isolation of the wider policy framework. We believe that the current planning system has provided stability and investor confidence for large energy infrastructure developers, through the dedicated process for planning consents for nationally significant infrastructure projects (Planning Act 2008 Nationally Significant Infrastructure Projects). By frontloading the planning application process and enabling early stakeholder engagement with host community's developers are able to refine proposals to deliver the best outcome, and reduce the risk of protracted planning inquiries and delay.

We believe that it is essential that Government policy on planning remains stable and clear, as the consenting process needs to be predictable, timely and transparent to allow the private sector to come forward with confidence to invest in very large infrastructure projects.
We also believe that the interaction between national need and local policy must be clearly expressed in guidance and understood by local authorities and their partners. The reason for this is that the development of policies which devolve more decisions to the local level could have the effect of elevating local opinion over national need. This is a concern as it may have the effect of recreating the previous system, which often resulted in protracted planning inquiries and delays for essential nationally significant infrastructure projects, whereas the current regimes provide an appropriate balance.

Energy UK welcomes the establishment of a National Infrastructure Commission to take a long-term and cross-sector view on infrastructure. It will be important to ensure clarity on how the Commission’s role interacts with the national and local planning regimes, in order to avoid creating further uncertainty whilst investors wait to see the Commission’s first assessment.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved? National policy for planning and the built environment

We believe that the current planning policy framework is stable and generally provides adequate certainty, investor confidence and community input, yet it cannot be viewed in isolation, and must work cohesively with the wider energy policy framework. Additionally, a new national policy for planning and the built environment may undermine the current benefits brought about by the previous reforms, by elevating local opinion over national need, instead of the current approach which balances the national need for low carbon and sustainable energy infrastructure projects with the view of local people. A change in this balance could lead to a risk of protracted planning inquiries and delays.

In the electricity sector, the Government, with cross-party support, has implemented fundamental reforms to the electricity market, designed to provide a framework which will deliver decarbonisation policy objectives which the earlier electricity market arrangements were not designed to deliver. The Electricity Market Reforms (EMR) need time to work by bringing forward new electricity generation infrastructure. We believe that it is important that any new initiatives on infrastructure planning and built environment policies do not undermine those reforms.

Of particular relevance was introduction through the Planning Act 2008 (as modified by the Localism Act 2011) of the concept of National Policy Statements, to guide decision-making on Nationally Significant Infrastructure Projects (NSIPs). The Energy NPSs provide a stable policy framework for planning for energy infrastructure projects, and is one of the important factors for building investor confidence in new projects.

Energy UK believes that the Energy National Policy Statement (NPS) framework is fit for purpose. It is widely recognised that in order to deliver the UK’s energy policy goals of secure, affordable and sustainable energy, significant investment is necessary. To deliver
this investment, the industry requires a stable policy framework. Therefore, it is essential to retain the overarching policy framework that the NPSs for energy infrastructure provide.

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

Energy UK recognises the fundamental importance of a robust and predictable planning system in delivering sustainable development. We believe that large scale investment in electricity infrastructure is urgently required to replace existing generation plants. This is required to ensure secure and affordable energy supplies, and meet our climate change targets, in particular the legally binding target to deliver an 80% reduction in greenhouse gas emissions by 2050, as established in the Climate Change Act 2008. It is important that the transition to a low carbon economy is progressed efficiently to ensure that the competitiveness of UK energy supplies is maintained, while also ensuring the stability and affordability of energy prices.

We understand that it is essential that the right decisions are made when developing and protecting the built and natural environment. However, decisions need to be taken at a nationally strategic level to secure investment in large-scale low-carbon electricity generation and promote the transition to a low carbon economy incorporating a diverse energy mix. Equally, decisions on key gas infrastructure projects to ensure the ongoing security of UK gas supplies remains an important part of Government’s energy affordability and security of supply objectives, as the transition to a low carbon economy progresses.

Alongside the NSIP regime, we believe that the National Planning Policy Framework (NPPF) enables the Government’s statutory energy and climate change objectives to be met. It defines the UK’s national economic, environmental and social infrastructure needs and clarifies the planning priorities for all development under the Town and Country Planning Act (TCPA) regime. We actively support the overarching principle of having a “presumption in favour of sustainable development”. We believe that more emphasis should be given in the NPPF to the role of energy infrastructure within the TCPA regime, and in particular, as an important component of the Government’s growth agenda.

There were significant benefits to streamlining and rationalising the old suite of planning policy documents, however we are concerned that there are some instances where useful detailed guidance for developers and local authorities has been omitted, for example that in Planning Policy Statement 22 (“Renewable Energy”).

Local planning authorities and community stakeholders have opportunities to question and analyse major infrastructure projects through the nationally significant infrastructure planning process. This gives scope for the positive and negative impacts to be weighed as part of the Examination Process undertaken by the Planning Inspectorate (PINS). It is important that, in cases where developers may need to make applications for Associated Development as part of the same project under both national and local planning processes, the national need of the main project is a material consideration. We therefore believe that
the Energy NPSs should be a material consideration under the TCPA regime, and that this should be stated explicitly in the NPPF, in line with the wording in the designated NPSs (e.g. paragraph 1.2.1 of the Overarching NPS for Energy (EN-1)).

4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

A number of aspects of planning policy already deliver a spatial perspective, and we are not aware of a significant gap in policy in this respect. Before introducing a further spatial element to national policy, it is essential that any perceived policy gap is defined, with clear supporting evidence. The NPPF calls upon local planning authorities to produce Local Plans, which, once all Plans are in place, will deliver a cohesive picture of land use across the country, including identifying areas where renewable energy projects are particularly encouraged. In order to meet the UK’s future energy needs any low carbon and sustainable energy infrastructure projects must be considered on their merits with development not restricted to those areas identified in Local Plans.

Rather than introducing further changes to the NSIP and TCPA regimes Government should focus on assisting all local planning authorities to produce robust Local Plans in full consultation with their local communities, and within a specified timescale.

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

Planning for energy infrastructure requires a longer-term view. It would be prudent for those developing planning and future built environment policy to consider the infrastructure necessary to deliver the UK growth plans. For instance, the required massive expansion in new housing has a direct impact on energy capacity, and so policy makers need to consider not only the replacement of existing aged energy infrastructure, but new generation and other forms of energy, and the necessary connections to meet the nation’s current and future energy needs. Energy UK suggests planning for the UK’s energy needs should look to at least 2030 to deliver a stable long-term policy framework which would attract investors.

Buildings and places: New and old

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

Energy UK’s response to Question 5 refers.

Skills and design
9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

Energy UK believes that there is a strong need to reinforce planning resources, as lack of resource has, on occasion, hampered some local planning authorities in responding in a timely way to energy infrastructure applications. Sufficient experienced and knowledgeable planning officers are needed to manage and deliver the planning authorities’ wide-ranging duties and responsibilities under both the local planning and Nationally Significant Infrastructure Project (NSIP) regimes.

**Community involvement and community impact**

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

Energy UK believes that the front-ended NSIP regime allows for meaningful and early engagement with local communities and their representatives, which can help developers enhance their designs to accommodate local suggestions / address local concerns.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public

Energy UK’s response to Question 11 refers.

The Environment Agency and Chartered Institution of Water and Environmental Management – Oral Evidence (QQ283-307)

Transcript to be found under Chartered Institution of Water and Environmental Management
Eythorne Parish Council – Written Evidence (BEN0068)

Question 11- National Policy makers should involve the local community as a matter of course. Parish Councils know the local environment, the issues that are unique to the area and hold consultations with the community but their expertise is often completely ignored.

Question 12 - Local communities are not necessarily consulted even when companies are planning large scale developments. (DOV 14/00477). It should be mandatory for a public consultation to be held if the proposed site is to be above a certain number of dwellings in a rural area or in a conservation area or an area of outstanding natural beauty.

The time scale for submitting evidence to an appeal lodged with the Planning Inspectorate is insufficient and does not allow local communities, particularly Parish Councils, to prepare their response adequately. Developers can take months to perfect their appeal paperwork but members of the public can have as little as 21 days. The imbalance needs to be addressed. (i.e Barville Wind Turbine APP/X2220/W/14/300041 and Monkton Court Lane APP/X2220/W/15/3103239).

Farrells – Written Evidence (BEN0139)

Written Submission from Max Farrell, on behalf of the Farrell Review for Architecture & the Built Environment Policy

Max Farrell, on behalf of The Farrell Review of Architecture Policy, welcomes the opportunity to submit to the House of Lords Community on National Policy for the Built Environment.

In summary, our recommendations to the Committee are as follows:

1. The UK’s planning system needs to be proactive rather than reactive, anticipating rather than responding to the future needs of our towns and cities. By planning proactively like other countries do, we would anticipate issues like the national housing shortage or susceptibility to flooding and address them before they reach crisis levels.

2. Places would be greatly improved if the people who make decisions about our built environment, such as planning committee members and highway engineers, were empowered by training in design literacy. Local planning authorities should also set out a plan for attracting and retaining the best and most design-literate individuals for planning departments.

3. The Government’s Housing Design Panel to ensure more representation from a range of disciplines, including planning, landscaping, conservation and design.

About the Farrell Review of Architecture Policy

Sir Terry Farrell was asked by the Department for Culture, Media & Sport (DCMS) to conduct an independent review of Architecture and the Built Environment in March 2013. The Review has engaged as widely as possible to help DCMS develop its thinking about the role for government in achieving high-quality design and to help the built environment sector address the important issues of our times. The Review published its findings in March 2014 and its final recommendations can be found here: http://www.farrellreview.co.uk/download

Sir Terry Farrell conducted the process independently and was supported by an expert advisory panel made up from members of the built environment industry.

Policymaking, integration and coordination

The built environment has seen enormous flux within government over the years, moving between many different departments. For this reason, policies should be developed which are enabled by government, but led independently by the industry. The Farrell Review recommended that the future lies in empowering cities and localities, with central government increasingly taking on an enabling role.
However, central government can do a lot to support the built environment and encourage quality placemaking. The Farrell Review of Architecture (FAR) welcomes the decision to move architecture from the Department for Culture, Media & Sport to the Department for Communities and Local Government so that planning and housing policymaking sit together. We also welcome the establishment of the Housing Design Panel. However, more can be done at a central level; for example:

- Build and expand on the Housing Design Panel to ensure more representation from a range of disciplines, including planning, landscaping, conservation and design
- Adopt a range of consistent policies within and for each department with built environment in their portfolios
- Ensure that all government decision-making panels for major infrastructure reviews have design and planning professionals represented
- Provide official endorsements for built environment professionals working on high-profile projects overseas and recognise the soft power it brings
- Recognise building design as closely connected to manufacturing in order to acknowledge the export value to UK plc

National policy for planning and the built environment

One of the central themes of the Farrell Review has been the recommendation to open up the planning system and embrace a new proactive approach to planning. Anticipating needs and opportunities, not simply responding to proposals for new development, and looking at places in their entirety, rather than just at individual buildings and their design, is essential to create healthy, sustainable places.

This requires a fundamental, philosophical rethink from everybody involved in the system – from architects and developers, to policy-makers and communities. Policies should be developed which are enabled by politicians, but need to be led independently by the industry and the very communities themselves, with the focus of these policies being the core “places” of villages, towns and cities. The stewardship, long-term planning and identity of real places should be a fundamental part of built environment policies. The future lies in empowering cities and localities and the people that live in them.

Our planning system has become too reactive and relies on development control, which forces local authority planners to spend their time fire fighting rather than thinking creatively about the future shape and form of villages, towns and cities.

Everything is open to negotiation for every planning application and, as a result, huge amounts of time and resources are spent on issues that could have been predetermined by a collective vision shaped in collaboration with local communities, neighbourhood forums
and “PLACE” (Planning, Landscape, Architecture, Conservation and Engineering) Review Panels.

Proactive planning would free up valuable time for local authority planners to develop masterplans and design codes which are supported by local communities, whilst reinvigorating the planning profession and its public perception.

**Buildings and places: New and old**

Proactive planning is essential in order to help us address issues of housing supply, as the only way of persuading those already housed of the benefits of more housing is by presenting a credible vision of the future.

We have already seen with neighbourhood planning that it can make an incredible difference to the way that people think about new development and new housing. The private sector is supportive of this approach, as it gives them certainty and a greater guarantee of success in terms of securing consent for a planning application.

In terms of sustainability, government and industry must show leadership. Sustainable design should be incentivised and the right kind of leadership at city level should be championed.

Our existing buildings are a valuable resource, and the Farrell Review recommended that retrofitting should lead the carbon emissions and climate change agenda. The government should legislate to address the disproportionate VAT on retrofit and redistribute it to new build if necessary. As research from the ‘Cut the VAT Campaign Coalition’ has demonstrated, while there might be a short-term impact in VAT terms, it would provide much greater fiscal stimulus overall by increasing demand and boosting the construction industry through supply chains and increasing the workforce.

Architecture schools should include refurbishment and low-carbon retrofitting of old buildings in their curriculum and conservation and heritage issues in course content. This is an emerging and high-value market, and these skills are increasingly sought after, so they should be developed early and then with Continuing Professional Development (CPD) whilst in practice.

**Skills and design**

There is an urgent need to ensure that local decision makers are adequately trained and skilled to make the significant decisions about the built environment that they make. Places would be greatly improved if the people who make decisions about our built environment, such as planning committee members and highway engineers, were empowered by training in design literacy.
The Farrell Review recommended that newly elected councillors (who already receive mandatory training on financial and legal duties) should receive placemaking and design training at the same time. Information and communications technology should be used to make the most of people’s time when volunteering to skill up decision makers, and CPD points should be offered by PLACE institutions to incentivise this.

There is also a need to attract the best students into local authority planning departments. We urge the government to support a proposal being developed by Finn Williams, former Regeneration Area Manager at the GLA and former Deputy Team Leader of Placemaking at Croydon. He is exploring options for a programme that, in the style of the ‘Teach First’ initiative, seeks to place newly qualified planners into local authority planning teams.

**Community involvement and community impact**

We have discussed elsewhere in this submission the impact a more proactive planning system would have on encouraging and generating greater and more positive engagement from communities in development, placemaking and design. Neighbourhood Planning has done much to galvanize and excite many communities by providing them with a real chance to engage early on in the future shape of their towns and villages. We strongly support Neighbourhood Planning and recommend the government looks at how it can “scale up” this approach.

The Farrell Review also recommended the creation of ‘Urban Rooms’ around the country to engage local communities in exploring the past, present and future of that place. These Urban Rooms would be an opportunity to communicate an area’s Local Plan – which can be very dense and technical documents – into a more engaging visions for the future. We are delighted that since the Farrell Review launched over a year ago, around 18 Urban Rooms have been opened across the country. We would urge both central and local government to support these centres of exploration – if not with direct financial support, then with words and resources.

Supplementary evidence on Government policy and SME house builders access to finance

Select Committee on National Policy for the Built Environment

Ministers in the previous and current Government have sought to respond to the difficulties in accessing finance faced by small house builders. The Builders Finance Fund was put in place in 2014, and the lower threshold was reduced from 15 units to 5 units. This pot of funding was consolidated with other schemes and extended to 2020/21 as a £1 billion fund in the 2015 Spending Review. Though we do need to look at some of the barriers to take up, this funding pot is very welcome and is part of an improving environment for SME builders.

However, FMB survey evidence suggests that access to finance challenges remain severest for those developing the very smallest sites, and for small contractors and other new entrants seeking to access finance to bring forward their own developments – these firms invariably find themselves refused because of their lack of ‘track record’. Government could look to see what more they can do to reach these firms through current funding schemes like the Builders Finance Fund.

The Government has also co-invested through the Home and Communities Agency with Lloyds Banking Group in the Housing Growth Partnership, which is seeking to make equity investments in projects with a gross development value (GDV) of between £0.75m and £12m. If the terms of investment are right, this approach will allow small developers to expand and open up more sites by reducing the capital they need to invest in any one project. As such, if we are looking to expand the capacity of the SME sector, this approach should be a productive one to take.

However, ultimately, until the lending positions of major banks change, it seems unlikely that the sector will receive finance on the scale and on the terms it needs to drive a real transformation in the output of SME house builders. For this reason, we remain convinced that some form of guarantee system on loans to SME house builders would be the most effective means of ensuring an adequate supply of finance to this sector.

Examination of Witnesses

Chris Carr, Chair of the Home Builders Group, Federation of Master Builders, and John Slaughter, Director of External Affairs, Home Builders Federation

Q94 The Chairman: Welcome to this evidence session of the Select Committee on National Policy for the Built Environment. Thank you very much for giving up your time. I know that everybody is busy nowadays and to give this slot of time is probably a bit of an irritant, but it is very valuable to us. We learn a huge amount from these sessions, so thank you for doing it. You have in front of you a list of the interests that have been declared by members of the Committee. A transcript of the meeting will be taken and published on the Committee’s website. You will of course have the opportunity to make corrections to that transcript where necessary. I begin by asking each of you to briefly introduce yourselves, please, to the Committee. This is for the record.

John Slaughter: My name is John Slaughter. I am the director of external affairs for the Home Builders Federation and am responsible for quite a wide range of policy issues within the federation. I have been working in the housing field for more than 12 years now.

Chris Carr: I am Chris Carr, the managing director of Carr & Carr (Builders), based in Cleethorpes in north-east Lincolnshire. It is a family-run business and has been running for nearly 100 years. My son is now the fourth generation to join the company. By trade I am a
carpenter, although I sit behind a desk for most of my time now. Until the recession, probably 90% of our work was in building new homes but during the recession, we dropped off and went on to doing contracting and listed building work, purely because of the housing market. So from 10 to 15 buildings a year, we dropped back. In the last five years, we built one house, but we are now back on to the market and have started building again.

**The Chairman:** What do you see as the total for this 12 months, starting now?

**Chris Carr:** We have one site with four units, which we are in the middle of, and we have just got a site for 96 where the infrastructure is going in now. By the time we have the Section 106 agreed, the conditions lifted and the infrastructure in, we will probably start in the middle of next year. We will probably still build only 10 or 15 a year at the moment.

**The Chairman:** But are you feeling more hopeful?

**Chris Carr:** Oh yes.

**Q95 The Chairman:** Good, thank you. You have had a list of questions. The first question is from me. The Committee has previously been told that the private sector will only ever deliver around half of the new housing required in England. Why is this? How many new homes, in your view, is the private sector able to deliver over the forthcoming years, and how in broad terms might it deliver more? I suppose you will say that if the economy is booming, companies such as yours would be able to, but over to you.

**Chris Carr:** The crash in the housing industry was predominantly everywhere bar London. I spoke to a gentleman down at Canary Wharf who said that the recession was for 18 months. We need to get away from that. It has been five years where we are, and we are only just coming out of it now. There has to be an understanding that London and the south-east are almost their own market. We need to remember that, because I represent builders from all over the UK.

We are looking at a benchmark of 220,000 homes. Historically, we managed to build 150,000 in the private sector before the crash. I still see achieving that again as being a long way off. The key constraint at the moment, I suppose, is skills. It is brought up over and over again and is still a key factor, but my members say that the biggest problem is still finance. The SME sector is still struggling to access finance through the traditional banking system, and having to look at alternatives. We can bring the numbers up. I do not think we can achieve the
150,000 straight away. It will take a few years to get up to that sort of level. My biggest worry is the amount of developing companies that have gone out of business, or pulled out of it. We were building two-thirds of all new homes around 25 years ago; we are now down to a third. So we have lost a third of the capacity, and with the greatest respect to the national housebuilders they cannot take up that sort of slack. They are doing very well to deliver the numbers, but when you lose a third of your industry it is a big problem. Even though we are coming out of the recession, the NHBC announced at its AGM that it has lost 400 registered builders in the last year. Yes, we are on the up, but we are still managing to lose 400.

The Chairman: How many registered builders are there?

Chris Carr: I cannot give an answer for that. I am sorry that I do not know.

The Chairman: Perhaps we can follow it up by asking HSBC.

Chris Carr: It is the NHBC.

The Chairman: Oh, the NHBC—I thought you were talking about the bankers and finance. I will pursue one point. You mentioned skills. I have been getting a lot of questions saying, “What you mean by skills? Everybody’s got skills”. So what are the real deficits in the areas of skills? Is it in architecture, brickies or roofers, or whatever?

John Slaughter: From the data and from talking to our members, it is a range of roles. If you talk about sites, site management is a key function. Certainly it is in some of the professions, such as quantity surveying. We all know that nationally there are not enough planners to go around anyway. But it is also in key trades such as bricklaying and carpentry. There is a range of roles where we need to have more people with the right skills coming into the industry. It is about attracting people who are already in the workforce and may have previous or relevant experience, as well as people coming into the workforce for the first time.

The Chairman: In an ideal world, if there were no constraints, how would you overcome this lack of skills? Would it be through further education colleges, more apprentices, or what?

John Slaughter: Again, it will be a range of things. Certainly, it would be through having more apprenticeships, but personally I am very keen on the new generation of university technical colleges. As a bridge between technical, vocational and academic education, they offer a lot of opportunities to bring more people into the industry in a creative way. Five or six UTCs already have a construction or housebuilding affiliation, but we would like to see a lot more
of that kind of initiative. It could be in restructuring of the Construction Industry Training Board’s support mechanisms. The construction sector is almost unique; only one other part of the economy has an existing levy and grant system. From the housebuilding perspective, we are pressing hard for a reform of the CITB in a way that will make the support it provides far more attuned to the requirements of our industry, so that we can add much more value by bringing more people into the industry.

**Lord Inglewood**: This is a quick question. One of the big political questions of the day is the immigration of people, particularly from eastern Europe, to work in the building trade. Are they taking jobs from British people, or would you be unable to build even what you are now without them?

**John Slaughter**: I think it is the latter; we need these people to come in. You cannot switch on a new apprentice, as an apprenticeship is a two or three-year process to get someone up to speed, so if the need is now there is probably no alternative. I do not think they are actually taking British people’s jobs. We need both, in reality.

**The Chairman**: That is reassuring, actually—it hits other buttons.

**Q96 Baroness Andrews**: I have a couple of short questions. What you said about the UTCs is very interesting, because that model fills the gap between very high-spec engineering-type training and the sort of skills that you can really put to use quite quickly. You recommend them, but we obviously need more, as you say.

**John Slaughter**: A lot more, I would say.

**Baroness Andrews**: You mentioned finance. Can you explain a bit more about where the difficulty actually presents itself when you come to try to fund your developments?

**Chris Carr**: The finance is quite crucial to us. We have been with our bank for at least 80 years and we are now deemed as a risky project for no other reason than we are an SME housebuilder. Gaining finance from banks in the traditional way is quite harrowing at the moment. We are having to look at alternatives. I chair the FMB’s homebuilders group. When we spoke to a group of our members the other day, of the 12 ladies and gentlemen there who are based all over the UK, six or eight of them borrow off friends and private investors, normally people who know them and so know that their money is safe. That is what a bank used to do when your bank manager knew who you were. They trusted you, and you did not
want to let them down because they were almost a personal friend. It has got to the stage now where we are purely a number, and because our number comes under the category of an SME housebuilder we are refused point blank.

**Baroness Andrews**: Is that to do with the size of your firm or its function?

**Chris Carr**: That is the million-dollar question. We do not know why. It is just that we do not have bank managers any more; we have relationship managers.

**Baroness Andrews**: So you do not know why you are in that category?

**Chris Carr**: They take a report and send it off to the head office in Leeds or Birmingham. Then they send it back saying whether they will lend or not. They will not give you the criteria. We had a relationship with a bank for more than 80 years. We never defaulted on a payment, we always paid, and they made good money out of us over the years. It is just that it now goes from my relationship manager, since we do not have bank managers, who feeds it into a computer—and the computer says no.

**Baroness Andrews**: Do you have a date for when that changed?

**Chris Carr**: It was within a year or 18 months of the recession coming in. The banks were heavily into the national housebuilders, by the billions, and knew that they had to pull back as an industry. They had overstretched themselves in the construction industry, so the easiest people to hit were the ones in the middle. They could not pull the plug on the ones at the top, who owed so much, and the ones at the bottom they did not know a great deal and that were not the problem. It was the ones in the middle, the genuine SME entrepreneurial house developers, for whom they just stopped the finance.

**Baroness Andrews**: May I ask a question following on from that? Have you as a group, a trade association, gone to see any of the banking groups or authorities?

**Chris Carr**: We have. Emma Reynolds MP and Chris Leslie MP held a meeting with the FMB and some top people at the banks to see where the problems were. They did a great job. Emma Reynolds did a fantastic job in finding out what the problems were, but I think even she was shocked by the attitude of the banks. When they went around the room and asked them who would lend to the SME sector, they all sat on their hands. A couple—Lloyds and Nat West, possibly—said that they were interested. I thought the others might give the idea
that they would lend, just because they were in front of two MPs, but they did not. They just said, “We are not interested”.

**The Chairman:** Yes, but surely you could aim higher than that. You make press statements, do you not?

**Chris Carr:** Yes.

**The Chairman:** You could say that this is some of the evidence you gave to this Committee, or whatever, but Carney ought to know that this is going on.

**Chris Carr:** I think that people know it is going on.

**The Chairman:** They are a block on progress and on fulfilling the Government’s objective.

**John Slaughter:** I think that is right. Perhaps I could come in on this. I also want to come back to your initial question about whether there is a limit on what the private sector can deliver. The answer is no, not really. If you have favourable economic conditions and a sensible policy and regulatory framework, then in principle the private sector can grow as far as it needs to grow. We would not say that there is any particular limit on what the private sector can deliver, but a key part of that picture is the issues that Chris has touched on. We have seen a reduction of 75% in the number of SMEs in housebuilding over the last 25 or 30 years. We really need to remove the barriers to entry for small businesses, and to enable them to grow into big businesses. If we are to be successful over time in meeting the housing supply challenge, we need to do that.

Finance is part of it. Our perspective is that finance has been improving for smaller companies. It is not perfect, but another key point here is that smaller businesses often rely essentially on project finance, as opposed to wider financial facilities, so it is a different type of dialogue. From our members’ feedback, part of the reflection of the tightening of the banks’ attitude to project finance for small companies was in effect that they were expecting small companies to put more equity into project finance themselves. That would obviously challenge their ability to either stay in the market or grow their output. Some of the initiatives which the Government have taken recently are trying to address those types of issues and help with that side of things, but we need to do a lot more to help small companies.

**The Chairman:** Maybe when wearing your hat as a trade association, you ought to get together. I do not want to pursue this point, because we have a lot of questions, but it
coincides with a lot of complaints out there in the financial world about the loss of that relationship management. I know that the Treasury is trying to do even more to make it easier—there was even something in one of the papers yesterday. On the back of these questions, Lady Whitaker wanted to come in, and then Lord Inglewood.

**Baroness Whitaker:** I have a very quick question, returning to the issue of skills. Mr Slaughter mentioned an increase in CITB support. I know that it has gone down considerably and was very valuable. How should this be funded?

**John Slaughter:** It is about the use of the funding that the CITB already has. Through the levy from the construction sector, it generates annually about £160 million—

**Baroness Whitaker:** So it has enough.

**John Slaughter:** It has enough; it is just the way that funding is used. From our point of view, the funding has not been used in the best way.

**Baroness Whitaker:** But is not the industry represented on the CITB to say how the money should be used?

**John Slaughter:** It has been, but this is a very big subject. The CITB is in the midst of a process of significant change and governance restructuring. The old structures did not really work very effectively, so that from our point of view our voice was rather lost in the way that the CITB worked, even though we had representation. There is a genuine feeling in the industry that we could invest far more effectively for the future in the skills that the housebuilding part of construction needs, if the CITB were more responsive and working in a way that properly understood how the industry is structured and where the money could gain most benefit.

**Baroness Whitaker:** If you wanted to send us a note on your ideal CITB, that would be very helpful.

**John Slaughter:** I am very happy to do that.

**The Chairman:** You took the words out of my mouth, because we do not want to spend much time on this. But you obviously know all about it, and I certainly do not know anything about it. It would be most helpful if you could give us an aide-memoire on this.

**John Slaughter:** Yes, that is no problem.

**Lord Inglewood:** One quick question, if I may. You have spoken to us about the lending policies of banks. Is it your evidence to us that the banks’ lending policies have a direct and
material responsibility for at least some of the shortfall of housing that is needed in the country today?

The Chairman: Yes or no?

Lord Inglewood: It is a yes or no answer really.

Chris Carr: A very big yes.

John Slaughter: And it would be a yes from us as well.

The Chairman: Let us have the next question.

Q97 Baroness Rawlings: Thank you for your very clear answers. I wondered how the local plan-making process might be improved to allow the delivery of a greater number of new homes. As you know, we are preparing a report for the Government, which will be debated. There are ways that we might improve the process and develop ideas. What are your views?

I do not know whether you saw Clive Aslet’s idea in the Times this week about out-of-town shopping centres and large land areas. He said that shopping centres often occupy what were large farms and are “not strictly ... brownfield sites, because they’re still in use”. He went on: “Keep the ground-floor shops, put the cars below ground and raise four or five storeys of housing on top”. To help to do this, he said, “Changes to the tax system could be introduced to incentivise them”. Apart from having large areas of land, one of the most important parts is that they have the infrastructure there. Aslet said: “At present, the push-me, pull-you of planning delivers the worst of all worlds: unhappiness to nimbys, not enough houses for the chancellor and misery for those” who would like more houses. What are your views on that?

Chris Carr: The local plans play a very important role for all new housing. I know that you talked about building above out-of-town shopping centres, but that would work in very few places. In London, it would be great, but in Grimsby I could not see that doing that would make any difference whatever.

Baroness Rawlings: But what about putting the cars underneath so you can build the houses on top?

Chris Carr: I understand that we cannot have car parks underground in flood-risk areas. There would be no desirability or commercial viability in probably three-quarters of the UK. It would work in certain key areas—your Londons and your Bristols—but not even, I would think, in the northern powerhouse of Manchester. I do not think that would work except in a limited
amount of places. The trouble is that the local plans are based mainly on these big strategic sites, which will not give the numbers you are looking for. If you have a planning application that delivers 2,000 units on a site, it will still probably deliver you only 40 units a year—and if you had two developers on that site, it would deliver you only 60 units a year. So if you have two national builders on a 2,000 unit site, it will deliver a maximum of only 60 to 80 units a year.

Delivering more of the larger sites will not deliver the numbers we are looking for. We need more of the smaller sites. We need everything and everybody—all the local towns, hamlets and villages—to take their fair proportion. Percentage-wise, in a hamlet with six houses you might build two houses. In a village of 1,000, you might build only 20 houses at the side of it. That is more sustainable and deliverable, and you will get the numbers growing a lot quicker than you would on those big strategic sites.

**The Chairman:** Is there not also a feeling that we want people to be going not “up and up” but “out and out”? The big thing about that Clive Aslet article is that he is a man, obviously. Women do not like going into those underground or multi-storey car parks. None of my friends would want that, because they have a bad name and you never can find your car, and goodness knows what else. So there are problems with multi-storey car parks. I think the answer is what we saw in the Elephant: keeping cars underneath the houses and away from the general traffic-flow areas.

**John Slaughter:** Certainly that model can work, as Chris says, in particular market contexts. To broaden it out, we need to be inventive and look at all such opportunities. In the housing sector, one of the Government’s reforms that has helped to boost housing volumes over the last couple of years has been permitted development rights to convert vacant office premises into residential—

**The Chairman:** That is true.

**John Slaughter:** The Government recently confirmed that that flexibility is to be made permanent, so a range of things can be done on the supply side. None of them will solve the problem individually, but we could take enough measures across the board by looking at opportunities to be inventive, such as using out-of-town shopping facilities. I am aware that there are situations where out-of-town developments may not go ahead or get scaled back
because of changes of fashions in the way that we all shop and live. We have to be open to all these flexibilities and possibilities.

To go back to the big question of what we can do to make a difference through the local plans, first, we really have to stick with the system as it has been reformed under the NPPF—a helpful set of reforms. We are very pleased that the Government are saying in the Housing and Planning Bill that all local authorities should have a local plan in place by early 2017. Within that, from the housing perspective, it is a question of ensuring that the local plan properly assesses what housing requirements are and then makes the right land supply allocations for them. The points that Chris raises are very important in that respect. We totally agree that an overreliance on a few large strategic sites is not necessarily the right way to go. You need strategic sites, but you need a whole range of different sites. In fact, the way the market works, the more active sites you have across an area the more you can build up supply, because any individual site tends to have an absorption limit. Housing markets are very local in practice, so you need as many active sites as you can reasonably have across an area.

**Q98 Baroness Young of Old Scone**: I have a question for Mr Carr. You said that even on the strategic sites, the big builders will deliver only a very limited number of houses. Why is that?

**Chris Carr**: It is about physically delivering the houses when they take such a long time to build up now. It is probably three or four months before you can complete a property, with the infrastructure going in. It is not an easy process.

**Baroness Young of Old Scone**: You do not think that there is any dragging of feet to keep prices up.

**Chris Carr**: No, I would not like to say that about the national housebuilders. Can we change the subject?

**Baroness Young of Old Scone**: Think it and we will read your mind.

**Chris Carr**: You are very good at mindreading. To a certain extent I think there is, but they want to deliver as many as they can. They have shareholders demanding that these houses are built, so, in defence of the national housebuilders, they cannot drag their heels too much. Building a new house is a slow and complicated process; there are so many things to go into it that it is no easy thing. We need to find easier ways to develop new homes, which might increase the numbers.
**John Slaughter:** There is a limit. You obviously have to sell at a price that is viable, so that is a factor, but there is also a market absorption level. Another way of looking at this is that every builder has their own market space. They are not all necessarily competing for exactly the same customer base, so in any given area there will be a limit on the number of sales you could reasonably make on a type of development. That brings you back to the question of having more active sites, because if you do you will have a bigger range of builders active—and they will be in different parts of the marketspace. You will have a more varied product offer overall, which is what the market needs to flourish.

**Baroness Andrews:** May I pursue this?

**The Chairman:** Yes, but we are running out of time on these questions, and Lady Parminter is before you on the lists that we take from your signals. We do that very fairly.

**Q99 Baroness Parminter:** Can I tease it out a bit more? You are suggesting that if more sites are available and there is a fully functioning local plan and sufficient finance, effectively the sky’s the limit for how many houses you can build. But the evidence we have had from some people in the public sector, and indeed others in the industry, is that there is a limit on the amount that the volume housebuilders will build to meet the Government’s targets, just because of the nature of your market. It is just the way a competitive market operates. Would you confirm whether there is a limit to the amount that the volume housebuilders could deliver in meeting the Government’s agenda? You seem otherwise to be suggesting to us that you could meet the whole need.

**John Slaughter:** I should be clear that I am not saying it would be just through the existing volume housebuilders. They can grow but the point that Chris and I are making is that ultimately we need more players on the pitch, because the more businesses that are out there, the more sites they are operating. That is how, touching on the answers I have just given, we could actually build up supply. The large builders have grown since the recession, and, if you read their trading statements, they are still planning to grow further. But it is fair to say that if we are to get to the levels of output we would all like to see in a relatively short time, that would be much assisted if we could bring more players into the market.

There is no physical limit as such, but there are investment decision points if you grow a business beyond a certain size. This is a very quick aside. The big builders effectively comprise
an agglomeration of regional business units. When they are growing they have to open new regional business units, each of which has infrastructure and set-up costs. You need to be confident that you can grow your business to that extent and sustain it. You do not want to open up that capacity and then, given that it has traditionally been a fairly cyclical market, have to think about closing it down again. There may be reasons to be quite judicious about how you grow your business, but there is no actual physical reason within the nature of the industry why it cannot happen, and it does.

**Baroness Andrews:** I want to drill down a bit more on the management of these strategic sites. Are you not essentially talking about market absorption in relation to private homeowners?

**John Slaughter:** Yes.

**Baroness Andrews:** The other players in the field are essentially local authorities and social landlords, so on a strategic site you would obviously get a lot more building than the current market has.

**John Slaughter:** Oh yes.

**Baroness Andrews:** I just want to make sure that we do not all run away with the impression that these sites are lingering half-empty for donkeys’ years.

**John Slaughter:** No, that is right.

**Baroness Andrews:** What do you see as the relationship these days between the private and public sectors in terms of building? First, are there opportunities for more partnership and co-operation? Secondly, we are moving from S106 over to CIL—the community infrastructure levy. Can you tell us something about how that is enabling or inhibiting development, from your perspective?

**The Chairman:** Can I interrupt for one moment? Could you send us that answer, as we are really running out of time? What Lady Andrews asks seems technical but I could be wrong and there might be something that we could get on that.

**John Slaughter:** Yes, we could send a note based on the work that we do on CIL around the country.

**The Chairman:** That would be very helpful, thank you.
Baroness Andrews: But on the first question, this relationship between the public and private sectors is quite important for innovation and prompting the market.

John Slaughter: I know that we are short of time, but it is probably worth saying on that first question that of course we are in a landscape that is changing quite significantly at the moment, with the Housing and Planning Bill as well as some of the other changes that the Government are introducing. The larger housing associations—what we tend to call the developing housing associations—are in many ways moving closer to a private sector model, so that necessarily opens up opportunities for collaboration perhaps in ways that did not happen in the past.

Baroness Whitaker: Very quickly, I want to return to the time that it takes to build a house, which Mr Carr talked about. I have seen very economical and well-designed prefabricated houses, both in the UK and abroad. Is this a useful technology that we should be encouraging or even incentivising?

Chris Carr: No.

Baroness Whitaker: Why? I asked for a quick answer, but I think that we need just a little background.

Chris Carr: We have looked at this. We are driven now by quality and design. With prefabricated, you probably get the quality but you do not get the design—they are premanufactured. You will get the same property over and over again.

Baroness Whitaker: You get the quality but not the design?

Chris Carr: For the design, you almost pick the design off the shelf. However, we are being told that we need more unique new homes—something that stands out and something that is going to last. The prefabricated homes are not brick and block, which is traditional in the UK because of our adverse weather; they are mostly timber-framed. There is a market for them. Some of the custom-build sites to deliver new homes, which we are potentially looking at, could work in that market, where you develop a site with infrastructure and you literally pick a home off the shelf. That could work, but not for mass-produced. I think the National House Building Council has looked at the idea and the SME sector has definitely looked at it—and it is fairly popular in Scotland—but it does not attract the type of clients who buy our homes.
The Chairman: Is rain the only problem?

Chris Carr: Driving rain is the problem.

The Chairman: In Scandinavia, they have lots of them.

John Slaughter: Our perspective on this is probably a bit different from Chris Carr’s. Among our members we have all the large-volume national builders as well as smaller companies. Some of the volume builders use off-site manufacture. From all the work that has been done on this during my time at HBF, the main reason why there is not greater use of off-site manufacture is essentially economic, in that unless you have assurance of a real volume of production from the offsite manufacturing, the upfront capital cost is not necessarily competitive with traditional methods.

Baroness Whitaker: So the return is lower?

John Slaughter: Yes. It has many other potential advantages. I accept Chris Carr’s point that it may not be the right thing for certain types of development, but if you are a volume builder using a range of house types, it could work quite well. However, if the economics are not attractive, obviously you will not go into it. The idea is being looked at again at the moment, and—to tie this back into skills—because of the skills issue, if we are going to grow output, the economics of offsite manufacture may become more attractive and there may be a bigger take-up of it in the next few years.

Baroness Whitaker: That is very interesting. Thank you very much.

Q100 Baroness Young of Old Scone: Can we talk about the green belt? The greenbelt policy has been long-standing and has done some good stuff on stopping urban sprawl and settlement sprawl, but is there a need now for a change of policy? If so, how would that deliver its traditional benefits and, in particular, promote the sustainability and environmental agenda? Would it need to be set alongside a policy of still having brownfield as a priority?

John Slaughter: I do not think there is a need for a change of policy as such. The current planning rules—the NPPF and associated guidance—allow for greenbelt use through local plans where that is reasonably justified. There are undoubtedly a number of parts of the country that are severely constrained by the existing green belt and are unable to grow within their existing area without potentially looking at some revision of greenbelt boundaries. The
ability to look at that is already available within the planning rules. I do not think that we would suggest that we need to change those rules, but it may be helpful for the Government to reiterate that that flexibility exists and, if a proper case can be made for some change to green-belt allocations, it can be looked at. Within a green belt, there are often areas either of what are in effect brownfield land that have been used previously or that are of relatively low environmental quality. So if there is a sensitive review of the options for redrawing the green-belt boundaries, we would not want that not to be looked at where, otherwise growth simply cannot be accommodated. It has to be a sensible way to go.

The Chairman: Do you agree, Mr Carr?

Chris Carr: Yes, I do agree. There needs to be a common-sense approach. To put a line through everything and just say, “Yes, we can build on green-belt land”, would be wrong. I think local authorities should think about whether there are areas that they need to develop that are in the green belt rather than just say that there is an open policy to develop. I am very keen on brownfield developments, and our members are very keen on brownfield developments. I do not like so much the out-of-town developments for shopping.

In many smaller northern towns, such as where I live in Grimsby, and Cleethorpes in North East Lincolnshire, our local authority is pushing heavily for regeneration of the centre of Grimsby to stop everyone moving out. That incorporates having a nightlife economy—so we need to make sure that there is an after five o’clock economy—and we need to make sure that the younger people and the elderly who want to live in the centre of town have the right facilities there. If you have a family, you traditionally move out to the outskirts, but you want to move in as you get older. We need to cater for that, so I think that there needs to be an overall package so that we do not destroy the town centres. I am doing some work with Central Bedfordshire Council on exactly the same thing for one of its towns, because the council is frightened that if everything is put outside the town, the inside will suffer from the doughnut effect, which we have all heard about. I think there needs to be a combination of the two, so we need to look at greenfield, but we certainly need to look at town centre regeneration rather than think that we can just add numbers to the outside of the town. That would be a short-term win, but in the long term it would absolutely destroy our towns and cities.
The Chairman: We saw quite a good example of that last week when we went to Birmingham—it was really amazing—where they are doing both.

Baroness Andrews: May I ask a short follow-on question? Mr Slaughter made the precise point that the change-of-use arrangements for permitted developments—from offices to housing—would make a big difference. This is clearly one of the things that will revive and sustain town centres. What about the use of shops? Clearly, the whole retail landscape, which we have not talked about in this Committee, is completely changing, and that is having a devastating effect on the normal patterns of shopping and therefore on town centres. That will also have an impact on planning. Do you see the town-centre challenge as also being about bringing a new sort of accommodation—literally accommodation, from shop fronts and everything else—into different sorts of uses? Small builders would have a particular role in that sort of development.

Chris Carr: New shopping is not a problem; converting existing shops is quite a logistical problem for sound, for fire and for everything else. It becomes not particularly commercially viable to take an existing unit and turn it into housing above. The cost is prohibitive, so we just cannot do it because of the regulations—rightly, for safety you need fire exits, but you might have sprinkler systems, so you need to rip out the whole interior and redo it. You also need sound-proofing from building to building and from room to room. All those things just put on additional cost, which means that it is not commercially viable at all. However, it would be viable with new build. If you were doing new-build shopping centres of shops, yes I could see that you could influence them to do that. But for existing shops, the issue is commercial viability. We looked at it for our local authority, and it just did not stack up.

John Slaughter: There are other things that can be looked at in terms of town-centre opportunities. Another issue that we are working on quite a lot at the moment is improving the supply of retirement housing for older people. Very often, the ideal location for that is in the town centre or very close to the town centre. That could help bring new life into town centres. I know that this is not on your list of questions, but it would probably be helpful to mention that as part of the picture as well.
Q101 Baroness Andrews: I think this question has been answered in some ways. It is about the disparity between the granting of planning permissions and the actual build out. Is there anything that you want to add on that to what you have said already?

John Slaughter: We have done quite a lot of work on this as the HBF, so yes I have some additional comments. It is quite a complex picture, but let me recap and clarify the implications of some of the things that we have already discussed. One reason would be the effect of altered local plans, where a lot of weight has been put into a relatively small number of large sites. When you look at the statistics, when a consent is given for a large strategic site for, say, 2,000 units, that is what will show up in the consents. However, as we have discussed, those 2,000 consents will not all be built out in one year, so that alone would partly explain the divergence between the number of consents and the number of starts.

There are other factors, such as the length of time that the full planning process takes to come through. The stats may tell you partly about outline consents rather than full consents, but even when you have a full consent, these days you regularly have a lot of pre-commencement planning conditions that have to be discharged before you can start on site. So the statistics probably do not tell you about those non-discharged planning conditions that are stopping you starting work on sites. You need to dig down into those kinds of issues to understand it.

Baroness Andrews: Is the shortage of planners an issue?

John Slaughter: The shortage of planners is a big issue. We are certainly concerned about that, because at the end of the day that slows down the process for the industry as well as causing issues for local authorities.

Baroness Andrews: Is there any way round that?

John Slaughter: Well, we have discussed all sorts of possibilities, including looking at whether an increase in fee income could be ring-fenced specifically for that resource, but I know that there are issues with ring-fencing in terms of local government finance arrangements. There is probably more scope for joint working between local authorities, and they could maybe even look at outsourcing. There is a range of possibilities. We are discussing those with the Government—with the DCLG.

Baroness Andrews: How interesting. How far have your discussions got?
John Slaughter: Not as far advanced as we would like. It is a tricky set of issues, but they are being discussed.

Baroness Andrews: But you would be prepared to pay higher fees for aspects of planning permission that would not compromise the outcome, shall we say?

John Slaughter: Yes, if it was set up in the right way. Our concern would be about paying higher fees if that did not result in a better service. That is why you would need to look at seriously ring-fencing the system if you went down that route.

The Chairman: Sorry, did Mr Carr want to respond to the question?

Chris Carr: Our local authority is privately running our planning system.

Baroness Andrews: Which local authority is that?

Chris Carr: North East Lincolnshire. We have a company called Cofely GDF SUEZ—it used to be Balfour Beatty—which runs our planning system, highways, trees and woodlands and building control. It runs a huge amount of services. Six to 10 years ago, we were ranked one of the worst planning authorities in the UK, but I would like to think that we are now one of the top for delivery. When I say delivery, that is not about approving planning; it is about the way that it is done. If the application is refused, it is refused quickly and we are told the reason why. It is very much run on a business model rather than a traditional public sector model. We have noticed a massive difference.

Lord Clement-Jones: Has that reduced the number of appeals and that sort of thing?

Chris Carr: The trouble with appeals, with the greatest respect, is usually down to the planning committee. You may have a great planning system, but you are reliant on the ladies and gentlemen sitting around the planning committee who can go against their officers’ recommendations. The planning appeals are probably still the same, but the winning of a planning appeal is reduced because they work so closely. We work together—we work together as a unit. That may sound a bit bizarre, but we have informal meetings and they are associate members of my association and there is a relationship side to this. We mix together, and if they have an issue, they come to us, and if we have an issue, we go to them. It is a working relationship rather than a “them and us”. Since doing that, that has made a huge difference.

Baroness Andrews: Does that happen anywhere else?
Chris Carr: I think that two other local authorities have done it. By the way, I am not being paid by this company for promoting it. It is just that I have worked so long and I have moaned about how bad things were to see this coming forward. It is just putting the matter on a professional basis. Just as we are professional as a construction company, they are as a planning company.

The Chairman: Is it the French influence?

Chris Carr: I do not think so. The name changes, but the people tend to stay the same. They are just more proactive. Our working relationship with the officers there has changed dramatically because they are respected by the developers—we respect them. We have an understanding of how it works, and it is a good place to work. The planning officers say that it is a far better place to work than it used to be when it was run by the local council.

Lord Inglewood: Are they the same people who were previously in the demoralised organisation? Is it the same personnel?

Chris Carr: Yes. Some of the traditional people who have been there for a long time, whom we might say were institutionalised, have a way of working that they will not change, but the new, younger planning officers coming through—usually, the best planning people get poached by developers—are willing to stay there because they enjoy being at work. Before, I do not think that the planners did enjoy being at work, if the truth be known.

Lord Clement-Jones: Were they TUPE-ed over in the first place?

Chris Carr: Yes.

Q102 Earl of Lytton: There is a perception out there that developers are accumulating large land banks that could be brought forward much more quickly to boost housing supply. How could such land be more quickly developed?

Let me also insert my supplementary at this point. It would be helpful if you could explain to the Committee—I come to this with a certain amount of professional knowledge, being in the employment of a firm of chartered quantity surveyors—what the processes are between the granting of planning permission and the groundwork, as it were, in actually getting on site? What are the issues and the time lags that might be involved in that?

Chris Carr: From planning approval to starting on site?

Earl of Lytton: Yes.
Chris Carr: As we said before, the conditions need to be lifted and the Section 106 agreements all need signing. That will take you, we would say, probably between 18 months and two years from getting the planning approval to actually physically starting on site—probably 18 months. When you have planning approval, for a highway for example, you then need to send it off to a consultant, who will tell you how to design it. You have to get that signed off and you then have to go out to contractors to get prices to tender to do the work. That comes back and then you have to find time within their schedule to deliver the work. All that sort of thing goes on all the time. For example with services, you cannot start without gas, water or electricity—especially water and electricity, because you may need them to build. Your infrastructure needs to go in—you have your health and safety management—and you are usually encouraged to start straightaway on the biodiversity, so you need to plant trees and hedgerows. By the time that you have done all that, you are 18 months to two years down the line before you physically sell the house—I am not saying build it. The building might take four to six months, depending on the size of the property. At the top end, a more bespoke property will take us at least six months to build. That is where the time lag is.

Earl of Lytton: What about the land-banking issue?

Chris Carr: I think that some people do land bank. I suppose that, technically, my company does so, but I like to call it reinvesting in my business. I am building on land that my grandfather and my father bought, but I am investing now for my son and grandchild—I have a grandson. We are looking to reinvest all the time. The land that we buy is not land with planning permission. If I buy agricultural land 20 to 30 years in advance, do you call that land banking, or does land banking refer only to land that has full planning permission?

Earl of Lytton: The thought is that people are hoarding things that have consent and not bringing them forward because there is some notion that it may go up in value.

Chris Carr: The SME sector cannot do that, because if we buy the land, the bank wants a return straightaway, so we cannot land bank. So the idea that a small developer will buy such land and sit on is just not going to happen. The national housebuilders are accused all the time of land banking, but in their defence from purchasing a piece of land to actually building the first property on site is probably three to five years. People do not realise that we are probably going for a year on pre-application before we actually put an application in. With the pre-
application talks, where we try to sort everything out, it is three to five years. These PLCs would be doing a disservice to their shareholders if they did not show that they have at least five to seven or eight years of land in front of them. As a PLC business, you need to deliver for your shareholders, and it is bad business if you do not have the materials in front of you to do the work.

John Slaughter: Thank you, Chris, for that very good explanation of the situation. Perhaps I could add a bit about the national builders. It is true that there is often a perception of “land-banking” out there but it is really important to understand the status of the land that we are talking about. It is precisely as Chris is saying: the larger companies need the visibility of a forward pipeline of land to develop to satisfy their shareholders, because they are a business at scale. You need a fair amount of land going through various stages of the planning system, from being an initial option to being in pre-application discussions and to outline consent—whatever it is, you have to keep that pipeline moving to maintain and grow the volume of your business over time.

When it comes to land that has full implementable planning consent, which is after a resolution to grant when you have discharged all the conditions and can physically start to work on site, the large companies have exactly the same interests as the small ones. They want to get going straight away as at that stage they have a lot of capital tied up in that site, if they own it. Until they build something and sell it, they are not getting any return on the capital they have laid out. It is a high-risk industry. The builders are judged on their rate of return on capital employed. It simply does not work that you get a better return by hanging on to land and not developing it, compared with building out and selling.

Baroness Whitaker: You mentioned what was the Highways Agency. Are it and the other road authorities easy to deal with? They will already have joined in the permission which has been given. Why do they hold things up?

Chris Carr: Would you believe that every area has a different way of building a road? We do not have a national policy on how to build an A4 road.

Baroness Whitaker: That is interesting.

Chris Carr: So my company could be building in three local authorities, and each will want their road constructed in different ways. It seems a bit of a crazy way to do it.
Baroness Whitaker: So we are not talking about the design of the roads and where they go but their construction.

Chris Carr: Yes, it is the design of the construction and the specification.

Baroness Whitaker: The construction and not the routes.

Q103 Baroness Young of Old Scone: Can I go back to land banking? There is a lot of loose talk and accusations against the larger housebuilders. Should we have a proposition in this country that would provide more transparency and some sort of compulsory registration of land acquired for housing development purposes, so that people could see what is held by various companies and what is being actively developed?

John Slaughter: We do not have a strong view about that. It was an idea looked at before the election in the Lyons review. There would be no problem with it in principle, as long as there were no unintended consequences. We would not want to see any steps taken that could in any way, however unintended, frustrate the land market and add to risk. I am not sure whether that would in itself. But I think it would generally be known in practice through local authorities, certainly for any site of any size. Because of the nature of the local plan process, it is not untransparent now.

Baroness Young of Old Scone: Presumably the options process is not visible to the public.

John Slaughter: No, that process might not be but if it is a site of any size, you would probably try to promote it to be an allocated site through the local plan process. At that point, it becomes quite transparent that that site is in play. You are probably talking in practice about going further back in time and whether that would be helpful. But for most sizeable sites, at any rate, the local plan process gives relatively early visibility anyway.

Lord Inglewood: Are we not moving to a system of land registration of title anyway, which will enable anybody to find out who owns any piece of land when it is finished?

John Slaughter: Indeed, yes.

The Chairman: Is there any evidence that people who have large land banks soft pedal on releasing them?

John Slaughter: Probably the only study we are aware of that has looked at this—I do not know whether the Committee has already looked at this—was done by a company called Molior in London. It showed some indication of that in the London market, but it has to be
said that its analysis also showed that it is not housebuilders who are hanging onto it but other parties. The reason that housebuilders are not doing that is for the economic rationale that I explained a minute or two ago.

**The Chairman**: Perhaps you could drop us a link on that.

**Q104 Lord Inglewood**: We have covered a great deal of the points that might have arisen in response to the question I wanted to ask. Perhaps I may simply say, particularly to Mr Carr, that we have heard evidence that the reduction in the number of smaller builders has had an impact on the amount of housing coming forward. Are there any serious barriers to entry, for example to a building firm wanting to become a small housebuilder, which make that step more difficult than it need be? Obviously it costs money that, as we know, banks are not being very good about supplying. But are there other things such as regulation, or whatever?

**Chris Carr**: The predominant one is finance and the lack of a track record. A smaller jobbing builder who wants to become a developer and build one or two houses does not have a track record in doing that, so the banks would just wave them away straightaway. The availability of small sites is another issue. We do the SHLAAs, or strategic housing land availability assessments, but those do not cater for units that are five and below—or is it 10 and below?—so those sorts of mini-sites are not easily accessible. It can be an onerous task for a smaller company to navigate the planning system, which is very complicated. When you get into it, it becomes a lot easier. Viability and developer contributions can also be proportionally against the smaller sites compared to the larger sites.

**Lord Inglewood**: Could you explain that further?

**Chris Carr**: On smaller sites, in our area, we have only 20% social housing because we are a fairly low-cost area. There probably does not need to be any social housing on some of the brownfield sites we were talking about. We are still seen, although it sounds awful, as a kind of cash cow to the local authorities. Since the funding has been cut from national government, they see the developer as still being one to claim their money off. For example, we had a small site—96 units—and the highways officer wanted a contribution to the highways. I said, “Can you justify why?”. He said, “No”, so I said, “Then why are you asking for it?”. He said, “Because all the other departments ask for money”. So you pay to education and to other things, and that sort of mentality becomes the issue.
To go back to your original question about getting smaller companies and individuals to get together, we have a land company called Humberside Land Developers, which is based in north-east Lincolnshire. It is a consortium of probably 20 companies, which range from one-man bands to companies building 100 units a year. We get together and buy against the national housebuilders: when a piece of land comes up with, say, 1,000 or 500 units, we will get together as a consortium to buy it. The more money you put in, the more land you get out. An umbrella company funds the purchase of the land, the infrastructure and everything else, so you just pay proportionately into it. This has worked very well.

In fact—this is quite embarrassing—my plumber of 15 years ago is now building 80 units a year, which is far more than I have ever done, and my joiner is building 40 a year. They came in and said, “Can we have one plot?”, then the next time they bought two plots on a development site. It has worked so well. Of those 20 companies, probably only 12 want to go for a given site and then you do the proportions between you. The bigger companies take the bigger amount of land, just to subsidise the smaller ones, but we work together. It is not that I am proud to say this, but we have only one national housebuilder in north-east Lincolnshire, because we buy as a consortium together. There are two companies, Land Developers (Lincs) and Humberside Land Developers. People said that it would never work, but one has been going for 60 years and the other has been going for 40.

Lord Inglewood: Is that model being worked up on that basis?

Chris Carr: No—the DCLG wants me to do a paper on it because it is quite unique. I thought that everyone did it as we have two in our town, but if you talk to anybody else they say “No, we’ve never heard of it before”. That working together is what gets you the tradespeople. It goes from my plumber who, as I say, now delivers 80 to 100 units a year and my joiner, who is delivering 40 or 50, to all these other individuals who come in and carry on.

John Slaughter: I do not know of any other examples like that and I can see the logic of doing it. We would say that if the National Planning Policy Framework and the local plan assessment of housing, and the allocation of land for it, is got right we perhaps would not need to do that. For the small company, part of that is about making sure that local plans allocate a range of sites. I hope that some of the other measures that the Government have in mind at the
moment, such as the new brownfield land register and facilitating getting planning permission for land that is on it, would help smaller companies as part of the picture.

On what Chris has said about barriers, I would add that there are quite high upfront costs for someone to come into the market as a small housebuilder. Over the past 20 or 30 years, the planning system has certainly become a lot more complex. Getting initial planning consent is quite a costly business and you have to deal with a number of other regulatory and policy requirements, so that potentially costs you quite a bit of money. If you are working on a project finance basis, the situation probably arises that you have to lay that money out before you get anything back. That in itself is quite a big barrier to entry. It also constrains the ability of SME housebuilders to grow their businesses, because if they have that degree of capital locked up in an individual project, it partly frustrates them being able to take on another project.

Q105 Baroness Whitaker: There is quite a variation in standards of design quality over England and that is probably one of the reasons why local communities often resist new housing: they really have no confidence in the design, not having seen a good one. Why is the practice so varied? How are housebuilders working to improve design standards and, very much to our point, what could encourage more consistent attention to design quality across the industry?

Chris Carr: The reason that we are not delivering better quality design is pure laziness. There is no reason whatever; a house is a house and is built in the same way whether you design it in brick, block or timber frame. We believe that these homes will be there for 100 or 200 years. No other product you buy will ever last that long, except for jewellery, probably. So we take pride—and I think people do take pride—in delivering something different, especially in the SME sector. We cannot compete on price with the national housebuilders so we have to deliver a better quality product. I am not talking about quality in build, because the national housebuilders do good quality work, but quality in design. We have to be unique and build something that nobody else is, but we are up against constraints.

My architect has won awards all over the UK and he is fantastic. When we get together, he draws a design when I tell him what I am looking for. I do not want something that you cannot physically build but I know something of what my clients want. So we come together to get a
great design laid out for a house and the site, but then it comes to the process of building regulations, energy efficiency targets, design codes, planning officer approval—and sometimes conservation officer approval—public consultation reaction, parish councils and planning committees. By the time you have done all that, everything in the quality gets chipped away. I would love to show you a design that we do—

Baroness Whitaker: I am sorry. Are you saying that the design codes militate against good design being achieved?

Chris Carr: The design codes are okay; it is just how they are interpreted by the planning officer. The codes work okay if there is some flexibility in them, which in theory there should be, but it is about how they are interpreted by an officer. My frustration is: why pay an architect a huge amount of money to have his plans destroyed by everybody around him?

Baroness Whitaker: You are saying that planning officers do not, on the whole, facilitate good design.

Chris Carr: No, planning officers are trained and qualified, but probably not as trained and qualified as my architect.

Baroness Whitaker: Okay. You might put up very good designs, but that is not the national picture uniformly. Can you give any insight into that and what we ought to do about it?

The Chairman: Does this go back to the problem of the shortage of skills or training, or the FEs versus the universities?

Baroness Whitaker: For instance, do builders tend to think about place-making as opposed to making a building?

Chris Carr: We would look at communities. We try to build a community because we want these homes to sell.

Baroness Whitaker: Why does not everyone do that?

Chris Carr: I do not think that any company will go out to build a house that it cannot sell or is not in a good community. Sometimes the national housebuilders have a house design which they will use all over the UK. That is the way they deliver it. It is like Ford building huge amounts of the same car so that people know whatever car they buy, wherever it is in the UK, they are buying the same quality. But in the SME sector we have to differentiate and build something of higher quality, or what I think is a better design.
Baroness Whitaker: Would a chief architect be a good idea to try to get everybody at a government standard?

Chris Carr: As long as they knew what they were doing.

The Chairman: Okay, thank you. Mr Slaughter, what do you think?

John Slaughter: It is partly a skills issue, both in industry and in local authorities and other parties. One of the things that has been fed back to me recently about the lack of resource in local planning authorities is that it has no doubt affected the number of officers who have relevant understanding of good urban design principles. In answering your question, I would focus on urban design where, from the HBF perspective, we have promoted and supported over many years an initiative called Building for Life. It is now Building for Life 12, and sets out 12 principles of good urban design which could be applied in any context. We are still trying to promote that as a common currency that can be used by our members, and by local authorities and communities, to have sensible discussion about achieving good design outcomes.

It is not about not using standard house types but about how you lay the development out—the proper integration of car parking and the public realm and such things to create a good-quality place. We have deliberately tried to restructure Building for Life and make it more accessible, so that it could be used in community consultation as well as in discussion with local planning officers. We have very recently been talking about this internally. If we could see more consistent promotion by us, by local authorities and by national government of a set of principles such as Building for Life, we could demonstrate that they can facilitate the planning process by inspiring buy-in to them.

Baroness Whitaker: In other terms, you see a need for national leadership on this subject.

John Slaughter: Yes.

Q106 Baroness Andrews: On the Building for Life principles, you mentioned demographic factors previously and the fact that you were building residential homes. This is something that the Committee has yet to address: the impact that an ageing population is likely to have on the demand for different, high-quality sorts of homes. Mr Carr referred to the tension between having a good architect and having to conform to a lot of building standards and requirements, which sometimes pulls them away. The Lifetime Homes Standards ought to be
able to combine high quality of design and high spec in regulations, while meeting the needs of an aging population and your Building for Life principles. Is this something that you would like to see the Committee develop and recommend because it would meet a national need and your high-quality spec?

**John Slaughter:** I would certainly recommend it as good practice. I think that companies in the retirement sector are already building to Lifetime Homes standard.

**Baroness Andrews:** Individual builders such as McCarthy & Stone, yes, but it is not universal, is it?

**John Slaughter:** No, but then as HBF we would not necessarily support Lifetime Homes being a standard that was applied to every new home that was built because it is not necessarily what all consumers want. A revised version of Lifetime Homes is coming about through the housing standards review, but it still involves some additional construction cost. You also have to think about whether, if that is a cost that you are potentially asking all consumers to bear in the market but not all consumers actually want what you are providing, that is a reasonable thing to do. In purely practical terms, not necessarily everyone envisages sustaining the same home for life. It is a difficult one, but at present our view is that we support the appropriate use of Lifetime Homes through the housing standards process to meet the reasonable requirements for that type of accommodation, but not necessarily for all consumers.

**Q107 Lord Freeman:** I would like to follow that question on good design quality. What are the implications for good-quality design, bearing in mind the streamlining of zonal planning permissions? The same goes for zoning for brownfield sites.
