**John Slaughter:** These ideas are fairly fresh in government thinking, so I have to say that I do not think we have a massively developed answer on this one. In principle, the way to tackle this would be to include the right encouragement of good design practice in the framework conditions for these new routes to bring them to the market. The Government’s objective is clearly to facilitate land supply, so we would not want to put in place anything that reversed that process and slowed things down unnecessarily, but it would not be unreasonable, in the framework conditions that will apply to the new brownfield registers in the new zonal system, to have some general conditions or encouragement for good design. From our point of view, we recommend Building for Life 12 as a possible approach that would enable that because it
is quite a pragmatic and flexible way of applying good design principles to a wide range of contexts.

Lord Freeman: Have you impressed upon the Government the need for that?

John Slaughter: Not yet, because we are at a very early stage of the process of developing these ideas. There is not yet a lot of detail generally about how this zonal system is going to work. The fact that you have asked this question as a Committee is quite helpful for us, as we are thinking about how we want to take that forward.

Baroness Whitaker: I have seen criticism of the way that zoning works in America because it induces towards social segregation, sometimes of income, sometimes of race. We do not have the same situation here, but do you see that as a possible risk?

John Slaughter: That is not how we had interpreted the Government’s objective. I am not sure that I see it as a risk. As I understand the proposition, it is simply that you would make more land available more easily where it reasonably could be made available for development, but it is in no way judgmental about what that development would be. I do not particularly see that risk.

Baroness Parminter: Do you have concerns about the process of viability assessments in delivering what local authorities need that will meet the social and environmental requirements of local people, and about developers themselves saying that the process is not transparent and that there are question marks over it? I would welcome your reflections on that. As a supplementary, the FT yesterday talked about a more transparent model being to go along the German route of a land tax, which captures some of the uplift in the value of a property from when it receives planning permission to when it is actually built. Do you think that the viability assessments are working best, and what would your view be on replacing them with a land tax, which works successfully in Germany, where the level of housebuilding is far higher than it is in the UK?

The Chairman: But that is a cultural thing.

Chris Carr: In our survey this year 68% of FMB members cited viability as a major constraint on supply. That is the first time ever that this has come up as the top answer; for the past four or five years it has been finance. Viability is being seen as the biggest barrier to increasing output. However, landowners still have a high perceived value of land. The landowners that
we speak to still have the values of six or seven years ago, and do not realise that the NPPF has released a lot more land on to the market. It is all about supply and demand and, now that a lot more land is available, land prices are tumbling. Probably not in London and the south-east, but in most of the UK, you will see that land prices are not increasing a great deal. They say that house prices are increasing slightly, but the rest of the time it is about the land price. This is a generational issue. If you are a farmer sitting on 2,000 acres, you might as well wait another 30 to 50 years, which restricts the land, especially greenfield land, coming to the market.

On brownfield, though, you need to understand that the planning authorities need to promote all this more. I still think that we need to have joint ventures with local authorities on this surplus land. If we are going to deliver the numbers, why can we not deliver joint ventures with the local authority and work it so that they get an uplift on the sale of the property. Instead of us paying, for example, £50,000 an acre—sorry, £50,000 unit; I wish it was £50,000 an acre—if we developed it and sold it on, we would give an uplift of probably £65,000 a unit, so there is an increase all the time. You can do that with a shared equity scheme where the council owns the land. It can still own it, get a rental income off it and sell it after a 10-year period. The council can still borrow against the land because it owns it. There is an uplift straight away because the council will get a rental income off it, and at the end there will be an uplift in the value of the land because in 10 years’ time the land that the house is sat on will increase in value. It is a win-win situation. For me, it seems to be a natural progression to get rid of surplus land at a good value for local authorities, which will help the SME sector to develop brownfield sites that otherwise would not be developed.

The Chairman: But is there not again a tension between councils and private building? Councils are very short-term in their planning, whereas I would have thought that a company like yours was fairly long-term. You can never say who is going to be running the council, what cuts are coming in or how budgeting is going to be.

Chris Carr: I agree, and that was the big stumbling block. If the land was worth £1 million, it will still be worth £1 million in 10 years’ time—hopefully, it will be worth £2 million. So they are not losing the asset.
The Chairman: But they could flog it if they were forced by cuts to make economies somewhere else.

Chris Carr: They could but that is just a commercial decision. That is what we all have to do. The biggest issue with us was not selling it at a loss. Our council changes political party nearly every election; we just revolve. The question to me was, “Who’s going to get the money in 10 years’ time?” It is not about looking for the greater good of the town. This is the only way forward that I can see for local authorities to deliver some of their surplus land. If they sell the land at the moment, they will be selling in a bad market at a time when the market is so low. It is a crazy situation. No other company—I know that local authorities are not companies—would sell when the market was so low that they were almost giving it away. You might as well sit on it, retain the ownership to borrow against for government funding, and get a rental income off it, and it will increase in value all the time.

The Chairman: But the point is if there were an incremental income.

Q108 Baroness Young of Old Scone: The LGA is very keen that MoD and NHS sites are brought into some sort of proposition like that. Is that a real opportunity, or are the sites all in the wrong places?

Chris Carr: We have done a great deal of work with the Homes and Communities Agency on this because it is basically in charge of releasing this land to the market. It is very proactive in helping us not only to purchase the land but to finance it. The HCA has a few schemes set up to help the financing of development as well. Hospital sites tend to be in the centre of town so they can be quite a valuable asset if they are in a reasonably good area. The airfields are miles away from anywhere so maybe you would struggle a bit, unless you went into the development of garden towns or the like. To be fair, the agency supports land coming forward and tries to package it in a way that is commercially viable for us, and offers funding to help development. It has done a good job on that.

The Chairman: Thank you. Mr Slaughter, you have the last word.

John Slaughter: On viability assessment, if I understood your question correctly, we broadly say that the current system is probably working as it needs to. The two key elements are what the landowner is looking for commercially as a return and what the housebuilder or developer is looking for as a return. Those two things are never going to be the same from case to case.
because their market contexts vary, as do landowners’ expectations and the alternative uses of sites. Different developers also have different requirements in terms of their investor returns, so there cannot be a standard answer with regard to the numbers. We are in favour of standardising the approach to viability assessment as far as possible, but you always have to recognise that the numbers are going to vary from case to case.

Regarding the German position and a land tax, in many ways we already have land taxes; we have Section 106 and CIL, which are both about extracting land value from the giving of planning permission. There are issues about whether Section 106 and CIL are the most effective way of doing that, and we understand that the Government are looking to have a review of that area in the coming period, which is possibly another important part of the policy picture in the next several months. So there is already a land tax, although it may not be structured in the right way. However, you have to recognise that there will always be a limit to how much you can take in the way of land value. The reason why we quite often get hung up on viability assessment is probably because councils are continually pushing to try to maximise the amount that they extract.

Lord Inglewood: Do they tend to be greedy?

John Slaughter: Yes, certainly from our point of view. In their defence, I have to say that that is partly because they may not have many other routes to go down. If we are looking at an inquiry that is analysing the global picture, it is only fair to say that councils are effectively focused on, or driven to look at, these opportunities, which probably encourages them overpitch their requirements. That then sometimes leads to quite difficult decisions about the level of contribution that a particular site can make. We have what you might call a more rational approach to this: if we set the general level of tariff, if you would call it a tariff, or a tax at a more sensible level, we could probably avoid a lot of that.

The Chairman: Thank you both very much indeed. I am sure that I speak for all the Committee in saying that it has been a very worthwhile session. I am sorry if we have dragged on a bit; we have probably messed up your timetable for the rest of the day. If there is anything that you think we should have asked and did not but would be helpful in putting your point of view, do you think that you could just drop us a line?
John Slaughter: Yes of course, and I promised to send you some notes on the discussion, which I will do.

22 October 2015
Background to the Urban FWAC Network

Regional Advisory Committees (RACs) are statutory committees constituted under Section 37 of the Forestry Act 1967. The RACs advise the Forestry Commission, through our Area Directors, on the implementation of forestry and related policies in each region.

On 1 December 2013 the working title of the RACs changed to Forestry and Woodlands Advisory Committees (FWAC) to better reflect their role and refreshed remit.

Each FWAC covers one of nine distinct areas. The Committees consists of an independent Chair and eleven members appointed by the Forestry Commissioners. The composition of each FWAC is designed to achieve a spread of interests in the region. Members may include representatives of the forestry industry, environmental interests, woodland owners, local communities and others who it is considered can contribute.

In 2014 the Urban FWAC Network was established to support the Area FWAC members who had an interest in, and expertise on, urban forestry. Their role is to champion urban forestry to the Forestry Commission, and their respective FWACs; and to share and disseminate good practice amongst each other, and more widely through the forestry sector. They meet twice a year, and membership is supplemented by other invited specialists in urban forestry.”

This paper was written by the members of the Urban FWAC Network.

Jane Carlsen, Urban FWAC Network Chair and Chair of London FWAC

John Meehan, Environment Team Manager, Essex County Council, Representing East of England FWAC

Bruce Collinson, Whitehill and Bordon Regeneration Project, East Hampshire District Council, Representing the South East FWAC

David Houghton, Arboriculture Officer, London Borough of Camden, Representing London FWAC

Peter Wilkinson, Director, The Next Field Ltd, Green Space Business Advisors, Representing South West FWAC

Nick Grayson, Climate Change and Sustainability Manager, Birmingham City Council, Representing West Midlands FWAC

Paul Nolan, Director, The Mersey Forest
Iain Taylor, Director of Business Development, The Land Trust, Representing the North West FWAC

The Network is coordinated by Helen Townsend, Principal Adviser - Social Forestry (People)

Evidence

Below are set out the underlined questions in the Call for Written Evidence followed by the response of the Urban FWAC Network

Policymaking, integration and coordination

Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

We would like to see Green Infrastructure (GI) planning as integral to the planning of new urban areas and retrospectively developed in existing areas. We believe this initiative has to come from National Government and be delivered by city region and local policy makers. Each local authority should have a Green Infrastructure (GI) Plan which will include urban trees and woodlands as one element. It will make all our urban areas more resilient to climate change, pollution, heat stress, physical and mental health issues and wellbeing.

Green infrastructure should be fully integrated into infrastructure planning alongside transport, water and other infrastructure needed to make urban areas successful. This planning needs to start from the national level and find translation in Local Plans. Government should define functions and benefits of GI and provide examples of how GI can provide these benefits. The Landscape Institute the Urban FWAC network and other have produced visions and strategies that can inform Government. These organisations at National level could also identify some tools that can help show the economic viability and other multiple benefits of GI, exemplifying, it is not only aesthetics.

Within the context of a national infrastructure scheme there will be local drivers, political, economic, community or otherwise which can take the initiative and implement it on the ground.

How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

Clearly Government policy and implementation is not integrated. It needs to get its own house in order. Government needs to get co-ordinated, clearly identify a lead department and establish a co-ordination team that brings in all relevant government departments to oversee delivery of GI so it is integrated into infrastructure planning for urban areas. Policy
needs to be integrated once it is issued. Policy needs to have been consulted on internally before leaving government with all relevant Government Departments.

**National policy for planning and the built environment**

Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

There is need for better, integrated policy guidance on natural environment – at present it has many strands and no unifying language, nor plan.

What is required is high level Natural Capital policy and GI policy, delivered locally through GI Plans, community forest plans and ecological frameworks - all of which have shared objectives.

What is required is high level Natural Capital policy and GI policy set out in national guidance, delivered locally through GI Plans, community forest plans and ecological frameworks - all of which have shared objectives. These can then inform and provide the evidence base to support development plan policies on the built environment.

Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

As a minimum, consideration should be given to our urban areas as different to our rural areas. They are the most densely populated areas with the most social, economic and environmental problems. There are also critical interrelationships which should be recognised, for example, maintaining flood plains and wooded areas up stream of rivers leading into urban areas to reduce the risk of flooding.

There should be national Green Infrastructure planning policy and guidance to making our cities towns and villages more liveable and resilient.

Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

Need for long term, stable plan and policy for natural environment in the built environment. These plans can be adaptive. The Community Forest plans are 40 year plans. This has worked well; it is a good model to use as the basis for planning for the built environment. Green Infrastructure Plans will include many elements reflecting the multiple benefit and the partnership implementation. Delivery will be over many decades and will include projects relating to urban trees, green roofs, sustainable urban drainage, new green cycle ways, river and floodplain restorations etc. The long term integrated maintenance of this schemes also need to be considered as the project “grow” and multiply their benefits.
Buildings and places: New and old

What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

The built environment should be adapting to Climate change and the development of Green Infrastructure Plans and SUDs proposals are integral to these. GI will promote resilience, sustainability and economic benefits to urban communities that can come from GI not only amenity. GI Plans can be retro fitted to existing built areas and planned as part of new urban areas.

To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

Historic and Heritage environment create a sense of place pride. Understanding the history of where we live often leads to community involvement and community coherence. Trees and woodlands are part of the historic environment and can massively increase the value of an urban area. Historic trees and avenues in the urban areas are highly valued and add to the economic as well as aesthetic values of an area.

Skills and design

Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

There has been a skills drain in the public sector, with the removal of the experienced planners, surveyors, architects, engineers, resulting in poor design being implemented by unskilled or poorly qualified. Local Enterprise Partnerships and other skills agencies may have a role to play to reskill our public players. Critically we require multi-disciplinary practitioners to plan urban areas who understand architecture, landscape, climate change, engineering, drainage, pollution etc.

Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

The Landscape institute, the RTPI and other national bodies have a leading role to play in advising Government. These organisations have been an ardent supporter of GI and multi-
disciplinary planning and their energy and passion should be channelled into Government policy making.

Community involvement and community impact
Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

The reduction in public sector funding has led to the degrading of the public realm. Local Authorities cut non-statutory services of environment first leading to unsafe parks and city centres where perception of crime becomes a problem and wellbeing levels tumble, leading to increased welfare and health costs. An integrated approach that is community led often leads to the most sustainable solution socially, economically and environmentally. But it needs to recognised that public engagement whilst beneficial and positive does take time and skills to develop.

The design of our urban areas and green infrastructure must improve links to public health – eg councils have Directors of Public health that need to be given a stronger role in recognising, promoting, and enabling the opportunities of GI in achieving health benefits.

How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

The reduction of the public sector workforce through declining budgets has placed more pressure on the planning system. Consulting communities on shaping their built environment requires a resource that currently is not there or is present at a reduced capacity. To facilitate effective public consultation resources will need to be provided to the public sector to engage in long term sustainable solutions. These need not be large amounts but could be used to draw in third sector partners to facilitate this process.

Financial measures
Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

Government should investigate Green Bank investments into City or town Centres, which elevate the value of land and produce a return on that investment through increased land values.
Government should be looking at sustainable incomes rather than one-off capital payment. Incomes should be related to other incomes such as the Community Infrastructure Levy or the Landfill Communities Fund where a percentage of the payments help maintain the public realm into the future.

05 October 2015
FRIENDS OF THE EARTH ENGLAND, WALES AND NORTHERN IRELAND RESPONSE TO THE
SELECT COMMITTEE ON NATIONAL POLICY FOR THE BUILT ENVIRONMENT

Introduction

Friends of the Earth England Wales and Northern Ireland exists to create a just world where people and nature thrive. For people to thrive it is essential that they have a good quality and affordable home. It is also essential that the services that nature provides to people are maintained – climate stability, food production, flood protection, etc. (so-called ecosystem services). Without these services people cannot thrive. It is therefore necessary to ensure that built environment policy not only focuses on providing quality, affordable homes but in doing so it does not damage the world on which we depend.

Policymaking, integration and co-ordination

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policy makers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

1.1 There has been an increasing centralisation of decisions (taken up into the nationally significant infrastructure project regime under the Planning Act 2008), together with a significant increase in permitted development rights. The recent announcement of the National Infrastructure Commission continues this trend. Changes under the Growth and Infrastructure Act and on permitted development rights have removed decision-making from the local planning authority level. We are concerned that this is directly contrary to the subsidiarity principle and to the principle of democratic accountability and public participation in land-use planning.

1.2 The principle of subsidiarity (as enshrined in the Rio Declaration, Principle 10) states that: “Environmental issues are best handled with participation of all concerned citizens, at the relevant level. At the national level, each individual shall have appropriate access to information concerning the environment that is held by public authorities, including information on hazardous materials and activities in their communities, and the opportunity to participate in decision-making processes. States shall facilitate and encourage public awareness and participation by making information widely available. Effective access to judicial and administrative proceedings, including redress and remedy, shall be provided”. This is the principle detailed in the Aarhus Convention, to which the UK is a signatory.

1.3 Decentralising decisions to local government has been key to successful sustainable and innovative solutions which manage to deal with waste, pollution, transport, housing and energy on a local scale. At national, devolved and regional level there are strong reasons for action on ‘global’ issues (such as climate change or biodiversity loss or financial systems) to be set out clearly in both policy and legislation; but where local information is vital to securing the sustainability of the decision (for example in understanding the local economy,
local environmental risks and social impacts) then these decisions should be taken at a local level within this national context. For example, making a decision as a matter of course on a major housing development at nation state level fails to recognise the need to integrate into the spatial location that is vital to a successful and long term development (linked to education, health, work, utilities, leisure, culture and heritage, environment and travel).

1.4 While local planning authorities would benefit from some reorganisation (particularly in two-tier areas), there is also a regional level gap which is contrary to other European countries that benefit from strong regional identities.

1.5 In addition, England is not totally parished / represented by community councils. As the lowest level of government, closest to people, in our view it would be helpful to consider that all communities should have a local democratic tier that would bolster e.g. Neighbourhood planning. Policy-makers should support and understand the role of neighbourhood planning (which should be accessible to all, rather than only those who can afford it) and local planning in shaping places that people want to live and work in for the long term.

2. How well is policy co-ordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and co-ordination be improved?

2.1 We are concerned that England’s government departments are not working together to support local planning authorities. Local planning department budgets have been slashed, and Treasury, DECC, DCLG and DEFRA issue policies without public consultation and which impact on local planning authorities’ duties. For example, Section 19 of the Planning and Compulsory Purchase Act 2004 amended by the Planning Act 2008 to “Development plan documents must (taken as a whole) include policies designed to secure that the development and use of land in the local planning authority’s area contribute to the mitigation of, and adaptation to, climate change.” In contrast to this duty to tackle climate change, DECC/DCLG issued a joint statement on onshore wind to create stringent community backing and site allocation in plan requirements for development to go ahead in June this year, while the joint shale gas announcement in August, made in a statement to the Commons in September set out a ‘national need’ for fossil fuel exploitation.

2.2 In another example, ‘Fixing the Foundations’ published by Treasury was used by an Inspector recently to suggest the removal of sustainability requirements for on-site energy efficiency standards, by preventing any reference to the adoption of a national zero carbon homes standard, and also suggesting as another option that the policy be deleted entirely and referred to only in development management policies (see http://www.brighton-hove.gov.uk/sites/brighton-hove.gov.uk/files/ID-27%20Letter%20to%20Council%20Aug%2015.pdf).

2.3 Air quality is an example of another issue that fails to be tackled through integrated policy. The UK has failed to meet EU legal limits for NO₂ in 38 of the UK’s 43 zones for air
quality purposes by the latest possible deadline of 2015. As the current national Air Quality Strategy (AQS) was ordered quashed by the recent Supreme Court ruling, a new national AQS is required by the end of 2015 to bring air pollution within limits in the shortest time possible. This obviously requires action from several departments to make it effective – e.g. in land use planning rules and transport investment.

2.4 We recommend that each department, government agency, and organisations counted as public authorities (e.g. Network Rail) should be subject to a duty to achieving sustainable development through the exercise of their functions. The executive office must have a responsibility to account for the full impact and benefits of decisions in terms of sustainability. Without a clear chain of command and performance measurement, sustainable development (including policies that affect the built environment) will remain at the margins or non-existent in key Government departments. A sustainable development duty will help co-ordinate and shape policy across departments, and ensure that similar principles are applied to policies rather than contrary ones. The National Assembly for Wales’s Future Generations Act 2015 could be looked at in terms of a possible model for policy integration.

National policy for planning and the built environment

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

3.1 Our concern is that there are two key policies in the NPPF that trump the other policies when it comes to plan-making and decision-taking – the ‘presumption in favour of sustainable development’, and the viability test. The viability test is worded as follows: “Therefore, the sites and the scale of development identified in the plan should not be subject to such a scale of obligations and policy burdens that their ability to be developed viably is threatened. To ensure viability, the costs of any requirements likely to be applied to development, such as requirements for affordable housing, standards, infrastructure contributions or other requirements should, when taking account of the normal cost of development and mitigation, provide competitive returns to a willing land owner and willing developer to enable the development to be deliverable.” Both of these policies tip the balance in favour of development approval and as a consequence lessen the impact of the other policies set out in the NPPF to deliver the environmental, economic and social ‘goods’ for the public.

3.2 On the face of it, the introduction of the National Planning Policy Framework and the viability test have also been linked to the decrease in the provision of housing for those most in need. According to Shelter (using the DCLG figures) “The number of social dwellings completed in England in 2013/14 has decreased by 23% since 2011/12.” There are a number of examples of affordable housing provision being removed because of ‘viability’ as reported in The Guardian, (September 2013,
http://www.theguardian.com/society/2013/sep/18/thousands-affordable-homes-axed-councils). Indeed the definitions of affordable housing have been questioned by organisations such as the London Tenants Federation (http://www.londontenants.org/publications/other/theaffordablehousingconf.pdf).

3.3 The profits of the main volume housebuilders have risen in ranges from 34% to 92% (March 2015, http://www.thisismoney.co.uk/money/markets/article-2978450/Taylor-Wimpey-latest-builder-benefit-housing-recovery-revenues-profits-soar.html). We remain concerned that the balance between a sustainable house building sector and the delivery of the built environment we need is out of kilter. The planning system was designed and developed over the years in recognition that housing delivery governed by a ‘market’ would fail to deliver what society more broadly needs. Housing must be set within a planning framework, so that affordability, quality, standards, connections and locations, and other ‘externalities’ are accounted for and valued.

3.4 In our view, national planning policy should be more nuanced and balanced, so that policy integration is a reality, and that social and environmental goods do not consistently lose out in the viability test. We would in fact recommend the removal of the viability test, and a legal definition of sustainable development in the forthcoming Housing Bill, to ensure that the presumption in favour of sustainable development is precisely that, rather than just a presumption in favour of development.

3.5 In addition there are several vague policy areas that give rise to appeals – for instance the new onshore wind policy. All planning practice guidance published without being tested through public consultation should be assessed and revised to provide stronger, clearer and more detailed policy.

4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

4.1 There are good arguments for using a map and spatial understanding of England to frame development decisions. For instance understanding the in-combination effects of large developments on what is existing and planned at other scales as well as the other land uses. Adaptation has to be understood in terms of place – coastal erosion, flooding and afforestation are all tied to specific places. There are 2.4 million homes in the UK at risk of flooding from rivers and the sea, 370,000 of which are classified as at ‘significant risk’. And there are an additional 3 million homes at risk from flash floods. The spatial element also guards against the concept of ‘white space’ on maps where ‘nothing’ is happening. However our concern is that a national map of England would be used to further centralise and control decision-making in a way that severely lessens democracy and is contrary to the subsidiarity principle of long term sustainable development.

4.2 In our view, the duty to co-operate should be replaced with devolution arrangements that allow for democracy and public participation in planning, but do not co-opt or control
national agencies set up for the national interest e.g. on flooding, water resources, natural environment and heritage, nor put private interests in the driving seat.

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

5.1 The imperative of climate change, both mitigation and adaptation, and the latest scenarios provide timescales that need to influence built environment needs. Urban heat, coastal change, increased risk of flooding, biodiversity on the move are all environmental factors that have short, medium and long term timescales. If a decision is made to build something, then its lifetime impact should be assessed both in terms of where it is located, and what effect it will contribute to the environment. For example, Vancouver has a 100 year sustainability plan (http://www.cnv.org/Your%20Government/Sustainability%20in%20the%20City/City%20Initiatives/100%20Year%20Sustainability%20Vision).

5.2 Most of the homes that people will live in over the next 50-100 years have already been built. Many are poorly insulated, much worse than in countries such as Sweden, Denmark and the Czech Republic. Over 1.5 million private-rented sector homes do not even meet the basic ‘decent homes standard’ set by the Government. In our view, the government needs to put in place a programme to ensure that the UK is on track to achieving a target of bringing all low-income homes to EPC C by 2025, and all UK homes by 2035.

Buildings and places: New and old

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly co-ordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

6.1 Fixing the Foundations, as aforementioned, suggests the introduction of a ‘zonal system’ with the automatic grant of planning permission in the forthcoming Housing Bill. Only one report is referenced to provide evidence that the time taken to grant planning permission may be a significant factor on the housing market. We are concerned that the time taken for planning permission is necessary for a high quality built environment, given the lack of other levers to require this of volume housebuilders. We oppose this removal of democratic accountability and public participation over decisions that will have a major impact on the built environment.

6.2 The total number of new homes started in 2013/14 is around 133,000, and 112,000 were completed (DCLG figures, rounded). The current Government target for England is 200,000 new homes per year. According to the statistics (https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/462195/Planning_Applications_April_to_June_2015.pdf), applications received by local planning...
authorities in England have and continue to hover around the 120,000 mark since 2008/9 and the highs in 2004/5 of just under 200,000 has yet to be achieved again. It seems on the face of it that the changes wrought have not yet had a significant impact on the number of applications being submitted, while there is evidence that both quality and affordability are being lost.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

7.1 Freiburg’s developments are internationally renowned. To look at why this is, it is important to understand how its local government operates. For the Mayor or the Director of Development, public participation is top of the agenda. It is the people (the citizens) of Freiburg with whom the vision for the future is made through planning. The plan is then presented to the builders and developers, and the negotiation starts on delivery. In many cases the city contracts out work, but holds control of the plan and design. The results speak for themselves – it is one of the most popular places to live in Germany and one of the most successful (See here for Freiburg’s environmental policy http://www.freiburg.de/pb/LEN/372840.html).

7.2 Given the number of developments approved without, for example, SUDS, high water efficiency standards, on-site renewable energy generation or access to green space, in our view there will be resources required in the future to retrofit these into developments. It would be far more resource efficient (and cost effective) to simply build the best quality development now.

7.3 Local planning authorities and communities could be assisted in mapping their community and environmental assets, as part of identifying what they have, and then looking at what they need to improve their social, economic and natural environment. Community asset mapping could feed into local plans very effectively.

7.4 Our food culture and food systems are instrumental in contributing to poor nutrition and obesity, climate change, environmental degradation, poor animal welfare and unfair food systems globally. Government must develop integrated policies on food and agriculture to address this, including as to how the built environment contributes. The role that allotments and the concepts that informed garden cities are important in a sustainable built environment.

Skills and design

9. Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?
9.1 For good quality places to be designed there are resource requirements and the need for regulation – to create a level playing field, and to place a value on quality. Planning departments that are well resourced can provide better services. DCLG could provide extra support through boosting local authority planning departments on an “as and when required” basis e.g. when a significant application is before the authority (similar to the way ATLAS functioned), and the plans to roll back zero carbon homes should be reversed. Government should return to publishing White Papers for broad consultation and public debate rather than entering directly into legislative proposals which exclude meaningful public participation, and indeed participation by affected local planning authorities and democratic representatives.

Community involvement and community impact

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

11.1 The inquiry could consider the roles an ‘Aarhus Champion’ and a ‘Built Environment Champion’ could play in order to advocate for better public participation in built environment decisions, and for better standards in the built environment, taking into account how different policies and measures could impact on these issues, and to comment on policy integration.

11.2 Priorities for government, particularly for agencies and at local level are driven by resources and duties. In order to improve the consideration of the health of users, the Director of Public Health could be given a greater role in planning, improved planning guidance could be issued on health, and resources could be made available to deprived wards to focus planning and development management efforts on improving health.

11.3 In addition, the public sector duty in the Equality Act 2010 on socio-economic disadvantage could be brought into force ((1) An authority to which this section applies must, when making decisions of a strategic nature about how to exercise its functions, have due regard to the desirability of exercising them in a way that is designed to reduce the inequalities of outcome which result from socio-economic disadvantage.).

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

12.1 Local plan-making is rather onerous for communities. It is long-winded and is dominated by the private sector – usually developers. However it also enshrines the right to be heard in law – directly related to the right to participate in environmental decision as set out in the Aarhus Convention. In our view, the plan-making process therefore needs to focus
on engaging communities – which requires local authority resource, and local authority willingness to engage. Effective public engagement is often worn down because their inputs are devalued and disregarded, national policy has recently been through rapid and ongoing change (which then trumps local participatory input), and there is very little resource to promote and support the engagement of communities in local plan making. This has to change to stop the democratic deficit and disengagement of communities continuing. The public interest is not served by a planning system that is merely about bricks and mortar rather than about good governance, place, society, economy and environment.

13. Are there fiscal or financial measures potentially available which would help to address current issue of housing and land supply?

13.1 One option is to reduce inflationary pressures through introducing a Property and Land Tax – for more details see Friends of the Earth’s housing policy here (http://www.foe.co.uk/sites/default/files/downloads/environmental-socially-just-agenda-housing-48776.pdf). We suggest the inquiry might wish to look at this issue in detail.

06 October 2015
The Gardens Trust welcomes the opportunity to submit evidence to the House of Lords Select Committee on National Policy for the Built Environment.

1.0 Introduction to evidence

1.1 The Gardens Trust was formed in July 2015 by the merger of The Garden History Society (GHS) and the Association of Gardens Trusts (AGT).136

1.2 The GHS has been a statutory consultee for all sites included by Historic England on the Register of Parks and Gardens since 1995; Government has recently (July 2015) confirmed that The Gardens Trust retains the status of statutory consultee previously held by the GHS. The GHS has advised Government on matters of national planning policy as they affect historic designed landscapes.

1.3 The AGT represents a large body of grass-roots voluntary expertise (with a combined membership of some 8,000) embodied in the 39 county gardens trusts. Many county trusts have been active in the fields of planning and conservation for many years, and have considerable experience of the effects of the implementation of national policy at the local level.

2.0 Evidence

We respond to the following questions set out by the Select Committee:

Policymaking, integration and coordination

1. In theory the decisions that shape England’s built environment are taken at the appropriate administrative level, with Government providing over-arching policy, targets and objectives; and local government implementing these through local plan policies, determination of specific development proposals and implementation of local historic environment designations, including, most importantly, conservation areas. In practice, and in our experience, this bi-partite system is under great strain and does not work effectively for the historic environment principally due to a lack of necessary resources at local government level. In many places this has led to a lack of proper local plan provision to guide development to appropriate locations and to safeguard sites which are inappropriate for development or change; and a lack of the necessary professional advice and expertise within local government to enable properly informed and sensitive determinations to be reached.

We believe that a plan-led structure is best able to deliver consistent and effective policies for the built environment. However we are not convinced that central Government is prepared to play its part by ensuring that proper resources are available at local government

136 - See www.gardenhistorysociety.org and www.gardenstrust.org.uk for further information about both merged bodies.
level to ensure that the system works in a balanced way, taking into account local as well as national policy considerations and priorities.

2. Our experience suggests that policy co-ordination across Government is at best patchy, with Treasury-led initiatives such as housing targets cutting across other areas of interest with apparently little regard to the cumulative impact of such policies. The relatively lowly place of heritage in the Government hierarchy of ministries clearly does not help it secure due weight in inter-departmental policy discussions, and it is possible that conflicting interests within DCMS itself (the marriage of heritage and sport remains a curious and unconvincing alliance) contribute to the problem. We would like heritage to be given a stronger, more coherent voice than has often been the case in the past.

**National Policy for planning and the built environment**

3. We welcome NPPF and the holistic approach it takes to planning and the historic environment. We consider the definition of “sustainable development” set out in NPPF to be both appropriate and a sound foundation for the development of both national and local planning policy.

In theory NPPF provides sound policy guidance for those involved in planning, developing and protecting the built and natural environment. We have concerns that, as set out above, inadequate resources and skills at local government level impede the proper implementation of the sound policy objectives contained in NPPF; and we are concerned that the inevitably emerging “caselaw” surrounding NPPF, and especially considerations of “substantial harm” to heritage assets are complex, and often beyond the ability of local government to interpret and implement properly.

We would in addition highlight the provisions of the European Landscape Convention, which also promotes an holistic view of the historic environment with landscape binding together the various elements of the built environment. We consider this to offer a good model to Government, and record our regret that despite both the UK and Scottish Governments having signed-up to the Convention, its provisions appear not to be embedded into planning for the built environment in the UK.

4. We would agree that national planning policy in England lacks a spatial perspective. Policy, and the implementation of policy, both demonstrate an undue concentration on buildings. There is a failure to recognise that the spaces which buildings occupy are often designed and constructed as carefully as any building, and that it is the interaction between these different elements of the built environment which is what makes a particular place successful or unappealing and unsuccessful.

While we welcome recent guidance from Historic England on understanding the setting of heritage assets, we argue that this guidance should be incorporated into national policy to ensure that due weight is given to spatial considerations in planning and determining developments.
With regard specifically to designed landscapes (which are often the consciously designed settings for significant structures and therefore a key component element of the built environment), we believe that national policy should require those planning for the built environment to understand and give due weight to matters such as designed views into and out from a landscape, and to show that consideration has been given to the impact of proposed change on the relationship between different elements of a designed landscape, especially where that landscape is the subject of national designation.

5. We do not consider that the timescale for planning our future built environment needs is the key issue, or even a significant issue. Much more fundamental and pressing is adequate resourcing, especially at local government level, to ensure that the plan-led system functions effectively and fairly for all parties.

Buildings and places: New and old

6. Housing supply and targets appear to have become a political football, with each major party trying to appear more committed to provision of more new build than the other. It is far from clear that the present planning system is adequate to the task of delivering the reforms set out by Government, without running the risk of collapse.

7. In relation to delivering increased housing supply, an approach of “as much” and “wherever possible” is guaranteed to produce poor results and slums for future generations. Considerations of sustainable development must imply a need to consider more than just numbers of housing, but also quality, spatial arrangement, conservation of existing places and character, and quality of life for those who will live in the new homes. Existing buildings and places, especially where there is a clear sense of character or community, will provide a durable, sustainable base from which to develop successful built environments. In terms of ensuring that existing housing stock and built environments function to optimum levels, broader issues such as provision of high speed internet connections to enable enterprise and home working, resourcing of community initiatives to bolster a sense of individuality of place, and encouraging local government to be proactive in conserving local distinctiveness through designations such as Conservation Areas could all be important factors in ensuring that existing buildings and places will be able to adapt to changing needs and circumstances and to allow optimum, sustainable use to be made of the existing built environment.

8. The value of the historic environment in terms of regeneration, future planning and place-making is often under-estimated. Heritage designations continue to be seen in terms of constraints and a brake on development, rather than as opportunities. The economic benefits flowing from the conservation of the historic environment are often overlooked, while the social benefits of conserving the historic environment (and especially green space forming an integral part of a designed urban ensemble) in terms of well-being, mental health and enjoyment of residents is too often unrecognised. However, the many examples of successful conservation and regeneration, often effected in the face of proposed radical
redevelopment by local opposition, underlines the value of the historic environment as an integral element of the built environment time and again.

Skills and design

9. It is very clear that a skills gap exists within the professions dealing with the built environment. In particular, there is a wide spread lack of understanding of the relationship of the historic environment to the wider built environment; and the inter-relationship existing between the different elements of the historic environment (buildings, landscape, archaeology).

Lack of skills is particularly acute in the area of historic landscapes, their conservation, and their positive role in the creation of distinctive places and built environments. The loss in autumn 2015 of the only post-graduate course devoted to this expertise (University of Bath, M Sc) is very much to be deplored, and is symptomatic both of the absence of appropriate training for professionals working in the field, and a lack of understanding and commitment to the built environment on the part of institutions of higher education. The lack of appropriate skills is not confined to professionals working in the private sector, but is very evident in our dealings with local government. The number of conservation officers working in local government planning departments has shrunk alarmingly, and accordingly decision-making is not properly informed with regard to the sensitivities and needs of the historic environment. Similarly, the number of landscape architects employed by local government has declined significantly in recent years, with a consequent reduction in landscape and spatial advice being made available to case officers during the planning process, or to local authority departments when planning their own schemes. The management of conservation areas, so important for conserving local distinctiveness as well as aesthetically significant features (including buildings and designed urban space) is inadequately resourced.

Finally, we would highlight the decision taken by Historic England (for operational reasons as we understand), not to provide planning and conservation advice on proposals affecting designed landscapes through their Regional Landscape Architects, but through other professional channels. While we do not question staff expertise or integrity, we do find it a matter of great regret that in cases where a specialist landscape input is, in our view, essential to providing adequate advice to the local planning authority or the Planning Inspectorate, it is now often absent. Advice has, in some notable cases, been excessively orientated towards historic buildings, arguably leading to decisions which have been detrimental to the overall historic environment by reason of harm caused to designed landscapes which form the setting of those buildings.

10. “Place Making” (a term ironically derived from the eighteenth century landscape designer Lancelot “Capability” Brown rather than a contemporary management consultant),
carries the implication that in planning the built environment we are dealing with a “tabula rasa”. In reality, no site comes without a history, evolution and character. The key to good planning lies, we suggest, in achieving a detailed understanding of how a site has evolved over time and achieved its distinctive character. Since CABE was disbanded, is there is no national forum for promoting the aspirations of high quality design and “place-making” at a national level. We highlight with considerable concern the complete failure of the Design Council to recognise that CABE had within it a unit, CABE Space, devoted to landscape within the built environment; and through this omission has signally failed to carry forward any of the valuable work which was being undertaken in this area. There is therefore a significant gap in the provision of advice at a national level which requires to be addressed.

Community involvement and community impact

11. The perception exists that local government officers and other policy makers take decisions and determine planning proposals without adequate reference to the wishes and views of the local community; and that elected council members will often represent these views more faithfully. It is not clear that reality generally reflects this view; but some notable examples in our experience suggest that a disconnect can exist between local aspirations and the decisions of planning officers. An example would be a recent case at Warwick Castle where permanent “glamorous camping lodges” were proposed in the Grade I registered landscape forming the designed setting of the Grade I Listed Castle and Scheduled Ancient Monument: officers recommended approval on their interpretation of planning issues, but elected members voted against the proposals reflecting local opinion and the views of heritage and amenity groups including the GHS in its role as statutory consultee.

12. The greatest barriers to public participation in the planning system are: the perceived complexity of planning system; a lack of confidence to engage; and a lack of understanding of how to engage. The Historic Landscape Project, undertaken jointly over the past few years by the GHS and AGT with support from Historic England has amply demonstrated that even among those with an awareness of the planning system and a concern for the historic environment, these barriers prevent practical engagement.

However, the Historic Landscape Project has also shown that with training and appropriate resources (essentially very basic explanations of how the plan-led planning system works, pointers as to how to understand and articulate important issues for historic environment such as significance), the ability and willingness to engage with the planning system increases hugely.

137 - More details of the project, the training it delivers, and its outcomes can be found at www.gardenstrusts.org.uk/hlp.html
On a small scale, this project is a valuable example of the way in which voluntary bodies could prove to be an important means of securing greater public engagement in the planning system which shapes their environments.

**Financial matters**

13. While we do not wish to express a view on the first of these points relating to fiscal and financial measures which could help to address issues of land supply and housing, we do wish strongly to reiterate our belief that the most effective way in which to achieve better design and place-making is not through relying on, let alone offering subsidies to private developers to deliver better design, but through ensuring that we have a robust, balanced planning system properly resourced at local government and statutory advisor level with appropriately skilled professionals – conservation officers, landscape architects, and conservation architects.

Jonathan Lovie  
Principal Conservation Officer & Policy Advisor  
The Gardens Trust

04 October 2015
Introduction

1. The Gas Safety Trust, established in 2005 as a registered charitable body, has become the UK’s leading gas safety research charity with the key objectives of further improving gas/fossil fuel safety for the public and industry throughout the UK and reducing the incidents of death and serious injury from carbon monoxide (CO) exposure. The Trust does this through the funding of research and data collection relating to carbon monoxide poisoning.

2. We provide grant funding, advice and support to any organisation to carry out research and evidence gathering relating to gas safety. We would currently welcome applications for funding for projects looking at (but not limited to) the following areas:
   - Low level exposure
   - Built environment
   - Healthcare professionals’ understanding and awareness
   - Leisure activities

3. Since 2013 we have awarded nearly £800,000 to a variety of programmes and projects relating to gas/fossil fuel safety and carbon monoxide.

Background

4. People spend the majority of their time indoors most of which is spent in the home; typically 80 - 90% in developed countries. Particular groups such as the young, the elderly and those with ill health may spend even more of their time in the indoor environment. The quality of the indoor air is therefore a major determinant of the exposure people have to air pollutants.
5. The UK government has said that in order to cut carbon emissions by 80% in 2050 compared to that of 1990, all new homes built from 2016 will be carbon neutral.

6. The homes will have their sustainability and construction measured against nine categories, which include health and wellbeing. Airtightness is to be increased in order to lower thermal loss, which could lead to reduced ventilation. A lack of air for combustion could give rise to carbon monoxide being produced. The Gas Safety Trust has concerns about the effects this may have on indoor air quality and the potential health effects to occupants.

7. Combustion appliances, such as gas cookers, are a source of indoor air pollution and pose a health risk if there is inadequate ventilation; carbon monoxide (CO) can be produced which poses a significant health risk.

8. According to the World Health Organisation, CO is the leading cause of accidental and intentional deaths related to poisoning where intoxication can occur as a single or repeated exposure. Exposure to combustion generated pollutants such as CO, NO2, particles and environmental tobacco smoke can lead to a range of health effects including cardiovascular diseases, which are the leading cause of deaths in industrialised countries.

9. According to the Department of Health estimates, every year around 4,000 people are diagnosed by A&E departments as having been poisoned by carbon monoxide. But it is thought that the number of people who have been, and continue to be, affected by carbon monoxide poisoning is far greater because cases are being woefully under-reported. This is due to a lack of awareness and because of the difficulties in diagnosing carbon monoxide poisoning. Many people may be living with low-level poisoning, not knowing it is happening, and with their lives therefore at constant risk.

10. Combustion gases in homes can be emitted from space heaters (including un-flued appliances) using solid, liquid and gas fuels, as well as water heaters, cooking activities,
tobacco smoking and vehicle emissions, particularly if the vehicle is kept in an adjoining garages.

11. The main products of combustion are CO\(_2\) and water vapour but other products occur depending upon the fuels used, air content and the efficiency of the combustion process.

12. A study carried out by Cranfield University in 2011 and funded by the Gas Safety Trust considered the possible increased risk to occupant health due to exposure to incomplete products of combustion in energy efficient homes.

13. The study carried out the following work:
   - A literature review on indoor air, carbon monoxide, nitrogen dioxide, volatile organic compounds, sulphur dioxide, particles, energy efficient homes and the use of models to predict indoor air pollution.
   - A field study that used various instruments to take measurements of carbon monoxide and other combustion products.

14. The Gas Safety Trust would be delighted to share the report from this work with the Committee, if appropriate.

15. More recently, in 2014 the Gas Safety Trust has commissioned a piece of work together with the Institute of Gas Engineers and Managers (IGEM), which is currently being carried out by the Health and Safety Laboratory, which is looking into low levels of CO exposure specifically from flue-less gas appliances that may be caused by the application of increased insulation values to existing buildings.

16. The perceived problem being that by reducing the air changes to a property this may lead to the incorrect operation of the appliance/s leading to incomplete combustion and the possible discharge of CO. As stated above, the Gas Safety Trust would be happy to share the results of this work with the committee, if appropriate.
17. Given the Trust’s specific interest in the built environment in relation to gas safety, our submission confines our brief comments to Questions 2, 9 and 11.
Questions

(2) How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

18. The Gas Safety Trust believes that a coordinated approach is essential to deliver policy in the built environment that not only addresses the critical challenges present in improving the built environment but also to place consideration of gas safety at its heart.

19. Carbon monoxide poisoning is a topic that spans a number of government departments which have complementary, but sometimes contradictory, overlaps of responsibility. Regarding carbon monoxide, within the built environment particularly, responsibility for energy efficiency, the Building Regulations and health and safety are split between the Department for Energy and Climate Change, the Department for Communities and Local Government and the Department for Work and Pensions respectively, whilst the regulations for combustion appliances and detection devices sits with the Department for Business, Innovation and Skills.

20. A cross government group on carbon monoxide has been established which seeks to brings these Departments together, but it is the view of the Gas Safety Trust that this group needs to be better linked into, and higher profile within the relevant departments, to ensure that carbon monoxide is considered within various areas of policy.

(9) Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

21. One of the key issues facing the gas industry, and one that has implications for the built environment, is an aging workforce, and insufficient recruitment to ensure future demand is met and that the skills and knowledge are passed on.
22. The Gas Safety Trust believes that it is essential that the Government urgently reviews the demographics of key industries and future demand to ensure that we have sufficient, competent and experienced engineers to meet the 21st century challenges within the built environment.

23. This is critical to be able to make sure that appliances present within the built environment are correctly installed and appropriately maintained, in line with current regulation and to manufacturer’s instructions.

(11) Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

24. As mentioned in our previous comments, the Gas Safety Trust believes that it is essential that regard to carbon monoxide poisoning is firmly embedded in the built environment policy process.

25. The impact of 21st century built environment innovations and the underestimated interplay between energy efficiency and safety concerns means that there is a potential for seemingly innocuous environmental measures to have an unintended and potentially fatal consequence.

23 September 2015
Professor Jay Ginn and Professor Anthea Tinker – Written Evidence (BEN0046)

HOUSE OF LORDS SELECT COMMITTEE ON NATIONAL POLICY FOR THE BUILT ENVIRONMENT

Call for Written Evidence

This response is from Professor Anthea Tinker and Professor Jay Ginn, Institute of Gerontology, Department of Social Science Health and Medicine, King’s College London.

They draw mainly on recent research on Long Term Care (focussing especially on housing, Tinker, Ginn et al, 2014a and b) and Age Friendly Cities (Tinker and Ginn, 2015). We only answer the questions where we feel we have specific recent research experience. These mainly relate to older people, but as we argue in both publications, good design and attention to the environment for older people helps people of all ages.

Questions

Policymaking, integration and coordination

Q1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

1. The recent changes in policy with the requirement for every local authority (LA) to set up a new Public Health department has the potential for less chance of national policies being implemented. LAs must be adequately funded if they are to fulfil their new responsibilities for public health. We welcome the development of devolution but it depends on LAs both being well informed about, for example, research on the built environment and being responsive to local views. We would urge the need for joint research and the sharing of information and/or secondment of staff.

Q 2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

National policy for planning and the built environment

2. Research shows that many policies, especially for older people, are health led. While this is clearly of great importance there is need to bring in the other services, especially
social care services, to bring about an integrated policy. Recent research on the integration of services also shows the neglect of housing, design etc. in policies for older people (Tinker and Ginn, 2014a and b). Integration can be between policies, services, organisations and people

Buildings and places: New and old

Q 6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

3. With a housing crisis and lack of housing for all groups of people we would argue that housing is a key to healthy lives and should be given priority in times of economic austerity. The Organisation for Economic Cooperation and Development (OECD) say ‘Good housing conditions are also essential for people and affect childhood development’ (OECD, 2011, p. 81). They also found that in OECD countries subjective satisfaction is strongly correlated with all the objective indicators of housing’ (ibid, p. 85)

4. The emphasis should be on enabling people to stay in homes of their own. The value and cost effectiveness of home adaptations should equally be a high priority for older and for disabled people. For a minority of people specialist housing will be needed. For some types of specialist housing such as extra care housing for older people there is evidence that they can prevent or delay the need for institutional care. There is therefore a saving to the public purse.

5. It is also crucial that any new build housing is to ‘Lifetime Home’ standards so that they remain suitable, without modifications, for people at all life stages. A swift assessment of need followed by equally swift provision can reduce the risk of an older person falling; and if they have been in hospital, they can be more safely discharged to their home, releasing a hospital bed.

6. In addition we would draw attention to some newer forms of housing that can be provided or encouraged in the public, private or voluntary sector or a combination. In particular, we recommend co-housing for older people and expansion of Home Share schemes. Co-housing is when a group decide to join together to live together in a purpose built or refurbished building living independently in their accommodation but sharing some communal facilities. These schemes started for younger age groups in Scandinavia and the Netherlands but are now becoming more popular for older people. Two schemes have recently opened in London – both for older women. We suggest that encouragement in the form of help with planning applications, architectural and legal advice and possibly release of land would help such potential self-help communities.
7. Home Share is where someone, usually an older person, offers accommodation at a low or no rent in exchange for some help (not personal care). Some of these schemes are particularly useful for younger Interns. Publicity for such schemes with details of tax and other implications would be helpful.

Q7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

8. The built environment is crucial for the wellbeing of people. This was stated clearly in the well evidenced lecture by the late Professor Libby Burton in her Legacy Lecture ‘The Pursuit of Happiness’ given on 1.3.14 before her death (Burton, 2014).

9. The importance of health and wellbeing, especially the role of exercise and the need to encourage people of all ages to take exercise and to get out and about was underlined by the Chief Medical Officer of Health for England in her Annual report (Chief Medical Officer’s Annual Report, 2009. Department of Health, 2010.). She estimates the cost of a sedentary lifestyle at £8.3bn per year. This may mean more people suffering increased ill health and being admitted to hospitals and residential care homes.

10. There are many features that influence the well-being and social inclusion of people. Good neighbourhood design enables people of all ages to feel safe when going out for basic necessities such as shops and health services and for social and leisure reasons. Feeling safe to go out allows pursuit of interests and maintenance of relationships and enhances social capital, social inclusion and wellbeing.

11. We recommend that local authorities ensure that pavements are safe, in terms of an even surface and freedom from clutter, to improve local walkability, that they also provide sufficient all-day free accessible public toilets and signage to where they are available.

12. Barriers to going out include the speed of traffic, lack of safe crossings, fear of crime and fear of falling.

13. In our report ‘An Age-Friendly City – how far has London come’ we say ‘Green routes and small parks make walking outside more inviting and can lift mood: older people living close to an open green space are more likely to be satisfied with life’ (Tinker and Ginn, 2015, p. 15).

14. A current research project ‘Mobility, Mood and Place’ (MMP) is showing that older people are able and willing to engage with local authorities to help design environments that are pleasant, practical and safe (Brookfield, 2015). We cannot emphasise too much the value of asking people of all ages for their views which may sometimes be counterintuitive. For example in the MMP research older people in Hackney liked the graffiti around the canal.
and Olympic site as they felt that it showed that the area was vibrant and that younger artists were coming into the area. But they did not want the graffiti in the roads where they lived. They also commented very unfavourably on the design of seats which only held one person (to stop rough sleepers) when they needed to go out in pairs. There were lots of other sensible suggestions about the lack of public toilets and handrails. Some of these modifications would not cost very much money.

15. It would also be helpful if residents could be involved in creating more public gardens and small parks.

Skills and design

Q9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

16. Most professions are facing the issues of an ageing population. For example doctors, unless they work in paediatrics, will be treating older people in most hospital specialties as well as in General Practice. This is increasingly being recognised by the medical profession who are taking degrees in Social Gerontology as well as Geriatrics. There does not seem to be the same urgency or interest in those who train architects and surveyors.

17. In our experience most of the professions in general, and architects in particular, do not have the right skills and training to consider the built environment in a holistic manner. Training for these professions is still based on the need for award winning innovative designs. Inclusive design remains as an ‘add on’ rather than a core element that would allow the professions to design inclusive environments built for whole life use and incorporating the needs and desires of the local community.

18. To address this issue inclusive design should become a core element of the training of these professionals and should be the key fundamental underpinning all development. Local authority officials should also receive training in inclusive design with the concept embedded in all planning decisions.

Community involvement and community impact

Q 11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?
19. Please see answer to 7 and also the submission by Professor Catharine Ward Thompson, University of Edinburgh (Anthea Tinker is a co-investigator on this project)

Q 12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

20. Too often the planning process is a top down one with plans being produced and then reactions sought (but often ignored). This is of course an important part of planning but we would like to see a bottom up approach as well. For example in a piece of research on assistive technology older people identified their major problems and then possible solutions (McCreadie et al, 2002, Seale et al, 2002, Tinker, 2001). These were then translated into real products (in this case a stair climbing aid) by engineering students. The latter gained a great deal about the perceptions, needs and solutions from the potential users.

21. Others have also identified the evidence that ‘bottom up’ planning capitalises on the experience of residents in a neighbourhood (Bevan and Croucher, 2011).

Financial measures

Q 13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

22. We would hesitate to give what is often the answer to this type of question – a short term incentive. This, like pilot schemes may produce a short term benefit but may not be able to be sustained. We consider that this is an area ripe for research.

Glass and Glazing Federation – Written Evidence (BEN0174)

Policymaking, integration and coordination

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

The GGF believe that clear, national guidance on building regulations is fundamental to ensure the implementation of effective policy. Given the economic climate and wider fiscal context, national policy makers play a key role in ensuring the quality of the built environment is not compromised. The GGF has approximately 500 members who can be found in over 1,500 business locations throughout the UK, the majority of which are Small and Medium sized Enterprises (SMEs). The GGF therefore believe that engagement on a local level with trade associations and business is similarly important in ensuring national priorities align with local needs.

The GGF would therefore like to underline the importance of regular and meaningful engagement between national policy makers and trade associations representing the broader macro-concerns of the sector but also the need to engage smaller business affected by policy set at a national level.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

The GGF’s key focus is on improving the energy efficiency of households and commercial premises. We are passionate about promoting the uptake of energy efficient measures, which prove cost effective for consumers and beneficial for business. The GGF have therefore engaged extensively with the Department for Energy and Climate Change (DECC) on their energy efficiency policies and continue to do so. Consequently, we believe that any successful policy on the built environment must be considered alongside policies from other Government departments which aim to increase household energy efficiency.

In addition to this, the GGF would also underline the important of engagement with the Department of Communities and Local Government (DCLG). A simple yet proper regulatory framework especially in relation to building should propagate the successful improvement of energy efficiency within the built environment. The GGF believe however that the weakness lies in enforcement, particularly on new build. This is why the GGF set up FENSA - a government authorised Competent Persons Scheme for the replacement of windows, doors and roof lights in England and Wales which works with thousands of double glazing contractors to enforce regulations in existing properties. The GGF’s concern relates to new build properties as they deviate from approved regulations and also build to old regulation
standards. The GGF would therefore highlight the importance of both a simple yet extensive regulatory environment and the means to ensure regulations can be properly enforced. Therefore, as the Select Committee on Energy and Climate Change, and indeed DECC, consider the future of energy efficient schemes, we would urge the Select Committee’s inquiry on National Policy for the Built Environment to encourage an integrated, cross-department approach to policies on the built environment which is then properly enforced.

National policy for planning and the built environment

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

The GGF have previously welcomed the National Planning Policy Framework (NPPF) for its role in making the planning system less complex and more accessible. The GGF similarly welcomed the policies set out within the NPPF under, “Meeting the challenge of climate change, flooding and coastal change” of “actively support[ing] energy efficiency improvements to existing buildings.” However, since the introduction of the NPPF in 2012, the GGF has been extremely concerned with how energy efficiency has been prioritized both in the planning system and further Government schemes to promote the uptake of energy efficiency measures. The GGF believe that improving the energy efficiency of our buildings is a key measure that will improve the health and economic prosperity of families across the country by creating warmer, more comfortable homes and offices. Indeed, research by Age UK has found that cold homes cost the NHS £1.36 billion every year due to hospital and primary care costs. The GGF would therefore like to underline the importance of prioritizing energy efficiency in any future building and planning regulations so that the significant benefits they bring can be realised.

The GGF would also urge the Select Committee to draw attention to existing barriers to building new homes. The GGF was highly supportive of the Coalition Government’s decision to extend permitted development rights for example. This has allowed for a simpler, faster and more appropriate planning system. However, there remain barriers to the uptake of this. Of key concern to our Members is the imposition of Article 4 directions by multiple local authorities. Whilst the GGF recognizes the need to ensure that any external changes to the appearance of buildings is in keeping with the local environment, our Members are telling us that Article 4 Directions are being applied in many instances where they are not necessary. This is stifling the retrofit sector and is in many cases based on unfounded assumptions about the types of goods available to consumers. An example the GGF would point to is where the aesthetic of a certain product can often directly mimic the aesthetic Article 4 purports to protect, yet the uptake of these measures is still restricted. Whilst we recognise the trend towards local devolution, we would urge the Committee to ensure that there is a proper understanding of the types of innovations occurring in the sector so as to ensure that businesses and consumers are not held back by outdated assumptions by some local authorities.
4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

The GGF is not in a position to comment on this question.

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

The GGF would advocate that a planning system which incorporates clear short and long term objectives and regulations would make for a much more stable planning environment conducive to investment and growth. Therefore, the GGF would suggest that policies affecting the built environment be clearly categorized to give assurance to stakeholders and promote confidence within the sector. The GGF propose that policy be categorized in the following brackets:

- Short term – next 5 years
- Medium term – 5-15 years
- Longer term – 15-30 years

This would provide a longer term sustainability and vision to policy, rather than attaching it to specific Parliamentary or political cycles.

Buildings and places: New and old

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

The GGF is wholly supportive of Government initiatives to build more houses and so welcomed the Conservative manifesto pledge to build more affordable homes, including 200,000 new Starter Homes. We also support the Minster for Housing, Brandon Lewis MP’s recent commitment to reach 1m homes by 2020. However, as previously mentioned, the GGF strongly believe that when realizing such targets, the Government should ensure that these houses are built to a high, energy efficient standard, benefitting consumers and businesses alike. Policy supporting the standard of new homes coordinated at a central level is integral in achieving this and so on behalf of the GGF, I would like to underline how eager we are to work alongside Government on future policy to ensure energy efficiency is prioritized.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places
be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

The GGF are passionate about ensuring that consumers and businesses realise the significant and wide ranging benefits increased energy efficiency can have. Therefore, the GGF believe that a supportive and centrally-led policy ensuring the high standard of energy efficiency in our homes is vital. Existing housing stock is similarly important when considering the implications for energy efficiency. As promoted by the Energy Savings Trust (EST), it is imperative that locally and nationally we have a road map for homes to make the best use of existing housing stock and to capitalise on data to inform energy efficiency drives. In planning policy and in energy efficiency policy, it is also important to ensure that older houses are not left out of schemes. This is particularly a problem for people who live in energy inefficient homes in rural communities. The GGF is keen to underline that if we are to realise the health, social and economic benefits increased energy efficiency brings, then a clear and simple policy for future housing and retrofitting existing housing stock is key. Again, this is something that on behalf of the GGF, I look forward to working on this with you and the Government.

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

The GGF is not in a position to comment on this question.

Skills and design

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

The GGF believes it is crucial that those wishing to start and those already working within the sector have professional training to maintain standards and safeguard skills. This benefits both businesses and consumers. This is why the GGF run GGF Training Ltd, in partnership with the awarding body GQA Ltd (GQA), which offers a range of courses to teach new skills and maintain the skillset of those already in the glazing industry. The promotion of such courses is not only advantageous to those seeking employment, but safeguards the practice of businesses in the sector. The GGF would therefore like to underline the importance of such training and are keen to work with you and other stakeholders to promote this.

The GGF would further underline the absence of a joined-up approach when it comes to policy making on the built environment. Policy making on construction does not have one voice and simultaneously concerns varying stakeholders e.g. architects, material suppliers, contractors. This results in a lack of joined up thinking on both sides of the engagement process and results in stagnation in building strategy. The GGF would therefore advocate the importance of Government’s role in bringing together, facilitating and pushing forward planning policy.
10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

The GGF is not in a position to comment on this question.

Community involvement and community impact

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

As outlined, the GGF are particularly passionate about ensuring that individuals and businesses benefit from the wide ranging implications of improved household energy efficiency. Better energy efficiency within our regulatory planning policy would improve the lives of those affected by such a policy, not only by helping to reduce the cost of bills, but by creating warmer, healthier homes. The impact on health and the subsequent economic saving to the NHS is therefore substantial. Good glazing provides natural light, warmer homes, reduction in drafts and consequently better well-being for the occupants or users of the building. The GGF would like to highlight the importance of considering such effects when policy makers are formulating future policy and would be happy to provide further evidence to the Inquiry.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

The GGF believe that engagement on both a local and national level is central to the success of future policy. Proper and considered public engagement ensures that those affected by these policies can voice their concerns and future policy provides the best end result for our communities. The GGF would therefore like to emphasize how important trade associations are when formulating policy to represent the views of consumers and business. The GGF have always been keen to engage with central and local Government throughout the policy process and further engagement with trade bodies would not only help inform policy but would overcome the logistical challenges facing a national policy of local engagement.

Financial measures

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?
The GGF is not in a position to comment on this question.

On behalf of the GGF, I would be more than happy to provide any further evidence that may be useful throughout the consultation process and we look forward to engaging with the Select Committee on this important policy area.

Yours sincerely,

Giles Willson  
Managing Director  
Glass and Glazing Federation

09 October 2015
The Glass-house Community Led Design – Written Evidence (BEN0074)

Policymaking, integration and coordination

1. There is a disconnect between national policy and what happens in practice at a local authority level. In part, this results from a lack of proper planning on how policy can be applied at a local level, and the variety of contexts that exist within the local sphere (e.g. scale, infrastructure, demographics).

1.1 Where is the thread from policy instruments to their practical application and impact in real contexts? The mechanisms which are designed to support effective placeshaping are often inflexible and unable to facilitate new collaborative approaches which are emerging between public, private and voluntary organisations and initiatives.

1.2 Intervention by national government to local place decision-making is often misguided. National government needs to respect local decision-making, knowledge, as well as the needs and desires of their communities.

1.3 Local authorities are under huge pressures and increasing responsibility yet their resources are being depleted. They need skilled teams and funding to be fit to implement policies that have been put in place related to how we shape our built environment. We need to ensure that government is enabling local authorities with adequate resources to successfully deliver their responsibilities.

2. Policy across Government departments is not based on learning. Through our engagement with them, we have been aware many times of the fact that those at the top are not engaging with evaluation, nor are they drawing knowledge and learning from the experience and evidence of the diversity of efforts to shape our places.

2.1 There are immense challenges in making visible the diversity of voices, stories, experiences and knowledge of those working to improve and shape our places, raising the quality of design and quality of life for communities.

2.2 Government should be championing good design and place quality to support the work of different levels of placemaking, whether by local authorities, developers or local grassroots action groups.

2.3 Policy is poorly coordinated across different departments. It is not uncommon for decision-making at a policy level in one department to undermine another policy sitting in a different department. We have also seen, over successive governments, that when policy changes are made there is rarely a good transition mechanism in place. As a result, a lot of knowledge and progress that has been made is lost and our places suffer from that neglect.
National Policy for planning and the built environment

3. The NPPF responds to market forces rather than to places.

3.1 What is sustainable development? While the NPPF embeds the principle of sustainable development there is no leadership on what it is so what value does it have as a policy recommendation in that case?

5. As the United Nations states, “Climate change is not a far-off problem. It is happening now and is having very real consequences on people’s lives.”

We need to address climate change with a wide-ranging, holistic approach. We need to look ahead 100 years into the future to help us to mitigate and build resilience to the effects of climate change and other man-made and natural disasters that will challenge us over this century, and beyond.

Buildings and places: New and old

6. Everyone agrees that more housing is necessary to tackle the housing shortage. At present, national government is prioritising getting housing built, but not getting people into homes. With such a severe shortage in housing, why is it that, for example, 80% of housing in London can be sold to overseas investors, resulting in under occupancy and unaffordable properties in places where people need to live and work? Leadership from national government that reforms financing models, land management and quality of place would better support the development of housing in England over the next decades.

6.1 By introducing Right to Buy to Housing Association sector the government is also disrupting the income streams of Housing Associations and their role in supporting people in vulnerable positions to have a safe and stable place to call home.

6.2 Design quality standards could support the development of new housing stock which is sustainable and adaptable in the future.

7. Most policy and investment focuses on new housing, yet the biggest challenge is how we maximise existing housing stock (e.g. bring empty properties back into use, drive people and employment to areas with a housing surplus) and adapt this stock to make it more fit for purpose and environmentally friendly.

7.1 It is also unfortunate and unhelpful that there is still a VAT exemption on new build but not on refurbishment.

8. In some places, our heritage assets are becoming important community resources that support wellbeing, while respecting the historic value they imbue. We are currently one of
the partners in a five-year collaborative action research project ‘Empowering Design Practices: historic places of worship as catalysts for connecting communities’. The project is exploring how community-led design can help empower those who look after historic places of worship to create more open, vibrant and sustainable places that respect and enhance their heritage. Through the project we will capture the value of these heritage assets and the role of community involvement in order to show how one of the ways in which our historic environment can be optimised and protected for long into the future. The aim is to support groups to realise the potential of historic places of worship as a resource for the whole community, whilst still serving those who wish to worship in them.

**Skills and design**

9. In higher education the teaching of architecture still concentrates largely on the design of beautiful objects rather than places for people. Students are taught in silos and in turn when they enter the professional world, they tend to work in silos.

9.1 There is also still a stark lack of diversity in those working in the built environment sector and disciplines. We must ensure fairer representation starts with education, bringing built environment education into primary and secondary levels. We need to link people and place in education and in what we represent and celebrate about the built environment.

10. There is currently no national leadership on place quality. Movements like the Place Alliance ([www.placealliance.org.uk](http://www.placealliance.org.uk)) of which we are a core supporter, are bringing organisations, networks and individuals together to build awareness of place quality in enhancing quality of life. Through initiative likes TalkPlace we are trying to support a national dialogue about these issues. These efforts are also helping to increase diversity in representation, seeking to overcome the dominance of powerful lobbies from the built environment industry in influencing and shaping government’s policy directions on place.

**Community involvement and community impact**

11. The government need to be champions and enablers of place quality and equality. They should be supporting and creating spaces for collaborative placemaking to happen.

11.1 As a national charity that promotes good design through collaborative and participatory processes, we believe in the power of community led, participatory and co-design to transform places and bring positive and lasting change to local people. A commitment and an investment from policy to support this kind of work would widen the scope and increase the impact of work like ours with communities and other place stakeholders across the country.
11.2 National government has largely been unreceptive. They don’t engage with people on
the ground, rather they engage with the large organisations and bodies, often focussing on
the ‘profession’, and ignoring some of the most experienced and innovative placemakers.
There is a need to create spaces for specialist organisations to feed into policy no matter
what their size. Policy lacks knowledge from those with experiential knowledge and from
those people that use and engage with spaces and places, such as Rev. Christopher Rowe
from Milton in Glasgow.

Involving and enabling the needs and desires of local people, their knowledge and their
ideas are essential to the success of great places that enhance lives. Current policies such as
neighbourhood planning are but one mechanism.

11.3 There is an expectation by government that communities should be able to resolve
problems as volunteers. By treating communities as collaborators instead, government
could help facilitate processes that make great placemaking possible, respectful and
rewarding for those involved.

11.4 It is also important that national government and local government invite and
accommodate the rich diversity of ideas and approaches for solving the complex issues
relating to how our places are shaped, can thrive and be adapted over time. Government
should actively support experimentation and innovation in placeshaping. Evidence is
emerging of the value of collaborative economies and how new solutions start to emerge
when local authorities, businesses and communities work together to transform places,
which decision-makers can enable and support. We suggest that Government include a
more diverse representation in policy development and implementation, and engage with
and value more a cross-sector, interdisciplinary approach to place.

11.5 Working for over a decade to support communities to participate and lead placemaking
processes has shown us that these processes can be a catalyst for other things. In our
publication ‘Looking Back, Looking Forward’ (2009) we collect the sometimes forgotten
human impact of great participatory design processes. The stories in the booklet
demonstrate that a commitment to working collaboratively with local authorities, housing
associations, developers, businesses, schools, local organisations and local people, focuses
not on what is wrong, but what is possible, with real value and benefit for all.

12. The mechanism of neighbourhood planning introduced in 2011 allows communities to
inform the future development of their place, but it is not a fully formed policy. As a
mechanism, it enables some but not others, failing to enable the diversity of voices. It also
requires those who undertake one, to prepare a vast legal document which is impractical
and inaccessible. Take the experience of an Oxfordshire village neighbourhood plan group,
as shared by Sir Tom Shebbeare on our blog in March 2015:

“Planning legislation and the way it is applied in practice makes it almost incomprehensible
to outsiders. We have a community that has thrown up professional people of all disciplines
and we have an outstanding Parish Clerk. Without them we would have been lost. Things can certainly be made more transparent and user-friendly and some of the interminable jargon eliminated; planning is not something best left to university trained professionals.

The next phase of Neighbourhood Planning methodology must find ways in which less than 600 pages of NDP Report and Appendices are required for examination by the independent examiner. These were written by us, amateurs, on the insistence of professionals. They were read in their entirety by less than a dozen individuals.”

12.1 After four years of neighbourhood planning, public awareness of this new ‘power’ is still not widespread, and there are clear gaps in the quality of those that have been prepared.

12.2 While neighbourhood planning is a useful enabling power for communities to inform how their place is shaped, it is only one of the ways in which the public can be engaged in the process of decision-making that shapes their built environment.

In our work alone, since 2001, we have supported hundreds of projects led by local community groups and organisations to transform community buildings, housing, open spaces and neighbourhoods. Our support has always focused on empowering communities to engage in and lead design and development processes. By building capacity and confidence through hands-on learning and training in design, visioning and engagement skills, communities can play an active and effective role in shaping their environments. Placemaking professionals also need to be supported to develop the skills and knowledge to facilitate and engage in an inclusive and independent way. Ensuring communities are engaged in shaping their places is crucial to the economic success of our built environment. We can empower people to become contributors to growth, unlocking potential in people and in places

12.3 It is really important to get people thinking at an early age about their built environment. There remains still a huge proportion of the population who don’t think of the public realm as something which is theirs, that they own and can shape. We need to help people to be more demanding of quality and education has an essential role in this. Using place as a way of teaching STEM is one great tool.

We can also use place/the built environment as a teaching tool to tackle other issues such as social problems. We strongly believe that young people are important enablers of place, and through programmes such as our Young Spacemakers and Make it our Neighbourhood we can unlock their potential and lead them to great success in their future lives, both personally and professionally. More information on both programmes available directly from The Glass-House.

05 October 2015
Policy recommendations

Following the discussion at the evidence session on 11 November 2015, The Glass-House Community Led Design would like to make the following policy recommendations:

- Maintain a firm requirement for investment in community engagement and benefit in planned development. This investment should engage local residents, community networks and businesses in an informed and open conversation about the parameters of the development in question, and should identify clear parameters for influence in decision-making. Above all, this engagement should provide some element of investment in empowerment of local people and organisations, creating routes to skills development, building local networks and employability.

This is about using engagement to empower local people and at the same time build a resource of informed local collaborators and champions, both to move a given project forward and to contribute to the ongoing success of the area. There is also a real opportunity to introduce a new generation of talent and workforce to the development and construction industries, which are struggling to recruit the workforce they need, while supporting the skills development, employability and life chances for local people.

- All policy and government funding invested in housing and development, and indeed in neighbourhood planning, requires more rigorous evaluation of social and economic impact of its application on the ground in the short and long term. Government should then be prepared to learn from this evaluation and to respond with appropriate adjustments to policy and associated funding.

We currently measure the success of policy and government funding programmes against numerical and financial targets, with insufficient analysis of the real impact on the ground. For example, do we really have a clear picture of how many new homes have been built, how many of these have been bought or are lived in by British residents, whether the typology of new homes being built matches need, how the balance of investment in new homes sits alongside bringing empty homes back into use.

- Remove the VAT on refurbishment, as has been done for new build.

The biggest environmental challenge for Britain is not how we build new homes, but how we make the existing building stock fit for purpose, and how we reduce carbon emissions through refurbishment and retrofit. It makes no sense that new build should benefit from VAT exemption when refurbishment and retrofit does not.
• Policy should recognise and support collaborative economies and cross-sector partnerships. This requires a more flexible and less risk-averse approach to procurement and to the development of collaborative partnerships that test new models of working.

With every sector facing challenges and limited resources, we need to mobilise existing assets differently. This will only work if the small players in places are seen as equal contributors and if we reconfigure rigid procurement and commissioning practices so that they support, rather than eliminate the possibility for innovation and new models for collaboration, delivery and evaluating impact.

Case studies for consideration
The Glass-House works across sectors and disciplines on collaborative research and innovation in placemaking. The following two case studies represent examples of new models for working that mobilise existing assets more efficiently and that build in significant levels of community engagement and empowerment. The Glass-House would be happy to provide more detailed information on these case studies and others.

The Glass-House would like to showcase the sort of collaborative placemaking that we’ve been supporting over the past 15 years. These case studies demonstrate that relatively small investments can make both a concrete difference to the quality of place and life in a local area and can empower people and a community. At the same time, they can produce new flexible models that can both empower the communities supported to carry forward new work on their own, and provide valuable inspiration, learning and resources for others to take up.

The White City Green Placemaking Programme
Working with developer St James, of the Berkeley Group, and Phoenix High School in White City, West London, we delivered a four-month training programme for thirty year 10 students. The programme combined empowering young people in local decision-making and placemaking, with using place as a vehicle to support skills development and employability. We used a live regeneration scheme as the frame and context for training in design, development, regeneration and broader topics such as citizenship and communications.

The project empowered young people to play an active role in the design of an emerging local regeneration scheme, introduced them to career paths in the development sector and provided routes into work placements at St James. Above all, it gave the young people who took part a new sense of opportunity and of purpose for their futures. They grew enormously in confidence and particularly enjoyed the opportunity to work alongside adult professionals who were not their teachers, and to present their ideas and reflections to the St James Board of Directors.
The project also marked a significant culture change for the developers, now investing not merely in consultation or engagement, but in the empowerment and skills development of local young people and in supporting local networks.

**Tidworth Mums – a case for soft play**

As an active provider and supporter of creative activities for local families in their neighbourhood, Tidworth Mums have a vision for a soft play centre in Tidworth and wanted to explore how this could be achieved. The group was already working closely with Wiltshire Council and the Army Welfare Service when The Glass-House Community Led Design and the Open University joined this working group to form the co-design project.

The *Tidworth Mums: a case for soft play* project used asset mapping, play engagement and other creative activities to help Tidworth Mums to identify and unlock their assets and build a network of soft play supporters in their local area.

In this project, co-design and co-production were used as a way to uncover hidden assets in communities and unlock their potential. The project showed how hands-on, creative and playful activities can be useful in attracting and engaging people, unearthing and unlocking assets, and in initiating and driving positive changes within communities.

Key achievements of the project included:

- mobilising resources from the community, district council and Army Welfare Service to achieve what none could have alone, including play provision for 275 local children and 158 parents playing with them, during the Easter half term.
- using the delivery of play services to investigate community needs and desires and to explore and assess potential uptake of new services.

This work was delivered as part of *Unearth Hidden Assets through Community Co-Design and Co-Production*, a one-year collaborative research project (June 2013-June 2014) funded by the Arts and Humanities Research Council (AHRC) under their Connected Communities programme, which aims to help communities become stronger, more resilient and self-reliant so that they can adapt and thrive. This element of the wider project was a collaboration between Wiltshire-based, not-for-profit group Tidworth Mums, national charity The Glass-House Community Led Design, the Open University, Wiltshire Council and the Army Welfare Service.

The *Tidworth Mums: a case for soft play* resource pack tells the story of the project, and demonstrates how the project was used to produce a resource that can help others.

24 November 2015
Members present

Baroness O’Cathain (Chairman)
Baroness Finlay of Llandaff
Lord Freeman
Lord Inglewood
The Earl of Lytton
Baroness Parminter
Baroness Rawlings
Baroness Whitaker
Lord Woolmer of Leeds
Baroness Young of Old Scone

Examination of Witnesses

Q171 The Chairman: Welcome to this evidence session of the Select Committee on National Policy for the Built Environment. You have in front of you a list of the interests that have been declared by Members of the Committee. A transcript of the meeting will be taken and published on the Committee website. You will have the opportunity to make corrections to that transcript where necessary, but I will begin by asking each of you to briefly introduce yourselves to the Committee, please.

Carole Reilly: Hello. Thank you very much for inviting me to give evidence today. My name is Carole Reilly and I am the head of neighbourhood planning and community housing in Locality. Locality is a national charity and we are a membership body. We represent 600 community organisations that are actively working around the country, developing enterprises, developing assets and delivering services in their local communities. In addition to being a member body, we also run a number of contracts for Government, so I run the neighbourhood planning contract; we run the community rights, the right to build and the community management of assets programme. We used to run the asset transfer unit and,
until very recently, we ran the community organising contract for OCS, so we have a really grounded root in the community, as well as running national programmes.

**Sophia de Sousa:** Good morning. My name is Sophia de Sousa and I am the Chief Executive at the Glass-House Community Led Design. We are a national charity; we work around the UK, working with communities and the professionals with whom they work on shaping places. Our starting point is that the quality of our places affects our quality of life. The quality of places can be improved vastly by engaging local knowledge, networks, infrastructure and skills, so we work to help embed new processes, learn from existing processes and innovate as to how participatory, community-led and collaborative design processes can be embedded into practice, can be innovated and can be learned from by others and picked up.

**Q172 Lord Woolmer of Leeds:** What are the main opportunities and challenges associated with neighbourhood planning? In practice, how is the neighbourhood planning process working?

**Carole Reilly:** Shall I start with that? To start with the opportunities, we have to look at mass. We look at numbers. Neighbourhood planning is complicated; it is time consuming but, despite that, it has really captured the hearts and minds of communities, so we have almost 1,700 communities around the country taking up this challenge, in a relatively short period of time. That reflects 8 million people who live in areas that are covered either by a neighbourhood plan or a local plan that is beginning to be worked on. We have only 100 that have gone through a referendum—110 exactly.

It is really complicated and it takes a long time, and yet it is appealing to communities. You have thousands of people working on it. We have to think about why that has worked so well. In the Localism Act, a lot of new powers were given to communities, and this is the one that has had the most appeal. That is because it has struck a really good balance between the effort you put in and the outcome you get out, and that has to be based on the statutory weight of the neighbourhood plan. All the work that communities do is worth it and has to be listened to.

It is underpinned by genuine engagement and it very much enhances the planning system. Those people who we see are involved in neighbourhood plans are not really the usual suspects in terms of volunteering. They are often highly skilled professionals. Sometimes they
are quite time poor, but it has brought to the planning system a much wider group of people who would not normally be involved, and that can only enhance the system.

Planning can be—no offence—a bit boring, so why are all these people involved in it? It is not necessarily because they are really passionate about the built environment; it is because they are passionate about where they live. This maybe helps them to compute that the built environment is terribly important around health, well-being, crime, safety and building neighbourliness. Those are the opportunities for neighbourhood planning. If we had 100 people doing it four years on, we would say that it has not really worked but, despite the difficulties involved in it, it has really worked from the numbers that we have. There are 8 million people in the areas covered by growing neighbourhood plans.

To touch a little on the challenges, I have mentioned time. It takes a long time, which is why we see that only 110 have gone through a referendum now, but we will see, within the next 12 to 18 months, hundreds of neighbourhood plans coming through examination and referendum, being made and taken into law. We are going to see that 2015-16 will be the year of the neighbourhood plan. That would be really good.

Groups are doing it, embracing it and dedicating hundreds and thousands of hours to it, but they also need support. As was talked about by the previous evidence panel, they need technical support and guidance. Grants still exist; groups can get up to £18,000 or £14,000, depending on their need, and they can also get technical support around very specific areas that they need help with. Without that, groups would not really be able to take it any further. Not all my answers will be this long, but another challenge is that it is much harder for forums to start it off. Parish councils exist; they have a telephone; they have an infrastructure; they have a legal personality; they know about it; they have a network that is informed about it. They kicked off with it, and we saw in the very early days that this was just being led by town and parish councils. Increasingly we see forums. In our last review of expressions of interest to the programme, about 30% came from urban areas, which by virtue are forums. It is much more difficult for them. Ask yourselves, if you are involved in local plans around the country, where you would be without a vehicle to do it. It is more difficult for forums. More support has been given from Government, but it would not be achievable without that.
Sophia de Sousa: The first thing I would like to say is that a very useful outcome of neighbourhood plans and this whole initiative of Government has been to raise the profile of community engagement and empowerment in the built environment. That has been useful. We have seen as an organisation, in speaking to developers and housebuilders, that they have started to think about it a little more and a little differently.

We do have some concerns with neighbourhood planning. It is not an area that we focus on particularly, because we find it quite prescriptive. I would like to share a quote from Sir Tom Shebbeare, who was involved in a neighbourhood plan and recently wrote a think piece for us on neighbourhood planning. He said, “It took four years and we were asked by professionals to produce a document of 600 pages that 12 people read”. That shows the challenges of the magnitude of the task that is being asked. While neighbourhood planning is a tool in the box, it is one tool. It is important that we look at, and a bit later I can talk about, more of the other ways of engaging communities in the built environment.

There is a problem of awareness generally. The general public is not necessarily aware that they can go and do a neighbourhood plan, and they are not necessarily aware of the power of a neighbourhood plan. It is a tool that can be extremely powerful. It is a tool that can really help shape the quality and equality of places, but there is such a focus on getting groups across the line and getting the document produced that I fear we could be doing more to really open up the conversation about what the absolute purpose of this is. The purpose of this is to create places that work for people, great places of great quality and equality.

**Q173 Lord Inglewood:** Clearly neighbourhood plans, if they are put together by an intelligent community and then those who are responsible for implementing planning, be it developers or other bits of the public sector involved in regulatory activities, can work well, if the relationship exists properly. Every community has its fair share of local busybodies, so how do you stop these things becoming the vehicles for local busybodies to stick their noses into other people’s affairs and bully their neighbours?

Sophia de Sousa: May I object immediately to the term “local busybody”? I believe anybody who is a so-called “local busybody” is passionate about their place. The question is how we can turn this from a starting point of threat to opportunity.

**Lord Inglewood:** Passion is insufficient by itself.
Sophia de Sousa: There are vehicles to engage people in the conversation that get beyond a knee-jerk reaction. That is true of any kind of community engagement. The knee-jerk reaction is to protect our interests. We see it everywhere we go, so there needs to be investment. I talk about the investment of time and of commitment—it requires funding from somewhere as well—to support an honest conversation about the opportunities from any changes to the area and the compromises that will need to be made. Openness from the start will help that conversation along.

Lord Inglewood: That is what I was wanting to find out about, the conversation and openness, but are we sure that this is always how it happens on the ground?

Sophia de Sousa: No, it is not.

Carole Reilly: We also have to think that we have just come from a period where neighbourhood plans did not exist and now they do, so there will always be teething problems. That is going to be an issue. One of the things about avoiding the hard-to-avoid groups of people who sometimes want to dominate is that neighbourhood plans have a referendum, so there has to be a point when the community at large has a certain say—the most formal say that has been given to communities, other than in general elections and local elections, about whether the plan should exist or not. There is quite a spread in terms of turnout for the referendum, but in some areas it is in excess of 60%, which are general election levels.

With a neighbourhood plan, whilst you might have a few people who are annoying, at the front and want to dominate, they risk this being rejected at referendum if it is not really covering the will of the local people. Community empowerment and community engagement have to happen from the very beginning, and part of that is about setting up terms of reference for groups, making sure they know how to operate, doing a community engagement process that is not the same old boring standing in the library for four hours with 15,000 pages, saying, “Do you want to read this?” but looking at ways that are very different. We have seen some fascinating models of community engagement.

Lord Inglewood: You think that the referendum at the end of the process is a good counterbalance to excessive enthusiasm.

Carole Reilly: I think it can be.
**Lord Inglewood**: Have many of them been chucked out by referenda?

**Carole Reilly**: Two plans have failed so far by the examiner.

**Lord Inglewood**: They were failed by the examiner.

**Carole Reilly**: None of them has been turned down by the referenda. On the whole, the average vote in favour at a referendum is 88%, I believe.

**The Chairman**: Could you give us those sorts of details?

**Carole Reilly**: Yes.

**The Chairman**: I do not think they are in your evidence.

**Carole Reilly**: No, our evidence is broader.

**The Chairman**: They would be very useful because, as a Committee and individually, we all come up against this sort of nimbyism or BANANA, as they call it now. It is an interesting sideline on it.

**Q174 Earl of Lytton**: Good morning to you both and, Sophia, a particular good morning to you. Our paths have crossed before in a similar type of situation. One particular question is to do with the fact that planning is inevitably a longish-term process, particularly the bit that we are interested in, which is the longevity of the built environment. How we create and foster that is important. When some years ago the RICS, my professional body, had a land and community commission on which I sat, one of the people who gave evidence to us said that “I can get a lot of people to volunteer for a project, a sort of task and finish, but if you are talking about the ongoing future management and maintenance of the process, once you have got it started, I get very few buyers”. Is that a problem still, or are there ways in which either of you think that we can break out of that and somehow make Huck Finn’s painting of the fence, or whoever it was, something attractive and desirable for the long term?

**Sophia de Sousa**: As I said earlier, it is a tool in the box. Planning and that long-term vision is a tool in the box. There is a huge amount of activity going on, on the ground, as there always has been, of small, incremental, organic elements of change that make a huge difference to the community. Again, it is about giving people a sense of an understanding of what getting engaged in this long arduous process can produce. What really are the outcomes? We would all like to hear more about four years on and what we know now. It is important to share that with the general public and make it appetising.
If what we know is that it is really hard and not enough people can get it to the end of the
line, we need to ask ourselves why and whether it needs changing. If we understand that it
works—it is making a real difference and changing the way people engage—we need to shout
about it a bit more. That is one of the things. We also need to recognise that the spectrum of
community engagement is vast, it is one way and it is not a way that is appropriate for
everybody. That is fine, and it is best left to those who passionately want to do it, because it
is a big ask.

**Carole Reilly:** I speak with two hats on, in many ways. I speak with my Locality hat, where we
see hundreds of representatives from community organisations across the country painting
that fence and pushing Huck Finn out of the way, because they want to paint it. You see
community activists who want to do those really complicated things, like take over the
difficult heritage building, because they want to save it. As Locality, we have done an
enormous amount of work about encouraging social investment, negotiating with funders
and making sure that those organisations are business ready, robust and able to stand on
their own two feet into the future to deliver community services. We see that.

As we speak today, we have a conference with 600 community activists in Liverpool, our
national convention, which is one of the most inspiring places you can go to to see people
who really are the stickers—who continue there, year on year, in small communities, really
trying to plough a furrow.

Secondly, just going back to the neighbourhood planning programme, whilst I said earlier to
Lord Woolmer that it is more difficult for forums, with neighbourhood planning you have the
challenge of evidence. All neighbourhood plans have to be evidence based. That has been a
bit of a challenge for people, because when people say, “We need this here and we need that
there”, you have to say, “Let us have a look at some evidence, shall we, and then we will see
what your housing needs are, what your problems with immigrant communities are or what
your transport needs are?” That has been an incredibly useful discipline for communities.
Communities that have been through this process, and lots of them are reaching the end now,
have galvanised, have done an enormous amount of work and are there as a strong body to
take actions forward in the future.
We have run programmes under contract to DCLG for about four years. In the last programme, two groups dropped out. We gave grants to 1,000 groups and two of them went bad. That is really incredible. Grant-making bodies do not see that and, in terms of technical support, it was the same. You can see groups like Fortune Green & West Hampstead. They designated 15 areas of green space and are really interested in employment. They are a forum that did not exist prior to neighbourhood planning and now are a group of people who know what they see in their area; they know what they like and they love, but they also know the figures and statistics underneath it, what is true and what is not. That evidence and passion will create something that will give people a launch pad into the future to work on it.

**Lord Freeman:** Just specifically on this point, what was the main lesson that you learned from the Great Yarmouth initiative that you were responsible for? I think I know the building in question.

**Carole Reilly:** In my old life, in the Priory Centre in Great Yarmouth, for those of you who are not aware, I used to run a development trust. It was one of the largest in the area. It was based in a Grade I listed building. I spent half my time going, “This is an amazing building”, and half my time going, “Oh my God, the toilets have backed up and it is going to cost us £15,000 to repair them”. I was trying to navigate my way between community meetings in incredibly deprived areas and meeting the needs of a heritage building, having that funny thing where people would object to stuff just for the sake of it, when you are trying to encourage and bring the local community on board.

I learned a hard lesson on heritage in that one. For the first couple of years, I thought, “Why do we not have a nice new build?” I could have done all my work around mental health, well-being and teenage pregnancies, and we ran two Sure Starts—all of that business—without worrying, but that gave an incredible sense of place to people. Great Yarmouth ranks so highly in terms of indicators of deprivation. The Priory Centre is one of the very few buildings that are Grade I listed in daily use and in secular use. You have ordinary people going to a job club, with their mental health issues or trying to take their special needs kids to our special groups there, in a place of incredible beauty. As we were very lucky with Sure Start funding to develop that stage in those very early days, the renovation of the building was beautiful and people had an incredible sense of pride in it. My lessons are to take a deep breath, make sure you
understand that you are on a marathon and not on a sprint, keep the long-term goal and use those buildings to create a sense of pride. Subsequent to that, I sit now on the Heritage Lottery Fund, because of my passion for making heritage work for people, challenging this “We cannot change anything” view and making it work. Those buildings have lasted because they have adapted.

**The Chairman:** You have certainly enthused me to go to Great Yarmouth. It is great to see that and I do not think you are a busybody either, just one with real passion. There is a similar sort of thing in King’s Lynn. I was very impressed by what they have done there.

**Carole Reilly:** King’s Lynn is amazing.

**Q175 Baroness Rawlings:** It sounds really good, very important and everything that one believes in, with the neighbourhood planning, the commitment, the community engagement, the good intentions and looking four years on. I wonder what happens when things become major difficulties and things perhaps go slightly wrong, like recently around Stratford and around the Olympic Park, where there had been some bits where there was neighbourhood planning and, because of outside competition that has been very successful—that is, Westfield—everything is now boarded up and people have left whole big chunks. Some of them are nice buildings; some of them are not. The neighbourhood there has collapsed. The leader who started it all with the Olympics is not there anymore. I wonder how you would deal with that.

**Carole Reilly:** That is surely a lesson for neighbourhood planning, which is for engaging people and bringing people along. All of the developments in Stratford started prior to neighbourhood planning and a lot of them were imposed. In a lot of the work that happened around Stratford, people were taken out of local authority housing and moved to where they did not want to go. It looked very post-war, in terms of those approaches.

**The Chairman:** It was a special case.

**Carole Reilly:** Yes, it really is a very specific case. It is not an example for neighbourhood planning. The converse of that is that, if you want to make a change, if you bring people on, the power of neighbourhood planning is that it takes objection out of the planning system. Mostly, and as an unintended consequence of planning, the principle is, “I do not agree with you; I do not want that here”. That has been recurrent through the planning system and
planning officers are tired of it. Neighbourhood planning tries to bring a consensus and have an understanding that we have to jointly solve this problem. Stratford is not an example of neighbourhood planning. There are also lots of areas where planning permission predates neighbourhood plans and communities are having to work around that. Those are very difficult areas to work to.

**Sophia de Sousa:** Just briefly, it is a question around, as Carole alluded to, the confrontational nature of planning. Many see it as a vehicle for objection. There is something about setting up processes, whether neighbourhood planning or other processes, for a collaborative starting point. One of the things that we have been very excited about, in the work that we are doing, is bringing communities, developers, housing associations and academics—a mix of people—together at the starting point, so there is a joint conversation for a vision for change and a vision for the place. Everyone will not always agree, but it is that honesty at the outset that makes a difference. Allow people to say “This is my position, this is what I need to get done and these are my fears”, working through it from a starting point of honesty and collaboration. If we can use neighbourhood planning as a step towards a more collaborative approach to place making, and this is one of the tools in the box, that would be very helpful.

**Q176 Lord Inglewood:** I would like to explore what you have been saying a bit further. As an aside, it struck me that your experience of Great Yarmouth had certain application perhaps to the building we are sitting in now.

You have talked about promoting community engagement and, first of all, what are the policy changes that you think might be introduced to make community engagement work more effectively, bearing in mind that, when it works, it clearly works well, because you achieve the consensus that you are talking about? It is quite easy to envisage circumstances where you are going to get great tension between communities and national policy, for example, or perhaps communities and design considerations, both of which, in different ways, are discrete skills and expertise that necessarily stand outside the community’s comprehension. How do you square the circle?

**Sophia de Sousa:** First of all, there is a big difference between engagement as a consultation tool and engagement as an empowerment tool. We are talking about ensuring that everyone in the process has the skills to engage in that conversation. In some cases, and the
Glass-House has been working for 15 years around this, it is embedding design skills within communities, but also within local authority departments, which do not necessarily have a design and place-making background. Some of the skills gap is around how to engage a conversation or how to start a conversation: how to put forward a process that is open and transparent, and which harnesses what everyone can bring to the process. We tend to talk about communities as just people who live there, but communities are hugely rich with skills and experiences that we have harnessed effectively, but also local organisations and networks, which can be collaborators and allies, not opposition. If we create policy that first of all supports investment in a collaborative rather than an oppositional approach, and an investment in experimentation and risk taking—certainly within parameters, not just wildly trying anything—there is something about an expectation of engagement not just asking whether you like something or not but starting a process of empowerment and collaboration. There are some fantastic examples of the built environment and engagement being a process to embed employability skills in communities, but also, as shown by Great Yarmouth and other fantastic organisations around the country, they become a hub, a resource, a network to bring people into the conversation.

**Lord Inglewood**: Do you find in these conversations that the participants speak the same language? I do not mean English, as it were, but the comprehension whereby each understands what the other is really getting at and trying to achieve.

**Sophia de Sousa**: There is an investment required of time and resource to create a shared starting point. As I said, sometimes that requires embedding design skills over there, engagement skills over there and understanding of the planning system over here, getting everyone to a starting point where they can have a sensible conversation. That requires political will; it requires the will of developers, housing associations and local authorities to invest staff time in that conversation and to have the resources to engage people. They are struggling with that at the moment.

**Lord Inglewood**: If I granted you one wish for something that would happen to bring this about that does not happen now, what would it be?

**Sophia de Sousa**: I would say that the requirement for new development should go beyond simply consultation and require any new development or regeneration to have an element of
community empowerment, along with the standard consultation, so that you can create a really good working group.

**Lord Inglewood**: Forgive me for just pressing further, but when you use the word “empowerment”, what precisely do you mean?

**Sophia de Sousa**: I mean giving people an understanding of the process that lies ahead and giving people the information and skills they need to participate constructively. As I said earlier, there is a knee-jerk reaction. If someone is going to come and clear your street and demolish your homes, you are certainly going to fight against it. That is a knee-jerk reaction.

There could be a way to say, “This is the situation; these houses are crumbling down. Let us have a conversation about what is best. Do we refurbish them? Do we redevelop?” To have those conversations really intelligently, people need to have the facts, and there is a real fear in the development and the regeneration world to give those facts and put them on the table.

There is a real fear that, if people are told there is a budget of £50 million, they will say, “We want the moon”. When you start to go through the process of what that can really buy and what is essential, and again that conversation that neighbourhood planning is trying to have about what is important to our area, people can have an intelligent conversation. But there needs to be a starting point of honesty and openness, and there needs to be investment in everyone coming to the conversation with some shared information and tools, I believe.

**Carole Reilly**: I would just add briefly that the important point is to know the parameters of what you are engaging on and to manage expectation. Quite often when you see areas that are really suffering from engagement fatigue, because they have been asked 50 times seemingly very similar things, and nothing has changed, it feels like “I am not answering because you are not listening”. One of the things is about being absolutely realistic. We know what neighbourhood planning can and cannot do. If you want to say, “No houses here”, and you are in a growth area, neighbourhood planning is not for you. We have to manage expectations very clearly and help people to understand the direction of travel they are taking.

For example, I have worked with a number of communities on neighbourhood planning that have started with quite a nimby anti-growth approach but, on the basis of really thinking through where they want to go to, understanding what the needs of their community are,
talking and looking at the evidence, they say, “Actually, we do not want five-bedroom executive homes. We want starter homes for our kids. We want retirement and downsizing opportunities for those who stay in this village”. You find a 180-degree shift from going, “Absolutely no”, to “Yes, we will, but we want to shape and influence it, and we do not want it to be done to us”. Any engagement has to understand what the parameters are and what you can and cannot do because, if the engagement started with that group to say, “No homes, that will be absolutely fine, no problem”, but you knew that there was housing target in that area for 200 homes, it is pointless.

**Lord Inglewood**: You have to start from the wider planning framework. It is no good, if HS2 is going to your village, saying, “We should send it somewhere else”.

**Carole Reilly**: Absolutely, if that is what you are engaging on. It is about really managing expectations. A much wider programme that we have been involved with, which was funded by OCS, is the Community Organisers programme that you will be aware of. It started off with this very non-prescriptive approach: what do you love about where you live and what would you like to change? The agenda was stripped bare, and so residents thought, “Oh, what do I love? I love this little walkway there. What would I like to change? I would like to change a bit of lighting here”. Community projects developed from that and they were absolutely bottom-up, engaged in small or sometimes slightly larger areas. Community engagement works if you make the balance right, if you are clear about outcomes and if you are absolutely clear about what can be achieved by the process. There cannot be one model for what community engagement works.

Going back to neighbourhood planning and repeating myself, 88% yes votes and sometimes 60% at a referendum are significant figures. Who went to the police commissioners referendum? It was 15% on average. People do really care and they are really engaged, but you have to make sure you ask the right question. I said I would be short and I was not.

**The Chairman**: We have to rush on a bit. We are running out of time for questions. There was something you wanted to say.

**Sophia de Sousa**: I wanted to reiterate that it is about creating a resource in the community, rather than an obstacle, in a nutshell.

**The Chairman**: And a measure of trust, I should think, which has not been mentioned.
**Sophia de Sousa:** Absolutely.

**Baroness Finlay of Llandaff:** I was interested in your experience to know how much the communities understand the health needs of other groups, so for spaces, safe routes, cycle routes and so on, but also how much they understand the problems sometimes of refitted buildings, particularly when there is asbestos in them, and managing that. What has the view been towards boarded-up buildings being put to a different use, possibly a use for people who perhaps may not be viewed as the most socially desirable in their area, so temporary housing, transit housing or accommodation that is used for homeless to use as temporary transit accommodation?

**Carole Reilly:** In terms of boarded-up buildings, as Locality as a whole, we have been really concerned with the high street and the demise of the high street, in many ways. We are concerned about changes to permitted development. It is quite shocking what you can do now without planning permission, and small changes have massive impacts and unintended consequences. We can look at what does happen in our high streets. We have worked with an organisation called Meanwhile Space, which has really supported this pop-up initiative, which at least removes the boarded-up-window approach—the feeling that everything is going downhill a bit and that you have to get in your car to drive to Tesco.

**The Chairman:** Can I just intervene on that one? Pop-ups are fine in theory but, in practice, they make the people who are existing on the high street, at least where I live, think, “Oh, three more pop-up shops this month. That means we are really on the way out”. They are adjusting their buying patterns, their travel patterns and their demand for public transport. It is a very difficult one. It was an extremely good idea, but I also think about long-term security in a place. When the elderly people there see these shops popping up, they think, “Where is it all going to end?” because they go.

**Carole Reilly:** We need a delineation, though. Ironically, at the end of my street—and I live in a conservation area in a row of listed buildings, all Grade II—we have just had a pop-up and they are selling tinsel and tat. I feel exactly the same way, but we have examples of a number of other pop-up shops where young entrepreneurs and social entrepreneurs are looking at very interesting concepts that they want to try out. It is not a one-size-fits-all model.
The Chairman: They are saying that is why they are doing it, but they are not doing it that way. That is the point.

Sophia de Sousa: There is a point about leadership in the local area, about which pop-up shops are going in. There is looking at what is there already on the street and not creating competition that will hurt others but complementary activities.

The Chairman: Can I just point out that we are in a very small community of 3,500 people, and we have had three pop-up fudge shops? When I go home tomorrow, there will probably be one, if that. It is horses for courses, but it is a dangerous concept.

Carole Reilly: The market is difficult in terms of the high street because, if we do not look at pop-ups, we look at what has developed in any high street recently, where you have much more ubiquitous chain stores and out-of-town shopping centres, then you have hairdressers, cafés and now knitting shops. We are looking at very different high streets from what we saw 10 or 15 years ago.

Sophia de Sousa: Can I just come back to boarded-up homes, because there are some fantastic examples of communities delivering change and growth. Liverpool is one of them where streets were cleared for housing pathways and streets died for many years. Thirty-four out of 200 homes were occupied. There are fantastic examples. Cairns Street was just celebrated—I know you have worked with them as well—at the Academy of Urbanism awards. It was a group of people who stood up and said, “Our streets should not look like this and we are going to do something about it”.

When we talk about growth and fulfilling housing need, that community got together. They repainted. They refurbished. They revitalised their street, and homes that were empty and being compulsorily purchased for £8,000 are now being sold for £100,000 each, so there is also that organic change. There are some very effective homesteading policies, the £1 homes initiative and those sorts of things, if they are done with a sense of shared commitment and a sense of real regulation in place, so that they cannot fall prey to just development but are a vehicle for community building and revitalising places.

I just wanted to make one point on people’s understanding of each other’s needs. One of the things that communities have most often told us, and particularly young people, is that engagement processes very often speak to groups in their little boxes. They will go and speak
to the young people and they will go and speak to older people and they will go and speak to young single parents, but very rarely do they create an environment in which those people can have a conversation together.

**Q178 Baroness Rawlings:** You did touch very briefly on leadership. With all that you have been talking about, I have been listening very carefully to lots of dialogue and discussion; people are going to be talking forever. I was wondering about your Great Yarmouth success. There must have been a strong leader there driving it, who is there getting everything together, because otherwise everyone consulted talks for hours and hours and hours, and it goes on forever, unless you have somebody driving it who is a strong leader. You hardly mentioned that at all. Like your Great Yarmouth project, was there one visionary there who really drove it? It is all very well everybody talking about it. What is your view?

**Carole Reilly:** Briefly, I was the Chief Executive in Great Yarmouth and I took it forward. What we see at Locality, in terms of community development trusts that make things work—and everybody knows Coin Street in London, and Goodwin in Hull—we look at amazing development trusts that have brought local people on board. Leadership is incredibly important: making sure people on the ground have managed expectations, are brought in and understand what can be done, but there also has to be money to match it. One of the things that we absolutely can evidence in Locality and in development trusts before us is that these community organisations deliver on the ground. They deliver on the ground because they are rooted, they are not going anywhere and they are going to be there for the next 10, 20 or whatever years. We need to match regeneration funding to community organisations, because you get incredible value for that. For state-based regen programmes, if we look at the empty homes that you spoke about, Baroness Finlay, if they are delivered not necessarily by the local council alone but co-produced by residents’ associations and by local development trusts, things will work, especially where people know and love an area, and want to stay there. Was that brief enough?

**The Chairman:** Yes, that was fine.

**Sophia de Sousa:** I am going to be brief. The point is around collaboration, but it is also around leadership coming from a number of groups and organisations working together. It requires leadership in the council, leadership with a community organisation and leadership within
community groups. One leader is not enough. It requires, when that leadership is there, all of those leaders to mobilise their various assets, and I mean “assets” in the very broadest of terms. When that happens, you can do a lot with not very much.

**Lord Inglewood:** How do you achieve leadership?

**Sophia de Sousa:** It is important that leadership is not one person. You need that person who has inspiration and a driving force but, to be very brutal, if that person goes under a bus, it all falls apart if it is one leader. You need a group with leaders coming from different areas who are working together.

**Carole Reilly:** There is also a thing about small amounts of money that kick-start groups and give the confidence that allows leaders to come forward. In our community-led housing programmes, it is around a bit of cash that can help a community organisation either sort out its governance or buy an option for land, so they that they can take something forward. Those bits of money are not huge; they are reasonably insignificant, but they can build confidence—and confidence builds the foundations for good leadership.

**Sophia de Sousa:** That investment should have a collaboration caveat attached, I believe.

**Q179 Lord Freeman:** My question is about the balance of responsibility between national government and local authorities. Do you think that balance should be shifted more towards greater responsibilities at the local level, not just northern powerhouses, but communities all over the country?

**Carole Reilly:** I will be brief on that. Clearly in terms of planning policy anyway, we see a massive vacuum. You have national planning policy and then you have local/neighbourhood here, with this kind of gap in between, apart from in London where we have the London plan. You can see a vacuum and there is a real confusion about what you do about infrastructure, what you do about transport and how those things work. They impact enormously on the local thing—the neighbourhood plan in planning terms—but they are decided at a national level.

In Locality, we really are welcoming the discussions happening around devolution. We think that our community members could really be great vehicles for making sure that devolution onwards, double devolution, is worked out on the ground, but we have to make sure that you do not get another layer of bureaucracy and politicking that stops power and money going
down to neighbourhood areas. We are having discussions with a number of areas that are interested in doing devolution deals to see how we can keep it going down. We have to look at devolution onwards, and we have to make sure that the power rests at the neighbourhood level, because that is where you get the most worthwhile outcomes, as long as they are managed properly.

**The Chairman:** You mentioned the London plan, but we went to Birmingham on a site visit and that was very obviously part of a plan to remove the concrete collar around the centre of Birmingham. It was very successful. Any more on that one, Lord Freeman?

**Lord Freeman:** No.

**Sophia de Sousa:** I think there is a balance between leadership and policy. When we are talking about national and local government, and the balance of power, there is a responsibility for national government to have a very strong leadership role in being demanding about place quality and equality. There is certainly a challenged environment for local government, which has had its resources depleted significantly, and a lot of the skills have been drained from place-making departments of local government. There is a question there; there is a tension, if you like, but there is also an opportunity. This tension of lack of resource can help push the collaborative economy approach—developers, housing associations and community organisations together. If they pool their resources they can achieve more than they could alone. Creating vehicles to make that easier and encourage that will be really important.

**Baroness Whitaker:** Such as?

**Sophia de Sousa:** There is a real problem around stepping into a proposition. Let us take the example of a community park. Many local authorities are simply handing them over for community management or ownership, because they do not have the funds to look after them. That is a big ask for a community and there are some very good resources within local authority networks; there are good resources within community networks.

It is important when you are looking at all of these—asset transfer has been a really interesting journey, and we have worked together on that in the past—that you make sure that any new process, like asset transfer, like handing over management to any organisation, has checks and balances attached in terms of accountability, but also creates opportunities
and helps support that networking. One of the most important roles a local authority has and one of the most important tools is the networking opportunity. They know everyone. Who they do not know, the community organisations know. Who they do not know, the local authority does. How can you put those mechanisms in place for structures that support that networking collaboration approach?

Q180 Baroness Parminter: The question I was going to ask you has already been answered, because it is about how we get communities to engage in taking on new housing. You are saying that, as long as you use neighbourhood planning so that people feel it is being done with them, rather than being told to them, that is the way forward, so I am not going to ask about that. I am going to ask a supplementary question. You keep talking about education, education, education. Is there anything concrete? Do you mean formal changes to Key Stage 2 or Key Stage 3, or are you talking about education in a community setting?

Carole Reilly: Clearly, education is really important. There have been such enormous changes. I have been talking about training people to upskill and to support them for specific bits of skills, so I do not really have anything to add on education.

Sophia de Sousa: We have recently been involved in some really fantastic projects working with developers in schools, in areas where there is large-scale development happening. We are using a local development process as a means of talking about place and talking about citizenship, taking young people through a training programme, which is a big-picture programme, using a place as a vehicle for skills development and empowerment. That is interesting as a mechanism because not only does it start to bring young people, their families and local networks into the development conversation but also introduces them to a sector of employment opportunity they knew nothing about. For instance, this particular project we did in White City led to work placements for the young people with the developers involved. There are vehicles like that that take great will on the part of local schools and developers, and they are not easy to set up, but hold great value. They should be shared and celebrated, because it is a very effective model. When a young person engaged in such a programme says to you, “Now I understand why I have to go to school”, that is a place, and development, doing some good.
Q181 Baroness Whitaker: I absolutely support that communities must have a predominant role in the shaping of their own local environment. They have a range of skills, but there is a body of expertise in design and high quality place making that some communities may be unaware of. What policy measures do you think should be taken to bring communities into the knowledge that they really need to have to make sure that it is a high-quality place that they are going to shape? How can community engagement support good design in place making?

Sophia de Sousa: I believe it comes down to a starting point of not asking, “Do you like this?” or “Do you not like this?” but “What is special about your place?” and “What fills you with delight?”

Baroness Whitaker: On the process, if I could just pick you up on something that happened in Manchester’s New Islington, the architect, I cannot remember who it was—maybe it was Terry Farrell—had a large group of local people to whom he put alternatives. “Which do you like? Do you like this? Would you rather have that?” They were very participative, but he was a very skilled place maker who was showing them the options. Do you not think that something like that works?

Sophia de Sousa: People require training to engage, if you are really getting into a detailed conversation about assessing plans and development options. It is unreasonable to expect a person to just step in front of a set of plans and understand them. We have been delivering training for 15 years for community organisations, and they are most effective when community groups and organisations are trained alongside project officers and members of the development team, so they are developing a common design language. The architects that we have then worked with have said what a difference it makes when we have a starting point of a shared language and vocabulary. It is a whole lot easier then.

Baroness Whitaker: How could this be inculcated on a national scale? Do you have any thoughts?

Sophia de Sousa: It requires an investment, both of will and of financing. There are assets out there that can be mobilised. The development community is one. They have said that they will happily support engagement if the vehicles are there to do that. There are procurement issues and competitive advantage issues that get in the way of that early work. We do work
in schools. There is a lot you can do to talk about place and get people thinking about it. We are involved in the Place Alliance with Matthew over there, and the objective of that is to start a national conversation. We do not talk about place nearly enough in this country, and that is really the starting point, but then ministers need to engage with the diversity of voices that come back.

Baroness Whitaker: National leadership?

Sophia de Sousa: You need the national ear as well, willing to engage with the diversity of voices. It is too easy to route all of the opinions and views on place through organisations like Carole’s or mine. We can be fantastic spokespeople, because we work with hundreds and thousands of communities, but there will always be voices out there that need a route into the ear of government. Hopefully the Place Alliance is starting to tackle that.

Carole Reilly: If I take this back to neighbourhood planning, we have to say it is one of the vehicles that has the biggest number of people working on it in the country. Increasingly, we see neighbourhood plans having urban design policies in them. People care about it. We would encourage them not to be on a minute level around the detail of design of particular buildings, because the NPPF takes us away from that. It says it should be broad. We can see in neighbourhood planning groups that there are a number of really creative groups out there that are keen to embrace new development and to understand that we should be looking at a heritage for the 21st century, instead of just replicating old things or making a pastiche.

We have a vehicle that works. We have a vehicle that is being embraced. Through DCLG, we run a support programme, where we have just started to do a big piece of work in east Shoreditch around design and design codes. As long as neighbourhood areas are engaged in the process of what is going to happen to the area, they can say, “This works” and “That does not work”, in terms of permeability, or “How do I get my bike across?” or “If you build that estate there and it faces outwards, no one will use our shop and it will close, because everyone will get in their car”. These are the things around making a place that really make it work and build into it health, well-being and neighbourliness principles.

We can look at a couple of examples, like the Wing neighbourhood plan, which passed its referendum in March or July. I cannot quite remember. The shovels are in the ground now. They have worked with developers all the way along. Importantly, that has allowed them to
influence design. It has allowed them to influence place making. It has taken conflict out and sped up the process of getting growth. We really need to see that, when you do that and have a collaborative approach, things will kick off, but again the health warning is managing expectations. You can only do what you can do under this legislation.

**Q182 Baroness Finlay of Llandaff:** I have a brief question following on from that. Given that data can speak volumes, have you got any data from an area, such as the ones you have just been referring to, that show a drop in consultations for depression or mental health, a drop in disturbances in the community through disturbed teenagers or whatever, so that there is a number there—a before and after comparator?

**Carole Reilly:** No. I am afraid at this point I have to sit back and say neighbourhood planning is still relatively new. We only have 110 that have gone through referendum and 87 that are made. It is still too early. The impact on health and well-being measurements would lag where the neighbourhood plan was, although we are about to work with the OCSI, which is developing the data on deprivation, to look at this evidence planning for neighbourhoods. They could do something looking backwards on it, but we do not have it at this point.

**Baroness Finlay of Llandaff:** I am not sure about the lag, because there is something about a sense of belonging to a community that brings about very rapid health benefits, quite apart from the longer term ones later.

**Sophia de Sousa:** If I may, a really useful resource on that sort of information is the fantastic work being done within the Connected Communities programme funded by the Arts & Humanities Research Council. That supports action research, which is a collaboration between academia and practice on the ground, and communities. There are some fantastic projects. We have been involved in many and have a strategic partnership with Open University around that. What can we learn while we are doing? There is a huge resource there, both in gathering learning from experience and testing new methodologies, but also a resource in creating new opportunities to test models and support communities with free support. It is worth looking into. There is a vast spectrum and a large programme around communities and design.

**The Chairman:** It has already been slotted in by my policy analyst.
**Carole Reilly:** Can I just briefly add to this? Neighbourhoods are not defined in the NPPF. Neighbourhoods are as defined as the people who live in them, in terms of neighbourhood planning. Whilst that is great, one of the problems is that data collection might not fit in with your health authority area or data collected by police for your safety measures and so on. We have been working with a number of organisations that are rapidly developing a reporting system that can make a bespoke area and will do a best fit around numbers of data sets, so that data will come online. There is open data and it fits to the local authority boundary, the ward boundary and the education boundary, and they are really complex to understand, but there are massive developments to be made on that and we are working closely on it. I would really hope to say that, in a year, we can give you all this.

**The Chairman:** That sounds very promising.

**Sophia de Sousa:** May I just add one point, which is the value of stories and voices? We can talk about data but people’s stories about engaging with placemaking are equally important. A young man said one of the most powerful things that has ever been said to me, which was: “Before I got involved in a local garden project, I sat in my house all day long, on my own, watching television, and now I am a trained youth worker and I am out there with people”.

**Baroness Finlay of Llandaff:** Those stories need to be collected and collated, and then used, otherwise they get lost.

**Q183 Baroness Young of Old Scone:** We have been hearing quite a lot about a diminution in the level of skills in local planning departments. Are there some particular skills that you think local planning departments should have and do they have them?

**Sophia de Sousa:** Planning departments are being asked to be enablers now. There has been a real shift in their role from being reviewers and deciders on plans and policy. They are now being asked to help communities engage in neighbourhood planning, so there is a whole skills set required there. I know from going around the country, and I also sit on the Urban Panel, which goes into a lot of former market towns and former industrial cities, simply that local authorities do not have many personnel with a place perspective or with place expertise. That is a real problem, be it in heritage, planning or any of the architectural built environment professions. They are being chipped away at, so it is a problem.

**Baroness Young of Old Scone:** What is the solution?
The Chairman: Our report would recommend it.

Sophia de Sousa: I do not think it is necessarily about expanding government out again. It is about recognising there is a critical mass of skills sets required within a team to carry out certain duties. Particularly if devolution is happening and more duties are being handed over to local government, they need the mechanisms and support structures to do that. We can do some creative sharing of expertise across areas, and there are some nice examples of different local authorities pooling their resources to create a collective bank of knowledge that they can share and a personnel resource that they can share, and we will need to look at that more and more. Caseload is going to be an issue with something like that and local knowledge will be an issue with that.

Baroness Young of Old Scone: Does basic training for planners, architects, surveyors and builders need altering?

Sophia de Sousa: The education system should inject that. The built environment education works in silos, so they do not know enough about each other’s professions. A shift is starting to creep into higher education courses now. We are asked to go and do lectures and workshops, and embed what we have learned within university courses. The role of the designer and the planner is changing, and the higher education degrees need to reflect that. There is something we can do to help send them in the right direction. That investment is needed.

Carole Reilly: In terms of skills and capacity shortages for local authorities, there is no doubt that local authorities are incredibly stretched. Three or four years ago, they were far more suspicious of neighbourhood planning and the demands it would put upon them. Planning departments feel like a game of musical chairs where no one is removing the chair; they are removing the people. You go in and there are loads of empty chairs in the department, and so it feels like more work for us and we cannot do it. There is also a level of suspicion towards communities in terms of: “What do you know about this anyway?”

We have seen a significant change in that way. Local authorities are much more confident, and I could name a couple of local authorities that encourage neighbourhood plans to be developed in their areas. Bassetlaw, for example, is one of those that regularly encourages their groups. Leeds is another one. They feel like they are more confident about the skills of
communities to take this forward, and it feels more collaborative. If they can state clearly, “We are the local authority; under our duty to support, we will give you this, but we expect this back”, and if there is a really clear give-get or ask-offer between the local authority and the community body—some kind of contract—it makes it work. It means that skills shortages can be overcome.

One of the things we see, in terms of the reducing planning departments for neighbourhood planning, is one of the solutions is to produce loads of resources, and then people can take them and know how to write a plan. Remember, four years ago, there was no plan. Three years ago, there was no neighbourhood plan. It is like writing a thesis and no one had ever done one before. You do not know what it is. Now we see that there is much more, but we have to be really careful about just producing tool kits and resources, because otherwise neighbourhood plans will be defeated. They reflect the uniqueness, the individuality and the character of that area, as made by those local people. If you just build it from loads of different tool kits, it becomes a cut and paste job and it will mean nothing to local people. The power is in the people who wrote it and own it.

One last thing to say is that the community engagement and the skills needed have been reflected, as I said before, in referenda. It has inspired local authorities. I would really like to watch this space to think, “Will they do that then? Will they work with the community, as widely and as deeply, in terms of developing their local plans, when they have big changes for the area?” You have to look at non-traditional ways of engaging, getting different people around the table and getting their voice heard. It is not that costly if you know how to do it right.

**The Chairman:** Thank you very much indeed. It has been a most interesting session. Thank you for all the preparation you have done and for your written submissions. You will get the transcript and you can correct it where it is necessary. Thank you. It has been most useful.

*11 November 2015*
1. This submission deals with one of the greatest but least acknowledged barriers to effective community engagement: the extremely low level of recognition of the value of lay knowledge for policy making and spatial / urban planning. Lay knowledge is the knowledge that people have about their local areas and how those places work from personal experience, and is expressed in a qualitative and descriptive way.

2. The main focus of this submission is Question 12 of this Select Committee’s call for evidence, which asks about effective engagement of the public and communities with the processes of decision making for the built environment in which they “live and work”. It also centres on Question 11, which is about taking impacts on local people into account and improving considerations of impacts on health/mental health. We note that control over one’s own life is fundamental good mental health. These issues also relate to Question 1 on the ‘right level’ for decisions.

3. Recently completed research into community engagement in spatial planning, has shown the uses of lay knowledge. That work was conducted at UCL and the results are published in a peer-reviewed journal. There are enormous practical implications for Built Environment policy from that study. The relevant points are:

   a. Communities / the public are experts about how their own places work in a ‘spatial’ way, with multiple interlocking connections.

   b. Well-conducted participatory practice allows planners to draw on lay knowledge from communities / the public for decision-making.

   c. Lay knowledge provides causal explanations to spatial planning decisions, which is of particular value in:

      i. dealing with socially complex issues

      ii. shaping policy that affect multiple policy areas (health, transport, and education for instance)

---

138 Introduced with the 2011 Localism Act, as the committee is no doubt aware.

139 For instance where sensors are embedded in infrastructure or buildings to provide live streaming data on energy use or human activity.
The value of lay knowledge comes from daily life and community activities, so it is experiential and highly personal.

e. This non-technical form of knowledge is not recognized as planning evidence and is lost to written records, which perpetuates low trust in participatory processes.

4. While current policy developments have made progress in empowering ‘community scale’ actors and establishing legal rights to access decision-making, further work is needed to bring the public into decision-making. Ratification of the Aarhus in the UK is intended to secure legal rights to participation in decision-making, and greater community control over their localities through Neighbourhood Planning gives new statutory powers to produce a small-scale policy. These are progressive steps but such powers and rights are only ‘tokens’ unless communities can bring lay knowledge(s) to the table. In practical terms this has implications for what is understood as ‘material considerations’ within planning.

5. The current technocratic definition of ‘material considerations’ precludes matters that are of genuine concern to individuals and communities from being considered. This is often not understood particularly in neighbourhood planning, which creates confusion, and it discourages people from engaging with decisions on their local built environment.

6. Recognizing communities’ lay knowledge is particularly important in the context of increasing expectations of big data and the ‘internet of things’ in the built environment. Just like in older, smaller, offline data, the patterns and trends found through new sources of data only tell part of the story. They show ‘what is’ but not ‘why it is so’ and ‘how it matters’. Built environment impacts are social, complex, and explained by lay knowledge.

7. Part of the solution is giving greater support to planners and other built environment professionals, to enable them to spend time in engaging communities. Transfer of decision-making powers to lower scales of planning must come with the resources needed to invest time in face-to-face contact between local people and those responsible for planning, design and delivery of development and management of places.

8. We encourage this Select Committee to support the removal of this barrier for communities to engage in shaping their own environments with their valuable lay knowledge. Recognition of the value of lay knowledge for ‘material considerations’

---

141 Savills, 2015, “Beyond the election: what next for planning?”
needs a dedicated investigation and we suggest research is commissioned to ask: “How can communities’ lay knowledge become a material consideration for planning?”

06 October 2015
Dear Baroness O’Cathain,

I am pleased to have the opportunity to respond to the Committee’s inquiry into National Policy for the Built Environment on behalf of the Mayor of London. With London’s population at its highest ever level, and growing by 100,000 every year, the issues around housing and infrastructure being considered by the Committee could not be more timely, and I thought it would be helpful to set out some of the work being done, and the reforms needed, to ensure that all those living, working in and visiting London benefit from the best possible built environment as befitting the greatest big city in the world. The evidence covers the Mayor’s devolution campaign, the London Plan and the NPPF, suggested improvements to the planning system, and background on the new London Land Commission.

I have also included a short note on the Old Oak and Park Royal Development Corporation (OPDC), the Mayor’s new Development Corporation launched on 1st April. The OPDC is charged with maximising the benefits of the once-in-a-lifetime opportunity of investment in HS2 and Crossrail to develop an exemplar community and new centre in north-west London, creating opportunities for local people and driving innovation and growth in London and the UK. Its ground-breaking place-shaping work to transform and integrate one of the most inaccessible areas in London into a well-connected, world-class transport interchange, while delivering deliver 25,500 homes, significant new commercial space, and 65,000 new jobs supported by new sustainable and thriving neighbourhoods, may present an interesting case study opportunity as the Committee continues its inquiry.

Devolution

London’s ongoing success is predicated on the capital’s government being able to plan for, and deliver, the infrastructure necessary to underpin its welcome growth. To this end the Mayor, alongside London Councils and the Core Cities Group, has been campaigning for the devolution of property taxes to London’s government so that the capital is no longer reliant on hand-outs from Whitehall to forge forward with innovative and exciting housing and infrastructure schemes.

The devolution of the five taxes – business rates, stamp duty land tax, council tax, annual tax on enveloped dwellings and capital gains property disposal tax - is fundamental to cementing London’s long-term success. This was one of the key recommendations of the independent London Finance Commission (LFC), chaired by Professor Tony Travers which reported in May 2013 having looked in detail at how London’s funding arrangements could be improved to cater for current growth and plan for future growth. The report noted: “London government should have the freedom to make appropriate investments in its own infrastructure both to cater for the growth already forecast for its population and economy, and to promote economic growth... devolving revenue streams, including from
the full suite of property taxes, will afford London government the autonomy to invest in the capital and increase its accountability to London’s residents and businesses, without affecting the financial settlements of other parts of the country” (p38).

The devolution England’s cities have called for is relatively small. London’s local authorities and the Mayor currently keep about 5% of the taxes raised in the capital and are restricted in the amount of leverage this enables. The vast majority of London’s tax revenue goes directly to the Treasury. With the devolution of the combined suite of property taxes this would go up to about 11.5 per cent, meaning that the Treasury would still keep 88.5% for redistribution across the country. As an international comparator, New York keeps over 50% of taxes generated in the city, while Tokyo keeps 70 per cent (national treasury disbursements make up only 6% of Tokyo’s total spend), allowing these cities not only to invest securely for the future, but also to use local measures, such as varying local taxation levels, to deal with local issues and boost the economy.

The Chancellor’s announcement on 5 October 2015 that all business rates will be kept by local authorities for reinvestment has the potential to be transformative, and we look forward to working closely with the Treasury and DCLG on the details of the reform.

In addition to this, the Mayor believes there is a strong case for moving forward quickly with the proposal for stamp duty uplifts to be retained in the capital to help fund infrastructure improvements. Such uplifts would be an important enabler of many of London’s priority schemes, such as Crossrail 2, the Bakerloo line extension and road tunnels, because they support housing. Government could either ring-fence additional stamp duty revenue or create zones where London could retain additional revenue locally.

A corridor / zonal approach would see additional stamp duty from property sales close to new transport projects could be kept to fund those projects (similar to the zone for business rates uplift from the Northern Line Extension). Potential funding models for schemes such as Crossrail 2 and the Bakerloo line extension shows how important stamp revenues look likely to be as a way of capturing a proportion of residential value increases. Development of new housing is a key part of many transport schemes, with Crossrail 2 having the potential to enable up to 200,000 additional homes. Schemes also have an effect on the value of existing property in surrounding areas (20-25 per cent for Crossrail 1).

The planning system, the NPPF and the London Plan

Compared with its predecessors, the NPPF provides an invaluable and succinct national policy context and is well-tailored to the needs of its main audience, local planning authorities. However, despite paragraph 10 - which provides scope to tailor its application to local circumstances -experience shows that it can be applied in a mechanistic, ‘one size fits all’ way. This has particular implications for London, not just because of the distinct scale and nature of development in the capital, but also because of its unique planning arrangements. London alone has a two tier planning system, with borough Local Plans
having to be in ‘general conformity’ with the Mayor’s London Plan - together they constitute the Development Plan for an area. The NPPF provides national planning policy principles and explicit flexibility for addressing them in local circumstances. In London the London Plan provides the strategic dimension to this and the boroughs add their local dimensions. This reflects government’s localism objectives as well as its planning policy principles, and the Mayor feels it would be inappropriate for Government to add a further, top down, geographical dimension.

The London Plan sets out a statutory, integrated economic, social, transport and environmental framework for the development of London over the next 20-25 years, and borough Local Plans’ provide a more immediate and detailed perspective, typically over a decade. The London Plan follows an on-going process of ‘plan, monitor and manage’ and is regularly updated to address changing issues and national policy through formal Alterations. This process is expedited by the London Plan having a relatively streamlined preparation process. In view of the lead time involved in some infrastructure provision the Mayor has introduced a new, non-statutory, long term Infrastructure Plan, currently looking ahead to 2050. Cumulatively, these timescales and arrangements are considered appropriate and effective in addressing London’s planning requirements.

The London Plan has its own legislative base to provide a sound and appropriate strategic interpretation of national policy to address London’s unique circumstances. To ensure this it is subject to public consultation, an IIA and EIP, Assembly scrutiny and government sign-off. Despite these distinct arrangements, national policy also remains in force in London once government has ‘signed off’ the Plan, effectively meaning that planning decisions and appeals here can be considered through the prism of three layers of policy rather than the two which apply elsewhere in the country, and that Local Plans are prepared in the context of both national policy and the London dimension to it provided by the London Plan.

It would simplify the planning process for users and expedite local plan production by boroughs if government recognised that, having been through its statutory preparation procedures, the London Plan represents the London expression of the NPPF. Of course, should there be elements of national policy not covered by the London Plan, such as advertisement control, or if government introduced new policy after the Plan was prepared, then the NPPF would take precedence until the Plan was altered to address these issues.

It should also be recognised by the Government that the Mayor is best placed to provide guidance and strategic policy on the implementing and prioritising national planning policy principles in the unique circumstances of London through his Plan, subject to its preparation procedures (which includes Government ‘sign-off’).

The housing supply and the planning system

It must be accepted that the needs-driven approach of the NPPF to addressing housing supply is challenging, not least in reconciling provision for competing activities and
environmental priorities with a fixed stock of land. However, the Mayor and boroughs have demonstrated that it can be made to work – London needs 49,000 more homes a year and over 50,000 a year are being approved, backed by a pipeline of over 260,000 approvals. Clearly this requires a strong commitment to partnership working between all parties - the Mayor, boroughs, developers and other stakeholders. It also requires recognition that while the contribution of the planning process to increasing housing capacity can undoubtedly be improved, there is a complex series of other factors which are also constraining housing delivery and which must be addressed.

Improvements which could be made to the planning process include lowering the thresholds for referral of strategic planning proposals to the Mayor; a more streamlined approach to local plan making and decision making in areas with particular housing potential; devolution to the Mayor of historic central government powers over wharves, tall buildings, Thames policy areas and the extent of central London; recognition that there are distinct London dimensions to national policy initiatives such as liberalisation of Permitted Development Rights; and support for bottom-up arrangements to more effectively coordinate strategic policy and infrastructure across the wider South East. The Mayor is engaged with government on taking forward these and other measures through its ‘devolution’ agenda – they are issues which are most effectively addressed at the London rather than the central government level.

The London Land Commission

The London Land Commission was launched in July with the key objective of identifying land in public ownership, with a focus primarily on where clusters of land in the public sector could be better co-ordinated, reconfigured and maximised to ensure land is used more efficiently. From its initial analysis, the Commission has identified opportunities for where a strengthened public sector, working in collaboration, could assemble land for development to increase housing supply and contribute to place shaping. The scale of the opportunities is partly dependent on planning policy and feasibility assessments but highlights a significant role for the Greater London Authority (GLA) to work with public bodies to understand land use and enable the development of comprehensive masterplans.

To enable a strong interventionist role on land in public and private ownership and increase housing supply, London will require a substantial capital investment. Additionally, London’s government requires the appropriate legislative and mandatory powers to effect change in how land is acquired and ensure the procurement of housing delivery. Where advantageous to unlocking new supply, acquisitions of non-public land will be necessary to ensure the Mayor has ability to control developable land and procure the build out of those sites. To achieve optimum schemes, the Commission will prioritise acquisitions around transport infrastructure which is catalyst for future growth. The GLA and TfL are considering land assembly opportunities adjacent or near current and future infrastructure, including joint venture delivery models.
The Old Oak and Park Royal Development Corporation

The Mayor launched the Old Oak and Park Royal Development Corporation (OPDC) on 1 April with the ambition of delivering his vision for the delivery of homes and jobs on one of London's largest remaining brownfield sites. The HS1 Crossrail super-hub station is due to open in 2026 against a backdrop of existing rail connections that will provide a catalyst opportunity for major regeneration on a scale that we haven’t seen since the Olympic Games. As a Mayoral Development Corporation, the OPDC brings together local decision making into one coordinated authority, with borough leaders serving alongside transport agencies, business leaders, local representation and education, planning and regeneration experts on a publicly accountable Board to work cohesively together with the shared ambition to capitalise the opportunity for homes and jobs from the significant Government investment in the Old Oak Common station.

Not only will the OPDC provide a coordinated approach to major regeneration, it will work to seek to secure funding to enable the full regeneration potential to be achieved. The OPDC has been successful to date in coordinating not only the local interests but the national interests, and it has done this via securing Board representation from DfT, Network Rail, HS2 and TfL. The OPDC works across numerous Government departments via a cross-Whitehall HS2 Growth Delivery Team to ensure that matters such as housing, design, transport, infrastructure, sustainability and heritage and all integrated and coordinated across the programme.

The enormous potential around Old Oak Common to shape a unique vision for the built environment and deliver new homes, jobs and neighbourhoods, may be of particular interest to the Committee going forward and we would be delighted to provide further information.

Yours sincerely

Sir Edward Lister
Chief of Staff and Deputy Mayor, Policy and Planning

15 October 2015
Policymaking, integration and coordination

1. At the House of Lords National Policy for the Built Environment Select Committee meeting Stephen Quartermain made much of the government’s ‘bottom up’ policy on the development of residential and commercial property. There was also a question about the quality of structures and the need for ‘iconic’ design. With regard to who shapes what is in England’s built environment surely the responsibility should be split. For example big infrastructure projects such as a new bridge across the Thames or Crossrail should be co-ordinated and managed at the national policy maker level whereas new housing, retail and commercial building at street level needs to be the responsibility of local authorities. At each level there needs to be adequate design and heritage representation on the decision making team. This is emphasised in the Farrell Review. Each urban area, for example Chiswick in London, needs a master plan which establishes development guidelines and takes a long term view. It is important to combat the ‘we are where we are’ attitude and to correct building mistakes of the past when the opportunity arises.

2. In our opinion this varies greatly. The aspirations of some local authorities to develop master plans are ahead of the necessary infrastructure development that is controlled at government level. In business today the driving mantra is collaboration. No one company can operate without the support and input of its customers, supply chain and even competitors. Innovation is extremely difficult to achieve in isolation. Local authorities with grand ideas must be humble enough to, not only invite comment but, be prepared to reshape their plans to accommodate recommendations from neighbouring authorities and the local community to ensure that they can be aligned with other planned developments and are acceptable to the resident population.

National policy for planning and the built environment

3. No. The NPPF is insufficiently assertive when it comes to citizen engagement and input. Local Plans are aspirational and woolly and intentionally leave room for authority planning departments to disregard concerns over inappropriate developments and damage to heritage and traditional environments. The NPPF assumes that ‘local people’ have the same objectives as the NPPF i.e. to forge ahead at all cost with new development to achieve the government’s goals on housing etc. Surely the whole point of community engagement is to listen and adapt to input from the people who live and work in the areas where development is taking place. The NPPF glibly uses the concept of Sustainability being applied to economic growth and not to the long term affect on the character and context of neighbouring environments. For example much government effort has been focussed on
revitalising the high street while at the same time planning permissions have been granted for change of use from commercial to residential property. This creates conflict between, often noisy and bustling, commercial activity and the need for quiet family living. This same change of use actually discourages economic growth by reducing the quantum of commercial property and places of employment in town centres.

4. Absolutely it needs a spatial perspective. Imagine a Cupertino, Apple like high tech campus based in Cornwall. The west coast beach/surfing lifestyle would appeal to many young professionals. Staff would be both local and relocated from the South East. It was a travesty that Dyson was prevented from building a factory in the UK. Government subsidy should be offered to British companies wishing to expand in the UK. Land needs to be graded with regard to its suitability for development e.g. 0 = prime rural agricultural land, 1 = low grade agricultural land on urban perimeters, 2 = rural brown field sites, 3 = derelict, empty or low grade property, 4 = urban brown field sites, etc..

5. As with any forward planning there should be progressive time horizons with decreasing granularity the further forward the projection, say 5, 35 and 100 year intervals. In the medium term the attraction of London for immigrants needs to be diluted by encouraging economic development in the West, Midlands and the North. The UK has a temporary advantage coming out of the recession that needs to be maintained through the encouragement of new technology and medium to high volume manufacturing. In future we need to be finding our human resource needs from within the population rather than encouraging ever increasing numbers of immigrants. Education and increased productivity should be the resources to provide the export revenue needed to fund infrastructure and housing. Holding the population total steady will relieve pressure on schools, housing, utilities power etc. with the added benefit that our town centres, heritage and natural assets can remain uncompromised as attractions for overseas visitors.

Buildings and places: New and old

6. The government cannot rely on the private sector alone to solve the housing crisis. Corporate self-interest will always trump any sense of social responsibility. In our borough affordable housing guidelines have been disregarded under pressure from developers unwilling to share their viability justification on confidentiality grounds. One site in particular is being developed between two conservation areas – a desirable place to live! This council owned land is ‘too valuable’ to be used for social housing but this is exactly what the borough residents need. We are a borough with high immigrant influx, illegal garden development, overcrowding and unscrupulous private landlords. Instead the developer is set to build high value apartments which will encourage owners from outside the borough (further increasing its population) or overseas investors who will leave them empty. Needless to say this development is high rise, massively exceeds the GLA guidelines on density and infuriating the local residents who foresee pollution, congestion and overstretched infrastructure.
problems resulting. For the price of an HS2 railway line the government could solve the housing supply deficit nationally. Funding would be split between social housing and incentives to refurbish void council and empty private houses. Up until the mid-1980s our borough provided grants for housing renovation. These were largely taken up by small builders and owner occupiers. An empty property tax would also help return it to the market.

7. As said before much has been made of the need for quality of buildings. But design and aesthetics are vital ingredients for sustainability and resilience. We do not want a repeat of the post war rash of cheap ugly high rise blocks which are now having to be demolished. There is a very impressive development on the west side of Dorchester, Dorset. It comprises a mixture of 2, 3 and 4 storey buildings mixed together in a wide variety of architectural styles and materials ranging from cottages to apartment blocks. Although modern it is in keeping with the historical town centre and will stand the test of time in a way that serried ranks of identical chicken hutch houses would not. Yes there is an element of pastiche here but one feels that these are places where people would prefer to live rather than some architectural iconic statement which will look out of date in a 20 years.

8. Britain is known for its global influence on culture, law and politics. This is understood and appreciated internationally. Continued marketing of our unique historical heritage overseas is essential. However it is recognition and appreciation of this heritage by those who live in Britain where the priority lies in this context. Our historical, art, architecture and engineering heritage must be taught to all ages. Through understanding of and sensitivity to our cultural and social history, good decisions will then be made by planning authorities and local communities when integrating new and old buildings and landscapes.

Skills and design

9. In our case our local authority does have some skilled, professional people but they are overstretched and under resourced. The glaring omission is officers with the knowledge and power to curate the integration of new development into the existing built environment in a way that respects the context and character of the area. The pressure to meet housing targets leads to their granting planning permissions for over dense and inappropriate developments. They understandably rely on private building development companies to provide the construction but are often pressured by these companies to exceed the limits and guidelines set out in their Local Plan. Any objectors to council projects are treated as ‘the enemy’ which does little to encourage a climate of trust by local resident and business groups. Objections are managed away or just ignored leading to a sense of disillusionment and scepticism in the concept of Localism. Our elected councillors on the planning committee are ill informed and lack the skills necessary to argue their case with the highly paid professional lawyers, surveyors and architects fielded by the developers. The bottom up aspiration of the government is a myth.

10. ‘Place-making’ is a fine idea when planning totally new developments such as the regeneration of, say, the Docklands, Old Oak Common or new towns. However many
urban, town and village environments already have a strong sense of place. The NPPF does not provide sufficient guidance to safeguard these environments from inappropriate development and skewing of the socio/economic diversity. Building style and scale must respect the surrounding architecture. Modern building materials and techniques allow for very tall structures which can be totally out of place in areas of low rise buildings 50 or more years old. Recently there has been a trend back to using bricks rather than cladding, even for high rise buildings. London in particular has many heritage brick buildings and use of similar red or yellow London stock would better harmonise with existing buildings, particularly when combined with stone detailing. Council planning departments must

Community involvement and community impact

11. No doubt there are cases of developers being sympathetic to local people and environments. This is not our experience. Historically developers are not based in the area and in some cases not even in the UK. To them the projects are a profit making exercise where powerful legal teams are fielded to overcome objections and obstacles. Their legacy will be buildings inappropriate to the area which may stand for 100 years.

12. As expressed previously we are increasingly sanguine with regard to community engagement. In one particular case our well argued concerns by an educated and professionally qualified group of objectors comprising planners, surveyors, designers and ex company CEOs and longstanding residents associations (one representing a world heritage site) have been completely ignored. Powerful developers backed by the council have emphasised those elements of the project that align with the NPPF whilst effectively wishing away the negative impacts the project will have. Despite a sustained and well reasoned campaign there has been no mitigation or concessions made by the developers to address those aspects that will impact the local residents, businesses and infrastructure. The scheme has the implicit backing of the government. In an attempt to strengthen their position, over 15 resident associations in the borough have joined to form a single group with which to engage the council on a variety of issues where decisions detrimental to the local community have been made. This group though has no legal standing. The council hold regular fora meetings with the group but effectively ignore their complaints. Is this a way to build good relations with local communities? Even if the group had the time and the resources to form a Neighbourhood Plan there is no indication that the council would take any more notice of their recommendations. To brand local community groups as Nimbys and the enemy is both disrespectful and inaccurate. Almost without exception the group’s position has been to support the council’s projects. However we want to have a say in the detail implementation, to not only ‘shape’ the changes to their environment, such that they have a positive impact on the mental and physical health of its occupants, but to ensure that the type, design and quality of construction is in keeping with the character of the area and will add to, rather detract from, its long term heritage.
Financial measures

13. As mentioned above we believe government funding on a large scale needs to be made available to local authorities to undertake social housing schemes. Some of this money needs to be used to incentivise small builders and individuals to renovate and improve poor condition and void dwellings. Empty property purchased for investment purposes needs to be taxed. Town centre parking charges need to be revised to provide free parking periods to help restaurants and shops (our successful local first-30-mins-free scheme has neither compromised safety nor increased congestion). Developers need to be incentivised to be transparent with their business and project viability cases. This could be financial or via a national excellence award scheme where developers are rated by a third party panel. Currently across London, for example, there are a number of huge schemes being undertaken by some of the largest building development companies capable of purchasing the land and managing the projects. This makes life easy for the local authorities. We would like to see more smaller building companies encouraged to work alongside or even collaborate to develop housing schemes. These would more likely to be British or, better still, local to the area. Without the need to satisfy shareholders or generate massive profits these companies could afford to build smaller scale developments that fit better with crowded urban environments. This would require more regulation, conditions and council management but would result in healthier local economies.

05 October 2015
GUIDE DOGS RESPONSE TO THE COMMITTEE ON NATIONAL POLICY FOR THE BUILT ENVIRONMENT

Summary

0.1 Guide Dogs provides mobility services to increase the independence of people with sight loss in the UK. Alongside our mobility work we campaign to break down physical and legal barriers to help people with sight loss to get around on their own. Current estimates suggest two million people with sight loss in the UK of which around 360,000 are registered as blind or partially sighted.142

0.2 Our work includes campaigning so the built environment is inclusive for people with sight loss. We seek to ensure:
- The inclusion of necessary accessibility markers such as kerbs, tactile paving and pedestrian crossings. We are particularly concerned by shared surface schemes
- New developments have sufficient parking spaces. The alternative means vehicles park on pavements, blocking the way for pedestrians

0.3 In our response to this inquiry we address only the questions which relate to the impact of the built environment upon our user group: people with sight loss.

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

1.1 Currently local authorities take decisions about the development of streetscapes and the built environment, but with an obligation to have regard to guidance issued by central government. Whilst the principle behind this model is good, in practice much guidance is out of date and not properly heeded by all local authorities.

1.2 The guidance of most relevance to people with sight loss is a document called “Inclusive Mobility” which was produced by the Department for Transport in 2002 and updated in 2005. The content of the guidance is now, therefore, 10 years old. Inclusive Mobility is not legally enforceable, but a High Court ruling in 2012 emphasised, in a ruling on Newham Council’s decision to depart from national guidance on the use of tactile paving, that it should be properly considered by local authorities and used unless an alternative solution performs as well or better.143

---

143 Department for Transport, Door to Door Strategy, March 2013
1.3 As a result of the 2012 ruling, Local Authorities do use the guidance if it is considered relevant but, because it is so out of date it is often ignored, leaving a vacuum for local authorities looking for guidance to ensure that their built environments are accessible for people with disabilities. The Government committed to review and update Inclusive Mobility by the end of 2012 in its Accessibility Action Plan. However, this has not yet happened.  

1.4 The lack of clear and current guidance from central government can result in unnecessary variance between local authority areas. People don’t live their lives within local authority boundaries: for example many people live in one local authority area and work in another. People with disabilities need some degree of consistency and uniformity between local authority areas, and people with sight loss particularly need to be able to rely on consistent cues in the environment such as tactile paving and pedestrian crossings. When local authorities adopt different approaches to the built environment in each area it creates an environment which is extremely difficult and confusing for people with sight loss.

1.5 We agree that local authorities are best placed to take decisions on the built environment in order to ensure that it fits the needs of the local environment and population. However, this must be within the context and scope of clear, current and efficacious guidance from central government. We therefore recommended that the Department for Transport update the Inclusive Mobility guidance as soon as possible.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

2.1 Our evidence suggests that there is not enough coordination between designers of the street environment and transport planners. The ability of people to use public transport depends on them being able to access embarkation and disembarkation points. The Department for Transport has recognised this in its Door to Door Strategy, stating “we need to focus on improving the entire door-to-door journey.”

2.2 Safe access to bus stops and stations can be adversely affected by cars parked inappropriately, poor lighting, poor infrastructure design, poor maintenance of hedges and verges, isolated stops, and a lack of safe places to cross roads. The ability of people with sight loss to walk to and from stops and stations depends also upon pavement quality. Kerbed footways clearly delineate between pedestrian and traffic areas, indicate a safe place to walk, and denote the positioning of bus stops and shelters.

---

145 TNS-BMRB Report, The impact of shared surface streets and shared use pedestrian/cycle paths on the mobility and independence of blind and partially sighted people, telephone interviews with blind and partially sighted respondents, 2010
2.3 A lack of a clearly delineated and obstruction-free pavement can be a particular problem in rural areas where some roads do not have formal kerbed footways, making it difficult for blind and partially sighted people to reach public transport embarkation points.

2.3.1 “[the bus service is] just not suitable for people with sight loss living in rural areas. Need taxis to and from bus depots/stops.” Guide Dog Owner, Northern Ireland.

2.3.2 “There is one bus an hour into Chepstow, but the road I have to walk to get to the bus stop has no pavements. At one point there are high walls on both sides and the Lorries that go by frighten me. My guide dog and I have to push ourselves back against the wall if we get caught there, I really dread it” Mrs G, Guide Dog Owner, Caerwent.

2.4 We recommend that urban designers and public transport planners work more closely together to ensure that public transport embarkation points can be safely and easily reached by accessible routes.

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment be looking?

5.1 Built environment planning must be future-proofed to avoid the need for costly redesigns and redevelopments further down the line. With an ageing demographic in the UK, and the numbers of people with sight loss due to increase to almost 4 million by 2050, it is particularly important that the built environment is designed with accessibility at its forefront.

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

11.1 The fact that inaccessible shared surface schemes are allowed to be built in town centres illustrates that the decision-makers and developers involved do not always have an adequate understanding of the accessibility needs of people with disabilities.

11.2 Shared surface schemes are areas where road and pavements are built at the same level, removing the kerb so that cars, buses, cyclists and pedestrians share the same surface. Controlled crossings (such as pelican crossings) and road markings are also often removed in order to reduce clutter and create ambiguity. The scheme relies on eye contact to negotiate priority, which automatically puts people with sight loss at a disadvantage.

146 Coventry Telegraph, 2013
11.3 These streetscapes are inaccessible and dangerous for people with sight loss. Research published in 2010 found that 91% of people with sight loss interviewed had concerns about using shared surface streets. 42% of respondents reported a near miss with a car on a shared surface. In many cases people’s experiences of, or feelings toward, shared surface streets had a direct practical impact on independence and mobility, as people said they would seek alternative routes and actively avoid shared surface streets (44%) or were very reluctant to use them (18%).

11.4 In January 2013 a partially sighted pensioner was killed in Coventry after being hit by a bus on a shared surface scheme in an area that previously had a pedestrian controlled crossing. The court ruled that the bus driver was not responsible for the death after hearing a statement that the shared surface was so confusing as to make an accident inevitable. In January this year, in two separate incidents, two 90 year old men were hit by vehicles on shared surfaces in south west London.

11.5 In spite of the dangers posed to people with sight loss and others, councils continue to commission shared surfaces schemes. In 2014 Guide Dogs was made aware of 18 councils who were commissioning new schemes. The continued commissioning of these schemes indicates that decision-makers are not sufficiently considering the mental and physical health needs of users of the built environment.

11.6 In a further indication of a lack of consideration of accessibility, we see new housing developments built without sufficient car parking spaces, resulting in a situation where drivers park their cars on the pavement. Cars parked on pavements are dangerous to pedestrians, especially those with sight loss who may be forced into the road where they can’t see oncoming traffic. In addition, pavements are not designed to take the weight of cars and so pavement parking causes pavements to crack, creating trip hazards which are, again, particularly hazardous to people without sight.

11.7 To improve the consideration of the impact of the built environment upon the physical and mental wellbeing of users we recommend:

- A formal process of engagement with disabled people and their representatives at the beginning of the planning process.
- Clear and up-to-date guidance on accessibility issued by central government to local authorities.
- Specifically, a moratorium on new shared surface schemes until new guidance is issued.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

147 Your Local Guardian, 2015
148 Get Reading, Broad Street traffic lights stay off apart from one new crossing, September 2015
149 Minutes of Guide Dogs focus group, Nottingham, August 2015
12.1 We frequently hear complaints from our regional teams and from local sight loss groups, that local decision-makers have failed to engage with them around design and development issues. In the interests of brevity, we provide just one example and one comment below, but we would be happy to provide the Committee with more examples if required.

12.2 To ease traffic management, Reading Borough Council turned off the pedestrian traffic lights at a key junction in Reading town centre. People with sight loss and other disability groups complained to the council, arguing that the removal of the lights put their safety in danger. As a result, Reading Council agreed to carry out a consultation. However, despite a number of responses to the consultation from disability groups, a petition with 2,000 signatures, and significant local media coverage, the council continues to refuse to turn the pedestrian lights back on.\(^{150}\)

12.3 A comment from a respondent to a recent Guide Dogs focus group further illustrates the frustration felt by some people with disabilities over their perceived inability to communicate with, and influence, local decision-makers.

12.3.4 “(My council) can be great in some ways, but then they want to bring in a shared surface, we responded to a consultation with some other disability groups and they just ignored it” Person with sight loss.\(^{151}\)

12.4 We believe that local authorities can and should do more to engage with minority groups who are affected by changes to the built environment. This should be through proper consultation at the beginning of projects and joint working with disability groups in the development of new schemes.

06 October 2015

\(^{150}\) These are: level access; a flush threshold; door width and circulation space compliant with Part M of Building Regulations and a toilet on the entrance level. English Housing Survey 2012, DCLG.

\(^{151}\) See for instance: Key facts, housing and disabled people, Habinteg, 2015 (enclosed).
Habinteg welcomes the work being undertaken by the Select Committee to consider ‘the development and implementation of national policy for the Built Environment’ and welcomes the opportunity to submit to the Call for Evidence.

2. About Habinteg

Habinteg is a housing association with more than 40 years’ experience providing homes and services to disabled and non-disabled tenants.

Habinteg champions inclusion by working to:

- influence policy and promote good practice in relation to inclusive, accessible housing and independent living for disabled people;
- provide and strengthen research expertise and guidance on all aspects of housing and disability;
- inform the development of new ventures in areas such as: housing options and advice; supply of accessible homes; inclusive design in housing and neighbourhoods; effective home adaptations; support to individuals and families.

The social model of disability is crucial to every aspect of Habinteg’s work. We believe that people are disabled by barriers in society rather than by their own impairments.

Habinteg operates across more than 80 local authorities in England and Wales and manages over 3,300 homes. Of these more than 1,200 are designed for wheelchair users with the rest being designed to Lifetime Homes standard or similar. Over 59 per cent of our tenants (April 2012) tell us that they define themselves as disabled people. More Information at: http://www.habinteg.org.uk

3. Habinteg’s response

The Select Committee has set out a range of questions. Habinteg is responding on only some of these, to reflect our experience and area of expertise.

3.1 Overview

In responding to questions set out by the Select Committee Habinteg overall seeks to draw attention to the issue of accessibility. We believe that accessibility must be at the heart of policy development and delivery on housing and the built environment if these are to be
sustainable and fit to meet future demographic, social and economic challenges. Accessibility is not a secondary or niche issue. Whether or not good standards on accessibility are applied to the built environment will have a determining impact on who can access workplaces, homes, public buildings and streets. Permitting new housing to be built to design standards that are not inclusive will mean spending money – including public money – on housing where many people will not be able to get through the front door, access all the rooms in the house, use the bathroom, where they have to stay in hospital for much longer because their home is inaccessible, or where they can’t live independently or safely. For many people lack of accessible housing or workplaces means they cannot take up employment. For others it means they have to live in unsuitable accommodation for many years. For yet others it means spending very significant sums of money to retrospectively adapt properties.

Accessible design standards such as the Lifetime Homes Standard – similar to the new M4 (2) standard – produce housing that is better designed for all. It also matches the right and choice of disabled people of all ages to live independently and in areas of their choosing and the needs of an ageing society.

We believe these considerations must be at the heart of future policy on the built environment.

3.2 Questions

Q1 Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

The government’s Housing Standards Review (HSR) led to changes to the Building Regulations (Part M, Access) in 2015 by introducing new housing design access standards. Added to the pre-existing Part M (which emerged from the review without any significant improvement) are two new standards. Of the three standards only the first – M4 (1) – is mandatory. This is categorised as producing buildings that are ‘visitable’. In actual fact, the English Housing Survey shows that 95 per cent of existing housing is not even visitable by many disabled people. ‘Visitability’ in the EHS is defined as housing that has four very basic design features and these are much narrower than would permit many disabled people to reside in a property. As a significant proportion of this existing housing would have been built under Part M (1) standards, analysis of the EHS indicates that Part M (1) does not result in sufficiently accessible housing. However, the two new additional standards introduced in 2015 are purely optional for local authorities. Not only that, but central government having decided that more adequate accessible design standards should not be mandatory also decided to require local authorities to apply a particular form of viability test that is not

transparent and takes into account upfront building costs while ignoring socio-economic and longer term costs and benefits. Additionally, local authorities will be required to provide detailed analysis of local population needs as supportive evidence for any application of M4 (2) and M4 (3). Meeting such requirements will be resource intensive for local authorities and we fear that many will feel pressurised to err on the side of caution, with the result being insufficient delivery of accessible dwellings. Central government has made clear that if they believe local authorities are not sticking to the policy as set out further legislation will be enacted to force compliance.

In the Housing Standards Review central government presented no compelling case against the need for a significant growth in accessible housing. Hence the introduction of standards into the Building Regulations. The requirement for local authorities to produce evidence at a local level is therefore not rational: no evidence against the need nationally was presented. To pass a viability test weighted in favour of developer interests requires local authorities to place these needs on a higher level than the social and economic benefits and savings that would follow from having more or all new housing built to good access standards. The HSR was introduced as part of the 2010 government’s ‘red tape challenge’, yet central government has not reduced ‘red tape’ but is set to increase ‘red tape challenges’ for local authorities.

Habinteg therefore proposes that the two new accessible standards be mandatory, requiring all new housing to be built to accessible design standards (as has been the case in London since 2004). This will meet projections of need and will reduce burdens on local authorities.

Q3 Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

In relation to planning accessible, sustainable housing – no. The NPPF refers to the need to plan for a mix of housing appropriate to current and future demography (paragraphs 50 and 159) and that local authorities should prepare strategic housing market assessments accordingly. Guidance on how to conduct such assessments is weak. Habinteg has made its view clear to government on the need to improve this but this has not been addressed. On the other hand, the NPPF sets out in precise detail the viability test to be applied to development. This is designed only to take into account development costs and profits. Paragraph 173 of the NPPF states: ‘To ensure viability, the costs of any requirements likely to be applied to development, such as requirements for affordable housing, standards, infrastructure contributions or other requirements should, when taking account of the

154 Later life in the United Kingdom, Age UK, April 2013.
normal cost of development and mitigation, provide competitive returns to a willing land owner and willing developer to enable the development to be deliverable’.

More priority should be given to accessible, sustainable future housing in the NPPF. This can be done by amending the viability test so it gives similar weight to the socio-economic benefits of accessible housing, and by providing guidance, data resource and easy to use tools to local authorities to develop their evidence base.

Q6 What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

Habinteg is concerned that changes in 2015 to the planning system via the new standards as introduced through Building Regulations, and resulting from the Housing Standards Review, may actually lead to a fall in the delivery of accessible homes. As the delivery of accessible homes is already poor and inconsistent across England depending on local policy, and need for accessible homes is high and rising, this would be to go in entirely the wrong direction. We have this view because accessible standards are optional and are surrounded by viability testing weighted in favour of developer costs. The new planning system means that local authorities that want to plan for accessible housing will need to expend significantly greater resources in developing proposals and these will be at the mercy of challenge by developers who have the resources to expend on a complicated and opaque ‘viability’ process. Habinteg is concerned that this will lead to a decline in ambition when it comes to accessible homes and communities as local authorities may err on the side of caution or feel pressure to withdraw in face of well-resourced developer challenges. Government should be developing policy that meets evidenced need. All recent research shows a high level of unmet need for accessible housing and that this will rise in coming years unless action is taken. Instead of responding to this, the Housing Standards Review introduced only optional standards and then effectively limited the freedom of local authorities to choose these ‘options’. Habinteg argues that the case is clearly in favour of mandatory standards: effectively for an improved part M – by making Part M4 (2) the default standard applied to all new housing.

In addition, government plans to introduce ‘Right to Buy’ for housing association (HAs) properties poses the potential for a decline in accessible housing. This would be the case even if there is a hypothetical ‘one for one’ replacement policy as, under the new ‘optional’ standards, HAs may find it difficult to secure local authority agreement to build such replacement properties to Lifetime Homes equivalent standards – broadly speaking, M4(2).

Q7 How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?
Built environments that are sustainable are ones that are built to take account of demographic diversity and future trends. Diversity is in the nature of the human species and the challenge is whether built environments will accommodate growing diversity or will they continue to meet only the needs of a narrow section of the population?

Government statistics show that there are currently more than 11 million disabled people in Britain. Our society is ageing: there are now more people aged over 60 in the UK than under 18 and by 2031 there are expected to be more than 20 million people over 60.

Despite the reality of population diversity government policy has permitted the built environment to fail the needs of many people: many disabled people, older people and families with young children find negotiating housing and the built environment difficult or impossible. Research shows that one in five disabled people who require adaptations to their home say their accommodation is not suitable, while 145,000 disabled people aged 65 and over report living in homes that do not meet their needs. If we just talk about wheelchair users – only one section of disabled people – research shows that more than four out of five homes in England do not allow a wheelchair user to get through the front door and that at least 78,300 wheelchair user households in England have unmet housing needs, amounting to at least 240 households in an average local authority.

Lifetime Homes standards – now approximated to be optional standard M4(2) of building regulations – deliver homes built to design standards that are accessible to a wide range of people and can be adapted to changing needs over the years. Such standards are neither aesthetically unpleasant (quite the reverse) nor burdensome on developers: since 2004 all new housing in London has, at a minimum, had to be built to Lifetime Homes principles; the results have been good quality, sustainable properties and a building industry that has incorporated these standards.

The focus for Lifetime Homes has been on design and building standards, rather than adaptation of current stock, with the point being that it is much cheaper to build in good access standards at the outset than to make changes later. Sometimes later adaptations will be impossible or very expensive: e.g. adding a through-floor lift may be impossible to achieve depending on the structure, materials, layout or other features of a property and if so the occupant may no longer be able to access bathroom facilities if they can’t go upstairs. The occupant will then face unpalatable choices – such as a costly move, possibly uprooting an entire family and uprooting away from workplaces, schools, support networks and friends – if an alternative, more accessible property can be found. Or they could accept their exclusion from certain facilities in their home, and the assault to one’s independence, dignity and possibly health represented in that. Adaptations such as changes to kitchen

---

158 Assessing the Health Benefits of Lifetime Homes, Mike Roys, Building Research Establishment Ltd., DCLG 2012.
facilities may be difficult and expensive if dimensions, placing of electrical power sockets and so on have not been accessibly designed at the building stage.

Building homes to accessible standards such as the Lifetime Home Standard has the potential to produce large savings. Research commissioned and published by the DCLG showed that homes built to the Lifetime Homes Standard could save money above that for homes built to current Building Regulations\textsuperscript{160}. At present, potential demand for Disabled Facilities Grants, which exist to fund adaptations to render homes more accessible, is ten times higher than current funding provided for such grants\textsuperscript{161}. Badly designed, inaccessible housing also contributes to avoidable accidents and higher health care costs: the Ready for Ageing report in 2013 noted that general costs to the NHS of poor housing are estimated at more than £600 million a year\textsuperscript{162}, while research found that falls leading to hip fractures alone in the UK amounted to a cost of £276 million.

To ensure that built environments are sustainable, long-lasting and good value for money government should require all housing to be built to be accessible. This means that current optional housing standards should be mandatory: M4 (2) should be the default standard for all new housing and a proportion (e.g. 10 per cent) should be built to M4 (3) or wheelchair accessible standard.

Q9 Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

No, although there are some highly skilled professionals and pockets of good practice, many of the professions involved do not have adequate knowledge and skills to understand, develop and defend plans for accessible, sustainable built environments. This will become a bigger problem with the introduction of new planning regulations that require local authorities that seek to develop M4 (2) and M4 (3) properties to evidence need in detail and to pass a viability test that is weighted in favour of immediate developer profit. Planners need to be able to access good resources. Furthermore training in accessible design needs to become universal for planners and other relevant local authority professionals.

Q11 Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the

\textsuperscript{160} Ready for Ageing? Report of the Select Committee on Public Service and Demographic Change, 5 March 2013.
impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

Habinteg does not believe that those in government involved in the Housing Standards Review have taken sufficient account of the way in which the built environment affects people. If they had done, they would have embraced the clear case for change – by rolling out the accessible standards (particularly in housing) that have been enforced in London for more than a decade (and in other areas to some extent) across England instead of leaving existing mandatory standards unchanged. Even on the level of small (but important) legal detail that would resource disabled people to make their living environment more accessible, government chose not to bring forward into law a duty in the Equality Act 2010 that would require landlords to allow reasonable adjustments to ‘common parts’. This part of the Act would have meant that if a disabled tenant asked a landlord to alter a feature of a communal area – such as installing a ramp to a communal entrance door or installing grab rails – the landlord would be under a duty to do so, although the tenant could be asked to cover the cost.

Integrating equality and human rights obligations into planning and housing strategy at the earliest stage can help ensure investment is used effectively and can deliver homes and communities that are more inclusive, more equal and better places to live.

This review is also an opportunity to promote the concept of Lifetime Neighbourhoods\textsuperscript{163} which was researched and established in policy but has not been taken forward by recent governments – indeed the approach embedded in the new Housing Standards is contrary to the spirit and potential of Lifetime Neighbourhoods. This inquiry has the opportunity revive work already done in this area and recommend its integration into legislation, planning policy and practice.

\textsuperscript{163} Growth Through BIM, 2013, Richard Saxon CBE \url{http://cic.org.uk/publications/}
Policymaking, integration and coordination

1. Decision making needs to be at a local level. Neighbourhood Plans need to be included in all considerations, even in their “emerging” state provided they are appropriately supported.

2. There is a disconnect between local needs and government policy making. In Headcorn this has been amply demonstrated in the disconnect between the need for a complete overhaul of the drainage system in the village, as the current system cannot support the villages as it currently stands vs the deployment of the 5 year housing plan by MBC.

National policy for planning and the built environment

3. No. The housing policy drives a coach and horses through it..... The 5 year housing plan is supply at any cost. In Headcorn we are facing the threat of over development and a collapse of sustainability as the infrastructure simply cannot support the large number of builds proposed in the short term.

4. The current national planning policy has no spatial perspective.

5. There is no optimum time frame, planning and housing needs change all the time and we need to create a plan that is flexible with short, medium and long term needs factored in.

Buildings and places: New and Old

6. Housing should be reviewed at a national level and growth should be spread nationally, rather than focused in areas such as South East and those areas with reasonable access to London. Regional industrial/business development areas should be supported.

7. The key here is sustainable development, build where developments can be supported by local infrastructure. Don’t make decisions at national level and allow planners to ride rough shod over local communities. Town planners need a greater awareness of rural communities and the affect that planning decision have on those communities. Invest in quality and reasoned rationale behind development. Don’t buy buildings and leave them empty - use these sites for development as opposed to building on green field sites.

8. Make funding available to protect them, don’t rely on these properties finding their way into the hands of organisation such as the National Trust or English Heritage.
Skills and design

9. Headcorn Parish Council have cause to say that in our experience the individuals at the local authority do not have the experience to consider the built environment in an holistic way. We see a regular turnover of staff and anyone who “shines” quickly leaves the council for better jobs.

10. No in our experience it is a question of quantity vs quality. The current policy planning framework forces the local authority to focus on numbers.

Community involvement and community impact

11. No. More attention needs to be paid to local representatives, listen to what they have to say. Give Parish Councils more say.

12. Currently elected representatives are currently granted 3 minutes to speak at planning committee meetings. A revision of this time would be one way to address the barriers.

Caroline Carmichael

Clerk

Headcorn Parish Council

The Heritage Alliance, Historic England and Prince’s Regeneration Trust – Oral Evidence (QQ159-170)

Members present
Baroness O’Cathain (Chairman)
Baroness Andrews
Baroness Finlay of Llandaff
Lord Freeman
Lord Inglewood
The Earl of Lytton
Baroness Parminter
Baroness Rawlings
Baroness Whitaker
Lord Woolmer of Leeds
Baroness Young of Old Scone

Examination of Witnesses

Duncan Wilson, Chief Executive, Historic England, Henry Russell, Chairman of Spatial Planning Advocacy Group, The Heritage Alliance, and Ros Kerslake, Chief Executive, Prince’s Regeneration Trust

Q159 The Chairman: First of all, welcome to this evidence session of the Select Committee on National Policy for the Built Environment. You have in front of you a list of the interests that have been declared by Members of the Committee. In our few minutes that we had together before you arrived, we realised that there are three people in the room who have listed buildings.

Baroness Young of Old Scone: Four.

Baroness Rawlings: Five.

The Chairman: I just said that I have not. Thank you for giving up your time for this, and we are very much looking forward to your evidence. As we have three witnesses, a number of questions and a short amount of time, could you keep your answers brief and avoid any duplication of answers given by other members of the panel? This ad hoc committee is up against it, which is a real problem, because we have to report by 23 March, so we have very few evidence sessions and, as a result, we are trying to make the most of them. We are
unlikely to require three sets of answers to each question put by the Committee, so please do not feel that all three of you have to answer every question, but I do not want to stop you in any way.

I would also like to point out that it is my intention to suspend the meeting briefly at 10.59 am, so that we can observe the two minutes’ silence for Remembrance Day, as they do throughout the House at this time. I am told that the division bell will ring briefly at the beginning and at the end of the silence. You do not have an annunciator, but they are up there; there is a monitor. Could I begin the session, please, by asking each of you to briefly introduce yourselves to the Committee, for the purposes of the record?

**Ros Kerslake:** Good morning. My name is Ros Kerslake. I am Chief Executive of the Prince’s Regeneration Trust, which is an organisation that works across the UK, rescuing and reusing buildings at risk. It has been in operation for about 20 years. My own background is that I have been largely in the private sector for much of my career, working in property, the oil industry and a range of other industries, but I have more recently worked in regeneration, and most recently at the Heritage Alliance.

**Henry Russell:** I am Henry Russell and I am representing the Heritage Alliance. I chair the spatial planning advocacy group. We have a number of advocacy groups through which we focus a lot of our work, and this is the one that deals with this particular area. The Heritage Alliance now has 100 members and they range from organisations like the National Trust to much smaller organisations, and my own background is that I am an academic and I work at the University of Reading.

**Duncan Wilson:** I am Duncan Wilson. I am the Chief Executive of Historic England, which is the newly set up body from the old English Heritage, as of the beginning of April, which discharges the Government’s responsibility for statutory advice and research in respect of the historic environment. I have come from a background in large project management, I suppose you could say, at Alexandra Palace, Greenwich and Somerset House.

**The Chairman:** Thank you very much. I am sure we are in for a very interesting session. I am going to ask the first question, and it is: does the NPPF have adequate regard for the importance of the historic environment? How can the historic environment be better incorporated in built environment policy?
Duncan Wilson: Maybe I could take this first. Our view is that the National Planning Policy Framework does work quite well, in respect of the historic environment. It allows us and the historic environment to have an effective voice in making the case for retention or moderate alteration, but of course the decisions are made by local planning authorities and occasionally by the Secretary of State or a planning inspector. The reservations we have are about the application of the National Planning Policy Framework, rather than its design.

Henry Russell: I would echo the thoughts there. We did lose in the National Planning Policy Framework the presumption in favour of conservation, on the basis that the NPPF was only going to have one presumption and that was in favour of sustainability. The problem really is implementation and resources, particularly in skills at the moment. There may be an opportunity to discuss skills later on, I suspect.

The Chairman: Did you actually make representation that this should still remain included in the National Planning Policy Framework? Did you make any suggestions to Government that we should actually have the historic in mind as well as sustainability in the National Planning Policy Framework?

Henry Russell: The presumption in favour of conservation?

The Chairman: Yes.

Henry Russell: We did at the time, yes.

The Chairman: What was their reason for it?

Henry Russell: The reason at the time was that they only wanted to have one presumption in the NPPF, and that was to be the presumption in favour of sustainable development.

The Chairman: I will just ask around the table. Does anybody know if this happens in any other Government department—allowing just one presumption?

Baroness Andrews: Could I answer, Lord Chairman? I have declared my interests, and the NPPF was being worked through at the time when I was chairing English Heritage, so we had very close engagement, as I think our witnesses remember, with the making of the NPPF and the then Minister, Greg Clark. We had quite robust discussions about where and in what sort of language the protections for heritage would sit. The argument that Government made was essentially, because the country depends so heavily now on development and especially housing development, that had to take priority. However, the language around historic
protections about significant harm was thought and agreed by us all, at that point—and it was a consultation process that went across the heritage industry—to be sufficient providing, as Mr Wilson has said, it was observed not only in terms of the letter of the NPPF but also with the capacity and with the spirit of everyone responsible for the planning system being able to use it properly.

**Duncan Wilson:** If I may summarise, we would have had some trouble with, in effect, having a veto over development on historic environment conservation grounds, because that would have put us in the position of making a judgment that is more properly made democratically by the local planning authority. We need to make sure that the case for conservation is put within that framework as effectively as possible, and there are some issues with that.

**The Chairman:** Do you think it is possible for that to be put within the framework?

**Duncan Wilson:** Yes, I absolutely do.

**The Chairman:** That is some consolation.

**Q160 Lord Inglewood:** I would just reiterate my declaration about listed buildings. My understanding from some of the other evidence we have heard is that many people consider that sustainability includes conservation. Is that in fact a correct definition?

**Ros Kerslake:** I think it does—it absolutely does. The issue is in the implementation, which is the point that has already been made. The emphasis as it has been implemented has very much been about economic sustainability and the ability to contribute to economic growth. What has been insufficient is the recognition of social, environmental and cultural aspects of sustainability. It is the cultural aspect in particular. What you do not see within the implementation is heritage sitting there as a positive driver of sustainability. It is very much seen as: “By the way, while we are at it, we need to think about heritage”.

**Baroness Young of Old Scone:** In that context, could I ask Mr Wilson? English Heritage used to provide very useful guidance to supplement the formal planning framework. For a whole variety of reasons, a lot of useful guidance across subject areas is now not even on the main Government website but is archived. Is that proving to be a problem?

**Duncan Wilson:** It is still our intention to continue to provide that generic guidance. There is certainly no intention that we withdraw from that area of guidance, and local planning authorities do find it useful.
Baroness Young of Old Scone: Can they actually get at it?

Duncan Wilson: Yes, all our current guidance is available electronically. I am not exactly sure which document you might be referring to that had been archived and was not available, but I can certainly follow that up with you.

Baroness Young of Old Scone: This seems to be a pattern across a variety of fields at the moment. A lot of the environmental guidance, for example, that supported the planning framework has gone.

The Chairman: If you could give us some evidence on it that would be very useful, just to clear it up.

Baroness Andrews: Briefly, I want to pick up on what Ros Kerslake has said about sustainability. We have quite a lot of evidence about the need for proactive planning, and clearly spatial planning. Would it be your opinion, therefore, that a genuine proactive planning policy would be bound to do what Ros has described: building in the historic environment as a driver for sustainable and very high quality design, and so on? Bearing in mind that Duncan has just said that the NPPF is all right, why is it that we are still seeing significant harm done to buildings? What is going wrong? There are two parallel short questions.

The Chairman: You said that was a short question, but it could carry us for the whole day.

Duncan Wilson: In terms of the instances where we believe something does go wrong, they are normally down to the judgment of the local planning authority, a planning inspector or occasionally maybe the Secretary of State, where we have recommended one course of action and it has been overruled. The problem is that this is of course a matter of judgment and that is what the NPPF is based on. It attempts to circumscribe the judgment as reasonably and objectively as can be done, but ultimately it is a judgment. We would not claim that there have not been decisions we were unhappy with, but they are relatively small in number. It is down to the operation of the system, rather than the system.

Henry Russell: History shows that, over the last few years, the NPPF has generally worked well. I made the comment about the loss of the presumption, but that has been covered by substantial harm in most cases and the requirements around that. Much of the problem lies in the lack of resources, particularly in local authorities, because of the loss of conservation.
officers and the loss of archaeological officers in local authorities. That has meant that they have not had the specialist advice that would really help them see heritage as a benefit rather than as a barrier to development.

**Q161 The Chairman:** This is not the first time we have heard about resources being scarce at county councils and local councils. You have obviously discussed it endlessly, I suspect. Can you come up with any positive recommendations for how to overcome this? You are not going to say, “Just hire more planners”. I am a bit concerned people are saying that we do not have the resources, so therefore we cannot do it. These problems are sent to us to try to solve and we want to make sure that, whatever we report on, we have these sorts of positive suggestions.

**Henry Russell:** As you say, it is a situation that is not going to resolve itself in the short term or even the longer term.

**The Chairman:** It is going to get worse.

**Henry Russell:** Therefore, we need to think inventively about how we can deal with the problem and how we can provide advice to people when they need it, and that comes back to the issue of providing good guidance. There is a lot of good advice available on the Historic England website, but it is a matter of people being able to find it when they need to have it. It would be a matter of perhaps trying to reduce the burden on local authorities from enquiries about listed building consent. That may be by providing some guidance that does not exist at the moment on what requires listed building consent and what does not.

**The Chairman:** Actually, Mr Russell, I am just wondering; I have thrown this one at you. In the interests of time, do you think you can go away and give us a brief résumé of what you think it might be—open sky so to speak? Thank you.

**Henry Russell:** Yes.

**Duncan Wilson:** Maybe I could just add something very briefly to that. A focus on the quality of local plans, against which planners can test their decision-making, would be something of a shortcut to improving decision-making. As you have suggested, the problem of resourcing conservation officers is not immediately soluble, but encouraging local authorities to complete their local plans within the deadline, to a satisfactory standard, would at least mean there was some way of making sure that decisions were made against a suitable benchmark.
Q162 Baroness Rawlings: Mr Wilson, what have been the main consequences of the creation of Historic England as a separate body? What do you think might be the benefits or not of the responsibility for heritage being transferred from DCMS to DCLG? Very quickly, what is being done from your side regarding VAT on refurbishment of existing properties?

The Chairman: Lady Rawlings, that is the next question, so the only one they have not had notice of is responsibility for the heritage transfer.

Duncan Wilson: On the creation of Historic England, I would have to say that it is a bit early to say, because we are only six months in, but I can give you what I believe are the advantages and possible risks associated with the split of English Heritage. The advantage for Historic England is that we are able to focus on precisely these difficult issues for us as a nation, frankly, in terms of development and the importance of balancing the interests of heritage and conservation against those of development. As a single organisation that was inevitably focused on the day-to-day management of 400 properties with all these other things attached, that was going to be more difficult, so it has simplified the situation and allowed us to focus, both in terms of our day-to-day activities and our communications, on the preservation of the historic environment generally, which is a challenge. It has allowed us to get out some more difficult messages and, as an organisation, it has meant that we can come together and think about these issues more single-mindedly. I genuinely believe, although that sounds slightly soft, that is a really important change of emphasis and benefit.

In terms of risks, obviously we have a smaller budget. If we had a good year for properties, we could sometimes move money into grants that needed it. That flexibility is no longer available to us. The settlement for English Heritage is pretty clearly circumscribed.

The Chairman: I am afraid that is in every area of our activity now.

Baroness Rawlings: Do you think that is a good format for other similar bodies to follow?

Duncan Wilson: Yes, I do. It is born of a clarification of the commercial against the statutory and advisory in policy work. There are plenty of other departments of government where the two are mixed up. It is a good example; it will be a good example, particularly if the Government stick to their commitment to stand behind the new arrangement because, if they did not, that would set a rather bad example for others to follow.

The Chairman: We shall remember that when we are writing our report.
Ros Kerslake: If I could just add to that, as an organisation we welcome the clarity that is brought by the separation of what was English Heritage into two separate bodies. Having a focused organisation like Historic England looking at the key policy and implementation issues is wholly welcomed.

The challenge in relation to the built environment—and our focus is very much on buildings at risk and how you address those issues—is a mix of the resources issues that Duncan has just mentioned, coupled with the issues that we have just touched on in relation to reductions in local authorities. Added to that, there is a growth of buildings coming on to what I would call the at-risk market, as a result of public sector cutbacks. It is hard to look at any one of those in isolation. All of these factors coming together are putting severe pressure on those organisations that are attempting to address it. I know funding is an issue for everybody, but the level of funding available is increasingly challenging.

As has already been said, simply saying we need more money and we need more resources is the answer to every problem that comes in front of you, I am sure. One of the answers must be to simplify some of the processes that we are all trying to implement. I would quote as an example things like compulsory purchase. At the moment, there is far too much risk for any local authority to take it on, unless there is a really strong reason to do so. Historic England has historically provided a lot of support. I wonder whether they are going to be in a position to provide the same level of support for that. Although there are changes coming through in the CPO legislation, I am not sure they go far enough to simplify it.

The issue for me is that you cannot pick out the different elements and say, “Is this the one?” The problem is that the number of buildings at risk across the country is very significant and growing in some sectors. Our estimation across the UK is that there are about 20,000. That includes Grade II listed buildings, which are not properly captured around the country at the moment. It does not include any of the locally important but unlisted buildings. There would be a far greater number than that, particularly in deprived areas, where the level of investment going in from the private sector is very low, if anything.

The Chairman: I am sure you are absolutely right on this. Again, I am going to throw this one back at you and wonder if you could prioritise your wish list—it is a horrible term—on that one and let us have the most important. In the mean time, several Members have queries.
Baroness Andrews: I want to pick up this issue of risk. It takes a long time to save a building at risk, and it might be interesting just to have a very short explanation as to why. Both Historic England and PRT are involved in that. You have mentioned CPO and we are going to have some other suggestions. My anxiety is that we have a perfect storm. At the time when the number of buildings at risk sounds as if it is increasing, if I have heard you correctly, English Heritage potentially has fewer resources to address that problem. Am I overstating that, or is that a possibility? At the same time, we are losing capacity in local authorities. To what extent can English Heritage compensate for the loss of capacity? Will it have to reorganise its advisory system for local authorities, for example? Will it have to have a different mechanism for deciding what it must save at all costs, as opposed to the things that are desirable to save? For example, how do you decide on one piece of industrial archaeology rather than another, which may have an equal economic and social claim?

Duncan Wilson: There are two separate elements to this question. One is the provision of advice, support and training to local authorities. We are now addressing the issue directly with planning departments, which previously we would probably have addressed only through conservation officers, because plenty of local authorities do not have conservation officers. I am not being Panglossian about this, but sometimes that is more effective because, if planners are more directly informed about the provisions around heritage and heritage value, sometimes that can be a more effective way of dealing with things. I would not pretend that we would not rather that every local authority had conservation expertise in house, but we are trying to address the situation as we find it. There are risks to that, frankly, because the more helpful we are, the more there is a perverse encouragement to local authorities to withdraw from costly expertise, so it is a delicate balance, but we have to address the situation as we find it, ultimately, because our main aim is to protect the historic environment as best we can.

Linked to that is the second point about buildings at risk. As Ros has indicated, our monitoring of the situation outside London is currently confined to Grade I and II* buildings, because we have to prioritise those ahead of the much larger risk areas relating to Grade II. That gives us a picture of what is happening at one level. There are a lot of sites joining the heritage at risk register and quite a few sites leaving the register. The commonest category of site on the
register is round barrows, which of course we do not really think about when we think of buildings. Very often, the risks to a round barrow are relatively easy to solve with a decent partnership arrangement with the landowner. That is not to say that there is more joy in heaven over one difficult site saved than a large number of easy ones. Of course, in taking sites off the register, we now focus very much on sustainable solutions, rather than just patching up the place, saying it is no longer at risk and it being back in five years because nobody is using it, nobody is cleaning the gutters and nobody is actually generating any money to pay for regular maintenance. It is difficult, but we as an organisation have to prioritise those types of places. You are right that resources are increasingly squeezed. Last year, we had commitments of £19 million for heritage at risk grants, which is about half of what they used to be seven or eight years ago.

**Baroness Andrews**: How does that compare to the Heritage Lottery Fund?

**Duncan Wilson**: That is the other side of the coin. Overall, the HLF has introduced a massive amount of capital to saving and creating sustainable futures for heritage at risk. I would have to say that I do not think we and the HLF cover any of the same ground. Historic England can intervene much earlier on a more discretionary basis, and it is really important that that flexibility exists within the system or, in the time it takes for an organisation to develop itself and develop an HLF bid, the asset may be lost.

**Q164 Baroness Young of Old Scone**: I have two questions, totally unrelated. I cannot remember whether your sponsoring department has been one of the ones that is already settled in the Spending Review. If it has, do you know what the impact is going to be on you?

**Duncan Wilson**: The answer is that I believe a settlement may be imminent, but I do not know whether one has been reached. Even if it had been reached, I probably would not know what level it had been reached at. As and when it is announced, it may not be representative of the settlement that is reached with us, because obviously DCMS has a very large number of NDPBs, and it is unlikely that “one size fits all”. We probably will not know until 25 November.

**The Chairman**: To be completely fair actually, every single Government department is at that stage at the moment, and we hope that the Autumn Statement will do something to clarify the situation.
Baroness Young of Old Scone: It would be useful to know, if you are prepared to tell us, what the planning parameters were that you were asked to plan for, in terms of reduction, and what your thoughts have been about where you could make a squeeze.

Duncan Wilson: I think they were the same as for every other department, which was up to 40%, which was well known—but up to, rather than at.

Baroness Young of Old Scone: Do you have a feel for what percentage of local authorities do not have conservation officers now?

Duncan Wilson: In the last six years, there has been a 35% attrition rate. I can certainly write to the Committee with the exact numbers.

Baroness Young of Old Scone: It would be useful to know which local authorities just do not have conservation skills on board at all.

Q165 Lord Inglewood: In your earlier comments, Ros Kerslake, you talked about compulsory purchase. I assumed you are talking about compulsory purchase in the context of historic buildings.

Ros Kerslake: Yes, generally.

Lord Inglewood: Generally in the historic building context, rather than the wider context.

Ros Kerslake: Rather than regeneration CPOs, if I can put it like that.

Lord Inglewood: The point I want to put to you is that the compulsory purchase mechanism is a rather strange one, in that compulsory purchase is normally used to acquire assets that will then do something and generate an income, while in this case the compulsory purchase mechanism is intended to enable the acquiring authority to expend a great deal more money than it otherwise would have. On the whole, particularly in the current climate, local authorities are not likely to look for extra ways of spending money. Therefore, is it not actually a busted flush? Is not the real solution to this to make sure that buildings never get into the mess that they find themselves in?

Ros Kerslake: If I could answer that, because I have a lot of experience in this area, absolutely—I could not agree more. The first and foremost focus must be to stop buildings getting into that situation in the first place. That must be possible within the context of public sector buildings being disposed of. Actually, the very clear guidelines that Historic England
gives on the subject of disposal of public buildings would prevent many of the cases that are happening.

Some of them that exist, though, are historic, and they are historic because they relate back to a period of time when the market was much stronger and when people bought things believing, “It’s big; I must be able to make money out of it”. People’s thinking was not any more sophisticated than that. I am fresh back from Brussels, where I was on the panel for Europe’s seven most endangered historic sites, and a number of UK nominations were received. The vast majority of those related to what I would call difficult owners, which is, unfortunately, probably the biggest challenge for the ones we are dealing with. People had bought buildings historically, maybe before the 2006 crash. They have held them. They have very unrealistic ideas about the value of the site and what can be done with it. In the mean time, it continues to deteriorate. It is really quite interesting that, in the UK, that is one of the biggest causes.

Lord Inglewood: Is that the same issue in other countries in Europe?

Ros Kerslake: No, it is not. Interestingly, it is not. What you find in other countries is a whole range of things: natural environment hazards and quite a lot of political hazards actually, from countries that have been through very difficult times and still have big barriers in movement between different areas of the country, and things like that. This is very much a UK issue, driven I suspect by the overegged property market that we had and the size of the crash that we had.

Your point about whether the legislation is unworkable because of the fact that these are sites that have been acquired not for economic reuse, in the way that a normal regeneration CPO is, is not right. No local authority, in the current circumstances, unless they are incredibly brave, is going to take on a difficult site, which is the point that you are making. What they do is work to make sure that they have a back-to-back arrangement with another organisation, us or some other form of trust. In some instances, we have helped to set up specific trusts to take on these buildings. Part of the CPO process is demonstrating that you have a better plan for the building than the owner. You are not going to get a CPO unless you can demonstrate that you have a deliverable plan that can be taken forward.
Obviously that can be challenging on some sites, because it can heavily rely on the availability of grant funding or enabling development. Baroness Andrews commented about the length of time that it takes. It does take a very long time. The longest part of that, I have to say, is persuading a local authority that they can or should implement CPO proceedings, because of the different aspects of risk.

Lord Inglewood: Given the scale of the problem that you yourself described, it does suggest that, while in particular cases this could work, there are many cases where it has not worked and we have not got to grips with the real difficulty, as it were.

Ros Kerslake: I would completely agree with that. It cannot be the general solution. It has to be the solution of last resort, for a number of different reasons.

The Chairman: Can I just interject again? You are saying that the way we do it is quite different from the other people in the European Union. Is there anything that we could actually access to support that comment? Is there anything we could highlight that would benefit either our report or at least the general public and the Government?

Ros Kerslake: I would be very happy to see if there is further evidence I could submit that would support that. There has been work done in a number of areas, through Europa Nostra and other organisations, to look at some of the European issues. I would also be very happy, if it would be helpful, to give you more information about what the areas of risk are that are barriers to local authorities, because there is more than one.

The Chairman: That would be very helpful indeed, because that is the sort of evidence we need. We do not want to be constantly criticising. We want to be suggesting. Thank you very much. Now, Lord Freeman. Sorry, Mr Wilson.

Duncan Wilson: Can I make a very brief comment? Of course local authorities have a range of statutory powers, of which compulsory purchase is one, but they can serve repairs notices and other types of statutory enforcement, which would pose a lower level of risk to the local authority. There are similar problems, but not quite as extreme.

The Chairman: Thank you for suggesting that. That is useful.

Q166 Lord Freeman: How can reforms to the tax system, in particular VAT, where we know VAT is 20% on repairs and 5% on new build, incentivise the preservation of the historic environment and of heritage assets?
Henry Russell: Can I lead on that one? The Heritage Alliance has had a strong campaign on VAT for the last few years. The situation used to be that VAT was recoverable for extensions and additions to listed buildings, and then the Chancellor removed that a few years ago. In one sense, that was always wrongly targeted and we do need some help on VAT. A 5% rate would be very useful to the bodies that we represent at the Alliance, which are mostly charities. Something along those lines would be very helpful and it would also, on a wider perspective, support the small householder, because they are the people who also work in, live in and have to repair buildings that are often fairly expensive to repair. It would encourage them to do it if the Government, the state, would recognise that these people are looking after and repairing buildings that are in the national interest.

Ros Kerslake: I could make a further point over and above the VAT point, which I completely support and for which the case has been made well over a number of years. The other area that would be much cheaper for the Government to implement and that would potentially have an impact on the issue that I mentioned earlier of public buildings is an improvement or a slight relaxation to the Building Premises Renovation Allowance scheme. It presently is focused on regeneration areas and enables former business premises to be renovated as business premises, and provides 100% tax relief against some of the costs involved in doing that. It is an excellent scheme. It has not been hugely used. There have been some issues in implementation. I completely understand why the ultimate use should be economic, which we would wholly support. Our organisation focuses very much on bringing economic growth and using historic assets to do that.

At the moment, though, the initial use requirement that it has to be business premises means that you cannot use the allowance for civic premises. Former town halls, former prisons and all sorts of civic buildings, which are flexible buildings that could be adapted for business premises in the future, are excluded from this allowance. It is a very simple change that could be made, and we think the cost is very small—probably under £5 million. It is a very small issue that we think could have quite a significant impact. The most recent statistics that I was able to find were that 1,250 public buildings have been vacated since 2010. I suspect that the number is higher than that, because it is an extremely hard one to track.
The Chairman: I am just wondering if you could make a case, as you have made it powerfully here. Which is your Government sponsoring department?

Ros Kerslake: We do not have one as such, but I guess we would submit information to DCMS.

The Chairman: Say that you have made this impact. You could actually produce an impact statement. They are the buzzwords at the moment. You never know; you might be knocking at an open door.

Ros Kerslake: The Heritage Alliance has in fact submitted some information, as part of its submission to the current review. We are very much hoping that this is something that will be looked at.

Baroness Andrews: That was my question actually, Lord Chair, because I was just wondering when you last had that conversation with the Chancellor.

Ros Kerslake: We have had it once or twice and we have certainly had it recently.

Baroness Andrews: You have had it before the Autumn Statement.

Ros Kerslake: Yes.

The Chairman: Keep your fingers crossed.

Lord Inglewood: Can we see a copy of the submission?

The Chairman: Would that be feasible? Am I allowed to ask for a copy of the submission?

Ros Kerslake: I am very happy to do that. It is a public document.

Henry Russell: It will also appear in our submission as well, so we can provide a copy of that too.

The Chairman: Thank you. You have been very co-operative. All our witnesses are.

Q167 Baroness Finlay of Llandaff: Can I just pursue this a little further, in terms of trying to create an incentive with slightly lower rates of VAT? I have been concerned about the number of boarded-up buildings that are around, which are often residential. You have spoken about wonderful looking properties that people have bought that have fallen into disrepair, effectively becoming uninhabitable. Secondly, because of the housing problem and the housing shortage that we have for accommodation for people, has anyone done any work on looking at whether incentivising refurbishment of those for residential use and making them fit for purpose might happen, if there was a slightly lower rate of VAT, rather than people just
sitting on this large building, hoping that one day the price of it will go up and knowing at the moment that they cannot get anything for it?

**Ros Kerslake**: We have not done. We have done work on the general impact of reducing VAT and the positive impact it could have on the economy, because more would probably be declared and there would be a higher level of activity. We have submitted information on that. We have looked at the issue of conversion of buildings for residential and we think there is a real opportunity there. We have not looked at putting the two together. I have a vague recollection that there is a VAT incentive in relation to residential premises but, to be quite honest, I cannot recollect how it applies. It may well be worth exploring.

**Duncan Wilson**: If I may offer a generic comment, my experience of the Treasury, such as it is or was—I actually used to work for it at one stage, but that does not give me any special knowledge of tax, I must say—is that it does not like blanket tax incentives. It might be more persuaded by very closely targeted ones, and I think that is what happened in relation to VAT. We have to work out models whereby we can demonstrate that, for a relatively small loss of tax revenue, we can get a relatively large economic gain. I know that in Ireland, for example, they have geographically designated tax incentive zones in relation to historic town centres—just a few—and I believe the Republic of Ireland’s Treasury is no more or less difficult than ours.

**Lord Inglewood**: That is more like an enterprise zone.

**Duncan Wilson**: Yes, but it relates to VAT, as I understand it. There is probably some more work to be done there, rather than fighting yesterday’s battle.

**The Chairman**: It is always better to do that. You have to close the door on the past and then start afresh, I am afraid.

**Baroness Young of Old Scone**: I would just make a comment on that, because we have not yet taken evidence from anybody from the sustainable buildings sector, and I know that they are extremely interested in having that reduction for retrofitting and refurbishment of existing stock, in order to increase resilience, carbon reduction and various other environmental issues. I absolutely accept that targeting would be more attractive to the Treasury, but there may well be some other bidders for that reduction as well.

**The Chairman**: We could actually ask the Minister, when the Minister comes to the session.
Baroness Young of Old Scone: We are going to have some witnesses on the whole environmental sustainability and resilience front.

The Chairman: We will have another look after this meeting and see who we are next seeing.

Q168 Baroness Whitaker: There is a presumed tension between conservation and growth and, if this really is inherent, how can the need for conservation and preservation of the historic environment be reconciled with the demand for growth and new development? I wonder if you would answer not in terms of national treasures, which usually have their defenders, but more about the ordinary historic fabric of an area, which is often liked by residents and very much adds to their sense of place and identity, even if it is not a building of any great significance. I am interested in your views.

Duncan Wilson: I think your use of the word “presumed” is significant because, yes, indeed in some minds there is a presumed tension between conservation and development but, actually, very often the two go hand in hand. One very good example of that is the King’s Cross development, where the developer has taken an enlightened view, born of a very long-term approach.

Baroness Whitaker: Would you say that the preservation of various things like gas holders and all the things there enhances the asset value—that is, adds to growth?

Duncan Wilson: Absolutely, and the developer is very clear about that. The developer would not have attracted creative companies like Google to a standard city centre high-rise development. There is some fairly good evidence that creative industries and historic buildings are very good bedfellows, but it is born not just of an enlightened view of heritage but of a very long-term view. A developer that wants to maximise the realisable value of a site and sell it may not take that kind of long-term view. The two go hand in hand. I certainly believe that, in many instances, retaining listed buildings and developing them as part of a wider development, also involving new build, is as economically sustainable as a more simplistic approach involving clearing the site. Obviously that is one of the arguments we have to keep pressing.

Henry Russell: I have in mind a development a few years ago in Oxford Castle, which reused the prison in that area and had a lot of well-designed new building in it too. There are plenty of examples where development and heritage can go hand in hand, but it does need a
developer that understands what they are dealing with and is willing to take the right advice on doing it as well. Some years ago, there was also some research done by the British Property Federation and the RICS on the value of listed office buildings. I think English Heritage was involved with that research at the time. It has not been updated recently but, in central London, which they were looking at, it consistently showed that listed office buildings achieved higher rents than non-listed ones. It would be interesting to have that research updated. I do not know when it was last carried out; it was some years ago.

The Chairman: Our policy analyst is already on the case.

Ros Kerslake: On that particular point, the note that I have is that, in 2013, there was 4.4% higher rental for listed buildings than non-listed buildings. Very much picking up on the point that was made about the value that the heritage and historical environment brings to development, there are some very enlightened developers, like Argent, that completely understand that, get it, use it and get huge value from it. There are a number of others that, sadly, do not get it and feel that historic buildings are a bit of a problem within whatever site they have. I would argue very strongly that, actually, it is much easier to create a sense of place and to create value using historic buildings, and I come from a commercial property background. I come from working on large sites. There is, sadly, not the same recognition that there should be about how you drive that forward. I certainly do not think that the two are in conflict. Within our own work, we have been able to show that saving historic buildings can have a strong impact immediately within the site. We have saved a working pottery in Stoke-on-Trent, which immediately saved and created 116 jobs, but the impact within the area has been much stronger. We have been focusing a lot on how you see and measure the social impact, as well as the economic and environmental impact within an area.

One of the things that is important to help drive some of this forward is how you create investment mechanisms for these sorts of projects. Often much of our heritage sits in areas that do not automatically attract commercial development. A lot of it is in the north of England, in parts of the world where we had formerly thriving industrial towns, which are now being much restricted.

The Chairman: My Lords, ladies and gentlemen, can we stand, please?

The Committee paused for two minutes’ silence.
The Heritage Alliance, Historic England and Prince’s Regeneration Trust – Oral Evidence (QQ159-170)

The Chairman: I am sorry we interrupted you, Ms Kerslake.

Baroness Whitaker: I think we were very interested in the incentives to encourage a developer to enhance the sense of place by a good use of the historic fabric. My own sense is that this is very much an answer about design and it is a matter of how the design of the place can be properly stimulated. Have you got any ideas?

Ros Kerslake: I do have a couple of thoughts on it. One is I wanted to make mention, particularly on the whole design issue, of some work that has been done by my sister charity, the Prince’s Foundation for Building Community, on a project called Beauty-In-My-Back-Yard, which has been released very recently. It has focused exactly on how local communities can identify new development within their area that fits within the character of the area in which they live, rather than being antagonistic to it, so there is some work out there and some very useful tools that enable people to do that. The broader issue of how you persuade people to invest in these areas is a mix of stick and carrot. Partly it is about a more robust use of the existing mechanisms, including Section 106.

Baroness Whitaker: Is that on the part of the planning departments?

Ros Kerslake: Within planning departments, sometimes it is actually a more robust response to some of the proposals that come forward, robust use of the existing planning structures around Section 106 contributions to the historical environment, making it at the centre of what is coming forward more, rather than allowing developers to do the new bit first within their plans and then say they will sort out the old bit at the end. It forces them at least to do it in parallel or to have a phased approach. There are approaches that have been successful in doing that.

The other thing is about how you bring in new investment. We have just heard about the issue in terms of grant funding and the potential for Historic England’s grant to be cut. I very much hope it will not, because it is hugely useful. The Heritage Lottery Fund is fantastic and one of the few resilient sources of funding that is around, but the demand on it is massive, relative to the availability. The demand keeps growing and growing. The success of communities, and I think we are coming on to that, has a big impact.

One of the things we have to find a mechanism for is bringing in commercial investment, but in a way that works for those investors. Straight investment into these sorts of sites does not
work. One of the things that we have been working on is what we have called an Old Buildings, New Lives fund, which is about how you create a social investment fund that balances the risk across a range of projects, so that investors into it can access projects in areas that they would not normally invest in directly, get a modest return, but none the less a return for it, and a strong social impact. The reason we are very keen to do it is to create a model that could hopefully attract more investment, particularly in the more deprived areas, when there is market failure. We need those mechanisms because public sector funding or grant funding generally, whether it is from the public sector, foundations or Heritage Lottery Fund, cannot meet the level of need and demand. That is self-evident with the thousands of buildings we have that need to be addressed.

**Baroness Whitaker:** Perhaps we could get hold of the details of that.

**Duncan Wilson:** If I may just amplify that, one of the issues is early engagement and understanding on the part of the developer.

**Baroness Whitaker:** Is this on the part of the planning department or the local community?

**Duncan Wilson:** It is on the part of the developer with one of these particular problem sites. We are doing our best to address that. We now have negotiated with DCMS, via Treasury, a scheme where we are allowed to charge the cost of early engagement, and additional resources to make that possible, to clarify listing descriptions and to provide pre-application planning advice. Very often that process of clarification will say which part of the asset is special and which is not, which will enable the developer to work up a scheme that leaves the most important parts of the place or the building intact within the scheme, but allows him or her the flexibility to develop around that. Sometimes old listings can have rather blanket descriptions, which is often a bar to such a scheme being developed. It is a scheme we have called Enhanced Advisory Services, but we have had some success with that with major projects, including not just building but infrastructure projects, and we anticipate that it will work a lot better. We have worked quite well with developers.

**Baroness Whitaker:** Is that in ordinary little places too, not just King’s Cross and so on?

**Duncan Wilson:** Yes. It is available to anyone who wants to engage that way. We still provide 15 hours of advice free, but this applies across the board, whether it is a church, a listed
building or a big scheme. Either way, we encourage people to engage with us early, so that we can provide that better targeted advice, which helps sustainable development.

Q169 Lord Inglewood: I would just like to ask Ros Kerslake, since you were talking about this vehicle for investment, what type of investor you anticipate would invest in this vehicle for development.

Ros Kerslake: A range of different investors, we hope.

Lord Inglewood: If you are a property developer, you are going for the maximum amount of money. If you are a private person who wanted an old house, you would buy the old house for yourself. I cannot quite see, other than possibly some publicly spirited charities, who would invest in this fund.

Ros Kerslake: So far the sort of support we are getting is from people like Big Society Capital, which is tasked specifically with investing in these sorts of vehicles. They have a strong interest in doing that. Some of the trusts and foundations also have a track record in investing.

Lord Inglewood: I have got the picture.

Ros Kerslake: Other than that, there are also high-net-worth individuals who we believe are willing to put a proportion of their investments into something like this, if it achieves social good. It is about corporate social responsibility of individuals.

Lord Inglewood: It is a kind of quasi-philanthropic target audience.

Ros Kerslake: That is absolutely right.

Lord Inglewood: Thank you. I now see where you are coming from.

Earl of Lytton: I just wanted to do a supplementary on this particular one. Ros Kerslake, you referred to the question of trying to get developers, where there was a listed building element, to invest in the building upfront. Now I am a chartered surveyor, so I know something about the development process. Cash as ever is king and, Mr Wilson, you referred to the question of getting some upfront cash to do certain other things that might be called for—more public sector input. At the end of the day, nobody has a magic wand, so how does one get upfront cash when you have a development that is within its special purpose vehicle, its company structure or whatever, and try to extract money upfront, when you have all the infrastructure, possibly the land purchase and all the other things that have to go in? I know this debate has been going on regarding the point at which the Community Infrastructure
Levy would actually be paid or indeed be payable out of the development. Could you enlarge on how you think spending money on the listed building as an upfront operation actually works in practice? I am not talking about where it is conversion, but where there is obviously a separate listed building element that sits alongside a wider project.

**Ros Kerslake:** It depends on exactly that. If it sits on its own, it can be quite challenging and then you probably are looking at issues like grant funding or possibly the sort of funding I have just talked about, if there is the ability to pay money back at some point in the future. Some community-type projects will not have an exit. The building is perhaps quite small and it will always be a community asset. It is not possible to do that. For larger sites, former hospital sites, former schools and ones that have land as well as buildings that need to be rescued, it is possible to do it. I am working on one right now, where the proposal is to dispose of a proportion of the enabling development at the start, in order to have enough money to kick off the development, and then the thing just rolls and recycles through, maybe with a bit of grant funding in there to make the whole thing work as a package.

**Earl of Lytton:** This is about the question of the role that community engagement can play in supporting the historical environment. I go back to something you said, Mr. Russell, about skills. We have covered part of this already and I did think that Ros Kerslake’s reference to Beauty-In-My-Back-Yard and how that might impact the community partially answered this question, but there still remains the question of the skills shortfall at community level, as I see it. Given that, what can improve community engagement, first and foremost, and what changes would we need? What should we as a Committee be suggesting should be changed in order to reinvigorate that and make it more likely?

**Henry Russell:** A key one is bringing local communities into the assessment of conservation areas more. For example, what do they see in the value of their own area? How can that be integrated into the assessment of conservation areas? In terms of their actual protection, there are limited powers for conservation areas, but they are very much a vehicle for policy for the future and are sometimes underused. Again, it comes back to the resources for the local authority to develop its conservation area assessments and policies. That comes back to that issue but, if it works well, it could be a vehicle for local communities to get involved.
The other one is probably neighbourhood planning, which is becoming more and more successful in engaging communities as well. Those are two key ones at ground level for bringing local communities into protecting, enhancing and enjoying their own local historical environment.

**Duncan Wilson**: Neighbourhood planning is a really important part of the process, where success has been patchy, to be honest. As Historic England, we are trying to support the process of preparing a neighbourhood plan to make sure that it is implementable and compliant, and therefore useful, but there is quite a deficit in the number of neighbourhood plans prepared and the degree to which they are sufficiently comprehensive and well informed. It is potentially a very useful part of the process.

The other thing I would mention is volunteering. Of course, Britain has an extraordinarily well recognised and admired system overall for heritage volunteering, certainly if you include the National Trust and lots of local amenity groups. We should recognise that and build on it, not just assume that everything is not working as it should. A very large number of people profess a passion for their heritage—over 90% in a survey we did. We just need to make sure that that is effectively harnessed and used.

**Ros Kerslake**: If I could build on that point, it is manifestly obvious that, for the size of the issue that we are dealing with and the number of buildings at risk, you need a range of solutions to it. The commercial property solution, for the reasons we have just discussed, would only apply in certain types of properties, either because of the area, the size or the adaptability, so in many instances you need another solution and it has to be an economically viable solution. Often it will be about communities taking ownership, in the broadest possible sense, of the future of that building or site. The experiences completely endorse what Duncan has said about the level of interest. There is huge energy and enthusiasm out there, in many areas, interestingly even sometimes in areas where people may have moved into that particular location but still value the heritage there.

What there is not is the understanding and skills about how you move forward. We have been operating, as indeed have a number of other organisations, an education programme under the auspices of the Heritage Lottery Fund. Ours is called BRICK, and it is focused specifically on going all round the country and helping people on a range of things: how do I identify the
right building? How do I get people to agree? How do I get ownership? How do I fundraise for it? There are some solutions that are starting to be developed that are harnessing some of that enthusiasm but, again, like all these things, it needs to be invested in. Those programmes need to continue. We need to build the level of strength and capacity. We have an online community that we are growing as part of that, so we are very much trying to get peer-to-peer nurturing happening, one community group telling another community group what needs to be done, rather than it always having to be a top-down process. There are some tools, but they need to be nurtured and developed.

The Chairman: That is very interesting and very helpful. Are there any more comments?

Duncan Wilson: I might just say that we should not leave the subject without mentioning mainstream education—secondary and primary education. We have what I consider to be an extremely good value project running, mainly funded by the Department for Education, which we hope to extend beyond the present planning horizon, but we do not know yet. It gives teachers the tools to engage children in their local environment and understand their local environment. Very often, buildings can be the physical key to unlocking quite difficult subjects like justice, health and prisons, and all the buildings in towns around people that embody those civic values and civic obligations. Teaching civics can actually be made that much easier by showing children how the town hall evolved.

The Chairman: What is the name of that programme?

Duncan Wilson: It is education in schools. I can write to you with some more details about the historic environment education.

The Chairman: We should be having written evidence from a group called Pupils 2 Parliament. We have to agree it first, but it is exactly along those lines: asking the future generations what they like about—

Duncan Wilson: The Heritage Schools programme, I should have said.

Baroness Parminter: You all made the point about the value of neighbourhood planning. It is quite a new initiative under the last coalition Government, but none of you mentioned the grants that were available from DCLG, which ran out quite quickly, because they were so popular. Given you have talked about investment and the need to get those communities engaged on a long-term basis, would you agree that continuing those grants and, if it were
possible, extending them, but nevertheless continuing them, would be an important step in delivering some of the goals that you have talked about?

_Duncan Wilson_: I certainly think it would help, because preparing a neighbourhood plan is not a cost-free process. Often some professional advice is required to put it together. The frustrating thing is there is a lot of potential in that initiative, but it will not be delivered unless these plans are properly prepared.

_Ros Kerslake_: I would endorse that. The leverage is huge. For a fairly small investment upfront, you get a huge impact and a cost saving for local and national government out of it, but you do have to put in the investment upfront to achieve it.

_The Chairman_: Are you equally enthusiastic, Mr Russell?

_Henry Russell_: Yes. I was just pondering the fact that, for local communities working on and preparing their own neighbourhood development plan, it is quite a large exercise to do. They are going to need professional advice and that is going to need to be paid for, so any money, wherever it comes from, is going to be of benefit.

_Q170 Baroness Young of Old Scone_: Do you have any concern about the new propositions about brownfield registers and a more zonal approach to planning, in terms of heritage?

_Duncan Wilson_: Yes, we have concerns. At the moment—how can I put it?—our concerns could best be summarised as the law of unintended consequences. We have had plenty of reassurance from DCLG that no emasculation of the heritage protection provisions in the NPPF is intended, and I take that at face value, but we are concerned that we are not sure precisely how the role of heritage assessment within the brownfield land register will work to make sure that it is not treated as a bypass of all other planning legislation.

_The Chairman_: Thank you very much. I have been asked by Lady Andrews, who unfortunately had to go, to ask Mr Wilson and Ms Kerslake to give examples of heritage-led regeneration and its impact and sustainability. I am not asking you to do it now, because we are up against time, but if you can think of it. I know we have really bombarded you with requests for information, but it has been an extremely helpful session. Thank you all very much indeed.

11 November 2015
Historic England Response to the Select Committee on National Policy for the Built Environment

Historic England is the Government’s statutory adviser on all matters relating to the historic environment in England. We are a non-departmental public body established under the National Heritage Act 1983 and sponsored by the Department for Culture, Media and Sport (DCMS). We champion and protect England’s historic places, providing expert advice to local planning authorities, developers, owners and communities to help ensure our historic environment is properly understood, enjoyed and cared for.

Historic England’s responsibilities in respect of the historic environment have direct relevance to the wider built environment, and our activities and expertise span all the built environment fields, at a range of scales. In our championing of historic places we are trusted to act impartially and to take a long term view, providing clarity on which parts of our heritage are nationally important (e.g. through the National Heritage List for England). We work all over the country, offering constructive advice to support growth and development, supporting emergency works to heritage at risk through grants, and helping local authorities be more efficient through guidance, training and specialist advice.

Historic England welcomes the opportunity to submit evidence on the following issues:

### Policymaking, integration and coordination

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

- National-level policy regarding the shaping of the built environment is essential, to provide clear strategic direction; that policy should itself be subject to consultation and wholly integrated with the remainder of national policy.
- Local decision-making on planning policy and applications – by local authorities with the full engagement of their communities (including through neighbourhood planning) – is then essential if local character and distinctiveness are to be understood and maintained or enhanced. Adequate resourcing is necessary in support of this (in relation to both the information needed to provide an evidence base, and staff capacity/expertise).
- Decisions on significance are taken at both the national and local levels, with the majority of designated heritage assets being identified nationally, and local authorities able to designate conservation areas and to identify locally important heritage assets, through the preparation of local lists.
• Beyond planning policy, we also need to improve the care and upkeep of our built environment and its historic assets to ensure that construction investment is realised, and that benefits last many generations.
• Historic England plays an important role in all of the above, providing impartial, expert advice with a national perspective, largely delivered at the local level.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?
• Recent efforts to recognise the importance of design in road construction are welcome, but the importance of high-quality design and maintenance needs to be further embedded across all departments with an impact on the environment.
• Heritage and design policy are already well aligned, although heritage policy is not always given appropriate weight in policy implementation.
• There remains considerable scope for improvement in relation to the delivery of infrastructure, and in the resolution of potentially competing legislative requirements (e.g. reconciling the requirements of the 1975 Reservoirs Act and 2010 Flood and Water Management Act with conservation duties when dealing with listed or scheduled structures in and around ornamental lakes).

National policy for planning and the built environment

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?
• Drawing on its own experience, appeal decisions, and discussions with practitioners, Historic England believes that NPPF policy properly highlights how the protection of the historic environment, character, and local distinctiveness is integral to the delivery of sustainable development, and maintains an appropriate degree of protection for the historic environment (itself including buildings, monuments, areas and green spaces).
• In its current form, the NPPF successfully balances a range of core planning principles within the overall presumption in favour of sustainable development. Further prioritisation of any one element would undermine this balance, and thus jeopardise the delivery of sustainable development.
• Although NPPF policy is itself clear, there remain problems in interpreting and applying the policy in a few instances, with some Local Planning Authorities (LPAs) failing to give proper weight to historic environment considerations within wider planning judgements, or to appropriately integrate heritage issues into plan-making, and thereby straying from the sustainable development objectives of the NPPF. This issue is likely to be exacerbated when local authorities do not have access to the necessary expertise (see response to Question 9, below).
5. **Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?**

- The optimum timescale depends on the level of detail being considered, but longer timescales allow for greater certainty for both developers and communities, and also reinforce an understanding of the longevity of planning decisions, which have an impact on the built environment lasting hundreds of years in some cases.
- This longer perspective is also important in considering the lifetime of new buildings: an assumption of demolition and replacement every few decades is not particularly sustainable.
6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

- Historic England recognises the need to address current issues of housing supply, and believes that any interventions at central Government level should indeed be properly coordinated. These interventions should however recognise that planning is neither the whole problem nor the whole solution, and look to the wider context, including issues around development financing, landowner expectations, supply chain constraints, land assembly, and land remediation. Further effort to address these is needed to support housing delivery.

- There is not yet sufficient detail about the nature of the reforms currently being proposed to be clear about the impacts on either housing delivery or the planning system, but there are very real concerns that the focus on housing alone will not support the delivery of balanced, sustainable and productive communities, and that ‘streamlining’ the planning system will result in reduced overall protection for the historic environment (and lost opportunities for it to support distinctive changes to places in keeping with local character), as well as a reduction in community influence over the form and quality of local environments.

- With regard to the streamlining of the planning system (and mindful of the potential for confusion rather than clarification if additional routes to consent are introduced), it would be useful to explore the impact of current permitted development rights, and the extent to which they support the delivery of sustainable housing provision. The importance of carefully designed proposals in making development more palatable to local communities should also be considered.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

- Within a planning context, the proper and confident application of existing NPPF policy supports the development of sustainable and resilient environments, and actively promotes the conversion of existing buildings (incorporated within one of the core planning principles and within housing and rural policy, as well as being a mainstay of conservation policy and practice, not least in Historic England’s own work).

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

- Promoting the optimum use of the historic environment is at the core of Historic England’s role, and is reflected throughout our corporate plan.
The historic environment is an important asset in regeneration and place-making, physically, socially and economically (as shown in *Heritage and the Economy*):

- Across all age groups, older buildings are favoured over new.
- 91% of the public believe that parks and public spaces improves peoples’ quality of life.
- Investment in the local historic environment makes areas a better place in which to live, work, visit or operate a business.
- Businesses in historic buildings provide 1.4 million UK jobs and contribute over £47 billion in gross value added.
- Between 1980 and 2011, listed retail, office, and industrial properties generated total returns equal to or higher than their non-listed counterparts for 3, 5, 10 and 30 year periods.
- The historic environment is an important factor in deciding where businesses locate, the presence of heritage being as important as road access.
- Repair and maintenance on historic building stock supported approximately 14% of total construction industry employment in 2010.
- Heritage is a key driver of international tourism to the UK.

The NPPF requires that LPAs should have a positive strategy for the conservation and enjoyment of the historic environment, which recognises the importance of their use, and the wider benefits which their conservation can bring. Historic England supports LPAs in preparing local plans and policies that reflect this, and in making constructive decisions on applications thereafter.

Historic England firmly believes that heritage assets should contribute to job creation, business growth and economic prosperity, in ways that maximise what they have to offer whilst minimising the loss of the qualities that make them special in the first place. This is the basis for Historic England’s ‘constructive conservation’ approach, which is a positive, well-informed and collaborative approach to conservation, in which people are helped to understand their historic environment and use that understanding to manage change. We support innovative schemes that protect and enhance the significance of buildings and historic places, and make optimum use of the historic environment, stimulating sustainable growth (at the large scale, an example is the regeneration of the King’s Cross area, and at the small scale the conversion and reuse of the Old Bishop’s Palace in Ely). Wider adoption of this approach is one way in which more be made of heritage assets.

Making optimum use of the historic environment may also be supported by the exploration of alternative ownership models, such as community ownership.

Historic parks, green spaces, trees, and water features form a significant part of our green infrastructure and have an increasingly important role in helping us adapt to climate change. This network of green spaces offers multiple health, well-being, social, environmental, wildlife and economic values and benefits, but this is not currently reflected in their governance, management and funding.

Historic England is proposing the creation of a number of Heritage Action Zones, in agreement with partners such as local authorities and local enterprise partnerships, to unlock the potential of the local historic environment to contribute positively to economic growth.
Skills and design

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

- It is important that all relevant professionals have the ability to consider the built environment holistically, in both the public and private sectors, particularly in relation to design skills, and the ability to design well within existing historic contexts: as noted in the answer to Question 10, below, many professionals are not trained and/or confident in this area. Historic England offers some training, but a greater element of cross-discipline training is needed in built environment education.

- Planning is most effective when it is proactive and not just reactive, and it is best able to be proactive when its importance is recognised and it is adequately funded.

- On-going budgetary pressures have resulted in a considerable decline in the number of staff with heritage skills within local planning authorities since 2006. The number of conservation specialists advising local authorities in England has fallen by 35%, and the number of archaeoological specialists has fallen by 23%. Since 2010, the level of historic environment advice accessible to local authorities has fallen by 22%; over the same period (if numbers of planning application decisions are used as an indicator of workload), the number of planning application decisions per full time equivalent historic environment specialist has gone up by 26%. The development sector (e.g. British Property Federation, July 2015) wishes to see appropriately skilled and staffed local planning authority teams, in support of timely and effective decision-making, and the delivery of high-quality outcomes.

- Issues around specialist resources do not just relate to numbers, however, but also to quality: the loss of experienced officers and their replacement (if indeed they are replaced) with junior or temporary staff all weakens the authority’s expertise and ability to deliver a high quality of service; outsourcing of elements of the planning service may also lead to weakened connections between informed management and place. In addition, 81% of council parks departments have lost skilled management staff since 2010, and 77% have lost front-line staff. Making decisions which are not informed by appropriately skilled advice places both heritage assets and local character at risk.

- Inevitably, this will have had an impact on the quality of service and decision-making, with historic environment considerations not being addressed within the planning process as required by the NPPF, and opportunities for proactive planning missed through a lack of confident planners and clear local authority leadership.

- The planning system works most effectively when specialist advice (from conservation, urban design and other specialists) is available, and is weighed against other relevant matters by planning officers (themselves with a reasonable degree of professional knowledge and experience in these areas). This cross-disciplinary awareness and
understanding is fundamental to enhancing place-making, as noted in the Farrell Review.

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

- The promotion of high quality design is a core planning principle within the NPPF, and the importance of place-making implicit throughout the document: design is correctly at the heart of the planning process.
- Many existing tools are of value in promoting high quality design and place-making, including historic characterisation (which aids in the understanding of heritage’s contribution to ‘place’), and heritage partnership agreements (which streamline the consent process in relation to listed buildings).
- Useful improvements in national leadership could relate to the promotion of training: 65% of building professionals do not feel that their formal education prepared them adequately for working on pre-1919 buildings, and 68% believe that much of the skills and knowledge they have acquired is self-taught.
- National leadership is enhanced in part by the Government leading by example, e.g. in the commissioning and delivery of infrastructure schemes and the disposal/development of its own assets.
- With effect from October 2015, and alongside our existing free planning and designation services, Historic England is introducing four new enhanced advisory services (fast-track listing, listing enhancement, extended pre-application advice, and a screening service), to give greater certainty to complex or time-sensitive development projects. These will offer greater speed, clarity and engagement in return for recovering the cost of providing these services.

**Community involvement and community impact**

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

- The evidence in support of the positive impact of the built (and specifically historic) environment on communities is clear:
  - The historic environment has a positive and significant relationship to sense of place.
  - 87% agree that better quality buildings and public spaces can improve quality of life and seven in ten that heritage sites are important to their local community.
  - Visiting different types of historic places has a positive impact on life satisfaction, or general wellbeing: the good effect on wellbeing was found to be the same or more than doing other activities, including sports, and visiting historic towns and buildings has the greatest impact. The monetary value of this positive impact on general wellbeing is calculated as £1,646 per person per year for the average heritage-goer.
Volunteers who actively participated in heritage projects report levels of mental health and wellbeing far higher than the general population, with one in three describing a notable increase in self-esteem; volunteers also gain new and improved skills through projects and use them beyond the workplace to engage with their community, with 75% of volunteers reporting a strong sense of belonging to their immediate neighbourhood.

Living near parks, woodland or other open spaces helps to reduce health inequalities, regardless of social class.

- These wider impacts are not all explicitly reflected in current policy and practice (although the NPPF does emphasise the importance of making places better for people [paragraph 56], establishing a strong sense of place [paragraph 58], not undermining quality of life [paragraph 58], and going beyond aesthetic considerations alone [paragraph 61]), but do suggest that a higher priority to design matters in wider decision-making (e.g. in the delivery of infrastructure schemes) is both desirable and beneficial. An increased awareness of these benefits might also give LPAs greater confidence in applying design policy within the planning system, something that Historic England seeks to support with the production of its own advice.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

- Whilst mechanisms exist for encouraging active community engagement in planning processes (e.g. ‘planning for real’ exercises; ‘urban rooms’), current resource pressures on staffing inevitably affect the capacity of LPAs to go beyond the statutory minimum consultation requirements, and encourage the wider community to participate. Research suggests that participation in planning as a whole is often limited to particular sectors of the community.

- Volunteers are however increasingly important in raising awareness of local heritage, and in contributing to plan-making, e.g. through undertaking the necessary research to support the formation of local lists.

- Neighbourhood planning provides a valuable opportunity for communities to engage with local decision-making on heritage and other topics, if properly resourced and not undermined by measures introduced to streamline planning and reduce opportunities for community involvement.

**Financial measures**

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

- Given the importance of the historic environment to the wider built environment, the costs of maintaining historic structures, and the large number of listed buildings in residential use, a reduction in VAT from 20% to 5% on the repair, maintenance and
improvement of dwellings in private ownership would promote both conservation and the economy.

- Housing supply in sustainable town and district centre locations could be increased by further encouraging the full use of upper floors of retail and commercial buildings.
- Existing systems (such as s. 106 agreements and the Community Infrastructure Levy) could be used more imaginatively to address place-making and heritage issues.

Victoria Thomson
02 October 2015
Further Comments

The points which Historic England would most like to draw to the Committee’s attention are as follows:

- The historic environment is an asset (rather than an obstacle) in place-making; it is certainly not the case that decision-makers have to make a choice between ‘old’ and ‘new’.
- The planning tools we have for managing the built environment (notably the National Planning Policy Framework) do broadly work, and maintain an appropriate degree of protection for the historic environment, if properly applied.
- In this regard, local authority resourcing is a very important issue, if there are to be adequate numbers of qualified and experienced staff applying the tools we have to manage the built environment, and delivering high-quality development.
- Cross-profession awareness/training in the relevant skills (including heritage) is needed.
- The historic environment is not just ‘built’, but includes green spaces (e.g. within conservation areas; parks and gardens; battlefields; below-ground archaeology) and also the marine element (largely wrecks).

Further Information

The Committee requested further information on a number of areas, as follows:

Page 4: Online Availability of Guidance (Baroness Young of Old Scone)

Historic England makes advice on a wide range of topics available on its website. Planning advice, for instance, is to be found here:

https://www.historicengland.org.uk/advice/planning/

All guidance has been recently reviewed to ensure that it is concise, up-to-date, and correctly badged as produced by ‘Historic England’.

Page 10: Local Authority Conservation Officer Staffing (Baroness Young of Old Scone)

Since 2006, the number of conservation specialists advising local authorities in England has fallen by 35%.

Historic England will be publishing authority-by-authority data on local capacity for the first time on 3 December, within the ‘Heritage Counts’ local authority profiles. This information will be available here:

http://hc.historicengland.org.uk/local-authority-profiles/
Page 22: Heritage Schools Programme (Baroness O’Cathain)
The Heritage Schools programme was developed in response to the government report on cultural education in England, and is intended to help school children develop an understanding of their local heritage and its significance. The programme includes clusters of schools in eight regions across England and runs from September 2012 to March 2016.

The aims of the Heritage Schools programme are to make sure that:
- Children develop a sense of pride in where they live
- Children understand their local heritage and how it relates to the national story
- Teachers are more confident in making effective use of local heritage resources in delivering the curriculum
- Local historic context is embedded in the school’s curriculum
- Heritage providers are more connected to the needs of local schools
- Parents are engaged in their children’s learning
- Communities are more deeply involved in the life of the school

More information on the programme is available here:
https://historicengland.org.uk/services-skills/education/heritage-schools/

Page 23: Heritage-Led Regeneration (Baroness Andrews)

Historic England firmly believes that heritage assets should contribute to job creation, business growth and economic prosperity, in ways that maximise what they have to offer whilst minimising the loss of the qualities that make them special in the first place. This is the basis for Historic England’s ‘constructive conservation’ approach, which is a positive, well-informed and collaborative approach to conservation, in which people are helped to understand their historic environment and use that understanding to manage change. We support innovative schemes that protect and enhance the significance of buildings and historic places, and make optimum use of the historic environment, stimulating sustainable growth.

At the large scale, an example is the regeneration of the King’s Cross area; at a smaller scale, an example is the conversion and reuse of the Old Bishop’s Palace in Ely. Many more examples may be found in our ‘Constructive Conservation’ publication:

https://historicengland.org.uk/advice/constructive-conservation/sustainable-growth-for-historic-places/

Related to this is the ‘Heritage Works’ publication, which specifically addresses the use of historic buildings in regeneration. It combines the expertise of the property and conservation sectors, and provides a step-by-step guide for developers, owners, practitioners or community groups to create successful heritage-led regeneration projects:
http://historicengland.org.uk/images-books/publications/heritage-works/.

25 November 2015

Historic England, The Heritage Alliance and Prince’s Regeneration Trust – Oral Evidence (QQ159-170)

Transcript to be found under The Heritage Alliance
### Policymaking, integration and coordination

1. **Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?**

   Not necessarily. There needs to be a better balance between central government and local with parish councils and communities having a greater say. Planning at present is determined by district / borough councils who do not make decisions for the good of the region but only look at their actual district. There needs to be more consideration and coordination between districts for housing and employment.

2. **How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?**

   Could be better and as said above, I would like to see more consultation at local level and strategic decisions across district boundaries.

### National policy for planning and the built environment

3. **Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?**

4. **Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?**

5. **Is there an optimum timescale for planning our future built environment?**

   There obviously needs to be a 20-30 year plan but final decisions in terms of number of houses.
environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?  

to be built must be delayed until there is certainty on needs. At present too much is based upon projections and not actual needs.

</tr>
</tbody>
</table>
**6.** What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

It seems there is a total lack of intervention by Government where no thought is given to need to relate house need to job opportunities. It seems that demands for housing in the S.East are accepted without challenge. This is while housing in other parts of the country is laying derelict due to lack of jobs.

**7.** How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

See 6 above.

**8.** To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

A piecemeal attitude prevails. Look at London – large prestigious buildings of suspect design are erected without out regard to the overall characteristics of the city.

**Skills and design**

**9.** Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do

Clearly they do not have the skills. Question 8 above covers this point.

Home Builders Federation and Federation of Master Builders (QQ94-108)

Transcript to be found under Federation of Master Builders
Written Evidence from The Housing Forum Home Performance Label Consortium to the House of Lords Select Committee for the Built Environment.

We are responding to the call for written evidence from the House of Lords Select Committee, with a particular focus on the critical requirement to enable consumers to make an informed choice about the home they purchase by providing them with comparable and meaningful information at the point of sale or about the performance of their new home. We believe that the provision of such information to the consumer will ultimately transform both the quality of and value in the construction of new homes, and create demand for the improvement of existing homes.

The Home Performance Label (HPL) Consortium is a partnership of:

- The Housing Forum (http://www.housingforum.org.uk/), a cross sector membership network of more than 120 housing developers, providers and suppliers,
- BLP Insurance (Building LifePlans Ltd) (http://www.blpinsurance.com/), part of the Thomas Miller Group, providing building defects insurance since 1999 and
- HTA Design LLP (http://www.hta.co.uk/) a leading multidisciplinary design consultancy in the housing and regeneration sector.

The purpose of the HPL Consortium is to bring forward a meaningful, consumer-facing labelling system for the housing market, capable of generating consumer pull that will ultimately transform quality and value. At the time of writing, the three HPL partners are in discussion with a wide ranging group of housing developers and providers about joining the consortium. These include Wates Living Space, Barratt Developments, L&Q, Pocket Living, Essential Living, Grainger, Notting Hill Housing Group, Grosvenor, Climate Energy Homes, Home Group, Hurford Salvi Carr, Laing O'Rourke, Lend Lease, First Base Ltd. and others.

Our response to the questions in the call for written evidence is as follows:

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

The Housing Forum is a cross sector membership network that collaborates to support the delivery of more homes and better homes. It has campaigned for many years to enable a voice for the consumer in the Housing Industry. It has published a series of influential reports over the years that have built up the argument and support for improved labelling of the housing product. The following can be downloaded from the Housing Forum website:
"Rationalising Regulations for Growth and Innovation" Report Published: 26 April 2012 available to download from: http://www.housingforum.org.uk/influencing/housing-forum-reports-

"Housing for the Information Age" Published: October 2013 available to download from: http://www.housingforum.org.uk/influencing/housing-forum-reports-

"The Case for Home Performance Labelling" Final Report Published: January 2015 available to download from: http://www.housingforum.org.uk/influencing/housing-forum-reports-

These reports are evidence that, the Housing Forum has consistently campaigned for the creation of a policy framework which enables informed choice in the housing market by equipping consumers with the comparable and meaningful information at the point of sale of renting new and second hand homes.

Our response to this question is that consumer decision making needs to be supported by a policy framework enabling informed choice until this is established, we will struggle to deliver consistent quality performance in our housing stock.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

We believe that by providing a clear set of independently verified performance measurements of homes on which purchasers and renters could base their purchasing decisions on, a more customer focused market could be created which would respond more directly to their needs. New housing would become more popular, old housing would be upgraded to higher standards of energy efficiency, and a virtuous cycle of supply and demand would emerge in time.

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

The NPPF is commendable in its brevity and in the priority given in this abbreviated form of planning policy to the importance of design quality. However, we in The Housing Forum HPL Consortium does not believe there is an adequate framework for defining what good looks like and we continue to be dismayed by the poor quality of design of many housing schemes that are approved by LPAs and which comply with Building Regulations.

We believe that in addition to the process of design review which many LPAs are adopting, there is a need for widely understood proxies of quality that can be applied in order to help
the industry and regulatory authorities differentiate good from bad and thereby raise standards generally.

The Building for Life 12 agenda has, for example, achieved the status of a helpful lingua franca that enables developers, local communities and LPAs to identify quality design in 12 areas that are, however, confined to design and the scale of the neighbourhood or housing layout. BFL12 does not concern itself with the design quality of the home itself. Nevertheless we believe that BFL12 should be identified in guidance to planning policy as an acceptable benchmark of design quality.

Our report, "The Case for Home Performance Labelling," amply illustrates that there are certain measures of housing performance which are meaningful proxies of quality and value of the home itself and that is why we have gone on to create a benchmarking club of leading home builders and housing providers to develop this principle into a labelling scheme ready to launch onto the market. In particular, apart from accrediting that homes on offer meet expected standards, we believe that the inclusion of robust and accredited calculation of monthly and annual energy costs, maintenance costs, and costs of ownership are capable of providing consumers with meaningful indicators of quality and value.

Our Consortium aims to create an industry based voluntary labelling scheme, recognising that the present political establishment is bent on reducing the burden of regulation upon commerce. We hope, at the very least, we may receive an endorsement of our effort from Government. But ideally we may in due course, and when our scheme is more tried and tested, similarly seek the identification of the Home Performance Label as a benchmark of quality in Government guidance.

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

We should anticipate a time when energy costs are very much higher than they are today and prepare consumers to become much more aware of the potential impacts of costs in use on their ability to afford to house themselves. Only when we begin as a society to trade off capital and borrowing costs against costs in use will be begin to create real consumer influence on a more sustainable housing market. The Home Performance Label is therefore a first step in a long term project to bring the influence of quality, value and performance to bear on the value we place on homes as an asset.

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

We believe that by providing support for Home Performance Labelling, the Government would inform the market that low quality homes are not welcome and that high quality
homes are needed. For homebuilders, the message that they should provide independently verified performance measurements of homes for purchasers and renters to base their purchasing decisions on, would create a more customer focussed market which responds more directly to the customers’ needs. New housing would become more popular, old housing would be upgraded to higher standards of energy efficiency, and a virtuous cycle of supply and demand would emerge in time.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

We believe that by providing a clear set of independently verified performance measurements of homes for purchasers and renters to base their purchasing decisions on, a more customer focussed market could be created which responds more directly to their needs. Being clear about the improved energy performance of new homes compared to older homes will make new housing more valuable to the purchaser. Lenders will be encouraged to lend more money for a home that will cost less to run over its lifetime, and this in turn will make it more advantageous for home builders to build more energy efficient homes. The current market sees energy efficiency as a cost rather than a value as mortgage lenders do not include the savings arising from energy efficiency in their valuation models. In this way, new homes would become greener and cheaper to run, and thus more popular, and older housing would be upgraded to higher standards of energy efficiency to compete, and a virtuous cycle of supply and demand would emerge in time.

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

The quality and value of new homes would be greatly improved by the availability of clear and accredited information about the quality and performance of new homes. Consumers have instant access to information on every other aspect of life on their smart phones and computers, so why not give them the same level of information about their homes, the most expensive purchase most of them will ever make?

The questions are: how best to introduce information to the marketplace? What information would be most useful? How are we to overcome the various obstacles involved?

The Housing Forum has brought together a wide range of contributors from across the industry seeking answers to these questions.

This work has culminated in the Home Performance Label Consortium, which has engaged designers, homebuilders and suppliers in an exercise to explore the idea of providing comprehensive data to potential purchasers of homes.
The Housing Forum tested the viability and potential reaction to this proposition by creating a prototype housing comparison website (www.homeperformancelabelling.co.uk) anticipating a time when customers will make choices about their next home fully informed about the standards it will achieve. This will include the running costs they will expect to incur as well as other important information, in addition to the price and the location.

The pilot illustrates how a website based on a Home Performance Label could be used by purchasers or renters to search for a home that met their needs using metrics such as price range, bedroom size, location, running costs, available space, lifecycle costs, daylight and broadband speed. The best performing homes are highlighted using a Red-Amber-Green scheme, and the selected homes can be sorted from lowest-to-highest or highest-to-lowest in each area of performance.

The home performance labelling pilot demonstration website comprised multiple data views for each featured house type.

**LIST VIEW**
The List View presents an image of each home, the estate agents’ description and a calculation of the price per square foot, generated from the data available as perhaps the most obviously straightforward measure of value.
GRID VIEW
The Grid View provides a more condensed and therefore rapidly scan-able array for browsers to be able to draw comparisons between homes on offer.
MAP VIEW
We valued the designs on the hypothetical basis that they were all located on the Isle of Dogs in London’s East End. We chose this location on the basis that there is a great deal of development activity and already a very diverse range of housing typologies available to prospective purchasers in the area.

THE DATA VIEW
The Data View provides the opportunity to compare homes in terms of the parameters we have selected for the pilot. As well as indicating whether each home performs in accordance with (amber), better than (green) or below (red) benchmark standards, the user can rank the selection under each performance parameter by clicking at the head of each column. No attempt is made at an overall ranking in recognition that consumers have widely different priorities for making their choice.

The outcome of this pilot exercise justifies the idea that more information should be provided to home seekers than is currently the case. In the pilot the range of running costs amongst new homes built to contemporary standards is almost £3,000 per annum. The amount of space available in a 3 bed home varies by 47 square metres. Many homes in the pilot failed to provide adequate storage, and levels of daylighting provided vary widely. Crucially, none of these differences are recognised in the pricing of new homes.

Purchasers of two three-bedroom houses in the same post code will most likely be offered the same mortgage, irrespective of any differences between the two homes, and of the
purchasers’ ability to pay more for a bigger or better performing home. Price does not reflect performance.

Now that the housing market, particularly in London, is moving away from home ownership, it is important that renters in the affordable and private markets understand the full costs of their bills so that they can manage their budgets effectively. Providing an assessment of their likely bills in a new home will help them to make the appropriate choice for their pocket, and also enable them to get the best value for money. The system will also benefit landlords, as they can use a Label to differentiate their rental offer by including the amenities available in their homes as well as the running costs.

In the medium term we anticipate extending this approach to the existing home market. Labelling existing homes will counterbalance some of the more emotionally driven aspects of choice (e.g. a 17th Century cottage in a flood risk zone), and highlight where a new home offers better value and more affordable lifecycle costs for purchasers. By demonstrating that the running costs of new homes are generally lower than for existing homes, we would expect to encourage the sellers of existing homes to bring them up to equal energy performance with the new homes market, and by enabling purchasers to compare the space standards of new homes with existing homes we would expect house builders to build to the best space standards that they can afford to deliver. The better elements of both sides of the market would spur the other to improve.

On the basis of the understanding obtained through the pilot, we have developed a recommendation for the first move to introduce Home Performance Labelling to the housing market. This is based on the assumption that Government will not legislate any time soon for the introduction of mandatory labelling. Instead, we intend to offer a product for use, initially by homebuilders, housing associations, mortgage lenders, estate agents and local authorities, that will demonstrate the compliance (or otherwise) of homes with parameters such as the space standards set out in the National Standards, energy performance (including appliance running costs, lifecycle costs and levels of daylight), storage space and broadband speed.

To develop the product and bring it to market, we have formed a Consortium of interested parties to fund and promote the initiative.

This group will meet regularly to oversee the development of the Label from an idea to a market-ready proposition. By involving a cross-sector group of companies, we intend to capture the needs of a wide selection of home providers, manufacturers and landlords, both private and affordable.

We believe this initiative will lay the foundations of a framework for more and more consumer information about housing of all sorts. To achieve this outcome, we recognise that we will need more partners, and we hope that bodies such as the Home Builders Federation, the Homes and Communities Agency, the Council of Mortgage Lenders and New London Architecture, among others, will encourage potential collaborators to make contact and begin the necessary dialogue.
The use of the label will indicate to the consumer that:

- The home on offer meets all the locally applicable standards as indicated on the Label.
- The homebuilder or housing provider is committed to full disclosure of consumer information.
- The predicted performance of the home shown on the Label has been calculated using the best available information and techniques.
- The predicted performances, including costs in use, are recognised by Government, the RICS and Building Societies Association as legitimate predictions.
- The homebuilder or housing provider is committed to long term examination of performance feedback to improve the HPL methodology continuously.
- If you follow the recommended guidelines your home should perform as predicted.

The organisations who have pledged support to date include Wates Ltd, Barratt Developments PLC, Pocket Living Ltd, and L&Q. The first Consortium meeting was also attended by Notting Hill Housing Group, Osborne, Grainger PLC, Essential Living, Hurford Salvi Carr Ltd, Lend Lease, First Base Ltd, and Home Group.

We propose that the Government should endorse Home Performance Labelling as a cost effective way of fostering new high performance housing in the capital. By encouraging developers to display the performance of their properties to the market, consumers will be moved to push for higher quality in areas that matter to them, asking for more space, more light, more storage and lower bills. This will act to improve the quality of housing on offer, making homes more liveable and reducing harmful emissions. In the long term, this approach can be extended to the existing stock to encourage its improvement.

**The HPL brand**

The project brand has evolved as the project has developed, with the latest iteration being the registered kitemark and logotype shown above. A more informative website is in development, with the focus on project updates, primarily for members of the HPL consortium.

*01 October 2015*
Call for evidence House of Lords Select Committee on National Policy and the Built Environment

Who am I

My name is Roger Hutton. I am familiar with all aspects of the planning and housing development process.

I have identified land for development, approached owners, assembled individual ownerships into larger areas of land; dealt with all of the technical issues surrounding development e.g. highways, drainage, ecology etc; submitted planning applications and secured planning permission; handled planning appeals; negotiated s106 agreements; built houses and sold and let them.

I have also set up and run my own town planning consultancy and written on planning matters in a national magazine. I have helped write a Neighbourhood Development Plan for our village.

I have seen the planning system evolve over the last 25 years and get forever more and more complicated.

I am now retired so can look at the system dispassionately without having my own agenda or self interest to pursue.

EVER RISING HOUSE PRICES

The planning system places much of its focus on deciding where you cannot build housing. By and large it has been successful in that objective. Planning how many, and where to build, new homes has been somewhat less successful.

The inadvertent rationing of housing through the planning system to a level which is below need or demand produces inevitable upward pressure on prices. The beneficiaries are the already housed and it is no coincidence that they are typically amongst the most vociferous objectors to new housing proposals.

Governments are understandably wary of policies that would reduce the value of the electorate’s housing and which would see them rapidly removed from office. House price inflation is not without some societal benefit. It creates an asset that can be used to support those in retirement, either by trading down or through equity release. In that case rising house prices benefit the public purse by securing the financial future of many of the retired so that they do not have to rely on the state.
It is accepted that it would be politically and probably, in practice, impossible to produce a very large increase in housing supply such that it reduces existing house prices. The key is to get a better balance.

A better balance is to be seen in the commercial sector. In many areas there is a reasonable match between the supply and demand of commercial property and that leads to stable prices. It is interesting to note, for example, that the value of our office premises in Guildford is little different from what it was when it was built in the late 1980s. That is in stark contrast to the tripling of house prices over the same period.

So why have successive Government failed to significantly increase the supply of housing to the level needed which, at c. 250,000 dwellings a year, is a level we were producing and exceeding in the 1960s.

**SO - WHY SO FEW HOUSES?**

There is the same tension at local level as there is at Government level between those charged with taking the decisions about housing numbers and their electorate.

At the local level planning decisions are taken by elected members which inevitably makes them political. Elected councillors are encouraged to seek the lowest housing numbers possible in their locality to appease a vocal minority who want to ‘protect’ what they have and are anti change. There is also an anti development bias in the media which needs to be challenged;

That is the over arching reason behind the country’s repeated failure to deliver enough housing. In a sentence... persistent, unchallenged anti development bias and the need for local councillors who are charged with deciding housing numbers and planning applications to be re elected by a ‘conservative’ and, often numerically small, electorate.

Even with growth supporting councillors the local plan system is too complex and long winded and repeated changes to the local plan system, by successive Governments and which require Councils to significantly revise or start their local plans all over again provides a useful excuse for councillors to kick the difficult decisions on the numbers of houses into the long grass.

Viable development opportunities are also harder to find as the associated financial demands attached to a consent for infrastructure contributions, affordable housing, ecology improvements, higher flood risk standards, higher building regulation standards, renewable energy requirements and meeting the latest sustainable building codes etc all add significantly to costs. These costs are easier to bear on undeveloped (‘greenfield’) sites but not on previously developed commercial land which often has its own significant value.

Favouring the politically more acceptable redevelopment of brownfield land before developing new greenfield land is an understandable and potentially suitable policy response but we need both and, in some areas, eg my own at Mole Valley, there are limited
and insufficient brownfield opportunities. It is finite resource which has, in many areas, now been exhausted. In any event this policy approach has to be used wisely so that areas do not become dormitories with sufficient housing but little or no employment leading to significant out commuting with its own traffic implications.

Even when land is identified for housing the planning application system itself is far too complicated and needs radical overhaul.

The information required to support planning applications is now complicated, expensive to produce and beyond the resources of the smaller builder; some surveys that need to be undertaken e.g. ecological can only take place at certain times of the year and so can seriously delay the submission of an application; the pre application meeting system is flawed; the process for validating planning applications is excessive; the 8/13 week target determination time has been counterproductive; objectors are better organised and encouraged by an anti development tone in the media; planning policies are often too subjective reducing the predictability of outcome of applications; committee members do not understand their role in determining applications; planning decisions are over influenced by local politics and members not sanctioned for refusing a controversial application, against officers advice, in the knowledge that an inspector is likely to overturn their decision but leave them with ‘clean hands’; legal agreements take far too long to negotiate;

With that introductory summary I do not wish to produce a paper long on analysis and short on solutions. I have sought to reverse that process. I would invite the reader to assume that the problem identified does exist and suggest here some possible ideas to pursue.

**Deciding housing numbers – the ‘political’ element**

The Government’s push towards localism – ‘let local people decide’ only works if coupled with the mandatory requirement to assess, and then meet, its objectively assessed housing need unless there are overriding reasons why the need should not be met. However the approach is itself flawed. An objective assessment of housing need of a village is not possible so many Neighbourhood Development Plans (NDPs) are being prepared in a vacuum. Councils with overall housing targets should be required to divide these out.

The duty to cooperate between local authorities and NDP areas and the need to carry our Strategic Housing Market Area Assessments (known as ‘SHMAAs’) which don’t recognise LPA boundaries is an explicit acknowledgement that it is difficult to plan areas even at the LPA level. The duty to cooperate is a fig leaf to cover the contradiction at the heart of localism – planning is very difficult at the local level because people nowadays are so mobile. This issue needs to be addressed not ignored and better guidance given on how housing numbers should be decided for small areas if localism is to succeed.
In some authorities and NDP areas the only undeveloped land is in the green belt. Should it be used? Cynically we note that the need to protect the green belt becomes more politically significant as an election approaches.

Politically the Government should encourage councils to review green belt boundaries that are over 30 years old but advise them to look at adding compensatory land to the green belt, where possible, if some is to be removed. N.B. in the Mole Valley district some GB land (under 5%) would be needed to meet all of its objectively assessed housing need.

Tying Government grant to the delivery of housing has helped and might be expanded. Maybe the Government should set overall housing targets and councils bid for their share with a timeline for delivery which produces timed release of grant. This approach will disadvantage those areas environmentally constrained e.g. predominantly green belt but perhaps there is an argument to say that these areas of limited change should merge into larger councils or, at the very least, be forced to share facilities.

Finally the Government needs to repeatedly make the point that single issue organisations e.g. the National Trust, Natural England, CPRE etc do not have its wider responsibility to meet the housing, employment, infrastructure, social and other needs of the nation. The Government should make the point that single issue organisations have it easy. The CPRE for instance love threats to the green belt as it is a wonderful recruitment tool which enables it to expand its membership. Government guidance should be given to make it clear that a single issue will rarely trump the nation’s obligation need to plan to meet the future needs of its people.

Anti-development bias

Government should take the lead and repeatedly make the point that the most of us live in a property built on what was originally a greenfield site, and often it was a developer that had the foresight and took the risk to bring their property into existence. It should make the case that those of us who have benefitted from previous planning decisions and the initiative of developers should be slow to resist proposals that would similarly benefit others. That could be alluded to in guidance to councils advising them on how much weight should be given to local objections and how they should be assessed.

Many of the fears anticipated by residents are exaggerated, a cover for a desire to prevent unwanted change and so do not turn out to happen in practice. The Government should encourage Councils to undertake resident’s surveys (or commission such surveys itself), sometime after development has taken place and been assimilated to see, if the objections raised by local people at the time of the application were borne out. Few are and that information should be made available to councillors. Many residents, after the fact, will say they can’t remember what all the fuss was about. Sometimes they have only objected because a local determined individual has organised the opposition. Some are encouraged to sign petitions but, in a hurry and on the doorstep, have no way of knowing whether the
objector’s claims about the impact of the or even the content are correct. A further reason for Government to issue guidance to councils advising them on how much weight should be given to give local objections.

Finally the media should be encouraged to publicise successful developments and the positive aspects of development including interviews with the (often delighted) new residents. This might be achieved through a new Public Relations arm of the Housing and Communities Agency.

Local plans

The plan led system is fine in principle and was devised to make planning assessments and planning decisions objective and thus more predictable. However that objectivity has been undermined by planning policies which increasingly include subjective tests e.g. ‘proposals that are out of character with the area or detrimental to neighbouring amenity will be refused’.

Often little guidance is given on how these factors will be assessed. Unguided requirements readily became a matter of opinion and create an opportunity for residents to object and councillors to support the objectors. ‘Character’ and ‘neighbour’s amenity’ are the reasons most often cited as justification for locally led refusals. Government should issue guidance on how these factors are to be assessed and when they become material (I can provide an outline).

Local plans are far too complex with an excessive consultation regime that builds in delay and so take too long to produce. Plans used to be simple and relate primarily to land use.

The whole local plan system should be simplified, easier and quicker to review and update and easier for the public to use and understand. The LDF system of allowing significant numbers of different documents to form part of the plan has not worked well and meets none of the objectives.

I have developed an alternative model but am mindful that a change now would add further unwanted delay to plan preparation. The solution would be to require councils once they have plans in place to change the format of the existing plan to meet the new model which then allows more regular and quicker partial reviews and is more comprehensible.

The Government’s threat to take over planning in LPA areas unless there is a plan in place by 2017 means many will miss the date. A number of council’s suspended their plans and will be going back to the beginning because of the Government’s (election influenced) ‘clarification’ that housing need does not trump green belt. Up to then councils in areas of green belt and high housing demand were carrying out green belt reviews and proposing
green belt changes. The late clarification has stalled a number of local plans and has itself made the 2017 very missable.

Taking over local planning will not sit well with the localism agenda.

Government should require the housing part of the plan to be produced quickly, examined and in place by 2017. That target is more likely to be achievable. Note early guidance will need to be given on amending green belt boundaries (see earlier comment perhaps relating to creating new compensatory green belt).

The other major inhibitor of development potential is the ‘area wide’ designation which goes beyond LPA boundaries. The recently approved South Downs National Park is a prime example. It covers a huge area from Winchester to Eastbourne. There was a natural desire when surveying to include as large an area as possible yet within the designated area there is a huge mix of towns, cities, villages and landscapes.

The South Downs National Park Authority has now taken over the planning functions from the local councils and, we are advised, are proposing to meet only half the park’s objectively assessed need for housing and make no significant additional employment allocations, all this in an area of the south of England that covers 1600km2.

All the large, area wide, designations suffer from the same problem. This include green belts, Areas of Outstanding Natural Beauty, European Special Protections Areas and a host of other landscape designations. The tendency is include as much as possible, create a restrictive policy over all of the land included and don’t recognise that there are inevitably wide variations in the land included within the designated areas.

A better and objective system of taking account of the characteristics of the land and comparing it with the purposes of the designation needs to be found if such designation is not going to continue to strangle growth.

THE PLANNING APPLICATION REGIME

Planning applications are now very complicated, expensive to prepare and are typically beyond the ability and resources of smaller housebuilders. Two examples of planning officer’s reports on an affordable housing development 11 units and a larger development of 108 houses are added by way of illustration at appendices 1a and 1b. It is also informative to examine the number of conditions attached to the consent.

At present all of the work has to be done prior to the submission of an application and paid for ‘on risk’ with no guarantee of a permission. Consideration should be given to encouraging the grant of a a genuine outline planning permission which establishes only that the principle of say residential development and would list the issues that need to be addressed by a later application. Such applications would quickly and simply identify an acceptable land use.
Ecology

Some ecological surveys can only take place at certain times of the year and so can seriously delay applications. Bat surveys for example have been asked for extensions to houses where the roof is involved and even the demolition of a garage. Worse than that sometime surveys are asked for covering different times of the year e.g. to cover hibernation, foraging, and with young.

Greater crested newts are subject to survey timing issues as are many other species. Surveys of birds in Special Protection Areas can only be undertaken at certain times of year so if you have missed the survey window you have to wait. These time sensitive surveys can, if the timing works against the application, delay an application for up to a year. Many applicants don’t know of the ecological requirements until the after the application has been submitted.

The problem arises because some ecological consultees over interpret legislation to mean that permission cannot be granted unless there is certainty of no adverse effect. Yet in most cases ecological interests, if the legislation is not over interpreted, can be addressed, solutions found and so are not (or should not be) fatal to an application on their own.

Common sense needs to return and if surveys are not available then the application is approved consent should be conditioned so that development cannot proceed until survey have been done and a solution agreed. Note this is conditional consent, subject to further information, is currently done with site contamination or archaeological interest.

Pre application meetings

The present pre application meeting system is flawed. It is anti democratic. The applicant ask for them to see if the application is likely be approved before residents and statutory consultees have been approached. That can subvert the democratic process. Everything is agreed before the application has been submitted! More often officers are aware of the dilemma so the advice is of little value. Officers are wary about saying ‘yes’ but confident to say ‘no’. Even a ‘yes’ is often so qualified as to be almost valueless. They are of even less value where (as often happens) the officer has not undertaken a site visit.

A different pre application regime is required. Government should make clear that the objective should not be to elicit pre application support for the proposals but should be used to identify all of the relevant issues and policies that the applicant will need to address. Advice should never be given without site visit. The council should be required to identify similar relevant applications and appeals (allowed and refused). The meeting should be referred to as a ‘pre application information’ meeting.

Application validation.

The process for validating planning applications remains excessive. In one case the council require a completed s106 agreement signed by the landowners and all the mortgagees
before the application is registered. Others have a long list of requirements and are judge and jury of what is needed for an application to be registered.

A quick system where an applicant can ask a third party whether validation requirements are justified would be helpful. At present an aggrieved applicant can only lodge an appeal.

The 8/13 week deadlines to determine applications

These targets have, in many cases, been counterproductive. The reader is invited to look at the application for 108 houses at appendix 1 and ask whether it could realistically be done in the statutory 13 weeks.

The targets have not speeded up applications but shifted much of the work to the pre application stage where there is no requirement to respond to queries in a timely fashion.

Also council are in the habit of not looking at planning applications until after the consultation results are in and that leaves no time to respond by making changes to the application. Often the changes are minor and could have been dealt with if identified earlier in the processing of the application. Without time to make changes the typical option we were offered so that the application can be determined within the time limits was ‘you can either withdraw the application and submit a new one or we will refuse it under delegated authority’.

Councils are becoming better at asking for time extensions but in our experience that is often because officers are behind rather than to allow the applicant time to make changes which would necessitate the officer starting a reconsultation.

The targets become even more of a problem where the application comes in at an inconvenient point in the committee cycle. Most council hold monthly planning meetings. If the application arrives between committee dates there may be only 6 weeks before the only committee meeting that is within the time limit and, with 2 weeks to write and prepare reports, that may only leave 4 weeks to process the application, far too short to deal with the application properly and process queries and amendments.

Government should advise councils that it is good practice to have an initial look at applications and do a site visit within 10 days of receipt to seek to indentify, early on, any missing information or obvious changes that need to be made. This might even allow changes to be made before the application goes out to consultation.

The planning application form could be changed to allow applicants to specify the time within which they wish to have a decision subject to the statutory minimum of 8 or 13 weeks. (We would have always asked for 13 weeks rather than 8 for even the smallest application to allow for any plan revisions). Council’s can then be performance tested against the time the applicant chose. In calculating time taken the clock should stop running on the date the council resolve to grant or refuse an application. (NB The Government is
looking at having targets for the completion of legal agreements – if these are to be subject to separate time limits time would start on the date the resolution is made).

In the case of insubstantial amendments being required more councils could make use of a resolution to grant permission subject to the receipt of plans showing the required change.
Statutory and other Consultees and greater transparency

Sometimes applicants find out too late in the process (often because the officer is too busy to pass on the information) that a statutory consultee, or another council department, has raised a query or an objection.

Some councils have deliberately withheld information they have received on the spurious grounds that they are entitled to do so until such time as the report has been written and been sent to members. Some don’t put responses on their website at all or in a timely fashion which requires you to visit the council officers. Some make excessive charges for copying.

Government should require all consultees to copy their responses directly to the applicant or agent who submitted the application. That will give the applicant the maximum amount of time to address any concerns.

Planning files should be open for inspection at any time and with notional copy charges.

Planning committee - members role

Planning decisions are over influenced by local politics and members are not sanctioned for refusing a controversial application, against officers advice, in the knowledge that an inspector is likely to overturn their decision but leave them with ‘clean hands’

This is possible in part because few committee members understand their role in planning.

A councillor may be approached by a constituent with a housing or some other problem. In that case it is right and proper that they take up the issue and represent their constituent’s interests to the Council. Here they perform a ‘representative’ role. However in planning matters, theirs is not a representative role, indeed if it were who would one represent? The applicant who is also a constituent or the neighbour?

The councillor’s role in planning is not to represent neighbours who object to development. It is this confusion of roles that is at the heart of decisions by members that are taken contrary to officer’s advice and which are often subsequently overturned by Inspectors.

It is the duty of members, in deciding planning matters, to take decisions in the wider public interest and this will include the interests of those who need to be housed within the area and whose voices are never heard at the time applications are considered.

Government needs to issue guidance on the role of members in determining applications to make this difference between the two roles much clearer.

Most councils allow residents to address the committee to represent their interests and so, if it accepted that the members role in planning is not a representative one, Government could advise that members are not be entitled to speak and represent residents where residents have the opportunity to address the committee themselves. Councillors would
only be allowed to speak in respect of the application as a whole and its effect on the district.

If public speaking by residents is not allowed by a particular council members could speak on behalf of the residents but in that instance not take part in the vote.

**Post refusal**

We suggest that, just as pre application meetings have been encouraged, so should post application meetings where an application has been refused. These could be required before an appeal is submitted (or considered by the Inspectorate). The meeting could be paid for and the council required to give constructive written advice on the way forward.

**INCREASING THE RATE OF DEVELOPMENT**

It is a common complaint that developers hoard land and do not produce much needed housing as fast as they could.

It is not surprising that large housebuilders, who need a certain level of production to sustain their company, need to forward plan so that they can guarantee they have for example the next 3 years production in hand.

The scarcity of consented resident land (for all of the reasons we have identified) means that a company would be foolish to try and acquire land that is needed at the last moment. That would be commercial suicide for a large housebuilder. This practice is no different from the manufacturer who, if his raw materials are scarce, will need to ensure they are acquired early enough to ensure continuity of production.

Publicly quoted housebuilders often give the number of ‘plots’ they have under their control in their annual report. These can be misinterpreted as land hoarding. Often the plots do not have planning permission. Some ‘plots’ are not identified for housing at all but are to be promoted in the future as suitable ‘potential’ sites for housing when the local plan is next reviewed.

What is true is that developers do not produce the housing at the fastest possible rate once planning permission has been granted. This is for commercial reasons which could be overridden in the public interest.

Developers typically, and not unnaturally, want to achieve the maximum sales price possible and they seek to match the rate at which they build to the rate they anticipate sales.

Releasing completed houses in phases is typical which can of course means that development takes much longer which has a knock on effect for the first residents who must anticipate living on a building site.
New housing typically commands a premium and the housebuilder can help himself achieve such a premium by limiting the rate of release of units. He would have to price them much more keenly if he built them all and completed the development without phasing.

Planning permissions are typically subject to a 5 year time limit during which the development must be started. At present a start on site preserves the consent for all time. There is no time limit to complete the development once it has started.

One LPA has suggested it should be able to charge council tax on unbuilt units to encourage earlier completions. This will not have the desired effect of accelerating delivery as house prices, in normal circumstances, usually rise faster than any annual council tax charge.

The Government should look at limiting the right to renew planning permissions other than in exceptional circumstances so that they have to be started within 5 years and set time limits for completion.

House of Lords Select Committee on National Policy for the Built Environment

Call for Written Evidence

John Worthington, responding on behalf the Independent Transport Commission (ITC) as Chairman of the Spatial Effects of HSR project

1.0 Introduction

The United Kingdom is currently undertaking a major programme of investment in infrastructure which will have a major impact on the form, character and quality of our built environment. The Independent Transport Commission (ITC) has dedicated one of its major research streams to investigating the spatial effects of High Speed Rail (http://www.theitic.org.uk/our-research/current-projects/high-speed-rail/). The review of existing experience of High Speed Trains in the UK and Europe identified the need to understand HSR as the cornerstone of an integrated infrastructure network, which could not only increase the long-term capacity of the UK’s transport infrastructure, but also shape the form of our cities and act as a catalyst for regional economic growth.

2.0 Policy making, integration and co-ordination

2.1 [Question 2] How well is policy coordinated across departments related to housing, design, transport infrastructure, sustainability and heritage?

At one of the ITC workshops on Governance and delivery, the UK’s central government was typecast as being deeply fractured both within and between departments. An observation was that HM Treasury’s principal concern was retaining revenue rather than offering a long-term perspective and central administrators were more concerned with defining policy than understanding the characteristics and needs of places. HS2 is acting as a welcome catalyst for raising awareness of the value of integrated thinking and the importance of place. The close working relationship between DfT (HS2 Directorate), BIS and the DCLG Cities and Local Growth Unit, is a welcome sign.

2.2 [Question 2] How could integration and coordination be improved?

The United Kingdom has one of Europe’s most centralized government systems. In mainland Europe we found a widespread recognition of the need for collaboration and trust between cities to form city regions and also between cities and central government. The recent growth deals originally brokered by the Minister of Cities are an encouraging sign of a greater inter-departmental thinking and a step towards a greater level of trust and collaboration between national and city government.
3.0 Buildings and Places: New and Old

[Question 7] How do we develop built environments that are resilient? The ITC review of major rail infrastructure projects identified that planning should provide for certainty whilst being able to adapt. Due to the long-term nature of major projects, it is likely that initial assumptions will have to be revised due to external changes. Case studies showed that those developments that were successful recognised change as continuous and incremental. They championed a culture of continuous evaluation and questioning and allowed sufficient slack in the plan to allow for adaptation over time.

4.0 Community Involvement and Community Impact

[Question 12] How effectively are communities engaged with the process of decision making that shapes the built environment? The ITC review and subsequent dissemination of the insights to city regions which will be impacted by major infrastructure investment has identified in addition to public private partnerships a third sector of civil society composed of trusts, community interest companies and academic institutions. These organisations are positive, pro-active and responsible, motivated by a desire to make a better city. In Bordeaux, the city acted as the initiator inducing active engagement of the community through establishing a consultative charter consisting of public meetings, “dialogue”, urban walks, training for residents and a “project house”. The process of building trust between public, private and civil society was begun 10 years before the planned arrival of HSR, and established an ongoing process of co-creation and co-production. At King’s Cross Central, Argent took a long term view working with the local council, businesses and community to set the basic principles for development. These have been maintained as the strategy for funding has adapted to economic cycles. The anchor development of the University of the Arts and transitional uses such as the Skip Gardens, a community interest company, have brought vitality to the area. Argent has repositioned King’s Cross from being a derelict backland to a thriving commercial, learning and residential community.

06 October 2015
Q. 1&6: What are the challenges associated with integrating transport and other infrastructure into the built environment?

- Infrastructure has a long timespan of planning and construction, an impact across local, regional and possibly national boundaries (ie. High Speed Rail, or Energy) and may need to adjust to economic, political and technological changes by adaptations in specification during the period of construction (see: Prof Harry Dimitriou, Omega Centre Bartlett School Of Planning UCL, Mega Projects: Lessons for Decision Makers, December 2012). Strategic plans need to be set nationally with clear measurable goals and mechanisms to assess impact as the project proceeds allowing feedback and adjustments to be made locally as the implementation of the plan progresses.

- The planning and construction of infrastructure if integrated with other services and sharing resources can result in significant savings, reduce disruption and foster long term collaboration in the governance and maintenance of the completed project (see ITC, Ambitions and Opportunities, Case study 4.1: HS1 as a Catalyst for Change).

Does planning policy in England need a more strategic, long-term approach to take account of future needs?

- Planning in the UK is currently focused on 5-year political cycles. The implementation of essential infrastructure may be spread over several political cycles. At a national level, the National Infrastructure Commission has the opportunity to take a 30-year perspective, and at a regional level the integrated transport authorities (TfL and TfGM as part of the greater Manchester Combined Authority) are a model of long term integrated thinking to then influence the statutory planning process.

- To capture the full value from a long-term, integrated approach will require a change of mentality so that ministers, civil servants and organizations operate between current silos and across boundaries. Connectivity is crucial to the UK’s future prosperity However, many of the benefits will be indirect and difficult to measure. Crossrail has created potentially highly beneficial impacts in each area served, but these were deliberately omitted from their brief and are now being retrofitted with difficulty. The lessons have been learnt for Crossrail 2 where one of its significant
benefits is in unlocking large under-developed areas of Greater London for much needed housing (information provided by Alan Baxter, ITC Commissioner).

**Q.3: How can local infrastructure contribute to better place making and design in the built environment?**

- Capturing the full value of infrastructure investment is dependent on ensuring the places where investment is planned are places people wish to come to and stay. The benefits for transport infrastructure projects are primarily assessed from the perspective of capturing the value of direct economic returns, rather than how to create the value through the social, cultural and perceptual impact of place. Places we enjoy and feel invigorated by are formed by the characteristics of the space and the way that people and institutions are stimulated to act within it. St Pancras International and Antwerp Centraal station are more than a place for boarding a train but are now destinations in their own right and contributing to the quality of the neighbourhood surrounding them. At Antwerp over 30% of the users of the station were not travelling and of those 8% were using the statin as a through way between different neighbourhoods (ITC, Ambitions and Opportunities, 4.10).

- Recognise that the statutory planning process is more than the granting of approval. With large scale projects, quality of place is achieved through continuous involvement with the project as a process of both “Co-creation “and Co-production” through to the completion of the project. In Northern Europe the Quality Team acts as an independent critical friend (Cambridgeshire Sustainable Growth Quality Panel is a UK example of such an approach).

**Q.4: Do local authorities and devolved bodies have the right skills, guidance and capacity to properly integrate infrastructure into the built environment?**

- If the full value of infrastructure investment is to be captured, planning will need to shift from being primarily a controller to an enabler (see: Urban Design Journal Summer 2015, Ed. John Worthington, Topic section: The City as Master Developer). The skills required within city hall are those of problem framer, strategic briefer and catalyst in order to assemble the resources from the public private and third sector to initiate action. Collaboration and co-operation between interest groups – not competition and distrusts – is being recognised (see www.futureoflondon.org, or the cities of Malmo and Rotterdam who have redefined their role as enablers of community revival).

**Q.5: To what extent can we predict changing trends in transport use and demand and how can such forecasts help policy makers to plan for future impacts on the built environment?**

- Predicting the future by extrapolating trends from past and current usage is a valuable benchmark to question what might happen in the future and provides
comforting precise numbers. Experience shows that future demand will emerge on completion of a project which is for different users, uses and journeys than the past.

Q.7: How can education help to play a role in the development and maintenance of resilient built environments?

- The challenge for higher education focused on the interests of the different professions will be to break down the barriers. Urbanism is the domain of many disciplines and transport is seen not as an end in itself but a means to improve livelihoods and wellbeing. EPSRC Teaching and Learning project Better Together led by Sheffield Hallam University explored the barriers and opportunities of collaborative cross disciplinary courses for the Built Environment. The University of the West of England (UWE) Faculty of the Built Environment has focused its courses on learning together by sharing Educational Resources for the Built Environment (ERBE). See Nicol and Pilling Changing Architectural Education; Towards a new professionalism (Spon 2000).

Examination of Witnesses

Professor John Worthington, Independent Transport Commission, and Esther Kurland, Director, Urban Design London

Q197 The Chairman: Welcome, Ms Kurland and Professor Worthington, to this evidence session of the Select Committee on the National Policy for the Built Environment. You have in front of you a list of the interests that have been declared by members of the Committee. A transcript of the meeting will be taken and published on the Committee website. You will have the opportunity to make corrections to that transcript where necessary. Could I begin by asking each of you, for the benefit of the transcribers, to briefly introduce yourselves to the Committee, please?

Esther Kurland: My name is Esther Kurland. I am a planner by background, but I have been involved in urban design, street design and suchlike probably for the last 15 to 20 years. For the last 10 years, I have been running a small organisation that supports all the London boroughs, TfL and the GLA on built environment issues—planning in housing, streets, stations and things like that.

Professor Worthington: Good morning. I am John Worthington. For the last 40 years, I have been both a practitioner and an academic. As a practitioner, I was a founding partner of DEGW, a global business that advises firms and organisations, including universities, on what
to build and, more importantly, how to use it and manage the process of change. In the last 10 years, I have acted as a collaborative urbanist, working both as a director of the Academy of Urbanism responsible for learning through place, and as a Commissioner of the Independent Transport Commission, where I have been leading the Commissions review of High-Speed Rail, although not necessarily High Speed 2, because it is a way of talking about High Speed 2 as a project.

**Q198 The Chairman:** The first question is mine. What are the challenges associated with integrating transport and other infrastructure into the built environment? Is there scope for better national policy in this regard?

**Professor Worthington:** Should I start on that and then Esther can come in? First, the challenge is the time taken over providing the planning and the impact over this long period. If you are going to do something like high-speed rail, the time taken is at least 30 years when you take it from inception to the end. That is a huge change. How do we deal with that change? You are faced with two major issues: first, the disruption to the community as you are conducting that process—and that is just the physical disruption; and, secondly, blight, because false hopes and uncertainty are created. I would start with those as the critical issues.

**Esther Kurland:** As well as those practical issues, funding is obviously often an issue, as well as who is responsible for doing what and when. How can people justify their actions? That is a big lesson that we have learnt from Crossrail 1, which is going into Crossrail 2, and from the Thames Tideway Tunnel. The Thames Tideway Tunnel is the big sewer thing, so it is not transport infrastructure, but it is infrastructure. They both started with a very focused, “We deliver this infrastructure. It moves whatever it is around”.

The Crossrail one was very interesting. Once they started looking at the numbers coming out of these massive stations in central London, people started asking, “How do people move once they get out of the station? You are chucking another however many thousand people an hour on to this bit of London. How does that work”. There was a realisation that they have a responsibility to integrate their infrastructure into the built environment that it is serving. Crossrail at that point decided that it would undertake urban integration studies for all its stations. We were involved in design-reviewing all those, which was absolutely fascinating. For the outer London stations, it said to the boroughs, “Here you go. We have done a study
on how your station and your service should integrate with Romford town centre”, or wherever else it happens to be, “and it’s up to you to take that forward”. It is very interesting that TfL then found some money to help those to go forward. Abbey Wood in Bexley, for example, now has a £4 million programme to integrate the station into Abbey Wood and to create all the benefits that could come about for the local community, the economy and transport interchanges. That is being funded by Network Rail, Transport for London and Bexley Council.

Crossrail took it upon itself to take responsibility for those integration studies and start the ball rolling. It is not going to deliver all that work, but it recognised that it was important for it to do so. There is nothing that requires it to do that. You need political will to push the boundary and say, “Hang on a minute. We have a responsibility to go beyond what we are being asked to do”. There has been a suggestion that it might be useful, in national policy or whatever, to require infrastructure providers to have a duty to consider their influence on the surrounding area. That could free them up a bit more. Internally, the argument is actually, “We have a responsibility for this. We are allowed to do it, and national policy or whatever tells us that it is our role”. Otherwise you get the auditor, the lawyer or whoever saying, “No, that is not for us to do”.

Similarly, the Tideway Tunnel looked at where it is building out over the foreshore to create ventilation equipment. It is actually creating some new bits of public realm, which could have been dire but in the end, as far as I know—I have not seen the schemes for quite some time—it is coming up with some lovely ideas for new pocket parks and things that again integrate that infrastructure into the surrounding area.

The Chairman: That is absolutely fascinating, particularly the bit about more people getting to their destination and then being dumped on the pavement. That is happening at Victoria Station now, in effect. Should there be a demand by government that this is always taken into account, not just that some bright spark in Crossrail said, “This is not going to work unless we do something else”, and then it evolved? There is a great merit in allowing the contractors to do that, but there is also great merit in making sure that it happens.

Esther Kurland: It may not be the responsibility of infrastructure providers to actually do it but to consider and work with those who will. In the same way, if we were building a massive
housing development somewhere, we would be looking at the impact that will have on the surrounding area, using Section 106 or whatever else it happens to be, not to mitigate but to manage those impacts.

**Professor Worthington:** You are absolutely right that we have to understand that we need to look outside the boundaries that we are given. We still have a very siloed way of working. I don’t think we are talking about more regulation or even more guidance; we are talking about changing our attitude of mind, the way we do things. It is very important. What we are going to see, first of all, is that you can no longer just look at your station; you have to say what is around the station and, even more important, what the secondary modes of transport would be. You cannot just think of one mode of transport; you have to think of the integrated forms and then ask, “What are the values that are going to be coming out of that?”.

We have a rather limited way of assessing value when we are building a railway line. With Crossrail 1 they looked at the wider area but then reduced the scope of what they could look at under the Bill, and afterwards they had to build back in the ability to get the real value, which is from all the other things happening around it. If you do not make a good place to come to and where people want to stay, you are not going to capture the full value of infrastructure investment. That is a critical point: you have to think beyond just the infrastructure.

**Q199 Baroness Whitaker:** Thank you very much, both of you. What are the current objectives of national transport policy? Should they be changed, and, if so, what to? What do the Government intend? What do they say the objectives are?

**Professor Worthington:** It is in flux in a way, which is good. We now have a National Infrastructure Commission, which I believe will be very important. The question then is: how far does that go back to change some of our policies?

**Baroness Whitaker:** Now, before the infrastructure has got going, what are the objectives of national transport policy at the moment?

**Professor Worthington:** They are not terribly well laid out. There are broad aspirations, but the detail of what we are trying to achieve is less well thought through.

**Baroness Whitaker:** That is what should be changed, you think.
Professor Worthington: I believe we need to look at it in more detail. In changing, you have to get the dialogue going about what you really want. There is change everywhere. We are talking about change in terms of devolution. There is huge change in which decisions need to be made centrally, which regionally and which locally. That will then change where you actually place the different policies.

Baroness Whitaker: Are the objectives of transport policy set out anywhere—road, rail, all of them?

Esther Kurland: The planning system is the only place where I know it has been set out. It is in the NPPF. There is a bit about integrated transport, sustainable transport, et cetera. It says a lot of what most people would consider are sensible things. The planning practice guidance that supports that focuses very much on the process of doing travel plans, et cetera. There is nothing wrong with that.

Baroness Whitaker: I would say that those are aims rather than objectives.

Esther Kurland: I think I agree with you. There is also very little on what “good” or “acceptable” looks like.

Baroness Whitaker: What is it for? That is what I want to know. Does it say what it is for anywhere?

Esther Kurland: Is it about moving more people, moving the same number of people quicker, moving people in a different mode, or all these things? I do not think it is particularly clear. It is more about the process of what to think through when producing a plan.

Baroness Whitaker: I will not hold up the Committee now. If you happen to have a blueprint of what you think the objectives ought to be, that would be very useful to us.

Q200 Lord Inglewood: In many ways, we have already covered most of the question I was going to put to you. You were talking about Crossrail. The issue, after everybody arrives, is: what happens next? Who should have responsibility for resolving these difficulties? Secondly, who should pay for the resulting changes that would be desirable?

Professor Worthington: The work that we are doing with the ITC now involves going to each city region and talking about what we have learnt from Europe and where we saw what happened. Of course, there is much greater devolution: something like 50% to 55% of the money gained is kept by those city regions, so they have a greater control over development.
The big question is how we are going to make decisions about how the money is distributed, at a very broad level. Obviously Crossrail 2 is competing for resources against the Northern Powerhouse and HS3.

These very big decisions have to be taken centrally, and have to be very clear. At the moment, most local authorities have been used to putting in proposals to the Government with a five-year time horizon. That is short term. They are now being asked, thank heavens, to think longer-term and to write about their aspirations as a city over a 20 or 30-year period and what they want from that. That is a very important change. It means that rather than seeing that you are competing against other people, the very first thing you have to do is say, “We all have to collaborate to understand how to divvy up the money to make a better country, make whatever it is and then compete”. The notion of collaborating to then compete is important. There are some good things that we are seeing ahead. The first is infrastructure. Originally TfL and now the Greater Manchester Combined Authority is taking that 20 or 30-year view on infrastructure, and strategic planning, to a certain extent, is happening outside the statutory planning process. It is happening through the big transport authorities. This is really important and will be the driver. You have London, for instance, and the GLA with its 2050 infrastructure plan. That is more than just a plan; it identifies what we want, how much it is going to cost and where the money is going to come from. It does not just say that it is coming from government; it is going to come from us having to raise more money in different sorts of ways.

The huge difference is that we are now beginning to think about how we create the wealth to plan in a way we want. If you have not created the wealth first, you cannot necessarily fulfil all your ambitions. Secondly, you have to create that wealth and distribute it equitably, which is where we come right back to the question about how we do it for London versus the others, and whether there is a grand plan for how to do it. It is a combination of all those things.

**Lord Inglewood:** It is always grand when the plan works out as hoped and anticipated, but every now and then plans do not.

**Professor Worthington:** I can say one thing here. We can be almost assured that the plan will not be what we thought it would be. We went around Europe. In Lille, for instance, we asked, “What did you want to achieve?”. They said, “We wanted to have international firms. Nobody was going to commute to Paris”, et cetera. We thought, “Oh my God”. I said, “What has
actually happened?” They said, “People commute to Paris. We do not have international firms, but we have two national universities. We are now confident in our role as part of a major urban conurbation of 20 million people, which is northern France and Belgium through to the Ruhrgebiet and Randstad. We are a different sort of place”. That is what will happen if you think that you can set 20 or 30 years ahead and that it is going to happen exactly like that and that you will measure it like that. Do not do that. You need a way of adapting as you go along, which is the critical thing that we have here.

**The Chairman:** Then you could be accused of chopping and changing your mind the whole time.

**Professor Worthington:** You have to understand the layering of this decision-making. You need aspirations that are always there. We might talk later about design quality panels. You are testing that you are not changing the big aspiration but adapting expectations. In other words, this is about the detailed brief. You have to be brave enough to say, “We need to change”. We have to build in the idea that you need to change as you go along. We are talking about behaviour change.

**Q201 Baroness Whitaker:** How important do you think infrastructure is in a national policy for the built environment? You have given us some very nice examples of how infrastructure has contributed to better place-making and some examples of good practice. What if you extended this outside the urban area—because infrastructure goes all over the country into the landscape—and what are your views on the training of highway engineers to accomplish this kind of aim?

**Professor Worthington:** Infrastructure is the driver in a sense, but it is also the supporter of what you want to do. Two things happen. Infrastructure starts to direct what is going to happen. When you put infrastructure down, it changes the relationships between places.

**Baroness Whitaker:** Between urban and rural?

**Professor Worthington:** Urban and rural is an interesting concept. The boundaries between urban and rural are increasingly blurred. Our cities are now urban conurbations, what we call polycentric cities. There is not just one place but lots of high-density points within a region that work as a city region. I would argue that Greater London, as an economic entity, is about
20 million people, from Brighton up to Cambridge, out towards Bristol and eastwards to the Dartford Bridge.

Baroness Whitaker: You are saying that infrastructure has pushed this change.

Professor Worthington: It is driving it. Actually, it is infrastructure that crosses political boundaries, which is why it is such a very strong planning mechanism. TfL is now responsible for some of the overground and the Abellio services out to the east. It is going outside its political boundaries. What is happening is very important. In that sense, infrastructure is driving the way we think about planning and some of the political issues.

Baroness Whitaker: You are speaking mainly of transport, but there is other huge infrastructure. Can you add that in?

Professor Worthington: Yes, I believe that you have to do that. The other huge ones are health, living and education.

Baroness Whitaker: There is nuclear energy.

Professor Worthington: There is energy and the hidden one: the stuff in the air, the virtual—communications, in other words. Just take some of the big ones that we can see, which make a big impact on our built environment directly: roads, rail, et cetera. But there are also the indirect ones that service and are in the public realm: health, education and housing. We have to take those into account as well when thinking about the infrastructure of our environment in the broadest terms. Those are the big things that impact it.

Baroness Whitaker: What about the training of those who do transport?

Professor Worthington: I cannot really talk specifically about transport. My background as an academic involved designing environments for work and learning. Professional education in particular interests me. It is about cross-disciplinary education.

Baroness Whitaker: Is it? Should it be?

Professor Worthington: It should be and it is coming. It is still not there, but it is getting much better.

Esther Kurland: Can I come in on this one? I have been doing this for the last 10 years. It is fascinating with highway engineers. When we started doing training on built environment issues and design quality, to start with they used to come in in high-vis jackets, sit there and be like, “When can I go?” Now we find built environment professionals who take pride in their
impact on the built environment, so you get planners going to technical highway training sessions and you get highway engineers going to quite technical planning sessions. Everyone goes to the landscape sessions. That empowers people to feel that they are doing something worthwhile, which is always useful when people are working to get them going. There is a big difference between what people may be learning more in silos, in universities, and what they may be learning in practice, where they find that a place is influenced by lots of different professionals and different groups. They need to understand at least something of where they are all coming from to be able to do the best job.

There are obviously lots of problems with training and people who do not understand things. I sent the Committee a couple of pictures of where people seriously do not understand tactile paving guidance, and it goes very wrong, which I can explain if you wish me to.

**The Chairman**: They are fascinating. I have already taken a look at those.

**Esther Kurland**: Do you want to know what is going on?

**The Chairman**: Yes, please.

**Esther Kurland**: I will not tell you where they are, because that is embarrassing for the places. The one where the two older people are walking down the tactile paving is a shared-space town centre scheme, where all the intentions were right to create somewhere that was going to provide the infrastructure for social town centre activities. They decided not to have a kerb and to have pavement cafes and things like that. However, when you do not have a kerb, you have to support people who are visually impaired. One thing you can do is this type of tactile paving. It should be on the kerb line so that it warns people who are visually impaired that they would be walking into a carriageway, but they have put it in the wrong place. The kerb line on this picture is on the other side of the post, so they have ended up with horrible tactile to walk on down the middle of the pavement, where everyone is walking. That was just a total misunderstanding of the guidance. That is where training is really struggling.

The other one is a very large new housing development. Master planning causes all sorts of problems with infrastructure. The architects who are dealing with the master plans early on may not have the same understanding of street infrastructure as the highway engineer, who later comes along and looks at the detailing of that street to see whether or not they will adopt it. The adoption issue is really difficult for street design.
Baroness Whitaker: They should have got together much earlier on there.

Esther Kurland: They should. That is actually a cycle lane that is meant to be green. All that tactile paving is telling people that you are going on and off shared spaces, where there may or may not be cycles. It is all total gobbledegook. It does not help anyone, and you can see on this picture further up that a car has just parked in it anyway. That is what is going to happen. Following guidance without understanding it, and following rules and processes without thinking about the place that you are creating, causes problems.

Baroness Whitaker: You are talking about the need for early liaison, I take it.

Esther Kurland: Yes, early liaison, but there is also a need to empower the professional to think beyond tick-boxing and to get a real understanding of the actual purpose of things like tactile paving.

The Chairman: Surely it should be the number one item when they first enrol for a course in this. I am looking at the university.

Esther Kurland: It is not.

Professor Worthington: What is increasing now is learning by going out and looking, and not just with one group of people but with different interests. In this example of looking at this master-planned area, we now see a group of people going out together—the architects, engineers and people from the maintenance department—walking around and sharing experience of what they are learning. Learning by doing, by looking and then feeding it back is some of the most important learning that we can get, and we are increasingly seeing that happening. It is often happening because organisations such as the Academy of Urbanism and Esther Kurland’s organisation are doing this sort of thing as one-day courses, et cetera. That is where the learning is happening.

The Chairman: I do not want to introduce levity into this, but in the first street example of what has gone wrong with this tactile thing, did you ever try it out with women in high heels, seriously?

Professor Worthington: It is very serious.

Esther Kurland: Changes to the tactile paving guidance are actually out for consultation at this moment, with the aim of trying to make it easier for people who have walking difficulties. Not only is it very uncomfortable in high heels, but if you have mobility problems this stuff is a
real barrier. It is about trying to balance the needs of different users. That is just one example, but it is always nice in a picture.

**The Chairman:** My heart sinks when I see these tactile pavements for blind people, but blind people wear high heels as well. You could break your leg on those things. Lord Inglewood, you want to come in, but not about high heels.

**Lord Inglewood:** No, that is right. Professor Worthington, you said, I am sure rightly, that the infrastructure networks are crossing political boundaries. Does it follow from that that we should change the political boundaries to accommodate them?

**Professor Worthington:** No. It is much better that we recognise that there is never a perfect fit between all the different systems, because things will change over time. It is much better to start to get an attitude of mind that recognises that we live in a fuzzy world, a world of contrasts, a paradoxical world. In the old days, it was either this or that. We sat as a political organisation as if we were two sides of something. Now, it is both this and that. This really comes back to the fundamentals of the built environment. The built environment is a continually changing and adapting place. How do we create that ability to have both things? That is why you need allow for these overlaps, rather than try to control it all.

**The Chairman:** It is all about accessibility, is it not?

**Professor Worthington:** Yes, but accessibility is not just physical; there is accessibility in the mind.

**The Chairman:** It is about being open to new ideas but not throwing the baby out with the bathwater.

**Professor Worthington:** That is right.

**The Chairman:** You see it so many times.

**Q202 Lord Woolmer of Leeds:** Turning now to local authorities and devolved bodies, do you think they have right skills, guidance and capacity to integrate infrastructure in the built environment? Does the national planning practice guidance adequately support decision-making, and is any further guidance needed?

**Professor Worthington:** Can I say something and then Esther? It has been a fascinating experience for the ITC to be allowed to go to all the city regions, work with them for a day and see what is happening. First, there is real commitment there to want to change and do
things, but there is a big difference in relation to what will happen when we have real devolved power. By “power” I do not mean that they just have the responsibility; they actually have to have the power of money to do things and to think in the longer term, “What do I want?”, rather than, “What do I think central government wants?”. I believe there is a gap in how we develop things. The red-line idea is very much because people feel risk. They are always up against risk, because they do not have control. You draw a red line around something, and that is what I am going to look at, yet we have just said that we need to look outside the red line to do things. I believe there has to be a beginning to work on, which is happening quite fast, to change attitudes about things and how we look at them.

Esther Kurland: The question is whether we have the right skills to deliver good infrastructure. It is incredibly patchy. Some places definitely deliver it. Other places do not. One of the challenges is to balance that out, because the need does not necessarily follow the resource. Interestingly, the GLA did some research recently on the number of people working in certain built environment areas, such as housing regeneration, and the number of houses that they were meant to be working on. They just did not match: the places with the most housing need did not have the staff, and the places without very much housing need had the staff. It is absolutely fascinating. That happens a lot with streets and highways as well.

A huge amount of luck is involved in local infrastructure, which may be the new local school, a doctor’s surgery, street improvement or something like that. It comes down to individuals, political leadership and how that political leadership will empower one or two people within an authority. A lot of the best schemes that I am aware of have had one person behind them who drives them. They allow others to develop the skills, or ensure or push others to develop the skills, and make sure it happens. Without that leadership, all the skills in the world in that authority are just not used and they dissipate.

As well as skills, motivation and support are needed. There is a scheme, which I did not show a picture of, in Leonard Circus in Hackney. There is a video of it on our website, if you are interested. It is an absolutely fascinating transformation of an incredibly boring crossroads into a local park, with everything going through it. There are new lunchtime cafés with loads of people in them. There are still cyclists going through it, people walking their dogs, big lorries going through it and everything. That cost £600,000. It was really cheap and it was done
almost entirely by one officer working in that local authority. They had really good political leadership. They have gone now. They found it too much hassle working or did not want to continue with that type of work, and they have gone to do something different in another part of the country. That skill, experience and ability have gone. Those jewels, those individual people who know how to do it and can pass on that information to others are really important.

We are talking about a massive country, with thousands of people working on different schemes, but it just takes a few as a catalyst. Things bubble up from there, and people can get skills and develop. Just this week, we gave certificates to the first 20 people who finished a new course in cycling infrastructure so that they do not make the sorts of cycle lanes that were on that picture. They are all working for local authorities and they have committed to spending time coming to training and then doing an exercise that was checked by a university. They have passed, and now they are much more skilled at designing junctions for cycling. It can happen, but it needs the push and the will and empowering people to just get out and do it.

Lord Woolmer of Leeds: There are two kinds of infrastructure levels. You have touched on what I would almost call the micro level, which is very important. The professor talked about high-speed rail, highways, new hospitals, major schools and so on. They are big infrastructure considerations. Do you think that local authorities are able in practice to take account of the need to integrate those kinds of significant infrastructure projects into the place of the communities where they are located and serve?

Professor Worthington: The will is there and the ability is potentially there at the top. There is very good leadership and mostly really interesting young people coming through. What is going to be critical, though, is how you transmit down through that leadership, the message that you are allowed to be pro-active. As mentioned, a lot of this is about giving people the sense that they can go out and do something. This is not just within your local authority; it is also recognising that an important thing is to work with what I call civil society. That is not exactly the same as localism, which was the neighbourhood, but it is those people who have civic pride in their city and city region, of whom there are a great number, often in organisations and the universities themselves. That is a big area that we can use in this. That
is going to be important. There is a feeling that we do not have to control what they are doing; we just have to go and work with those people and give people permission to do things. The head of the architects department of Copenhagen City Council told all her department that when somebody rings up you do not say, “No, you can’t do it”. You have to say yes to start with and then find out why it cannot be done. That is a simple idea, but that is what I believe this is about. It is not that the people are not willing; we have to change the mind-set.

Esther Kurland: Also, do not forget that not all the work has to be done by people in local authorities. They work very well in partnership with architects, planning consultants or developers. Where those partnership work, a whole range of skills which the authority might not need to use that often so would not necessarily want in-house all the time can be developed.

On the skills and capacity side, there is another interesting thing coming out of the GLA and the Farrell review of the built environment about planning first or having a cohort of built environment experts who can be seconded into different bodies for six months. The GLA is trialling that now with a few local authorities in London. If you need somebody who knows a lot more about schools, town centres or something, and you do not think that you want to or you cannot employ someone, even on a fixed-term contract, there is a list of people who do want to do this who may not be from the public sector. You can second one of those into your authority for six months to help you do that. Every time that fleet-of-foot movement of skills happens, lots of learning is going on within that organisation. That sort of thing is a good way of getting things moving.

Q203 Lord Woolmer of Leeds: Professor, you have been to the new combined authorities. There is an issue with the scope and reach of the combined authorities and of the underlying local authorities. Outside Greater Manchester, do you feel that the balance of where the approach to infrastructure is taking place and the resources are is at the appropriate level? In other words, are the combined authorities covering these large areas going to have the skills and resources to develop and follow through the aspirations?

Professor Worthington: The two that are way ahead of the game are Greater London and Greater Manchester. Birmingham is a slightly different issue, because of course it had the West Midlands, but it needs to include the Black Country as well, which it is doing now. The
thing that made the breakthrough in a way was Midlands Connect, which was not yet a transport authority. That is now putting it together. The latest growth thing last week, in which they have 20 or 30-year money that has been put forward for what they can do, is very important. They are going to learn from what London and Manchester did, and Europe, which is very important to look at. They will learn why we need to collaborate to do things.

It would be difficult to answer in relation to each phase, but I would say that not every place is exactly the same. This is the old thinking from the top that one policy fits all. We start from places now and work backwards. The question you just asked me is very difficult to answer, but I am hopeful, and I have looked at what is happening.

The Chairman: Can I ask a question that we do not have on the list about leadership? “Leadership” is a word that is bandied around, but nobody really analyses what they mean by leadership. It is the ability to be risk-taking and the ability to communicate, particularly with those on the same level as you, overseas, or even with the bosses or the Ministers. It also means—this sounds awfully cuddly and lovely—trying to encourage awareness of the fact that each person working for you or working in that area has a brain that has been underused.

What is your idea on this? Do we need this in this area?

Professor Worthington: The Academy of Urbanism looks at great European cities. The biggest thing that comes out there is leadership. Leadership there is very interesting. You become Prime Minister of France, and then you go to your city, which is an even more important job, to be mayor. Alain Juppé is the mayor of Bordeaux. That is a big change. In the Netherlands, leadership is very interesting. The equivalent of what we call a lord mayor is positioned by the state, and the chief alderman is what we would call a mayor. It is about bringing the two things together, but in all cases these people have become the real leaders because they are looking at more than their little piece. When I look at the best people here, they are prepared to look across even their new regional boundaries to see what is going to happen between the regions.

Esther Kurland: I agree with your list of what a good leader could do, but this also relates to your first question about what we are trying to achieve and whether we know what “good” or “acceptable” looks like. A leader can set those objectives, and that is what we have seen in London. I am talking about London because I work in London, so I know it much better than
anywhere else. We are trying to declutter streets and to improve bus networks, journey times or whatever it happens to be. Decisions about what your job is come down from the leadership and filter through whole organisations, which allows those organisations to work together and not to fracture. It is much more efficient. That is one of the less exciting bits of leadership, but it is absolutely vital. You have to make sure that it is clearly understood by everybody, is consistent and is in place long enough to actually matter.

The Chairman: That is very interesting.

Q204 Lord Freeman: My Lord Chairman, may I declare a rather modest interest as joint patron, with Lord Adonis, of the Independent Transport Commission? Professor Worthington will confirm that I have played no part in his distinguished work for the commission, for which we are all extremely grateful. My question is to what extent we can predict changing trends in transport, principally demand but also use. How can such forecasts help policymakers to plan for future impacts on the built environment?

Professor Worthington: First, I would just say that your role as a patron of the ITC is wonderful because you are looking across all modes of transport, which is what we are trying to do. I am one little piece of that.

On this issue of how we look ahead, we cannot predict exactly what lies ahead. What we can do, though, is look ahead and suggest scenarios to help us understand better what we should do now to move forward. If we think—and this is what frightens me—that we are going to build for something in 30 years’ time and will have 25,000 jobs and X million of turnover, that is still aspirational. It is nice to have an aspiration. That is what we would like, but we are not necessarily going to get there.

What can we do? First, we can be very prepared to look backwards. In everything that we are doing, the city is just a continuous process. What I have learnt in the work that I am doing on cities for the Independent Transport Commission is that each city has a legacy over the last 30 years of things that they started doing but is still unfinished business. We suddenly get a new thing coming in such as high-speed trains, as if it is a whole new thing. You have to build on what you have already, work through it and see how that supports you. You need to understand where the big changes are going to happen that might change what will happen, and then start to model them. The work that BIS and the Government Office for Science are
doing through Foresight on the future of cities with Sir Alan Wilson is absolutely excellent. That is something that we should continue and that should come back into our infrastructure thinking.

**The Chairman:** It is continuing outside the big cities, because the smaller cities are very often left behind in these things, and then become despairing and depressed. You see lots of pop-up shops and things like that.

**Professor Worthington:** It is the whole integrated system.

**Esther Kurland:** There could be an answer to your question about the prosaic and the local as well, if you are interested in that. It is about the way we model predicted outcomes from changes to infrastructure at quite a detailed level. I am never convinced of how good that industry actually is, and I challenge it to recalibrate itself at times. We do not really understand cycling, for example. All the models for future transport use, either with a change or without a change, involve assumptions, and we do not necessarily always go back and test those assumptions to make sure that they are up to date. There is an industry involved in this and it may be worth looking into in more detail, because the outcomes from those models are very persuasive, numerical and influential. We should take them with a pinch of salt sometimes.

**Lord Freeman:** I wonder if I could ask one brief supplementary. Clearly there has been an improvement in central and indeed local government in looking at the impact of the built transport infrastructure, for example, roads and rail in particular, upon the local environment—towns and cities—and on daily life and commerce. Do we have further progress to make in analysing the impact of the built transport environment in particular?

**Professor Worthington:** First, we are saying look backwards to look forwards. Secondly, do not just look backwards. Try to understand what we said we wanted, what has actually happened and, more importantly, understand all the things that have come out of it that might not have been things we could have dreamt of.

**Esther Kurland:** The other side of that potentially is not to set things in stone, assume what the outcome of something is going to be and build for it without giving some wiggle-room. We have seen quite a growth in trialling stuff, such as straw bales and the wonderful parklets, which are basically like B&Q decks. They get put on a couple of parking spaces for a couple of
weeks, with some seating and stuff on it, to see what happens. If it causes a problem, you take it away again. Doing that kind of assessment and learning from those activities is obviously hard to do with a huge station, new train line or whatever, but it helps us to understand impacts, because people behave in ways that we do not expect and they adapt. Assumptions of what is going to happen, economically and physically, do not always work, so building temporary testing time into these schemes is potentially very useful.

Q205 Earl of Lytton: As you may know, I am a chartered surveyor, so I have an interest in some of this. My question relates to the planning policy in England and the need for what you have described as a strategic longer-term approach, particularly in transport. You have talked about leadership and that sort of thing, but leaders come and go, elected members come and go, and bodies change their political colouration. Over the 30-year period that you, Professor Worthington, were talking about, how do we harness that? We obviously need something like this, but how do we get it, or are we looking at the wrong bit of the equation?

Esther Kurland: Is it planning policy that you really want to drill down into? Planning policy as it is at the moment is slightly different from infrastructure investment plans.

Earl of Lytton: You explained earlier that infrastructure almost sits alongside planning, yet the infrastructure must take account of people actually wanting to use that, so there is a planning dimension there. How do we bolt these together so that they actually work, if not seamlessly, then rather less disjointedly than they sometimes seem to?

Esther Kurland: PTALs, public transport accessibility levels, are one element of the way planning looks at infrastructure. We have a feeling that we build more densely where PTALs are higher. They have been a key planning policy for the last 15 or more years, which is great, and are about the efficient use of land and the transport resources, but they are simplistic. They do not consider the capacity of that public transport infrastructure, its cost or the range of places that you can get to when doing that from that spot. It is just about getting on to the public transport system. There is that relationship between that form of investment in infrastructure and planning policies on what we build, but it is simplistic, and there is quite a lot of work going on to change that at this point. When it is changed and minds have been put to it, it needs time to bed down and to be accepted across the industry in the way the PTAL density concept has been accepted over the last 10 or so years.
The other element is the ingredients that make up a good neighbourhood, the things people need to go alongside housing in particular. I do not think we are particularly sophisticated in how we do that, not only in our understanding of what is needed where. The spatial dimension is often left out. Are those facilities somewhere where people can easily get to or not, compared to where the homes are being built? There is also the timing. It is a chicken-and-egg thing: we tend not to be hugely good at getting the infrastructure in before the people who need it. We wait until the people who need it have a problem before we do something about it, which gives planning a really bad name and probably leads to people not wanting anything to happen in their areas because they have seen this happen before. This is a well-known issue. The front-loading of infrastructure provision is incredibly difficult to do in financial terms, but it is very important in order to get planning working.

Another element is incremental change. Where you have areas with lots of incremental change, the overall impact on infrastructure needs is not considered well enough. We have these master plans—I prefer the term “master path” rather than “master plan”, because they never end up as they should—for huge areas, where everything is planned together, we get a new school, new sewers and whatever else. On the back of that, the area next door sees massive change on individual sites. The cumulative impact on infrastructure need is not necessarily taken into account well enough. There are a lot of ways in which planning could be improved, but they probably all have resource implications and reasons why people have not done them and have not taken them forward. I hope that answers your question.

**Professor Worthington:** The question at the central level is the big infrastructure planning that you are talking about. We are seeing some interesting things happening. Essentially for five years the Cabinet Office, with Greg Clark, in the last Government was doing a lot of this on cities, and it is now shifting to DCLG. We are seeing the beginnings of bringing these two together. If one wants to see more than an experiment, you have to look to the Netherlands, which disbanded its department of the environment and communities, a quite extraordinary thing to do. It has gone into the Ministry of Infrastructure and the Environment. They have a tradition there. The common thing that brought them all together was water, and the municipal water boards. Infrastructure is playing an equally important role in the UK now and over the next 30 years. It is the big integrator between everything. That was a very interesting
move. We do not know exactly what is happening on that, but they were the leaders on physical space and planning. Their five-year spatial plans were absolutely tremendous and they are still carrying on with that.

**Baroness Whitaker**: That is interesting. Very quickly, are you arguing for the concept of place-making to go much broader than the place that the authorities are actually thinking about? It should look at the impact on the neighbouring places, and national infrastructure and big infrastructure in particular must be integrated even into local place-making.

**Esther Kurland**: Of course.

**Professor Worthington**: That is it, all the time.

**Baroness Whitaker**: We do not have that.

**Professor Worthington**: No. Each time you do something, you must think outside your red line. Even someone who is just given a house to do has to think outside their red line. Each time you are given a red line, almost the first thing you think is, “What is happening outside it, because I am part of that, as well as what I do?”

**Baroness Whitaker**: Our planning structure does not reflect that.

**Esther Kurland**: Look at schemes like King’s Cross, where it does.

**Baroness Whitaker**: There is no counsel of perfection?

**Esther Kurland**: It may not be perfection, but there is also the question of how the area inside the red line pays for the infrastructure, whereas the areas just outside it do not. It is about capturing the value from those, which may very well benefit from the investment. CIL helps with that. Vauxhall and the Northern Line extension, for example, are big areas, but a lot of investment needs to be funded from one red-line area.

**Q206 Baroness Young of Old Scone**: You have probably almost answered this question. It is about the educational needs to get development and maintenance of resilience into the system. You have talked a lot about multi-disciplinary education, but is there anything further, particularly in terms of this issue of resilience?

**Professor Worthington**: Education on the way you think and the way you work together is critical. That is the starting point. Resilience comes, of course, from a state of mind as well. I try all the time to think how I can adapt in the future. How do I ensure that value is based not
just on looking at the cheapest thing now but on having built in enough slack in the system to allow me to change?

**Baroness Young of Old Scone**: How much do you reckon that happens at the moment? Is it hardly at all?

**Professor Worthington**: It is not happening sufficiently, because we assess projects much more in terms of value engineering and what we can cut out rather than value management. What do we need to do to ensure long-term success?

**The Chairman**: Do they ever do a post-audit four years after a new development?

**Professor Worthington**: What we call a post-operative evaluation is critical. It has to be done not as an audit but as a learning process.

**The Chairman**: That is what I mean—using it as a learning process.

**Professor Worthington**: You are allowed to make mistakes. If we never made mistakes, we would not move forward.

**Esther Kurland**: The other side of education is that we need content to be able to educate people. That is about learning from what we have done, but we also need very clear policies and some research. When you talk about resilience, I guess you are talking more about flooding and such.

**Baroness Young of Old Scone**: I am talking about resilience in terms of demographic change and future technological change.

**Esther Kurland**: It is the ability of places to flex to respond to the demands that are being put on them at a time. We do not have fabulous content. It is not that we do not have the experience, but we do not have much policy on that.

**The Chairman**: It is interesting, because we are in the lead for scientific research and medical research, but in things like this, which have just as much impact on every man and woman in the country, we are not.

**Esther Kurland**: It is actually quite frightening how poorly we assess the impact of tall buildings on microclimate, for example. It is not that the science is not there; it is just that the requirement to do so, the processes and therefore the understanding are not there.
Baroness Young of Old Scone: Could I just ask you one other thing that you talked about? You talked about resilience in terms of water, floods, climate change and stuff like that. How well do you think those elements of resilience are taken account of?

Esther Kurland: Again, it is very patchy.

Baroness Young of Old Scone: Do we need more guidance there?

Esther Kurland: We definitely do. The issue with floodwater and SUDS—sustainable urban drainage systems—which are a form of infrastructure, I am guessing, is that the local authority only really got the responsibility to manage this last April following a new Act. I cannot remember the name of the Act. There has been very little good practice in how they do that. It is about the attenuation of surface floodwater and the quality of that surface water. We desperately need some research or work to understand what best practice looks like here and how it can be delivered and paid for.

Q207 The Chairman: You were not present at the beginning of the last session, when they all seemed to have lists of 10 points, seven points, four points or three points. It was very helpful. I would love to ask you, if you have a spare half hour in your busy lives, to put down the things that you think are fundamental to the inquiry that we are doing on policies for the built environment. That would be very useful.

Professor Worthington: Is that in terms of change?

The Chairman: Yes, exactly. If somebody said to you, “Draw up a plan”, what do you need most to get it right? While I am on that, thank you very much for these pictures. We do not have time to go over them, unfortunately, but do you think you could give us a commentary, just a few one-liners, on what we should be looking for in these pictures?

Esther Kurland: I certainly can, yes. There is also a book. I have brought a couple of copies. It has lots of before-and-after pictures of different street schemes, so this is the street element. It is not big infrastructure, but you might find them useful.

The Chairman: We would probably have to mention the copyright.

Esther Kurland: It is a TfL document.

The Chairman: Thank you very much indeed. Thank you for giving up your time and for being so engaging in your answers.

19 November 2015
The Innovate UK response to the House of Lords Select Committee inquiry into how we create a better built environment.

1. Innovate UK is the UK’s innovation agency, a non-departmental public body sponsored by BIS. It is the prime channel through which the Government incentivises innovation in business. Innovate UK is business-led. Our governing board and executive team is comprised of experienced business innovators and experts. We work with people, companies and partner organisations to find and drive the science and technology innovations that will increase productivity and exports and grow the UK economy.

2. We are working to:
   - accelerate UK economic growth by nurturing small high-growth potential firms in key market sectors, helping them to become high-growth mid-sized companies with strong productivity and export success;
   - build on innovation excellence throughout the UK, investing locally in areas of strength;
   - develop Catapult centres within a national innovation network, to provide access to cutting edge technologies, encourage inward investment and enable technical advances in existing businesses;
   - turn scientific excellence into economic impact and deliver results through innovation, in collaboration with the Research Community and Government; and,
   - evolve our funding models to explore ways to help public funding go further and work harder, while continuing to deliver impact from innovation.

3. In line with our strategy\(^{164}\) we operate across Government and advise on polices which relate to technology, innovation and knowledge transfer. We also support government departments to become more efficient by supporting them in developing innovative solutions through harnessing the creativity that businesses can offer.

4. Innovate UK was established in July 2007 (as the Technology Strategy Board). We have committed more than £1.5 billion to date and independent evaluations have established that overall Innovate UK has created over £6 of GVA for every £1 it has invested, and 7 jobs for every business it has invested in. Over the last 8 years, this has added up to delivering a total of £7.5Bn and 35,000 jobs. The private sector more than matches that investment, doubling the power of public sector money, and we have directly supported over 6,500 companies. We work with nearly every university in the UK to stimulate the commercialisation of leading-edge academic research and innovation.

5. At Innovate UK, we think about the future and what a future economy will look like. Since 2008, Innovate UK’s Built Environment team has funded and supported over 800

\(^{164}\) The Farrell Review, 2014, Sir Terry Farrell CBE [http://www.farrellreview.co.uk/download](http://www.farrellreview.co.uk/download)
organisations across 580 projects and 20 major innovation challenge programs. Over the last five years, we have funded £118m of cutting-edge built environment projects and enabled multiple SME’s to successfully establish and grow their businesses. We have developed a significant, publicly available portfolio of reports, case studies and data sets for our sector. We welcome the Committee’s inquiry into the Government’s approach to sustainable development. Set out below is our response to the questions raised by the Committee.

Policymaking, integration and coordination

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

6. The built environment represents 15% of UK GDP through construction, facilities management and property. The sector employs over 3 million people and Government procures 40% of all construction output. Given the scale of the sector and the challenges it faces to modernise, Government should take a key role in a clear and consistent strategy.

7. The decisions and regulations that shape the built environment are split through multiple levels of government, EU, local authorities and private sector organisations. As such, the ability to deliver consistent solutions to national needs such as housing, infrastructure or transport is extremely challenging. The Farrell Review drew attention to the continual division of the built environment between government departments and concluded an increase in coordination of policymakers would enable delivery of high quality integrated built environment.

8. Such disconnected policies and regulation affects the ability of the private sector to provide innovative solutions to the needs of the market. The result is an unproductive built environment that fails to deliver quality, whole-life solutions for its users as noted in numerous reviews. National policy makers should ensure UK industry is prepared for the impact of directives coming out of Brussels. In particular the recast European Performance of Buildings Directive, which includes an initiative on Smart Finance for Smart Buildings.

165 Taylor Review, 2012, Lord Taylor of Goss Moor
170 http://digital-built-britain.com/
9. The built environment is a major consumer of energy and is vulnerable to climate change. National policy makers should ensure the costs to citizens associated with improving the UK building stock (i.e. retrofit) is proportionate to the costs of investing in new power stations (e.g. contracts for difference for new nuclear), the costs of responding to the impacts of climate change (e.g. flood protection schemes), and costs of the economic impact of business operations being affected by fuel shortages (e.g. industrial energy demand offsetting).

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

10. Productivity and coordination can be improved through the greater adoption of Building Information Modelling (BIM) that has been championed by the Department of Business Innovation and Skills. BIM encourages all stakeholders to engage with a single process-driven digital model of the project instead of the traditional, uncoordinated project files and paper drawings. The adoption of BIM in the built environment is analogous to the design technologies that transformed the automotive and aerospace industries. This method reduces uncertainty and design mistakes, shortens delivery time and results in a higher quality product. The Government has supported the adoption of BIM in the UK and mandated its use on all centrally procured Government construction projects. This has placed the UK in a world leading position in joining up the design, construction and management of the built environment. Use of BIM saved the public purse £840m in 13/14 and an estimated £1bn in 14/15.¹⁷²

11. Improved infrastructure and higher levels of housebuilding will underpin future productivity improvements.¹⁷¹ Adoption of innovative technology such as BIM and other approaches proposed in Digital Built Britain¹⁷² can deliver substantial cost savings and improved outcomes to the sector, but require consistent policy to allow certainty of investment into the research and innovation required.

National policy for planning and the built environment.

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

12. The NPPF sets out broad guidance for planning, developing and protecting the built and natural environment. This guidance is input based, e.g. it assumes that if the NPPF is

¹⁷¹ AECB “We Must Change our Disgraceful Approach to Build Quality – or Wave Goodbye to Energy Savings” http://www.aecb.net/publications/we-must-change-our-disgraceful-approach-to-build-quality-or-wave-goodbye-to-energy-savings/
followed, a good building or development will be created. There is evidence to suggest that this is not the case, and the end product does not perform as intended. As a potential solution, the NPPF could encourage the concept of whole life performance of buildings based on a continual learning and feedback cycle. This concept of whole life performance is taken from the aerospace and automotive industries who continually monitor the quality of the final product. In the built environment this would encourage planners to consider building’s lifetime energy consumption and its lifetime impact on the natural environment, health, community and wellbeing.

13. National planning could substantially benefit from the adoption of innovative technologies such as geo-spatial and satellite mapping, 3D visualisation, augmented reality and data management. These technologies can provide critical information relating to economic, social and environmental factors to assist decision makers. Innovate UK has supported projects to use publically funded environmental data to solve business challenges such as the impact on the natural environment of construction. An example of this is a project between the Scottish Environmental Protection Agency (SEPA) and Scottish Hydro Electric Transmission to develop a joint tool to quantify the impacts of land use change in developments and manage the biodiversity offsets. Such innovations could be extended across the planning system.

4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

14. A national policy for spatial planning would be beneficial as it would afford a central place to access data relating to local plans, economic growth regions, utility capacity maps, transport plans and historic land usage information. Such data can enable key decisions to be made and risks of developments to be easily mitigated.

15. The Future Cities Catapult is working with an exciting group of partners in Manchester on establishing a city-wide open data synchronisation network for the benefit of citizens. The Greater Manchester Data Synchronisation Project (GMDSP) aims to stimulate growth in areas such as education, environment and planning.

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

16. The Climate Change Act of 2008 calls for 25% Carbon reduction by 2020 and 80% Carbon reduction by 2050 compared to the 1990 baseline. The UK’s built environment energy

173 https://futurecities.catapult.org.uk/news-template/-/asset_publisher/Qw0bKmomFN4q/content/open-data-sharing-for-manchester

175 Reducing Urban Heat Risk, July 2014, ARUP
usage contributes approximately 38% of the UK’s total emissions\textsuperscript{176}. Achieving or exceeding the 2050 deadline should be seen as a minimum timescale. In this respect we would encourage the Committee to review the work of the Green Construction Board who are dedicated to this subject.

17. The summer heatwave of 2003 killed 15,000 people across Europe. This type of heatwave statistically occurs 1 year in every 7. By 2050 this type of heatwave could occur every 1 in 3 years and by 2080 become a once in every 2 year event\textsuperscript{177}. The effects of climate change should be considered at each stage of the requirements process when planning the built environment and we would encourage the Committee to consider the reports generated from our 2010 Design for Future Climate program which funded the climate adaptation programs for 50 buildings\textsuperscript{178}.

Buildings and places: New and old

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

18. Housing supply is a complicated issue. Historical analysis of the housing supply profile demonstrates a near continuous decline in completion rates since 1965. Since 1972 to the present day, Private Sector housebuilding has remained virtually flat at approximately 140,000 units per annum. Housing Association housebuilding has also remained flat during this period at about 20% of total volume. The major decline in housebuilding occurred between 1965 and 1985 and was due to Local Authorities, who ceased construction of new housing. At their peak, Local Authorities were delivering 120,000 homes per annum.

19. The market incentivises private sector house builders to bring a slow and steady number of homes onto the market. Enough to sell to buyers who can gain financing. Not enough to reduce the sale price of each new home, or to significantly increase the rate of completions. Selling more homes may increase private house builders’ turnover; conversely, selling fewer homes may increase their profit margins. Making it easier and cheaper to secure planning permission enables house builders to further increase profits. This does not incentivise house builders to build more homes. It may instead incentivise them to buy and sell land rather than houses.

20. The economics of supply and demand have often been cited as a cause for the limited delivery of housing. However significant productivity constraints exist through labour and skills shortages and materials shortages. Given the challenging nature of market conditions, innovative businesses within the sector are seeking a step change in

\textsuperscript{176} Design for Future Climate project pages https://connect.innovateuk.org/web/design-for-future-climate
\textsuperscript{177} For more information, see https://connect.innovateuk.org/web/rethinking-the-build-process/
\textsuperscript{178} https://connect.innovateuk.org/web/design-for-future-climate
approach to increase housing supply productivity by the development of mass-manufactured, industrialised housing. Mass-manufacturing of housing is known as offsite manufacturing and seeks to construct mass-produced housing solutions in a controlled factory environment. The mass-manufacturing methods of a factory ensures a higher quality product. The factory environment does not require the same skills or materials as traditional construction so can be free from these limitations. Innovate UK has supported some early examples of this methodology in our Rethinking the Build Process program\(^{179}\) and we are seeking to further assist innovation in this area.

21. Modern offsite manufacturing allows innovative materials and technologies to be adopted at the source of the product – the factory. The UK’s excellence in manufacturing provides a strong expertise in quality of delivery that in turn assists to close the performance gap by producing quality, energy efficient homes that don’t require highly skilled labour to construct on site.

22. The now obsolete *Code for Sustainable Homes* was seen by the built environment sector to be a driver for offsite manufacturing as the energy efficiency targets were difficult to meet using traditional on-site construction methods.

7. **How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?**

23. There is evidence to suggest that our existing built environment will not fare well in our predicted future climate. Innovate UK’s *Design for Future Climate* program demonstrated the sector’s poor understanding of the future climate weather patterns such as Urban Heat Islands, excess wind forces and flooding\(^{180}\). We would draw the Committee’s attention our 2010 *Design for Future Climate* programme where we funded the climate adaptation projects for 50 buildings and in turn created a substantial body of evidence. *Design for Future Climate* demonstrated the potential for “stranded assets” caused by climate change and some developers are already taking steps to mitigate this risk\(^{181}\).

24. Our current regulations form a front-loaded process that assumes that once all minimum criteria are met, a good quality building will result. This often not the case and our built environment is blighted by poor quality and inefficiency. One commonly cited result of this is the widely known “performance gap”. Innovate UK has undertaken substantial investigative work into the performance gap through our *Building Performance Evaluation* program\(^{182}\). Our program found that in many cases, homes and offices were found to be consuming up to four times their designed energy usage. The

---

\(^{182}\) [https://retrofit.innovateuk.org/](https://retrofit.innovateuk.org/)
scale of this challenge requires a refocus of regulatory objectives to be outcome-led and concentrated on the performance of the building, not the construction.

25. Overheating and urban heat islands present a key problem for our cities. Some buildings will become uninhabitable without extensive retrofitting. The increased demand placed onto the electricity grid by cooling presents a potentially big problem for the National Grid. The *Overheating in Buildings* report\(^ {183}\) that was commissioned by the Zero Carbon Hub drew upon evidence from *Design for Future Climate*. It concluded that good planning was required to ensure that the design of homes for energy efficiency needs to be balanced with the need to avoid factors that lead to overheating.

8. *To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?*

26. 90% of the buildings which exist now will still be standing in 2050. To maintain these buildings and to keep them in use will require substantial retrofitting. Innovate UK has completed several significant projects related to the historic built environment including 2009 *Retrofit for the Future*\(^ {184}\), 2010 *Energy efficient Whitehall*\(^ {185}\) and 2013 *Scaling up Retrofit*\(^ {186}\). These have revealed the challenges of economics, materials technologies and communication when undertaking improvement work on our existing building stock.

27. We would encourage the Committee to familiarise themselves with the joint DECC and DCLG review currently being undertaken by Peter Bonfield *Review of Consumer Protection, Advice, Standards and Enforcement for UK Housing Energy Efficiency and Renewable Energy*\(^ {187}\).

**Skills and design**

9. *Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?*

28. There has been a substantial fall in apprenticeship completions in construction related sectors relative to other sectors. Low levels of training amongst the self-employed, and skills shortages amongst trade and professional occupations, are inhibiting technology deployment and innovation. The poor image of construction is seen as a key reason for

---

\(^{183}\) [https://connect.innovateuk.org/web/3336014/energy-efficient-whitehall](https://connect.innovateuk.org/web/3336014/energy-efficient-whitehall)

\(^{184}\) [https://connect.innovateuk.org/web/retrofit](https://connect.innovateuk.org/web/retrofit)

\(^{185}\) Review currently underway – [http://www.bre.co.uk/page.jsp?id=1732](http://www.bre.co.uk/page.jsp?id=1732)

\(^{187}\) [www.aechackathon.com](http://www.aechackathon.com)
its failure to attract skilled workers and the Government has undertaken steps to improve this.\(^{188}\)

29. There is a particularly acute skills shortage within Local Authority planning, where design, engineering and scientific skills should be applied when making decisions on projects, especially when the technologies applied and embedded in buildings are increasing in complexity.

30. Innovate UK believes that research, innovation and technology are the best ways to attract individuals to gain skills which can be applied to the built environment by showing how dynamic and vibrant the sector can be. This can be achieved in the same way that the digital industry has transformed to attract a diverse workforce.

31. The built environment already has the seeds of this transformation with BIM, Future Cities, Smart Home and Internet of Things offering huge opportunities for transformation. Innovate UK has run a number of competitions addressing these challenges that have attracted considerable interest from start-ups and micro-SME’s, many of which were founded by graduates. Our recent “AEC Hackathon”\(^{189}\) (bringing built environment experts together with digital experts) also attracted school children, students, graduates and professionals over a weekend of technology-inspired competition.

10. **Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?**

32. Innovate UK is supporting excellence in design and place-making of urban environments through the Future Cities Catapult. The Catapult is developing spatial mapping and data tools together with drawing Internet of Things organisations such as HyperCAT\(^{190}\) into the place-making world. The Catapult is enabling urban designers and planners to access the critical expertise required to bring user-centred design into cities and is attracting considerable interest from overseas.

33. The Future Cities Catapult is also beginning work on a new project designed to assist policy makers, planners, designers and developers in UK cities to make better, evidence-based decisions, tailored to the cities they work in. The 3-year Tombolo\(^{191}\) project, in partnership with Space Syntax and partly funded by Innovate UK, is working with cities across the UK, including Manchester, Leeds, Greenwich and Milton Keynes, to develop a new tool for interconnecting urban models.

**Community involvement and community impact**

\(^{188}\) HyperCAT consortium, Interoperable Smart City Innovation [http://www.hypercatcity.com/](http://www.hypercatcity.com/)

\(^{189}\) Tombolo project for Integrated Urban Modelling [http://tombolo.org.uk/](http://tombolo.org.uk/)

\(^{190}\) BRE Health impact assessments [http://www.bre.co.uk/page.jsp?id=2369](http://www.bre.co.uk/page.jsp?id=2369)

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

34. A growing body of evidence links productivity, health and wellbeing to the built environment. This concept of ‘wellbeing’ is an emergent trend across Innovate UK programmes and projects. For example we are working to support NHS England’s Healthy New Towns programme which will seek to design in health and care into new housing developments from the outset. We will carefully consider the progress of these trends for potential areas to stimulate innovation within our built environment.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

35. Engaging local communities in planning decisions could be enhanced using the technology offered through BIM. Software packages can provide near photo-realistic 3D walkthroughs of major building projects or via augmented and virtual reality mobile phone apps.

36. Innovate UK’s 2014 Digitising the Construction Sector and 2012 Rethinking the Build Process competitions have both funded innovative projects of engaging visual and social technologies for the built environment which can enhance public understanding of what is planned.

Financial measures

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

37. We look to others more expert in the field to answer this particular question on potential financial, or other methods, which may affect housing, place and design issues.

Evidence submitted on behalf of the Innovate UK by:

Dr Ruth McKernan, CBE

Chief Executive, Innovate UK

06 October 2015
Institute of Acoustics response to House of Lords Call for Written Evidence for the Select Committee on National Policy for the Built Environment

Summary

0.0 The Institute of Acoustics (IoA) is the UK’s professional body for the acoustics industry, with around 3000 members. The IoA wishes to draw the Committee’s attention to the important role of the acoustic environment in facilitating positive health and quality of life outcomes, within the broader context of the built and natural environment. The economic value of the protection and enhancement of our aural environment is woefully underestimated. The Government has estimated that the annual social cost of road traffic noise alone is around £7 – 10 billion (https://www.gov.uk/guidance/noise-pollution-economic-analysis). The World Health Organisation in March 2011 found that in Western Europe alone one million healthy years are lost per year, due to traffic noise, making it the second biggest environmental health risk. Estimates are not yet available for the annual social cost of aircraft or railway noise, nor for the cost of poor acoustic design of new and existing housing. The emerging evidence of the social, environmental and economic costs of environmental noise, poor acoustics in buildings, and a failure to use sound positively, highlights the need to prioritise the proper consideration of the acoustic environment as a key component of the National Planning Policy Framework (NPPF) and of the future built and natural environment.

0.1 The summarised responses below relate to each question number in turn. The full responses then follow:

Policy making, integration and co-ordination

1. The IoA is concerned at the shift to decentralise policymaking (for all but the most sensitive and high-profile built environment schemes). To ensure a sustainable built environment in a more decentralised policy world, robust policies capable of delivering the outcomes needed, and competent authorities to scrutinise applications and enforce those outcomes, are required. There is a need to for practitioners in Planning, Environmental Protection and Building Control Departments within local authorities to retain and develop the skills needed to enable them to form good judgements on technical matters. Acoustics is an important part of ensuring that developments are fit for the intended use now and in the future, providing users with improved conditions to maintain or achieve well-being. The IoA would be pleased to partner with national policy

makers to get this right, and help to build and maintain a robust local authority capability in planning, licensing and environmental protection, in conjunction with other bodies.

2. The IoA is concerned that there is a significant disconnect between Government departments that implement policy covering the built environment. This will impair the UK’s ability to meet Government aims for sustainable development. We ask for better integration of policy between departments to encourage integrated design. Attention must be given to unifying and developing a consistent approach to inter-disciplinary influences on the planning, design, permitting and construction process for all built environment schemes. Acoustics should be at its core to ensure that comfort, health and well-being are achieved.

National policy for planning and the built environment

3. The IoA considers that the NPPF does not provide sufficient guidance for practitioners seeking to manage and protect the acoustic aspects of the built and natural environment. Whilst new noise policy objectives have been introduced in the Noise Policy Statement for England (NPSE) and the guidance to the NPPF (NPPG), supporting technical advice and guidance is largely missing. This omission means that the opportunity to build-in quality in an area often poorly understood by many participants is missed. Uncertainty resulting from lack of guidance may slow the operation of the planning system at a time when the rapid provision of new housing is high on the political agenda. Speed of applications through the planning system and quality are both important. With policies backed up by clear guidance, good design and rapid delivery can both be achieved.

The IoA is currently responding to a strong demand from practitioners for additional technical guidance on the management of noise within the planning system. The IoA is collaborating with the Association of Noise Consultants (ANC) and Chartered Institute of Environmental Health (CIEH) to produce guidance for developers and professional advisers (ProPG: Planning and Noise) centred on the land-use planning process to encourage good acoustic design. Initially, this is focused on new noise-sensitive development, in particular housing.

4. The use of a spatial policy seems positive. The IoA suggests that acoustic policy is developed, going well beyond noise zoning and noise control, but including challenge to improve the overall aural environment with more extensive use of positive soundscapes. There is opportunity for the quality of our aural environment to improve immeasurably.

5. The IoA agrees with Government policy on noise (in the NPSE) which states that “The Government recognises that the effective management of noise requires a co-ordinated and long term approach that encompasses many aspects of modern society.” For
buildings, we would encourage short and medium term plans. In the short term, for new and refurbished building stock, implement a rescue plan (over four years) which would embed design to withstand standardised extremes, to maintain sufficient comfort for occupants. A medium term plan (to 20 years) is suggested to advance the quality and delivery of holistic design for all new buildings. Acoustics plays a key role in creating good design of built and natural environments. Policy should expect positive use of sound, as well as providing protection from noise pollution.

Buildings and places: New and old
6. The IoA encourages the Government to consider forming a policy to encourage re-use of existing buildings, making this the starting point for sustainable development. Removing the worst of the stock, and upgrading and revitalising the remaining, including decarbonizing their operation, can be an effective way to help tackle the existing housing shortfall. It is the IoA’s opinion that the recent reforms will do little. We need a more radical focus on stimulation to encourage refurbishment programmes that achieve high eco standards. Emphasis can be placed on creating higher density dwellings in urban centres, creating communities in which people can thrive, which have both vibrancy and access to peace and quiet, including use of our positive connection with natural sounds.

7. It is recommended that the Government undertakes detailed consultations with leading UK institutions to enhance the form and content of new planning legislation for the sustainable built environment. Planning for an uncertain future, and engineering resilience into our solutions is essential. Clear parameters to be met by adaptive designs must be agreed and put into legislation – the Government’s role. A cross-party task force could be formed to create an integrated approach to define how adaption should be included. The IoA would be pleased to be a part of such a group. There is widespread experience within the Institute of upgrading existing buildings to meet current enhanced schemes.

8. The IoA considers that we do not make optimum use of our historic environments to regenerate and place-make. We know that acoustic design is crucial in many uses of these assets e.g. in broadcasting, performing arts, historical pageantry etc. We can make more of this. The balance needs to be struck between overly onerous planning and conservation restrictions, which may hamper and discourage the regeneration and integration of heritage buildings into our communities. More could be made of these assets as built environments which anchor people and communities to the past, giving them identity and integrating them in such a way as they are preserved, but brought to life as part of the community. They can be of assistance in regenerating society’s connection to our historic environments and preserving them for future generations rather than seeing them lost. Suggestions are made as part of the full answer on how more could be made of our national assets like Stonehenge, which is an example of our heritage built environment.
Skills and Design

9. There are currently poor standards of knowledge and experience across many disciplines central to the built environment in relation to the impact of design on behavioural outcomes. There is a high level of acoustic design skill available from IoA members, many of whom have powerful environmental and economic experience. The Institute is encouraging a more holistic approach to the built environment and the realisation of the central role of acoustics in establishing social sustainability. There is therefore a training task to do internally within the IoA, which is under way. Opportunities to bring together professional institutions to encourage cross-discipline cooperation to seek holistic solutions to achieving sustainable design could be encouraged. Effort is needed to reduce the leak of skills from local authorities which is currently occurring. In schools STEM initiatives are encouraged, which the IoA contributes to and supports.

10. An improved sustainability assessment method is required, which takes all three pillars of sustainability (eco, people, fiscal) equally into account. The IoA would suggest that acoustics can play a significant part in evidencing the benefits of good acoustic design in all three pillars, and would be pleased to contribute to developing this. The requirement for BIM (Building Information Modelling) within design also requires further thought so that it readily enables an improved sustainability assessment method to be realised. Affordable access to BIM to enable the inclusion of design advice from acousticians, many of whom will not currently have access to licensed software due to cost, would be helpful. A centrally accessible tool/ on-line portal for designers is suggested to accelerate take up by all disciplines.

Community involvement and community impact

11. The IoA considers the answer to the first question to likely be that “they try to”. However, there is a shortfall of experience of social science relevant to this field. There may be doubt currently as to the correct planning or design approaches or tools to adopt, in any given built environment scenario, to achieve the balanced outcome on benefits that are required to deliver sustainable development. The correct tools to assess this across all disciplines are therefore needed – tools that leave no room for ambiguity or doubt as to the appropriateness of the design and planning methodology being adopted. It is encouraging to see schemes such as BSRIA’s “Soft Landings” initiative, which aims to provide a detailed Post-Occupancy Evaluation (POE) methodology for a wide range of built environment assets. However, such schemes do not properly consider acoustics at this time. This is despite the evidence which indicates that poor acoustics is an obstacle to everything from optimal function at work, learning and performance at school, quality of life at home, and our speed of recovery in hospital. The IoA recommends that the Government may consider it useful to form and structure a national design and policy task force, which focuses on achieving overarching policy across disciplines. Public Health England could have a greater role to play in this area contributing to society, the environment and the economic success of the UK, within a global context. We will then
be able to use this knowledge to assist others to do the same, and strengthen our offering through professional services and build on our global reputation.

There was no response to questions 12 and 13.

This written response was prepared for the Institute of Acoustics, by Peter Rogers of the Sustainable Design Task Force and Parliamentary Liaison Group with contributions from Colin Grimwood of the Environmental Noise Group and Alex Krasnic of the Building Acoustics Group

Full responses to questions are set out below.
Preamble

1.0 The importance of the acoustic environment to health and quality of life has been recognised by Government – the long term vision of the Government’s policy on noise (i.e. unwanted sound) is to “promote good health and a good quality of life through the effective management of noise within the context of Government policy on sustainable development” (Noise Policy Statement for England, March 2010).

1.1 The National Policy for the Built Environment Committee clearly recognises the important role of the built environment in delivering good health and good quality of life, with substantial associated economic advantage. The IoA wishes in particular to highlight the importance of the proper consideration of both sound (and its positive effects) and noise as an inherent part of the good design of buildings, places and spaces.

1.2 Defra has estimated that the annual social cost of urban road noise in England is £7 to 10 billion. This places it at a similar magnitude to road accidents (£9 billion) and significantly greater than the impact of climate change (£1 to 4 billion). Road traffic noise is only one of many sources of noise in the built environment. A report published by the World Health Organisation (WHO) in March 2011 identified environmental noise, from traffic, as the second largest environmental health risk in Western Europe, costing one million healthy days per year.

1.3 The IoA considers that beneficial impacts of sound, as well as the adverse impacts of noise must be fully considered as an integrated part of the decision making and policy approach on the built environment and its interaction with the natural environment.

1.4 Each of the questions raised in the call for written evidence are dealt with in turn. If further information is required on any aspect please do place a request for further information, and the IoA Parliamentary Liaison Group will be pleased to prepare a briefing note on that issue.

Responses to questions

Policymaking, integration and coordination

1. Are the decisions that shape England's built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

Answer 1

1.5 The IoA is concerned by the gradual shift to decentralise policymaking (for all but the most sensitive and high-profile built environment schemes). Policymakers should be vigilant that all planning and construction policies, which have a material impact on the delivery of new built environment schemes for the next 20 years, are being implemented with clear delivery
of sustainable development. Currently local authorities drive the enforcement of such policies, but their dwindling resources affect practitioners and their ability to form good judgements in areas such as local authority Planning, Environmental Protection and Building Control Departments. The IoA considers that the policy decisions may need to be taken at a more national and strategic level to maintain a coherent strategic direction.

1.6 It is the IoA’s view that acoustics is an important part of ensuring the resulting built environment is not just fit for its intended use, but also provides users with improved conditions to maintain or achieve well-being. Unless this is achieved built environments cannot be truly sustainable. The pursuit of this goal by policy makers, with support being offered to the professionals at a local level, in partnership with the Chartered Institute of Environmental Health (CIEH), would maintain a credible service into the future with a clear strategic direction.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

Answer 2

2.0 The IoA is concerned that there currently appears to be a significant disconnect between Government departments which implement policy affecting all built environment disciplines (from housing through to heritage). This is in danger of hampering the optimal progression of future built environment schemes across the UK that meet government aims for sustainable development. Through better integration of policy between departments it is considered that encouragement of good integrated design will assist that end goal. The IoA suggests that particular attention could be given to unifying and developing a consistent approach to all design matters which influence the planning, design and construction process for all built environment schemes. This approach should include acoustics at its core to ensure that comfort, health and well-being are achieved. This is so that each type of environment is designed to achieve its full potential both for its current intended use and with regard for possible future uses (such as the conversion of a factory unit to a school, as has just occurred in Corby, Northants with Education Funding Agency involvement). Intelligent reuse of our existing buildings is important as a policy driver to be sustainable.

2.1 The IoA suggests that built environments should now strive to include the use of materials with top eco credentials as standard, with a disincentive to use less eco-friendly materials. Acousticians can assist to accommodate this in their specifications, with design advice to remove obstacles to sustainable design. Re-using and re-purposing of old buildings through refurbishment is considered a sensible way to maximize what we achieve with as little impact as possible, and strengthening Policy to encourage refurbishments without dropping

standards is considered necessary to achieve truly sustainable developments for either new or refurbished built environments. Broadly this must, in turn, not just work for those using the resulting buildings, but also enhance their ability to achieve good health, wellbeing throughout the buildings life, which requires a lifetime strategic plan for the building, in which the acoustics is a core consideration. For this approach to be possible better co-ordination is essential to provide encouragement, stimulation and joining up of the thinking from each Government department, but good design must be kept at its heart.

**National policy for planning and the built environment**

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

Answer 3

3.0 The IoA considers that the NPPF does not provide sufficient guidance for practitioners seeking to manage and protect the acoustic aspects of the built and natural environment. Whilst new noise policy objectives have been introduced in both the Noise Policy Statement for England (NPSE) and the guidance to the NPPF (NPPG), supporting technical advice and guidance is largely missing. Government has advised that it does not intend to provide such technical guidance – an omission that misses the opportunity to build-in quality to an area often poorly understood by many participants. This is leading to uncertainty for developers, regulators and their advisers alike regarding the approach to take. In the absence of clear guidance there is an increased risk that development may be mistakenly refused, constrained or approved thus adding to the number of disputes and appeals that can slow down the operation of the planning system at a time when the provision of new housing is high on the political agenda. Recent case law linked to the licensed premises (Ministry of Sound, London\(^{197}\)) emphasises the need for careful consideration before allowing residential development to encroach on established business, as this may result in their forced closure or displacement and cause economic harm. This demonstrates the need for balance between noise-sensitive and noise-making businesses at a time when the global trend (see KPMG Mega Trends report 2014\(^{198}\)) is for people to be moving into cities, which themselves are often vibrant in character and therefore noisy. Acoustic solutions can provide technical ways to achieve this balance, and avoid damage to the economy and enable social cohesion.

---

\(^{197}\) https://en.wikipedia.org/wiki/Archaeoacoustics

\(^{198}\) ttp://www.salford.ac.uk/computing-science-engineering/research/acoustics/architectural-and-building-acoustics/acoustics-of-stonehenge
to thrive, but clear technical guidance is needed to steer and drive input from acoustics professionals.

3.1 The IoA is currently responding to a strong demand from practitioners for additional technical guidance on the management of noise within the planning system by jointly working with a number of other professional bodies to produce Professional Practice Guidance on Planning and Noise (ProPG: Planning & Noise). This initiative is being overseen by a steering group consisting of representatives of the Association of Noise Consultants (ANC), Institute of Acoustics (IoA) and Chartered Institute of Environmental Health (CIEH).

3.2 The aims of the ProPG: Planning & Noise are to give good practice advice to local planning authorities in England and to developers’ professional advisers on the application of the land-use planning process to encourage good acoustic design. The working group has determined that the initial focus of the ProPG should be on new noise-sensitive development, but in particular focusing on housing because of the social need. However similar advice on noise-generating development may follow in due course in other areas of priority delivery for the UK.

3.3 The Government has estimated that the annual social cost of road traffic noise alone is around £7 – 10 billion (https://www.gov.uk/guidance/noise-pollution-economic-analysis). Estimates are not yet available for the annual social cost of aircraft or railway noise, nor for the cost of poor acoustic design of new and existing housing. However, the emerging evidence of the social cost of environmental noise is likely to increase the pressure to prioritise the proper consideration of the acoustic environment as a key component of the NPPF and of the future built environment.

4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

Answer 4

4.0 The use of a spatial policy seems positive. This prompts the suggestion that a broad policy centered on our aural environment (beyond noise zoning and mapping), to include evaluation of the opportunities to use sound positively, can raise standards from the current poor position.

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

Answer 5
5.0 The IoA agrees with Government policy on noise (in the NPSE) which states that “The Government recognises that the effective management of noise requires a co-ordinated and long term approach that encompasses many aspects of modern society.”

5.1 The IoA also recognises that climate change places urgency on a short (four years) to medium (up to 20 years) term plan for action, as buildings that are being commissioned now will be locking in carbon that will make it difficult for the UK to achieve the internationally agreed targets. The optimum timescale to be able to focus on a short term rescue plan is not more than a parliamentary term, with the focus on delivery of low to zero carbon new buildings with input from all disciplines (including acoustics) to maintain sufficient comfort for occupants. This means a soundscape that people feel acoustically secure and safe in. In this first phase it is suggested that improvements to the existing built stock needs addressing urgently, and a start could be made to upgrade in that timeframe. Not to do this urgently could result in the need for more drastic adaption action later, with a greater risk of public dissatisfaction, as the IoA has recently noted around issues such as airport expansion and resistance to wind farm applications.

5.2 The medium term plan spanning parliamentary terms, but with longer (20 years) delivery to targets in mind, could then focus on how we can advance and refine the quality of our delivery so that good integrated design is fully embraced for all new buildings. This should support the goals of sustainable development and deliver on good quality of life, health and well-being in low to zero, or even negative carbon buildings that work to enhance the environment. Acoustics can be of assistance in creating built and natural environments that use technology and scientific knowledge to improve our quality of lives, using positive sound to create solutions that enhance health and well-being for all by improving soundscape quality.

**Buildings and places: New and old**

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

Answer 6

6.0 The clearest indicator for addressing the issue of housing supply is to streamline the planning process and to address the issue of existing energy inefficient housing stock. The Government has already facilitated the way in which Compulsory Purchase Orders and the automatic granting of planning permission for brownfield sites is conducted by local authorities. More can be done to fast track development which achieves exemplar standards (such as Code 6 homes). This assumes that it can be demonstrated that the impacts (including noise) on other people and residents, business and nature are very low and there are wider benefits to
people, the environment and financial wealth, as set out in a strengthened national strategic plan for sustainable development.

6.1 The IoA encourages the Government to recognise the role that acoustics plays in that, and how the IoA ProPG could achieve clear and consistent engagement of members and local authority practitioners to conduct noise impact assessments. This enables local authorities to manage more consistently the introduction of refurbished and new build housing supply whilst protecting against harm to amenity, quality of life, and health.

6.2 The IoA encourages the Government to re-use existing buildings as a starting point by removing the worst of the stock, and upgrading and revitalising the remaining existing stock with the aim of decarbonizing their operation through good refurbishment design. It is the IoA’s opinion that the recent reforms will do little. We need a more radical stimulation to encourage refurbishment programmes to tackle existing stock. Emphasis can be placed on creating higher density dwellings in urban centres, and creating communities with vibrant hearts that are supported with good design. In this way we can achieve the balance that people want between vibrancy, peace and quiet including use of our positive connection with natural sounds.

6.3 It is anticipated that the effect of introducing these incentives and drivers for swift change at the planning level, should allow developers the opportunity to change positively the built environment in both the private and social housing sectors.

6.4 There is widespread experience within the IoA of upgrading existing buildings to meet current improved standards.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

Answer 7

7.0 It is recommended that the Government undertakes detailed consultations with leading UK institutions with experience of assisting policymakers to enhance the form and content of new planning legislation for the built environment. It is the IoA’s view that the Government’s focus should be on delivering the maximal tangible benefits to society, economically and environmentally, whilst protecting and creating environments in which people and our ecosystems can thrive. The added element is including resilience and planning for an uncertain future and engineering resilience into our design solutions. Adaptation design would benefit from clear parameters from experts which can be embedded into legislation that will provide the required drive. Building Regulations would be the natural place to start integrating this.
It is crucial that the Government gleans sufficient knowledge from institutions, such as the IoA, to assist with understanding the planning and design implications, inherent with a multi-disciplinary approach to the delivery of built environment schemes that will withstand the environmental threats that we face over their design life. One suggestion for this would be to form a cross party task force to formulate an integrated response to define how adaptation should be accounted for. The IoA would be pleased to be a part of such a group, which could also be cross-professional discipline.

7.1 If this can be successfully achieved within a short timeframe then it should be possible to allow both adapted existing, new and future built environment assets to meet the needs of people in a changing world, with clear tangible social, economic and environmental benefits.

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

Answer 8

8.0 It is the IoA’s view that the UK does not make enough use of our historic built and natural environments. We know that acoustic design is crucial in many uses of these assets e.g. in broadcasting, performing arts, historical pageantry etc. We can make more of this.

A branch of acoustics has emerged called Archaeoacoustics\(^{199}\), which already has revealed in one example the particular opportunities for regeneration and place-making. Visitors to Stonehenge currently experience road traffic noise from the A303 that passes close to the site. This is detrimental to the quality of the soundscape and experience of visitors. The recently revealed acoustic features of the site, which may have been a potentially important part of the monument’s purpose, cannot be enjoyed without protection from the noise pollution (see article on acoustics of Stonehenge, Wiltshire\(^{200}\)). Action to put the road in a tunnel or divert it would be worth considering as part of a restoration project, given the site’s World Heritage status and value to our economy and identity as the UK.

\(^{200}\) These provided regional level planning frameworks in England, they were revoked in 2010.
Stonehenge is a single example. More broadly, there is merit in planning for the sensitive integration and connection of society with historical assets. This can assist to bring character and help build a focal point and strong local cultural identity. This is a vital part of place-making. Acoustic soundscapes have historically been one way in which local identity is defined. Soundmarks like Big Ben and the churches of London help to define a community’s local identity. Soundscapes can be more optimally used to assist in place-making with connection to heritage relevant to the area.

8.1 However, a balance needs to be struck between overly onerous planning and conservation restrictions, which may hamper and discourage the sustainable regeneration and integration of heritage buildings, and insufficiently robust policies which put our heritage at risk. More could be made of these assets as built environments which anchor people and communities to the past, giving them identity and integrating them in such a way as they are preserved, but brought to life as part of the community. The IoA would encourage using our emerging knowledge in this area to use sound to bring these assets to life, using hygienic soundmarks (like clocks and bells) to create a focal point for the surrounding communities. High quality public spaces could be created that have such assets within them to provide an escape from the bustle of life, where they are owned by the nation.

8.2 A not uncommon acoustic example is for local authority Planning Directorates to place onerous facade and other architectural and mechanical limitations on heritage building developments (i.e. no double-glazing, for instance). This can result in acoustic, thermal and ventilation performances becoming very complex to achieve for the comfort of future occupants of such buildings, thereby rendering such development unattractive to would-be developers and potentially stifling the economic and societal benefits that could be achieved. It could, therefore, be a helpful compromise to relax these conservation restrictions in favour of utilising the asset, where a sensitive design solution can be proposed.

Skills and design

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

Answer 9

9.0 Knowledge and experience of the impact of design on behavioural outcomes of is poor across many disciplines central to the built environment. Insufficient social science is in place to strengthen the social sustainability of most designs. Where regulation is sparse, there is little
to encourage the expansion in that field, and hence little impetus to provide education for it. There are high levels of acoustic design skills available from IoA members, many of whom are architects and engineers with powerful environmental and economic experience. The Institute is encouraging a more holistic approach to the built environment and the realisation of the central role of acoustics in establishing social sustainability. IoA members can assist by being part of a holistic approach to the built environment. However, wider knowledge of how good acoustic design can create wider benefits at economic, environmental and societal levels need to be disseminated further through our own and other disciplines to make sure that acoustic design is a consideration at the earliest stage of design. Often it is not seen as a key driving factor in development of designs, opportunities are lost, with the result that conflicts and reactive interventions can then create obstacles to sustainable design solutions.

9.1 The IoA has commenced an internal programme of education on sustainable design with its members, to widen their awareness of how acoustics can add value to sustainable design where acoustic input is provided at an early design stage. BREEAM has been of assistance in achieving this in more recent years, but that does not cover all buildings, and seems to be waning.

9.2 The IoA is concerned that local authorities are in serious danger of losing their technical skill base, which will result in them being unable to adequately or competently scrutinise applications for development of built environment schemes that contain noise or vibration impact assessments. This is due to an ongoing reduction of resourcing and funding at the local level. Outsourcing to other IoA members may be a temporary solution, but the risk is that there will not be proper consideration of noise impact and good design of schemes, which will in turn result in undermining the quality of delivery against the needs of society. The IoA is concerned that this squeeze on local government funding will mean that investment in better training for planners and practitioners will not happen despite an evident need. An emphasis on how the improved integration of acoustics creates benefits, should not be overlooked in any aspect of the built environment. This could be also introduced into the training of planners, architects, environmental health officers etc. as part of their basic training and, as a campaign drive by the IoA, in conjunction with Government to share and accelerate the skills development necessary to protect the good governance of the built environment at this critical point in history.

9.3 The IOA ProPG: Planning and Noise group is considering ways to promote the better sharing of good practice case studies to give examples for training and reference to all parties involved. The IoA would be happy to discuss involvement in providing other guidance which may be needed by other professions to assist in maintaining skills to avoid a skills void occurring.

9.4 The IoA agrees with the widely accepted view that there is a national skills shortage with regard to professionals engaged in the Built Environment sector. There are various possible reasons for the skills shortage, one of which is the underlying stereotype of it being a male-
dominated industry in the engineering field (see Scientific America article on Engineering is a Man’s field, 2013\textsuperscript{201}). However, the potential to encourage a greater proportion of women professionals into a career in this sector is an area with promise, which the IoA is exploring with restart support for mothers returning to the profession. The message from the IoA to Government is to facilitate and support schemes such as the Science, Technology, Engineering and Mathematics (STEM) by making these subjects more accessible to all gender, social and educational backgrounds at the earliest opportunity. Work by the IoA in this area is ongoing, from involvement at schools level to the Parliamentary Scientific Committee, of which we are a member.

9.5 It is therefore suggested by the IoA that a longer term training plan is put into place for local authorities, in particular, which has cross-party support from Parliament. The IoA can assist with providing accredited training in collaboration with the Chartered Institute of Environmental Health (CIEH), with the purpose of developing understanding of the often conflicting issues that acoustics brings to planning, licensing, design and construction of built environment projects. This could support the implementation of existing national policy and legislation such as NPPF, NPSE, The Licensing Act and The Building Regulations.

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

Answer 10

10.0 The Government requirement mandating BIM Level 2 to be used on all state-funded projects by 2016 should act as a catalyst to improve co-ordination within the sector. It is the IoA’s suggestion that the Government should also follow this up with a national skills programme, specifically aimed at assisting professionals in the sector to gain the necessary knowledge and skills to implement these requirements across disciplines. This would include educating designers on how best to interface with the software without having to maintain it (there is currently limited choice in software, and it is costly). If this is not done then it is likely that our members who work within small or medium sized firms will not be able to justify funding the software, and will provide design advice through other disciplines rather than as an acoustic layer (for instance). This will not achieve the integrated design approach needed and a rethink is necessary to enable accessibility of all members of the design team. Perhaps an on-line version held centrally as a resource might be a way to accelerate engagement with BIM.

10.1 Clearer guidance is also needed on what is objectively meant by “place-making”, and how best to quantify the societal, economic and environmental benefits. An assessment method which takes all three equally into account (rather than just one predominantly, as in BREEAM)

\textsuperscript{201} Locality report on understanding the potential of small scale community-led housing: http://locality.org.uk/wp-content/uploads/Locality_Small-Scale-Community-led-Housing.pdf
would be a way forward. The IoA would suggest that acoustics can play a significant part in evidencing the benefits in all three sectors.

**Community involvement and community impact**

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

*Answer 11*

11.0 The IoA considers the answer to the first question to likely be that they try to, but are often insufficiently trained or experienced to understand behavioural outcomes. There is also concern that this may be a luxury that local government can no longer afford to support. Intrinsically there is doubt and lack of consistency as to the correct planning or design approaches or tools to adopt, in any given built environment scenario, to achieve the balanced outcome or benefits that are required to deliver sustainable development. The correct tools to assess this across all disciplines are therefore needed, that leave little room for ambiguity or doubt as to the appropriateness of the design and planning methodology being adopted. Whilst it is encouraging to see schemes such as BSRIA’s “Soft Landings” initiative, which aims to provide a detailed Post-Occupancy Evaluation (POE) methodology for a wide range of built environment assets, these do not properly consider acoustics at this time. This is despite the evidence showing that poor acoustics is an obstacle to everything from optimal function at work, learning at school, quality of life at home, and our speed of recovery in hospital. The IoA recommends that the Government may consider it useful to form and structure a national design and policy task force, which focuses on achieving overarching policy across disciplines, delivering a measurable effect on the desired outcomes for the built environment sector against the three pillars of sustainability. The IoA would be keen to support this.

11.1 In answer to the second part of the question the IoA points out that it is widely accepted and known that auditory stimulation from music can change our mood and how we feel. There is also growing evidence that people’s state of mind and behaviour can be influenced by sound, and quantifiable changes in behaviour can be caused. Marketing techniques now use such knowledge for making products more desirable (e.g. automotive industry). This has potential, if further research can be funded, to develop a robust body of evidence on which to adopt strategies for designing for safety and health. The IoA has recently issued its members with guidance on this area to raise their awareness. These are called Sustainable Practice Notes for acousticians (SPN2 relates to Personal Security). The Noise Abatement Society has been doing work in this area in Brighton, with soundscapes that caused a quantifiable drop in crime in one example. As humans we are hard wired to constantly assess our state of safety through our aural sense. Our acoustic safety is fundamental to our well-being. The IoA suggests that a
robust evidence base should be developed around the positive effects that sound can have, as the industry has developed mainly around the management of noise. The potential to design the built environment with the acoustic environment in mind (both inside and outside) for positive benefits on behaviour, health and well-being, may play an important part in making our built environment fit for our future needs and also on cultural cohesion and safety, redefining what is good design for new or restored, safer and cohesive communities.

11.2 Public Health England could have a greater role to play in this area, including gathering a strong body of research, raising greater awareness of the negative impacts of poor acoustic environments (e.g. schools, offices, hospitals, restaurants and homes). It could also have a leading role in creating greater recognition of the positive benefits of good acoustic environments that can be brought to society, the environment and the economic success of the UK, within a global context. We will then be able to use this knowledge to assist others to do the same, and strengthen our offering through professional services and build on our global reputation.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

Answer 12

12.0 No response.

Answer 13

13.0 No response.

05 October 2015
The Institute of Historic Building Conservation (IHBC) is the professional body for building conservation practitioners and historic environment experts working in England, Northern Ireland, Scotland and Wales, with connections to the Republic of Ireland. The Institute exists to establish, develop and maintain the highest standards of conservation practice, to support the effective protection and enhancement of the historic environment, and to promote heritage-led regeneration and access to the historic environment for all.

Thank you for inviting us to submit evidence. Our submission exceeds your request for a maximum of 6 pages, so we commence with a summary of points referenced to our answers to the Questions.

Our recommended policy areas for attention are:

- An over-arching national development policy that applies to all Government departments and has clear and generally applicable principles. (Q1)
- Positive endorsement of the role of strategic planning. (Q1)
- Adoption of strategic planning at the city-region level. (Q1)
- Recognition of infrastructure as an investment that is often needed in advance of development. (Q1)
- Recognition of heritage as an asset rather than a burden. (Q1)
- A thorough review and simplification of planning regulations including re-regulation where simplicity is not possible. (Q1)
- Recognition of the cost-effectiveness of good and easily accessible guidance. (Q1)
- Consolidation of the planning legislation. (Q1)
- A statutory purpose for planning. (Q1)
- Moving responsibility for heritage to DCLG. (Q2)
- Bring NPPF heritage policy into line with statutory requirements. (Q3)
- Introduce a national, one-stop, on-line, seamless and tiered policy and guidance resource for all planning legislation, policy and guidance to a detailed level. (Q3)
- Not to prioritize policy in the NPPF. The weight to be given to the various policies must be a matter for circumstances on the ground. (Q3)
- Introduce a tiered national spatial strategy to rebalance the national economy. (Q4)
- Refine the local plan process with greater timescales for mainstream policy and shorter ones (perhaps annual) for development proposals (Q5)
- Plan for housing in terms of need not, as at present, in terms of what happens to be offered. (Q6)
- Revitalize the concept of place-making. (Q7)
- Capitalize on existing places of quality, heritage and character. (Q7)
- Expand the use of urban design as a technique. (Q7)
- Reinstate carefully measured carbon reduction programmes including the 0-carbon target. (Q7 and 13)
- Promote heritage as a tool of economic regeneration and sustainability. (Q8)
- Reinforce the place-making value of conservation areas. (Q8)
- Protect historic environments from casual damage by public authorities and utilities. (Q8)
- Improve skills in heritage, heritage craft trades and urban design. (Q9)
- Recognize that skills have to be applied and that the time needed to undertake design work of quality needs to be resourced. (Q9)
- Address low staffing in LPAs and give them resources to apply their skills properly. (Q9)
- Place-making is crucial but needs urban design skills. (Q10)
- A new body to replace CABE is urgently needed. (Q10)
- Urban design techniques to reduce adverse impacts and optimize results is a well-grounded area but needs resources for its application. (Q11)
- Communities need help to participate effectively and this needs resourcing. (Q12)
- Communities broad aspirations should be capable of simple formulation into SPD. (Q12)
- Set high standards for new development and require this to be funded at the expense of land value. (Q13)
- Pre-application advice should be free. It should be funded by raising planning application fees to cover the service. This would promote more use of pre-application advice and less abortive work by developers and planning authorities alike. (Q13)

**Answers to the questions**

*Policymaking, integration and coordination*
1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

a) The fragmentation of the various aspects of economic, social and physical planning and infrastructure provisions between Government departments tends to result in each regarding one or more of the others as a problem rather than as a contributor to the public good, e.g.:

- The Treasury seems to regard planning as a brake on development.
- The DCLG seems to regard heritage as an inhibitor of good development rather than a contributor to it.
- The Government abolished the strategic processes for development planning without putting anything coherent in its place.
- The constant pressure for de-regulation generally leads to confusing regulation and outcomes of dubious value, especially for affected third parties. Supposed de-regulation which is hedged with necessary environmental and amenity provisos and conditions that need to be interpreted on a case-by-case basis does nothing to reduce workloads and instil confidence. De-regulation that gives freedom for individual developments can reduce the value of neighbouring property. Such is the makings of a downward spiral of environmental quality.
- The Government's withdrawal from policy Guidance has been very detrimental. It has resulted in increasing numbers of poorly informed planning decisions.

What is needed is over-arching national development policy that applies to all Government departments and has clear and generally applicable principles:

- Strategic planning an essential tool: it gives confidence, cuts waste and adds value. It should set out what is required to be delivered and not just be a method of selecting the least bad of any options that might currently be on offer. It should co-ordinate planning and non-planning issues such as transport and infrastructure.
- Strategic planning needs to be carried out at city-region level and involve all relevant arms of Government with appropriately delegated budgets.
- Infrastructure is public investment which is often needed in advance of development. The City Fathers of the C19 understood this and this is what made our cities great. We need to shift the concept of infrastructure planning away from being a cost and towards being an investment.
- Heritage is an asset. People like and enjoy it. It adds value to property and economies. Places with heritage are, by and large, more successful than places without.
• A review of regulations. Regulations like “permitted development” need to be simplified to what can be permitted in very clear circumstances with very few conditions. Where they cannot be there should be simplified requirements for consent.

• Policy guidance and best practice are useful and cost-effective. They stop practitioners constantly having to “reinvent the wheel” in what they do. The case for a structured framework of approved planning, environmental and heritage guidance (right down to very specialist levels) as a centrally maintained on-line national resource with page-to-page links is overwhelming. The current Planning Practice Guidance provides the framework but is not detailed enough to do this.

b) The planning legislation is a mess.

• It has been repeatedly modified in a piecemeal fashion such that it scarcely understood by practitioners let alone the public.

• The 1990 separation of the Listed Building legislation was a mistake. It made heritage considerations into an adjunct rather than a mainstream contributor to planning outcomes that it should be.

• This separation has given rise to widespread duplication of secondary legislation which is similar but different enough to be confusing.

• The Planning Acts still have no stated purpose. Clarity on this point would be of benefit to the whole process.

What is needed is a consolidation of the Planning Acts into a single Act with a stated purpose to:

• Unify the processes.

• Remove confusing Welsh measures.

• Emancipate heritage to be a contributor to planning processes.

• Allow a root-and-branch review of secondary legislation (Q1a).

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

In parallel with the reintegration of the planning and heritage legislation we think that responsibility for heritage should move back to the DCLG. In the DCMS it is detached from mainstream planning processes but does not benefit from the special attention one might suppose as the DCMS is so strongly focussed on media and sport. In the DCLG heritage would become a mainstream function, which it deserves to be.
We do not advocate any detailed changed to Historic England which, it seems to us, could function more effectively within DCLG than in DCMS.

A wider understanding in the positive economic role heritage can play might be fostered with an inter-departmental committee.

**National policy for planning and the built environment**

3. **Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?**

The NPPF has been shown to be largely fit for purpose. It is succinct and covers the full range of planning policy pretty well, with the exception of heritage policy which needs addressing (see below). It does however, compared to previous national policy, leave considerable gaps of detail. Many of these are dealt with in the wide range of detailed guidance and best practice that is available from many different sources. The problem is that these are not well signposted at least in part because of the slightly obsessive requirements for the separation of policy and guidance. The need for a one-stop on-line seamless and tiered policy and guidance resource is obvious (Q1a, final bullet). The Planning Portal does not function adequately in this respect because there is no connectivity between documents.

NPPF policy should emphatically not be prioritized. The relative weight to be given to various aspects of NPPF policy varies with the circumstances of each case. Prioritization within the NPPF would distort the policy balance and lead to poor decision-making on the ground.

NPPF heritage policy does need some attention. The intentions of the heritage section are clear. But its terminology does not properly fit the requirements of the legislation.

- The assessment tool in the NPPF is “significance” while the statutory requirement is to have regard to “special architectural or historic interest”. This difference is confusing and needs to be remedied.

- Similarly, the other various heritage types covered by the NPPF have differing legislative protection and are not all well served by the policy.

- The statutory requirement to protect the setting of listed buildings is not directly covered by the NPPF but should be.

- There is inadequate policy on conservation areas which make a substantial contribution to the character of places (Q8).

4. **Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?**
Yes. A structured and tiered national spatial policy is urgently needed. At present there is little attention given to the relationship between the supply and demand for development opportunity and the impact of this on travel demand. In the south-east particularly each ring of settlements is forced to accept displaced demand from the next ring nearer the centre of London and exports its own demand to the next successive ring. The result is unsustainable travel demand and, we fear, increasing imbalances in the necessary make-up of local workforces.

What is needed is a national spatial strategy that actively promotes and resources measures to re-balance the national economy throughout England. The “Northern Powerhouse” is an example but it does need to be properly backed and resourced. In particular it needs to address how both development and travel demands are met in such a way that optimises the former and reduces the latter.

Also needed are similar strategies at city-region (Government regions and LEP areas are not a good proxy for city-regions) and local plan levels; although many local plans have a spatial dimension to some degree. Strategies for city-regions could be prepared collaboratively but would need to be binding.

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

Planning timescales depend on the nature of what is being planned. National level strategic plans need to have timescales reaching far beyond the period of a single parliament, in fact to many. This is achieved in many areas of Government planning – defence, for example – but seems to be illusive in the built environment. This requires cross-party agreement on the broad strategy to be followed.

At the local level planning policy needs to be looking forward about 10 years. But this is not helped by the complexity of local plan making. This takes so long that there are such infrequent chances for proposed development to be put forward and the public to be involved that it is necessary to consider proposals that are far from any prospect of development. With the introduction of a strategic element, with a timescale of say 20 years, the proposals aspect could be the subject of an annual review with only additions and subtractions being considered. Practising planners might say this was unachievable but annual plans are not only achievable but required in many area of public life. There doesn’t seem to be any real reason why this shouldn’t apply to planning.

Buildings and places: New and old

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level,
required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

This is a very complex problem which needs special attention. At its basis there is a fundamental economic problem which is that housing and development land have become tradable commodities predicated on rising values. This upward circle of value locks up increasing proportions of the economy in real estate. Accommodation needs are thus not being met or are subject to increasing affordability gaps.

Housing needs to be planned on a fundamental examination where houses are required, what type or range of housing is needed and how it is best funded and delivered. With the exception of the lamentably inadequate social housing programme housing is currently planned on the basis of what developers want to provide.

More effort needs to be given to the existing housing stock:

- There is far too much empty and underused property. Renewed efforts are needed to bring this into better use. Existing mechanisms are often not being used because of lack of resources.
- We have said this many times in the past, but the imposition of VAT on building maintenance but not on new-build makes timely maintenance more costly and thus less likely to be undertaken and favours new build over retention with all the release of embodied carbon that redevelopment imposes.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

The nub of this is place-making. There is no doubt that the most sustainable and resilient places tend to be those that are attractive to live and work in. The policy key should be:

- Protecting successful places from development that would undermine them, such as out-of-town retail developments.
- Prioritizing the retention and creation of local character, including heritage-led place-making.
- Making use of urban design techniques to rebuild local character where it has been lost or destroyed.

The Government's track-record on carbon use is not good. There is enormous potential for improvements given the right long-term strategy.

- The withdrawal from the 0-carbon target for new dwellings was a huge mistake. The short-sightedness of this lies in the near-universal separation of carbon use as an “in
“use” issue alone rather than a part of from the whole life-cycle analysis of development proposals. The advantages of 0-carbon housing to occupiers should be both obvious and highly marketable.

- The underlying objectives of the “Green Deal” were good and should be retained. The one-size-fits-all design and implementation of the Green Deal was not. Its failure leaves a gap for a sensible case-by-case process for improving the thermal performance of buildings that takes into account life-cycle analysis and deals with issues of repair and maintenance at the same time.

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

The obvious public appeal of heritage places makes this aspect an essential one to address:

- Improve the positive role of heritage by moving responsibility for it to the DCLG.
- Promote heritage as a tool for economic regeneration.
- Promote heritage as a facet of sustainability. The avoidance of new-build through building restoration is often the low-carbon solution.
- Emancipate the status of conservation areas. These contribute greatly to the character of places but are sadly short of adequate planning controls.
- Protect existing historic environments from damage caused by uncontrolled works including those undertaken by Highway Authorities and statutory undertakers.

Skills and design

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

Skills of the built environment industry are generally good but improvement is always desirable. The problem is that skills are not employed appropriately, often enough or resourced to the extent that will produce good results. Conservation architecture is a specific area of practice with high standards of accreditation. There may be a case for more general coverage of conservation issues in schools of architecture particularly as 40% of architectural work involves work to existing buildings. If urban design techniques were more widely used (as they should be) there would be a requirement for more training in urban design.

There is in some parts of the development industry an unfortunate blindness to the connexion between quality and value and this is worsened at present by the housing shortage in which just about anything will sell no matter how poorly designed. There is rather too much Government credence given to complaints by developers about their difficulties with planning
authorities and rather too little given to the fact that many developers are not doing the built environment any favours. Planners do not design development. They can only require good design to be provided. Developers need to recognize that high quality design adds value and is more than worth the investment. Good design takes time and that has to be resourced.

The skills levels in planning authorities have been declining in recent years with declining resources. This needs to be addressed urgently; and could be helped by the introduction of an easily accessible on-line tiered planning policy and guidance resource (Q3).

Planning authority resources have also been in decline. Since 2006 over a third of Conservation Officer posts in LPAs have been lost according to figures monitored and published by the IHBC and English Heritage/Historic England for many years. Some LPAs have no conservation resource at all. This lack of resource results in little or no advice to the owners of listed buildings:

- On their responsibilities as custodians of the nation's heritage.
- How to achieve profitable and beneficial use from listed buildings.
- How to make alterations to listed buildings to improve (for example) their thermal performance without harm to their significance or damage to their fabric.

There is grave concern that our national heritage, so important to our culture, and that supports our economy, and tourism, and that can underpin economic development is being abandoned by government and Local Authorities in order to meet short-term fiscal objectives and other LA statutory priorities.

A reformed system for Planning and Heritage Services that recognises their need for a sound and independent business and financial platform designed to meet local demand is urgently needed if we are not to miss the boat and starve developers and owners of heritage assets the support they need now to make the economy prosper.

There is a chronic shortage of building industry tradesmen skilled in the particular techniques required to maintain and restore historic and other traditionally constructed buildings. Work by the unskilled in this area often leads to further damage to the building through the use of inappropriate materials and techniques leading to further cost, loss of value and, sometimes, ill-health.

Skills could also be widely and rapidly enhanced by the formation of a new body to replace CABE (Q10)

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?
Place-making is a crucial aspect of good planning. Successive Governments have had good track records in recognizing this but, apart from commissioning reports, have taken little effective action. The Farrell Report was the latest example. The cut of funding to CABE was an enormous mistake. The enormous back-catalogue of good work and advice produced by CABE needs to be capitalized upon.

What is required is:

- A body to replace CABE's general sphere of interest and competence.
- A national commitment to design quality (and particularly urban design quality) and support for local authorities and communities that insist on it.
- Place-making requires vision – not the “vision” of truisms routinely required by mission statements and the like – but a visual plan for what a place might or ought to be like. This requires skills in urban design, which are highly developed and widely available (although insufficiently) but employed at the wider built environment level all too rarely.

**Community involvement and community impact**

11. **Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?**

This question would be a good starting point for a statutory definition of the purpose of Planning (Q1b). Its answer lies in the achievement of a structured methodology for achieving strategy, spatial distribution and quality in the built environment. There has, over the years, been much urban design research and guidance on the built environment from the user perspective. This should be brought up to date and built upon.

12. **How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?**

Community involvement can be a very effective tool, but it does rely on communities having the resources of time and skills to engage at the required level. Many communities have poor experiences of planning limited to campaigns against what they see as predatory development. Improvements might be:

- Continuing to build of the increasing success of neighbourhood planning.
• Bearing in mind that many communities do not have the capacity for neighbourhood planning, introduce a template for the expression of community aspirations to be adopted as SPD and given weight in planning decisions.

Financial measures

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

This is not an area of expertise to us. However, it does appear that there is a disconnect between the value of development land and the viability of the development that the community needs. Too often open-market land values are so high that no development is possible other than that which meets demand far beyond the means of community needs. There have been various attempts at regulating development land value in the past all of which have failed because they were not given long enough to succeed and/or did not meet political strictures.

It needs to be remembered that development land has its high value mainly because of the limited supply of development land created by the planning system. It is reasonable that the public policy that gives rise to the value is able to recoup some of it.

Land value is the main financial variable in the development equation. It is a major failing of the development process that land values are set early in the development process, often before any planning requirements or site constraints are known let alone allowed for. This means that other considerations are starved of resources. Design quality, affordable housing, 0-carbon have all suffered as a result. The only real way out of this is to give planning real teeth: the ability to set high standards and, if the developer will not meet them, compulsory purchase powers at land values that allow the development of the required standard to proceed.

Another way forward might be to give more power to development plans to set the land use at a finer scale than “housing”. Local plans with proper teeth to prescribe the nature of housing development that will be permitted. In time (and it will take time for land-owners with over-optimistic aspirations) the rates at which development land changes hand might become realistic.

CIL is a good tool in the right places. However it does not deliver adequate resources in areas where project viability is fragile. Infrastructure provision in less well off areas needs proper resources.

Pre-application advice should be free. To fund it and promote its use the cost of providing the service should be built into planning application fees. It should be publicised as being part of the planning process designed to add value and reduce abortive costs on unsatisfactory proposals.
The Institution of Structural Engineers – Written Evidence (BEN0033)

Comments from the Institution of Structural Engineers

The Institution of Structural Engineers represents a body of professionally qualified engineers that works to assure safety, efficiency, quality and value for money in the buildings that constitute our built environment. Structural Engineers work very closely with many other professionals in the creation and assurance of a vibrant and sustainable environment for business, education, health and culture in people’s lives. As with all professions working in this field, a national policy will help us ensure that our talent and value to society is best focussed on achieving the high value that our skills make possible. This will be a significant step forward for the planning of the country’s future.

We welcome the consultation that the House of Lord’s Select Committee is undertaking and wish to advise that in our view a National Policy for the Built Environment is essential, to bring together all the factors needed for a thriving nation: transport, energy, waste and water infrastructure, housing, public buildings, towns and cities. Policy should set out a clear vision for our national built infrastructure; how it will contribute to our prosperity and well-being. It should also set out a support structure (national and regional governance) and economic model (public/private partnering) that will be able to underpin private and public enterprise to deliver the vision. There is scope for the government to make a big impact through target-setting and standard-setting, to ensure a better-performing built environment.

Our response has been shaped through collaborative dialogue with other professional bodies both singly and through the umbrella groupings of the Royal Academy of Engineering and the Construction Industry Council.

Questions

Policymaking, Integration and coordination

Question 1: Decisions that shape England’s built environment should be made at levels where they are made by people with the understanding of local need and capacity. Local authorities continue to have their place, but as a nation the biggest decisions that set a long-term vision and set standards for performance, priorities for decision-making, socio-economic priorities across the country need to be established nationally by Policy.

Question 2: Policy across Government departments is poorly coordinated. This is unsurprising as there is no national policy for the built environment. This would give the essential integrating guidance to departments. This would be further strengthened by the appointment of a Chief Advisor for the Built Environment who would represent the policy and ensure development of sound guidelines towards improved performance.
National Policy for planning and the built environment

**Question 3:** We believe that the NPPF does not set a sufficiently clear vision or set of policy priorities. Therefore it does not help resolve the priorities, for instance judging between well-being of people and preservation of nature or conservation against renewal.

**Question 4:** National policy in England does lack a spatial perspective. Introducing such a perspective to national policy would enable our government to set clearer geographic priorities based on clear socio-economic data. Decisions would be based on assessments of socio-economic impact of projects and performance improvements could be predicted. Increased collection of strategic data would allow spatial modelling across cities and regions leading to more evidence-based decision-making.

**Question 5:** The lead time for development can be measured in decades rather than years. New transport infrastructure and major urban development needs to be planned 25 years ahead. More local developments for our towns and villages can still take 5 to 10 years to delivery. There needs to be a proper integration of economic policy with built environment policy that looks at least 25 years ahead within which shorter term planning decisions can be set out with greater assurance of obtaining the desired outcomes.

**Buildings and places: New and old**

**Question 6:** The government needs to act more effectively to require approved plans to be developed in their entirety within five years of approval to commence. More local community engagement in setting local planning guidelines will be helpful to create a nation-wide active population taking close interest in their local community. Local and regional plans need to sit within a National Policy framework to ensure that they are coherent and synergetic.

A National Policy should also address the failure for developers to develop land that has been agreed as suitable for development in the local plan but is being “land-banked” whilst recognising the commercial imperatives in a free market economy. There never-the-less must be incentives or penalties for failure to deliver development that is needed and agreed as appropriate.

**Question 7:** Communities become more resilient when they come together, take an active interest in their community and have the structure that permits action/reaction to events. Creating plans for action during extreme events is an essential part of raising reliance to unexpected events. A policy for the Built Environment should include plans to increase awareness and planning for extreme events through local community connectivity.

All this needs a masterplan for the built environment. The national infrastructure needs to be mapped in a comprehensive way and data on its operation needs to be pooled. In the longer term there needs to be a national model (a real time responsive model for its infrastructure and people) that allows scenarios to be tested and responses agreed.

Existing buildings need to be made to work better and harder. There needs to be a programme for upgrading our building stock. We need to make demolition less attractive a proposition
and make renovation refurbishment more acceptable. We need legislation that demands high quality construction that achieves agreed energy and carbon targets. We need a national standard measure of sustainable construction that applies to refurbished buildings as well as new construction and that revisits performance every five years as part of a national building performance data bank.

**Question 8:** The historic environment, both man-made and natural, has recognised value to the well-being of people and the success of the UK tourist industry. National assets such as these need to be planned as an integral part of our total built environment. They need not be preserved in aspic but be preserved within their complete context. To be valued they need to be valuable. This means old buildings have to have valid reasons for being, not just as museums or visitor attractions but as places of work, education or entertainment that bring life to historic parts of our built environment. A policy would need to address this integrated approach that accepts preservation alongside alteration, extension and renewal in important inner-city areas to maintain vibrancy.

In addition we would recommend further funding to research into the refurbishment of old building stock to reduce energy consumption and prolong useful life. New technological developments are beginning to make this more affordable but this needs to become a more concerted campaign for action. There is a great deal of value in terms of money and environmental benefits.

**Skills and Design**

**Question 9:** Our professions within the Built Environment are well-skilled and diverse but they do not integrate well enough. Better integrated professionals will help achieve a more efficient and effective industry. The CIC represents these professions to government. The skills that are missing are those that can see the bigger picture and understand the holistic nature of problems and solutions. Cross-disciplinary working is essential. Cross-disciplinary training at University would be a great step forwards. We need more awareness and skill in the creation of a better, more integrated and productive built environment.

A national policy will give local authorities a framework for local policy responses. But they will need to have the capability to drive this response in partnership with industry. Training as professionals responsible for the coordinated response to the design of the built environment will be essential – we must aim for something that will be a leap forward in its ambition and ability to deliver.

The government’s national leadership and mandating the use of BIM has been effective. Having a Chief Construction Advisor was regarded by the sector as a big asset but perhaps one that failed to engage strongly enough with government policy. A policy for the Built Environment will change everything and will give a Chief Adviser for the Built Environment a stronger platform and purpose; to advise government on delivery of a built environment sector that reforms around the agreed policy. Government Policy should continue to raise expectations from the digital revolution – from better coordinated data gathering, data sharing and ease of access, intelligent use of the data to improve our understanding and
ability to model outcomes. Government should set high standards for city governance and management – and seek to devolve authority and financial resources where they can.

**Question 10:** High quality design and place-making is crucial to enhance health and well-being, productivity and competitive economic growth. It is essential to have infrastructure that is well planned to serve predicted needs, buildings that are well designed with the human needs at the centre of the design and efficient use of resources being an integral part of their construction. Building and Infrastructure Information Modelling (BIIM) can raise the game in all these areas but there needs to be a shift of emphasis to include social impact. We have tools now that allow us to measure and predict human responses to their environment. National leadership can enhance the development of these capabilities and make the UK take the lead in human-centred design. They can ensure that a policy for the Built Environment is driven by standards of human-centred performance – not just lowest capital cost or even lowest carbon cost but also balanced with highest human benefit. This is true sustainability.

A national policy could review procurement routes and try to generate standards that are adhered to rather than made bespoke. Engaging with the manufacturers and contractors from the outset on projects can reduce costs, home in to the optimum solutions for all involved early in the process and achieve better end results through the simple process of teamwork. The goal needs to be value for money which includes quality of the outcome.

**Community involvement and community impact**

**Question 11:** We are not yet taking full advantages of the skills available to measure and model the impact that the built environment has on people. We are now in a position to measure the performance of our buildings in an holistic sense. Such data, turned into information and then into knowledge and understanding, would be an enormously valuable resource for the education of all professions in the built environment at all stages of their career. The opportunities in front of us are immense. We need to gather more data around the impact of buildings on people and their performance. The government should invest in a data gathering programme in public buildings such as hospitals and schools and build up a critically needed data bank on building performance and human impact. This will be of enormous value in providing base data for better designs based on performance and social impact. Those currently involved in delivering and managing the built environment do not have the information that they need to make informed decisions. Designers need this so that they can advise those procuring or managing existing facilities. Universities need to work with industry, through centres of learning and teaching. This is an opportunity that “big data” provides – but the government can help initiate the collection of more data to allow designers to move into the next phase of human centred design.

We need the data as the starting point and this should be a big part of the new Policy – mandating the collection and sharing of data and the use of it in better understanding of how we can improve performance and use policy to drive these improvements.

**Question 12:** People are becoming increasingly aware of the built environment around them and whether it is “good or bad”. They have less time when they are likely to volunteer to
engage in decision making processes such as public meetings and votes. But virtual meetings and secure on-line voting can make a big difference. By introducing more enabling and accessible on line information. Communities need access to good facilities with which to present their ideas and be confident people have understood them.

**Financial Measures**

**Question 13:** National Policy should address the challenge of un-developed land banks where “market-forces” preclude development that would be in the best interests of the community and national economy. In addition Policy should consider a levy on demolition to ensure that retention and renewal is given proper consideration ahead of whole-sale demolition. There needs to be an infrastructure and buildings policy that sets standards for all government development projects and includes consideration of long term social well-being and impact of developments as well as short term economic drivers.

*01 October 2015*
Dr Isaac Jamieson, Dr Erica Mallery-Blythe – Written Evidence (BEN0216)

There many planning issues that need to be addressed in order to create the maximum benefits for the country and its inhabitants.

1. ELECTROMAGNETIC RADIATION AND THE DESIGN OF THE BUILT ENVIRONMENT
Mains frequency magnetic fields and radiofrequency electromagnetic fields (RF EMFs) are classified as group 2B carcinogens (WHO/IARC 2011, 2002). Recently there have been calls to upgrade RF EMFs to a group 2A, or even a group 1 carcinogen (Morgan et al. 2015, Hardell & Carlberg 2013). There is also evidence excess electrostatic charge and mains frequency electric fields can negatively impact health at levels that can be encountered in the built environment (Jamieson 2014, Jamieson et al. 2010). Appropriate design of the built environment can greatly reduce such risks.

THE INSURANCE INDUSTRY PERSPECTIVE
Many insurance companies (including those providing cover for architectural and engineering firms) are now refusing to cover claims linked with electromagnetic radiation (EMR) (AVIVA 2015, HCC 2015, Hiscox PLC 2015). This development will greatly influence how the built environment is designed. Appropriate guidance, including best practice measures, are required within planning policies to reflect this change.

Already legal actions are being won for individuals who have had their health damaged by electromagnetic pollution (BBC 2015, GSMA 2013, WEEP News 2011). [Electrohypersensitivity [EHS] can be identified using disease biomarkers (Belpomme et al. 2015)].

BACKGROUND INFORMATION

![Number of studies on EMF impacts collected & collated based on study subjects & results (Rahmani et al. 2011)](chart.png)

Figure 1: The majority of peer-reviewed EMF papers indicate biological effects.

The review undertaken of 919 studies by Rahmani et al. (2011) revealed that the majority of studies on electromagnetic fields (EMFs) report biological effects as a result of exposure (Figure 1).
Similar findings were made in the review of 113 RF EMF studies by Cucurachi et al. (2013) [where around two thirds documented effects], and the review by Yakymenko et al. (2015), related to low intensity RF radiation (RFR), which found that: “... among 100 currently available peer-reviewed studies dealing with oxidative effects of low-intensity RFR, in general, 93 confirmed that RFR induces oxidative effects in biological systems.” [There are both direct and indirect connections between oxidative stress and around 200 human diseases. Oxidative stress is also recognised as a contributing factor to aging (Hybertson et al. 2011)]. The provision of healthier EMF environments should be part of National Planning policy to better protect both humans and the environment.

OPINIONS GIVEN ON ENVIRONMENTAL EMR EXPOSURES

PROFESSOR PAOLO VECCHIA AND ICNIRP

“... the ICNIRP guidelines are neither mandatory prescriptions for safety, the “last word” on the issue nor are they defensive walls for Industry or others,” Professor Paolo Vecchia [ICNIRP Chairman from 2004-2012] (Vecchia 2008). “... children, the elderly, and some chronically ill people might have a lower tolerance for one or more forms of [non-ionising radiation] exposure than the rest of the population,” (ICNIRP 2002). [Note: The UK presently adheres to ICNIRP (1998) guidelines].

TELECOMMUNICATIONS INDUSTRY

Members of the telecommunications industry too appear to have concerns over EMFs: "I want to be very clear. Industry has not said once - once - that ... [RF / microwave radiation is] safe. The federal government and various interagency working groups have said it is safe," K. Dane Snowden [when Vice President, External & State Affairs of CTIA-The Wireless Association. The CTIA is the International Association for the Wireless Telecommunications Industry] (Safeschool 2010).

Additionally, a major telecommunications provider is on record as stating: “The influence of electrosmog on the human body is a known problem. ... The risk of damage to health through electrosmog has also become better understood ... When, for example, human blood cells are irradiated with electromagnetic fields, clear damage to hereditary material has been demonstrated and there have been indications of an increased cancer risk,” Swisscom AG (2003).

SCIENTISTS

The above health-related concerns are shared by a growing number of scientists:

In 2015 an international appeal that has now been signed by over 200 scientists was submitted to the United Nations, UN member states and the WHO requesting that more protective EMF exposure guidelines be adopted (EMFscientist.org 2015).

ADVERSE HEALTH CONDITIONS LINKED WITH EMR

An increasing number of studies indicate adverse health effects as a result of environmental exposure to electromagnetic pollution. There is substantial evidence
indicating that even low intensity EMF exposures can cause ill health. Conditions linked with environmental EMF exposures include:

- **Cancer** (Coureau et al. 2014, Moon et al. 2014, Hardell & Carlberg 2013); **Alzheimer’s disease** (Davanipour & Sobel 2009, Huss et al. 2009); **Childhood & adult leukaemia** (Dolk et al. 1997, Hocking 1996); **Autism** (Herbert & Sage 2012, Kane 2004); **Immune system effects** (Boscolo et al. 2001, Novoselova et al. 1999); **Miscarriage** (Li et al. 2002); **Infertility** (Avendaño et al. 2010, Otitoloju et al. 2010, Aitken & De Iuliis 2007); **Asthma** (Jamieson et al. 2010, Bach 1967); **DNA damage** (De Iuliis et al. 2009, REFLEX 2004); **Oxidative stress** (Kumar et al. 2012, Agarwal et al. 2009, Ilhan et al. 2004).

We suggest the cost to the National Economy of “electromagnetic pollution” runs into many billions of pounds in terms of reduced health, wellbeing and productivity. This situation can be reversed.

**SLEEP QUALITY:** The annual cost to the UK of chronic sleep deprivation has been estimated at £1.6 billion (Bupa 2010). Many studies indicate that individuals sleep better in environments with very low EMF levels compared to those with even slightly raised EMF levels. As examples: **Improved sleep has been noted in low-field environments** with exposures of 0.05-0.22 V/m (0.0006-0.0128 µW/cm²) compared to 0.25-1.29 V/m (0.0165-0.4400 µW/cm²) (Oberfeld et al. 2004) and for 0.7 V/m exposures compared to 1.17 V/m exposures (Eger & Jahn 2010).

Sleep problems have been reported after wireless smart meter roll-outs which increase individuals EMF exposures 24/7 (Lamech 2014, Conrad & Friedman 2013, Halteman 2011). [Contrary to popular belief, smart meters are not compulsory (StopSmartMeters!UK 2014, Hansard 2011)].

Additionally, a dose-response relationship has been shown between sleep-related fatigue and injuries (Swaen et al. 2003), and almost 20% of all serious car crash injuries are associated with driver sleepiness (Connor et al. 2002).

Promoting the creation of low EMF building layouts and environments, and the specification of low EMF technologies, as a matter of best practice would help significantly reduce sleep deprivation, thereby improving health, wellbeing and productivity.

**DEPRESSION:** Suicide is the leading cause of death in England and Wales for men between 20-49 years old, and one of the main causes of death among 5-19 year olds (ONS Digital 2015). Depression is a gigantic public health burden that exceeds other common sources of morbidity and mortality. [In England in 2000, the annual cost of depression was estimated to be £9 billion (Thomas & Morris 2003)]. **Individuals with depression are at heightened risk of: Alzheimer’s disease; Cancer; Diabetes (type 2); Epilepsy; Obesity; and Stroke** (BC’s Physicians 2009).
Oberfeld et al. (2004) noted depressive tendency with 900/1800 MHz exposures of 0.25-1.29 V/m (0.0165-0.4400 μW/cm²) compared to 0.05-0.22 V/m (0.0006-0.0128 μW/cm²) \( (p = 0.0016) \). Others have made similar findings (Eger & Jahn 2010, Bortkiewicz et al. 2004, Santini et al. 2002). [Many wireless smart meters create RF EMF exposure levels above those associated with increased depressive tendency].

EFFECTS OF EMR ON BIODIVERSITY: Creating more natural built environments can be cost effective, increase biodiversity and be highly beneficial on many levels. Unfortunately, Nature too can be adversely affected by electromagnetic pollution. As examples:

**Ants:** Ants perform many vital services including: pollination, predation and seed removal and dispersion. Exposures of 0.0795 μW/cm² significantly inhibited memories and association between food sites and visual and olfactory cues. The overall state in exposed colonies appeared similar to bee colony collapse disorder (CCD) (Cammaerts et al. 2012). [Effects of on pollinators, such as bees, have also been reported (Rahmani et al. 2011)].

**Birds:** “... migratory birds are unable to use their magnetic compass in the presence of urban electromagnetic noise,” Engels et al. (2014). The RF levels assessed [0.001 μT, approximately equal to 0.3 V/m or 0.0236 μW/cm²] are similar to the levels found in the 2 kHz to 5 MHz frequency range in urban environments as a result of electromagnetic pollution.

**Mice:** Mice and rats can act as pollinators and form an important part in Nature’s food chain (Pattemore & Wilcove 2012). Exposure to 80-900 MHz radiation at 1.053 μW/cm² could cause irreversible infertility in mice after 3 generations, and levels of 0.168 μW/cm² caused total infertility after 5 generations (Magras & Zenos 1997). As mentioned earlier, research has additionally shown that EMFs can reduce human fertility (Avendaño et al. 2012, Falzone et al. 2011, Santini et al. 2002).

Revised planning and building guidelines that feature low EMF initiatives, and promote the use of the most biologically friendly types of technology and exposures, are urgently required to help protect the environment and help create the most viable long-term sustainability initiatives.

EMF EXPOSURE GUIDELINES AND BEST PRACTICE
The UK presently adheres to the ICNIRP (1998) exposure guidelines, which are amongst the most lax in the World, i.e. maximum permitted RF EMF exposures to the general public of 1000 μW/cm² at 2.1 GHz, compared to: 10 μW/cm² in Italy for sensitive areas [dwellings; playgrounds; school premises; areas where people spend ≥4 hours daily]; 10 μW/cm² in China as 1st class exposure limits [>0.3-300 GHz]; and a maximum power density level per carrier of 0.1 μW/cm² in Castilla-La Mancha, Spain for sensitive areas (President of the Council of Ministers 2013, Chiang 2009, Presidencia de la Junta 2001, ICNIRP 1998).
In China, out of 109 epidemiological studies, 108 noted biological effects as a result of EMF exposure. “No matter what the exposure level may be, lower or higher than [the Chinese] EMF exposure limits for public, health effects had been reported in these papers…” Cao (2007).

Over 44% of the World’s population live in countries or regions that have substantially more rigorous EMF exposure limits and non-binding EMF exposure recommendations than ICNIRP’s guidelines (Jamieson 2014). It would be prudent and wise to introduce proactive best practice measures to reduce electromagnetic pollution in the built environment wherever practical. Such initiatives are already being undertaken elsewhere. As an example, Italy aims “… to progressively minimise exposure to electromagnetic fields,” President of the Council of Ministers (2013). The latest country to promote low field environments is France, which in 2015 passed a proposed law prohibiting the use of Wi-Fi in nursery and daycare settings and restricting its use in primary schools (Assemblée Nationale 2015). In Russia there is already planning guidance in place showing how the layout of rooms and items within them can be improved to reduce occupants EMF exposures (Jamieson 2014). Ideally, EMF field templates should be developed for distinct items of electrical equipment to allow appropriate separation distances to be planned & their locations optimised.

The Council of Europe’s Resolution 1815 (PACE 2011) suggests that all reasonable measures should be taken to reduce exposure to electromagnetic pollution. In the design of the built environment, such measures include the creation and development of low EMF environments and technologies and improved low EMF layouts for rooms.

PROMOTION OF INCLUSIVE DESIGN MEASURES
INCLUSIVE DESIGN – ACCESSIBILITY REQUIREMENTS
“For people who are electromagnetically sensitive, the presence of cell phones and towers, portable telephones, computers, fluorescent lighting, unshielded transformers and wiring, battery re-chargers, wireless devices, security and scanning equipment, microwave ovens, electric ranges and numerous other electrical appliances can make a building inaccessible. … the Committee recommends that measures be taken to reduce EMF whenever possible in order to increase access for these individuals as well as taking a precautionary approach to protecting the health of all,” US National Institute of Building Sciences, (NIBS 2005).

The Parliamentary Report prepared by Lobb et al. (2015) for the Parliament of Canada states: “That the Government of Canada continue to provide reasonable accommodations for environmental sensitivities, including electromagnetic hypersensitivity, as required under the Canadian Human Rights Act.” It is proposed that the need to comply with such basic Human Rights should be stipulated in the National Policy for the Built Environment. [For further discussion refer to the supplementary information provided].
Between 3-6% of the general public may presently be affected by EHS, a number well in excess of the 1-2% of the population using wheelchairs (Jamieson 2014, Wheelchair 2015). It is predicted that such numbers will substantially grow in the future (Hallberg & Oberfeld 2006). Measures to address EHS could easily be added to inclusive design protocols. Many measures to create low EMF environments are no cost / low cost.

“Electromagnetic hypersensitivity sufferers experience a serious deterioration in their quality of life, not only because of the physical symptoms it usually entails, but also because their lives are totally disrupted by the need to avoid exposure. In practice, it means that they not only have to avoid almost all public facilities such as transport, hospitals and libraries, but even their own homes, in order to escape adverse health effects, which is a breach of rights that are enshrined in the EU Charter of Fundamental Rights,” (EESC 2014). Such matters have to be addressed through the creation of low EMF environments and biologically safe technologies.

We proposed that planning policy guidelines should stipulate the requirement for creating low EMF environments and ‘White Zones’. The creation of ‘White Zones’, particularly when run in conjunction with biophilic initiatives, would create the further benefit through encouraging biodiversity.

2. ADDRESSING TIER 1 THREATS IN NATIONAL PLANNING POLICY

Severe Weather Events, Manmade EMP Events and Cyber-Attack Events

The creation of low EMF environments and ‘White Zones’ could additionally form a starting point in helping protect buildings (and the built environment in general) against potential events that the UK Government already recognise as Tier 1 threats.

A. TERRESTRIAL SEVERE WEATHER EVENTS

It appears highly probable that terrestrial severe weather events will at some point compromise unprotected modern electronic technologies. As an example, smart meters have far lower resilience to severe weather events than the meters they were intended to replace (Jamieson 2012). Their widespread use could cause severe disruption and loss of life [due to sudden loss of power for heating or cooling during such events] due to their being designed to automatically disconnect when they fail. As mentioned earlier, contrary to popular belief, smart meters are not compulsory (StopSmartMetersUK 2014, Hansard 2011).

B. NATURAL AND MANMADE ELECTROMAGNETIC PULSE [EMP] EVENTS

Space weather electromagnetic pulse [EMP] events present a very real threat to the built environment as they can knock out power supplies and electronic devices. It has been suggested by the Royal Academy of Engineering (2013) that any component with a design lifetime of greater than 8.25 years needs to consider the threat of severe space weather. Manmade EMP events can also be created that would bring the country, or selected areas of the country, to a standstill and potentially result in high financial loss and high loss of life. Both are recognised as Tier 1 threats (House of Commons Defence Committee 2012). Proper protective
measures against such threats need to be included in national and local planning policies.

**Proposed EMP protection plan**

**Tier 1:** EMP protection for new build homes, offices, major shops and hospitals, with EMP-protected solar panels for on-site power generation. EMP protection of critical infrastructures.

**Tier 2:** Refurbishment of existing building stock to provide EMP protection. **At least one room per building to be shielded.** Also external EMP-protected solar panels, or other protected means of sustainable on-site energy production encouraged.

**Tier 3:** Lower income dwellings to have one room EMP shielded and external EMP-protected solar panels to provide on-site power.

**EMP-protected solar energy generation to become the design norm.** Refer also to: White (2015).

[Note: As it is indicated that long-term occupation of Faraday cage like enclosures can be harmful to immune system function (Jamieson et al. 2010), special design measures are required for EMP protected buildings].

**C. CYBER THREATS**

Cyber threats, which could cause whole areas to be without power and basic services for prolonged periods of time, urgently need to be addressed within the National Policy for the Built Environment. They present a Tier 1 threat (Gov.UK 2015).

"**The current attack surface for [smart] cities is huge and wide open to attack. This is a real and immediate danger. The more technology a city uses, the more vulnerable to cyber attacks it is, so the smartest cities have the highest risks**" (Cerrudo 2015). Most cities are poorly protected against cyber attacks, and are at risk of high financial loss through lack of adequate contingency planning.

"**In the near future, smart power or water meters could become targets, to black out an area of a city and demand a ransom ...**" (Flanagan 2015).

The intelligent provision of energy efficient low-tech systems and independent off-line smart systems in the design of the built environment can provide highly cost effective alternatives and help address many cyber threats.

**IMPROVING THE RESILIENCE OF THE BUILT ENVIRONMENT**

We propose that 20% of all developments should be created as EMP-shielded, low EMF environments with hard-wired connectivity and manual overrides to help address EMP events and cyber threats. Such provision will also enable low EMF zones for those who are EHS to be easily established.
We also suggest that in order to properly increase community resilience to natural and manmade threats, the creation of urban farms (including vertical farms and rooftop farms) and power provisions should be encouraged to allow the provision of locally sourced food, water and energy (at least at emergency ration level) in times of emergency.

Additionally, the extended promotion of biophilic design initiatives could help substantially reduce storm water runoff, heat island effects and levels of airborne pollutants. [The greening of street canyons with building integrated vegetation (BIV) can reduce street-level NO2 levels by as much as 40% and airborne particulate matter (PM) levels by ≥60% (Pugh et al. 2012)].

Resilient design policies and best practice measures should encourage the standard adoption of measures to enable basic energy, food and water provision to be maintained in areas should power and electronics fail for prolonged periods of time, and the creation of more sustainable environments and technologies to aid health, wellbeing and productivity.

3. ETHICAL, ENVIRONMENTAL AND SUSTAINABILITY ISSUES

Properly addressing ethical, environmental and sustainability issues delivers considerably better long-term financial returns on equity and returns of assets than failing to address such issues. High sustainability companies significantly outperform their low sustainability rivals. The same should hold true for countries (Juniper 2013, Eccles et al. 2011).

The ethical creation of safer, more biosustainable built environments and technologies that respect the rights of the individual can create substantial long-term benefits for all. A ‘Win/Win’ situation.

02 December 2015
Response by the Joint Parishes Group, Maidstone, Kent.

1. The JPG is a consortium of some sixteen Parish Councils representing over 25,000 people within the District of Maidstone Borough Council. We extend from Detling, Thurnham and Stockbury in the North Downs AONB to Headcorn in the Low Weald SLA. We have been a Rule 6 party to the Public Inquiry into the KIG development and more recently to the Waterside Park Inquiry at Junction 8/M.20 adjacent to Leeds Castle.

2. We are grateful for the opportunity to offer a summary of our evidence to the Select Committee. We would be pleased to assist the Committee further, if requested.

Preamble and overall Legislative comment;

3. The Local Government Act 1972 provided for the creation of new Districts, which subsumed the old Rural District Councils. In the instant case, the two larger (geographical and population) RDCs were merged into the smaller town borough. This caused an immutable fracture between town and country, which leads to the current “urban centric” perspective for the District.

4. Effective governance at all levels requires balances and checks. The King ruled, “sub Deo, sub lege”. Such constraints are absent from current Policy.

5. As a rural based community in Kent *(The Garden of England, where fruit growing is an important occupation)* we are acutely conscious of the need to husband natural resources; land use, scarce water resources, land drainage and waste water disposal and the need for the optimum long term use of agricultural land and the increase of UK food production. All these factors do not seem to be appreciated by urban centric planners.

Policymaking, integration and coordination; questions 1 & 2:
6. There is a fundamental flaw in the system. Put simply; it is not working.

7. At the heart of this is the dichotomy between Central Government and two tiers of Local Government [County and District]. This is the wrong emphasis and ignores the overall aspirations, well being and holistic survival of the local community.

8. Policies are often over simplified and rely upon local delegation for implementation. Where this fails to happen, there is no solution.

9. For example, the Parish Councils sought co-operation with the DC in developing Neighbourhood Plans and evolving the Local Plan. Despite specific grants from the DCLG this did not proceed satisfactorily.

10. One resiles from yet further QUANGOS and the Regional Authorities, yet there is a failure of strategic implementation. DC’s do not look outside their own boundary. As an interim measure the County Council could provide a coordinated approach.

National policy for planning and the built environment; questions 3, 4 & 5:

11. The NPPF is a document with a noble and laudable aim. However, it is all too frequently ignored by the DC or selectively quoted. It has done nothing to improve or simplify planning decisions. All pretence of Localism has been abandoned. The natural environment is suffering as a consequence. This will lead to long term issues.

12. National Planning in England does lack a spatial perspective. On this aspect there is an institutional inertia and lack of engagement at DC level. A recent international exhibition at the RA [ROYAL ACADEMY, April 2015] demonstrated the unique possibilities for innovative modelling in spatial perspectives for new house building. In England, this is absent and we have the common form modelling by mass production house builders. All this ignores the holistic approach for creating “communities” and the vain rush to meet “housing targets” ignores the considerable accumulation of future problems.
13. The built environment cannot be divorced from the natural environment. From our land use policies the countryman looks to a fifty or seventy-five year timescale. Clearly, building needs will fluctuate, but there must be an ecological synergy between the two requirements.

Buildings and places: New and Old; Questions 6, 7 & 8;

14. A facile and sound bite reply would be to suggest that Government should actively be involved in building vast new estates, particularly in the South East. This would be mistaken.

15. There needs to be attention to fiscal mattes; CGT and Stamp Duty. This inhibits persons who wish to downsize or to realise assets upon retirement.

16. Again, there should be a correlation of jobs // housing. We need more rural based housing; analogous to the “Workman’s Cottage” for indigenous needs. There is too ready an acceptance for unlimited house building in the South East; pace, the London Dormitory. There should be a parallel development of infrastructure. Within the last five years, The growth in Kent exceeded London. While Maidstone housing growth far exceeds the individual entirety of the Kent Districts or the Unitary Authority of Medway; which is treble the size.

17. There is considerable housing stock in the Northern cities, which could be renovated and restored.

18. We need to champion tourism. At present lip-service is paid to it. However, the rural economy depends upon attractiveness of rural villages, the easy and cost effective availability of B&B and ranges of hotel; together with convenient access.

19. There is a key role here for Parish Councils.

We had a recent example of the DC wanting to enlager the national treasure of Leeds Castle with a “campus type industrial park”.
20. Equally, some historic sites while in private hands, could be encouraged into the wider historic family. Somehow these treasures need to be unlocked and more readily accessible.

Skills and design; Questions 9 & 10;

21. The immediate answer is; NO, the professional do not have the individual skills to adequately consider the built environment in a holistic manner.

22. Consider for a moment why one journeys to Greece, Italy, and Turkey etc. It is to see and admire the holistic skills of ancient town planners in constructing the “polis”. Would one journey to England to view a modern urban extension?

23. Upon evidence, it would appear that Local Authorities do not have access to the skills and resources required to plan, shape and manage the built environment in their areas. Every planning applications is always prefaced by the weasel words—High quality design--.

24. The results for the built environment are appalling and a national disgrace.

In reality, the planning section of the large House Builders/Developers appear to set the tone. These are bland, mass produced, and indifferent to their surroundings and are dictated by optimum financial return.

More expressions, such as the work of HRH the Prince of Wales at Poundbury are to be welcomed.

25. Exhibitions at the RA bring home the excellence and high quality design of world leading British architects, designers and engineers. Unfortunately, this seems to be for “Export Only”.

Community involvement and community impact: Questions 11 & 12;
26. There is a lack of consideration of the rural environment, but like plastic bags & other detritus in the oceans this is going to catch up following the onward and unbridled urban expansion.

The old adage too often applies—it is cheaper to build on a Greenfield site, literally – yet you cannot just go on leaving scarred brownfield sites.

27. It is quite clear that DCs or other the planning authority give short shrift to the reasoned views of Parish Councils, or other local groups, CPRE, Residents and Community Associations.

28. Perhaps, Parish Councils should be afforded a right of appeal to PINS against bad planning decisions by the DC. This must be on a “no costs permitted” rule.

Financial measures: Question 13;

29. There should be a fiscal easing in Stamp Duty and CGT. Most Affordable Housing should be concentrated in Towns for that is where public transport connections and jobs are more available. There should be financial concessions to enable young people from villages to afford a first step towards a village based home.

30. Again, the Joint Parishes Group wish to thank the Select Committee for the opportunity to present this Memorial.

JN Horne

For & on Behalf of the Joint Parishes Group.

15 October 2015
Transcript to be found under British Land
Principle concerns of this submission: Housing, sustainability and Heritage

Green spaces and interactive spaces when houses are being built should become mandatory such as green roofs and communal growing spaces when gardens do not exist. Flood mitigation can also be integrated in the design of ground maintenance.

Currently installing green roofs on buildings is an opportunity being missed on many new builds where installing from initial building phase is far more financially feasible then retrofitting the roofs. Green roofs will lengthen the lifespan of a roof and reduce energy bills for the tenants and therefore be advantageous.

Installing Community Gardens when designing grounds are simple and can be an opportunity for community interaction particularly for older residents.

- Proposal: make bio diverse green roofs mandatory on all low lying roofs and sedum roofs mandatory on all high rise roofs which have no access.
- Where access is feasible for residents on roofs there should be roof gardens or bio diverse roofs.
- Planners and Builders can learn the skills realistically in 5 years and this should be looked into as policy for 2020.
- Trade networks can be developed in the space of 5-7 years reducing costs.
- Advantages are that the urban heat island effect is reduced significantly as evidenced in Soho, London.
- Residents become more aware of urban nature and can benefit from the health benefits.
- Communal gardening can benefit health bringing residents outdoors at times of good weather where they can meet one another.
- When installing trees consideration of those with respiratory problems need addressing. Plain trees are causing many problems for Londoners who didn’t previously have any respiratory issues and revision of the policy for keeping these trees should be looked at. I suggest removing them where there is reasonable request from residents.
- Local people should be involved with the planning and design phase where possible. Either one apprentice, one advisor and a group of concerned resident involved from the beginning.
- Visible depictions of local history and heritage should be open for all to see in old and new builds where opportunities for learning and increasing local honour can be achieved.

03 August 2015
2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

(a) The Kew Society is aware of difficulties in acquiring suitable locations for the siting of new schools needed as the population of London grows and land prices rise. We are looking at a current proposal for siting a new Free School, the Deer Park School, in a poor location on the busy A316. The Education Funding Agency, responsible for site acquisition, was not able to find any sites that were affordable and close to the areas most affected by rising demand for school places. This was due in part to high land value in the borough, which made the cost of acquiring many appropriate sites prohibitively high. Our local MP and Council officials agree that the location proposed is sub-optimal because of likely levels of air pollution and traffic congestion in an adjacent residential street likely to be the dropping off point for children. We have yet to see a planning application for this site but have been told in a public consultation meeting that the play area is likely to be on the roof of the new building. The EFA funding for site acquisition in London needs to be reviewed so that facilities can be built in appropriate locations suitable for children and taking account of public health policies on the health consequences of poor air quality, a particularly acute problem in Greater London.

(b) The Kew Society supported Richmond Council’s policy on affordable housing and commented on the draft policy to say our main concern was whether the policy could be implemented in practice. The policy projected that 50% of new units would represent affordable housing. In 2013-14, only 14% of completed housing units in the borough were classed as affordable. Richmond Council was nearest to approaching its affordable housing target in 2011-12, when 36% of new housing units were affordable. The high value of land in the area is clearly affecting the ability of the Council to meet its targets. Developers of large sites have successfully argued that schemes are not financially viable if affordable housing is included. The largest recent scheme, at the Old Inland Revenue site (Richmond Council ref 14/1488/FUL) was approved with only 16% affordable units. Laudable polices on housing are clearly not being delivered. Nor is the community allowed to see the financial viability assessments which justify this lack of community provision. Polices on housing and on the release of information, said to be commercially sensitive, need to be reviewed so that sustainable mixed communities, as set out in the National Policy Planning Framework, can be created and the claims of developers fully tested in public view.
4. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

(a) The Kew Society approached Richmond Council for a clearer picture of the skills and expertise of its planning team. The planning service at Richmond Council has approximately 45 full-time members of staff, supplemented by temporary staff to address high workloads and to cover vacancies. We have not reviewed the % of planning applications that the Council deal with within their target turn-around times but we are concerned that Richmond Council may not have sufficient resources to fund a permanent body of staff with the capacity to cope with fluctuating workloads. This is a particular concern as Richmond merges its functions with Wandsworth Council, potentially creating a greater distance of officers from knowledge of local communities.

(b) Richmond Council commissions external consultants to deliver specialist advice, such as on legal matters and complex areas of the planning system. One of the main reasons for Richmond Council commissioning external consultants is to provide expert advice on viability assessments. The Council uses an in-house viability consultant for one day a week and commissions external reviews as required. Most schemes that do not offer to provide affordable housing in line with current policy and present a viability case are reviewed externally. The representative of Richmond Council we spoke to noted that it is not practicable for planning officers to engage in complex negotiations on planning cases. Whilst it seems that the majority of viability cases are reviewed by external consultants on behalf of the Council, we question whether it would not be more cost effective in the long term for the Council’s planning officers to have the opportunity to develop skills in this area. Due to the local knowledge and expertise of the planning officers, their advice on viability cases may take into consideration the broader local context, in all of its complexity.

(c) In an area of significant historic assets, planning enforcement can require specialist skills and knowledge. In a time of financial cutbacks, it is important that local authorities are able to maintain adequate resources to monitor properly developers’ activities. Short term cutbacks in this area have important long term consequences.

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

The Kew Society aims to work constructively with the Council to encourage developments that benefit the community as a whole and maintain Kew’s special character and historic
environment. In a recent case, we supported the change of use of a former estate agent’s premises, which had been vacant for a considerable period of time, to residential flats. Whilst we are generally opposed to loss of employment space and concerned, like Richmond Council, that central Government policy on change of use is resulting in a significant loss of local employment opportunities, we supported this particular case because of our local knowledge of the building location and history of use. The applicant received planning permission for conversion but has not, in the 18 months since permission was granted, started the work. We would like to see a shorter time limit than the normal 3 years set for work to be started in commercial cases like this so that properties cannot be left empty – an eyesore in the community and a loss of much needed residential space. The Kew Society is concerned that planning decisions that encourage the regeneration of built assets in the area are sometimes not acted upon, to the detriment of the quality and vitality of Kew’s built environment.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

(a) The ability of the Kew Society to comment constructively on the extent to which a development site benefits community needs has been adversely affected by the withholding of financial viability assessments deemed to be commercially sensitive. The current plans for Brentford Community Football Stadium make no provision for affordable housing on the basis that the development would not be financially viable without the funds generated by “enabling developments”, which include 910 flats in high-rise blocks and a hotel. The height of the buildings, adjacent to listed buildings and the World Heritage Site of the Royal Botanic Gardens, Kew, is also justified as needed, contrary to the normal building height limits for the area, on financial grounds. As the financial viability assessment is being withheld as commercially sensitive, the Kew Society is unable to assess whether all alternative routes to funding have been exhausted.

(b) Hounslow Council has also claimed that the Kew Society’s independent professional assessment of traffic congestion and air pollution consequences of the enabling developments at this site, submitted in its case against approval, was flawed. When we asked to see the evidence on which this assertion was based, we were refused access to the information. The Kew Society’s ability to engage with the decisions that shape the long-term local built environment would be improved by greater transparency and the public release of reports.

Caroline Brock, Chair, Kew Society
Kwes Kent Woodland Employment Scheme — Written Evidence (BEN0150)

1) I am chairman of a small training charity, KWES Kent Woodland Employment Scheme. KWES is a registered charity No 1146114 and provides three-year, paid apprenticeships primarily for ex-Service personnel and ex-offenders, many of which often have difficulties moving from an institutionalised life into normal jobs, and young people having similar difficulties finding work.

2) The apprentices study for two professional forestry qualifications designed by the Royal Forestry Society (RFS) and awarded through the Awarding Bodies Consortium (ABC). The Level 2 Certificate in Forestry takes a year and the Level 3 Certificate in Silviculture (the sustainable management of woodlands) takes two. These qualifications enable them to obtain worthwhile jobs anywhere in the forestry industry. Our training helps meet the huge skills shortage that now exists in the UK’s broadleaf woodlands. Broadleaf woods in the south east have been in decline for over a century, as demand for log wood as fuel and other products such as wood for paper making decreased. Many ancient woods are now unmanaged and large amounts of wood un-harvested and the numbers of people with the skills and experience to work in them has also declined. The Forestry Commission estimate only 600 fully trained woodland workers still work in the UK and Greenwood products have been replaced by cheap imported products or plastics. But demand and prices have increased and the shortage of woodland workers is a void that KWES’s trainees will help fill.

3) Our apprentices train mainly in ancient woodlands in the Kent North Downs Area of Outstanding Natural Beauty for three reasons. Firstly many of these woodlands are “difficult” with damp and often sloping terrain which means the training experience they get in them is first class. Secondly many of our apprentices, (a greater proportion than we had suspected when we started), have been “damaged” by their experiences, mentally rather than physically. We see all the time the improvement in their well-being engendered by working in small, disciplined teams and out in all weathers in this natural environment. And lastly working in ancient woodlands to bring them back into sustainability means that our apprentices are also helping regenerate a unique and valuable part of our country’s heritage that is largely ignored by all levels of government.

4) The main reason for this is ignorance and the National Planning Policy Framework (NPPF) itself provides an excellent example. Neither the Planning Practice Guidance of the NPPF or the Technical Guidance makes any reference to ancient woodlands.

5) Much reference is made in the Planning Guidance to the importance of conserving the historic environment but these are all built environments such as scheduled
monuments, wreck sites, battlefields, listed buildings and parks and gardens. Ancient woodslands that date back to before 1600 and even earlier get not a single mention even though they often form a large part of AONB’s and National Parks.

6) Ancient woodland is defined as land that has been continually wooded since at least 1600AD. They were never ploughed and planted, never treated with fertilisers or pesticides and the biodiversity in these woodland soils is unique. After 1600 planting of woodland became more common, so woodland that pre-dates this is more than likely to have grown up naturally. Some ancient woods may even link back to the original wildwood that covered the UK around 10,000 years ago, after the last Ice Age. Their unique value stems from the long period of time over which they have been wooded, resulting in a complex ecosystem.

7) The traditional method of woodland management on which these woods depended was coppicing. Trees were harvested as a crop, cut down to a stump or stool which then re-grew to be coppiced again after several years. Because of this system ancient woodlands are unique in that they constantly regenerate and will continue to produce timber indefinitely if managed. If they are not coppiced and managed they will die. Coppicing enables trees to re-grow on a regular basis and lets light and air into the woodland floor. This allows the stools to re-generate and also helps the growth of other saplings and flora which in turn encourages fauna such as butterflies, birds and small animals (including the dormouse).

8) There are two broad types of ancient woodland - Ancient Semi-Natural Woodland (ASNW) and Planted Ancient Woodland Sites (PAWS). Ancient semi-natural woodland has developed naturally on undisturbed soils. The long continuity of ancient semi-natural woods and their undisturbed soils makes it the most valuable natural habitat. Plantations on Ancient Woodland Sites would have started life as ASNW but many of the native broadleaved trees were felled and non-native trees - usually conifers - planted in their place mainly in the period after the World War II, when timber stocks were low. As they grow more quickly than broadleaf natives they were considered ideal for timber as sawlogs.

9) Woods planted or growing up today will not become ancient woods in 400 years’ time because the soils on which they have developed have been modified by modern agriculture or industry, and the fragmentation of natural habitats in today’s landscape hampers species’ natural movements and interactions. Our remaining semi-natural ancient woodland is therefore irreplaceable. If we lose what little we have left then it will be gone forever.

10) Although today conifers are not often planted in ancient woods, there are many existing PAWS plantations which need restoration. These woods are damaged but not lost. Because remnants of ancient woodland plant and animal communities have usually survived, together with undisturbed ancient soils, gradual removal of the conifers enables these species to recover. Opening up the canopy slowly and with care encourages the unique flora and fauna of ancient woodland to recover and go on to thrive once more.
11) Kent is among the most heavily wooded of counties. Its woodlands, both ancient and modern, have contributed greatly to the county’s economy in the past and they along with woodlands elsewhere could do so again. The forges of the Weald, the tanneries of Canterbury, the coalmines of Betteshanger all depended on their wood. More recently the Bowater’s paper mill in Sittingbourne took about 140,000 tonnes of wood each year until it closed in the early 1990s. Much of this came from ancient woods.

12) One significant recent event to try and bring wood from these woodlands back into production along with more modern woodlands in the county was the establishment of the Kent Downs Woodfuel Pathfinder, established in 2011 as a partnership between Kent County Council (as part of the EU ERDF-funded MULTIFOR project) and the 3 Forestry Commission (as part of Defra’s Woodland Carbon Task Force) to support both producers and consumers of woodfuel to help secure a self-supporting industry.

13) The Woodfuel Pathfinder aimed to explore and deliver a range of interventions to help the woodheat sector evolve to a fully self-supporting industry delivering among other things: Support in the substitution of woodfuel for fossil fuels; Market driven management of Kent’s wood; Enhanced biodiversity via the re-establishment of traditional woodland practices such as coppicing; Job creation and security in the forestry; Woodfuel and biomass heating sectors; Maintenance of Kent’s landscape character; Establishment of local networks of production and usage allowing financial and environmental costs of transport to be minimized and The use of biomass fuel to provide an economic incentive to manage woodland and improve biodiversity.

14) But the development of woodfuel supply chains requires a skilled work force as well as a market. In May 2010 Forestry Commission England convened a small group including LANTRA to consider the skills issues faced by the forestry sector. Despite the positive outlook for forestry, businesses were and still are having recruitment difficulties. Existing data at the time revealed a worrying picture: 53% of the workforce is over 40 years old, indicating worse skills shortages in future if the number of new entrants does not increase and 43% of these vacancies are considered hard to fill, with the majority of these attributed to skills shortages.

15) KWES is trying to create some of that skilled work force and is now the largest woodland apprenticeship in the country. The most worrying statistic however is that KWES will have at the start of November this year only 20 apprentices so there is a very long way to go.

16) The NPPF guidance makes much mention of Local Plans taking into account “the wider social cultural and economic benefits that conservation of the historic environment can bring”. There is no doubt that ancient woods brought back to sustainability have the ability to bring such benefits but this will never happen unless those involved in planning and developing the built and natural environment are given guidance on the National Policy
that ancient woods are an integral part of the historic environment as well as scheduled monuments, wreck sites, battlefields, listed buildings and parks and garden.

17) Many local authorities in Kent own ancient woodlands but no longer have the means to maintain them. They would be only too delighted to pass on this responsibility given half a chance. From anecdotal information KWES receives I suspect this is the case elsewhere.

18) Unless these ancient woods are managed and brought back into sustainability they will continue to decline and the UK’s area of ancient woodland - currently less than 2% of its land cover - will disappear completely.

06 October 2015
LABC – Written Evidence (BEN0064)

1. LABC is the representative body for building control teams in local authorities in England and Wales. We have some 3000 staff working in more than 300 local authorities.

2. This inquiry into the development and implementation of national policy for the built environment is clearly wide-ranging. We note, however, that there is no specific mention of the Building Regulations in the call for evidence. This submission focusses on a few key points of real concern to us.

3. These Regulations are an essential tool in ensuring quality when building work is carried out. The Government emphasis on deregulation, with the introduction of its “one in, two out” rule, should not be allowed to undermine a system that has been developed over many years.

4. LABC believes that the building control system has a vital role to play in improving the quality of the built environment. It is therefore important that it is robust.

5. Building control is the one local government regulatory service which is in direct competition with the private sector, where any developer can choose to use an “approved inspector” rather than the local authority. While when it was introduced 30 years ago this competition undoubtedly improved customer service, the driving down of fees as a result can lead to insufficient site inspections being made by building control bodies. Performance standards for all building control bodies do exist, and it is important that adherence is made to these.

6. The financial pressures on local authorities in recent years, which are set to continue, has made it increasingly difficult for some councils to deliver a high quality building control service. To alleviate this, LABC has been helping many of its members to consider working together in a shared service between councils.

7. Local authorities also have to bear certain administrative costs, which are not imposed on the competition in connection with statutory notices from approved inspectors and competent person schemes. The Government should review whether these burdens can be reduced or eliminated.

8. Building control is an ageing profession, with many surveyors close to retirement and not enough young people being recruited. LABC has introduced a bursary scheme to
encourage new entrant training, but that of course can only make a small impact on the overall problem.

9. The increasing complexity of the Building Regulations over the years has meant that training of both new and existing staff is very important. LABC devotes a considerable proportion of its income from member subscriptions and commercial activities to running courses for local authority staff. We also train clients when changes to the Regulations occur.

10. The role of local authorities in protecting the public from dangerous buildings and other potential safety risks should not be overlooked, and needs to be properly financed.

05 October 2015
The Landscape Institute (LI) is the royal chartered body for the landscape profession. As a professional organisation and educational charity, we work to protect, conserve and enhance the built and natural environment for the public benefit. The LI represents 5000 landscape architects, planners, designers, managers and scientists. We champion multifunctional and sustainable landscapes in both town and country. We believe that through careful and appropriate planning, design and management, it is possible to deliver a wide range of environmental, social and economic benefits. We therefore welcome this inquiry and the opportunity it presents to submit evidence on such an important matter. We recognise that its creation stems from the work of Sir Terry Farrell and his Review of Architecture and the Built Environment and a subsequent debate in the House of Lords in July 2014. It is therefore appropriate at the outset to quote Sir Terry Farrell’s review report which stated that:

“Landscape should be seen as the primary infrastructure which creates value directly and indirectly. Government and built environment professionals need to reprioritise the importance of its role and perception in placemaking. This applies at all scales, from streets to parks to regional planning.”

We fully support this statement, but would go further and add that on a small and heavily populated island there is a symbiotic relationship between the built and natural environment. We believe that decisions about shaping the built environment can no longer be separated from rural land use and its management. Significant challenges – climate change resilience, renewable energy, supplies of clean water, the sustainability of food production, carbon sequestration, improved biodiversity and public health and wellbeing – demand an integrated approach to the way we plan, design and management the built environment; one that considers the relationship between town and country and the essential services provided by natural systems.

The responses provided here are numbered in accordance with the questions posed in the call for evidence.

Questions 1 and 2: Policymaking, integration and coordination

1.1 There is a gulf between policy objectives at the national level, such as those enshrined in the National Planning Policy Framework (NPPF), and local planning. Neighbourhood
planning has provided a tier which, in theory, enables local people to have a greater role in shaping where they live. This should help ensure the built environment is responsive to the needs and aspirations of local communities. However this is clearly not suited to address the gap between national and local policy which resulted from both the abolition of regional spatial planning and county level structure plans. We consider these steps a mistake as they were a critical connection between national priorities and needs, many relating to the built environment, with local decision making. National policy can only provide the context within which strategic decisions can be made. Unless the Government is prepared to develop a national spatial plan, it has to delegate strategic decision making to an effective sub-national level which no longer exists. The 2011 Communities and Local Government Select Committee inquiry report into the abolition of regional spatial strategies stated that:

“The Government must ensure that the beneficial and positive aspects of Regional Spatial Strategies, in particular for integrating infrastructure, economic development, housing, data collection and environment protection, are not swept away, but are retained in any new planning framework.”

1.2 Mechanisms designed to fill this void, such as the Duty to Cooperate, have in our view failed to deliver a similar level of integration on matters relating to the built environment and the relationship between town and country. Political differences and strategic priorities between neighbouring authorities can make effective cooperation, in terms of planning policies, difficult to achieve.

1.3 Adding to this, Government has reduced available guidance and archived many documents published by statutory consultees who employ the professionals with the skills and experience to ensure better quality placemaking in the built environment. The resultant loss of status of these documents at planning inquiries, together with the loss of funding for staff, advice and research, undermines the importance of these organisations in protecting and enhancing our built and natural environment.

2.1 There is insufficient policy coordination between Government departments. The challenges facing our built environment are the responsibility of different Government departments and agencies, each with their own priorities. The NPPF, and its accompanying NPPG does appear to acknowledge the varying considerations that need to be taken into account in planning, designing and managing the built environment. However, it is insufficient in its acknowledgement of the interrelationships between matters such as housing, design, transport, infrastructure, sustainable and heritage.

---

2.2 Green infrastructure (GI) is a concept we have been championing since 2009. An underling principle of the concept is the way in which natural systems, when planned and designed properly, deal with many pressures facing our built environment. All too often these are approached as separate issues. GI evolved in response to a growing recognition that those planning and designing urban areas often ignored the interactions between issues such as public health, flood management, housing delivery, biodiversity, climate change adaptation and recreation. GI is an integrated approach which provides the ecological services that are needed to ensure towns and cities are more sustainable.

2.3 The potential benefits of greater policy support for GI are enormous; however it is not within the remit of any one department or agency and messages from Government are mixed. Steps have recently been taken by DCLG to improve National Planning Practice Guidance on GI, and this is to be commended. But the Government’s recent refusal to accept the Natural Capital Committee’s recommendation that the National Infrastructure Plan should incorporate natural capital (which itself is enhanced through GI approaches to land use) into each of the main infrastructure sectors is unhelpful to say the least and will undermine efforts to deliver the liveable towns and cities we need.

2.4 Housing supply is one of the most pressing issues facing our built environment. This cannot be delivered sustainably in isolation from other policy objectives, such as health and wellbeing, design quality, water management, transport and GI. There has been progress in recent months, for example the transfer of responsibility for architecture from DCMS to DCLG. However this represents a relatively insignificant improvement. It appears that, for housing, piecemeal investment decisions made by the Treasury without a national strategy, promote and subsidise development in locations that are justified only by economic imperatives rather than a balance of social, environmental and economic benefits as required by NPPF. GI, which has the ability to deliver substantial economic, social and environmental benefits and are promoted in both NPPF and NPPG, are not mentioned in any Treasury statements.

2.5 We therefore suggest three potential ways in which policy coordination across Government could be improved:

- Clarity on departmental responsibility for green infrastructure, given its role in working with nature to deliver a range of policy objectives; and

---

- Require all Government departments abide by a Duty to Cooperate, similar to that expected by the NPPF of local authorities to ensure better alignment of national strategies and policies for housing, infrastructure, the natural environment, water management and sustainability.

**Questions 3, 4 and 5: National policy for planning and the built environment**

3.1 It is not the purpose of the NPPF alone to provide guidance. The NPPF provides the context and aims to be met, but the National Planning Practice Guidance (NPPG) is essential in supplementing the NPPF with detail to assist the planning, development and protection of the built and natural environment.

3.2 We believe that the NPPF still favours short-term economic objectives that override longer-term social and environmental goals. This could result in a greater future economic burden on the public purse and constrains the ability to provide the necessary development process that will deliver a built environment to support resilient places that can meet a variety of future challenges.

3.3 The wording of the opening text of the NPPF regarding sustainable development is weak and needs improving. While the concept of sustainable development is a complex one, the NPPF unravels the term and complicates matters unnecessarily. Ultimately sustainable development is about ensuring that decisions made now on meeting current needs do not compromise the ability of future generations to meet their own needs. It is unfortunate that this fundamental idea does not appear to be given any consideration in the current wording of the NPPF. We believe that more emphasis should be given to high quality and distinctive place making in the built environment with a greater appreciation of the ways in which multifunctional GI can help address additional planning objectives, such as climate change adaptation, resilience, health and wellbeing, water management, biodiversity and energy production.

3.4 The NPPF also fails to establish the need to consider the relationship between the built and natural environment, and town and country. Insufficient emphasis is given to multifunctional use of rural land and its potential services to urban living.

4.1 National planning policy is failing because it has no spatial context. A spatial planning approach is necessary to properly align all sectoral policies that have a territorial impact to achieve the ambitions set out in the NPPF. The effects of sub-national spatial plans would include the coordinated delivery of housing need, availability and effective
targeting of investment, appropriate planning of linear infrastructure such as rail, road and energy transmission and environmental protection/improvement.

4.2 The most effective scale of spatial planning is a combination of the national character mapping work, undertaken by Natural England, with the pattern of existing urban areas. Greater use should be made of the National Character Areas\(^{207}\) to inform the planning, design and delivery of housing, transport, infrastructure, sustainability and heritage. NCAs divide England into 159 distinct areas, each defined by a unique combination of landscape, biodiversity, history, culture and economic activity. Their boundaries follow natural lines in the landscape, rather than artificial administrative boundaries. If these were used as the spatial framework within which national policy was translated into local decision making it would help ensure that future design and planning of the built environment was more responsive to its unique location and wider rural hinterland.

5.1 This is a complex matter with different forms of infrastructure, and a need to consider the capacity for renewal and retrofitting alongside improvements in technology. Matters such as climate change forecasts, ageing populations, housing demand as well as energy and food security all need to be considered. We suggest that optimum timescales for planning our future built environment could benefit from consideration of two excellent pieces of research, published by the Government Office for Science / Foresight. Land Use Futures (2010) and Future of Cities (2015) both explore challenges facing our built environment over longer timescales and the policy interventions required to meet them.

Questions 6, 7 and 8: Buildings and places – New and old

6.1 The current housing shortage presents a complex challenge and the location and development of new housing is always a contentious issue. The scale of housebuilding required to meet the current shortage will result in a significant degree of change to our landscape. This change is an opportunity to enhance our environment, not a threat which should be resisted.

6.2 Housing quantity cannot be divorced from housing quality. England features many low-quality, poorly-designed, housing estates which are out of keeping with their local landscape. This is a significant barrier in increasing the supply of housing. Local communities often expect that new housing will be of poor quality and will impact negatively upon their local environment. This can lead to objections causing delays in the planning process or failure to receive planning permission. This is supported by

research from the Local Government Association. Its New Housing Developments Survey\(^{208}\) (2010) found that 61 per cent of local councillors considered public opposition to be a significant barrier to housing development. When asked what would make housing development more acceptable to local communities, the following responses were given:

- Ensuring housing came with improved services and facilities (including green space) – 82 per cent;
- Involving local communities in early discussions about design – 56 per cent;
- Ensuring a commitment to excellent design – 65 per cent

6.3 It is clear from this research that improved design, provision of green space and involvement of local communities are key to overcoming local opposition to new housing. All three can be tackled by a landscape-led approach to housing development. By this we mean an approach to the planning and design of development that considers and responds to landscape character. By working with landscape from the very outset of development, it is possible to achieve distinctive local character in housing developments and a public realm where communities can interact and thrive. At present, landscape is often an afterthought in the house building process and in order to improve quality, and at the same time increase support for new housing, it needs to take centre stage.

6.4 Building for Life 12 (BfL12) has the potential to achieve a real change in the quality of new housing. BfL12 is a traffic-light system which assesses the quality of development. The system asks 12 questions of development proposals, 11 of which are reliant upon landscape planning and design. Greater use of BfL12 by local authorities during pre-application discussions could play a considerable role in improving design, thereby reducing opposition to new development. It would also have the benefit of tackling poor design issues that may arise at a later stage which can result in greater costs and delays to delivery of housing.

7.1 In his report on the Review of Architecture and the Built Environment, Sir Terry Farrell stated that:

“Landscape architecture and urban design are often the most valued by the public yet contradictorily the least valued in terms of fees and are frequently where the first savings are made on any given project. Something has to be done about this, and we as an industry must make landscape and urban design much bigger priorities.”

However little appears to have changed since the publication of the report. It is vital for the Government to step in to address evident market failure. The market is unable to deliver built environments that are sustainable and resilient. The financial model for the volume developers is, in their current mode of operation, risk adverse an unable to capture the external disbenefits of their product that put a cost on the public purse. Sir Terry Farrell goes on to state that:

“Governments certainly don’t have all the answers...But the private sector does not act at the large strategic scale either, as it tends to be driven by short-term profits and the bottom line. We need leadership from private and public sectors that is not subject to the short-term political cycles and changes of government or driven by short-term profits and share values.”

We would also point the Committee to recommendation 52 of the report, which suggests that:

“Government could explore policies to incentivise private-sector contributions to public-realm and infrastructure improvements and address the perceived “market failure” whereby landowners who benefit financially from improvements are not always the ones to pay for them.”

7.2 Green infrastructure (GI) is just one aspect of the landscape and despite increasing interest in the concept, understanding of its potential to contribute to sustainable, resilient and adaptable built environments is still lacking. As stated previously, the integration of natural systems and processes within and between our settlements enables the delivery of a wide range of benefits for the economy, society and the environment. We believe there are a number of barriers which Government might help overcome:

- a number of local authorities do not have GI strategies in place and many appear not to be working strategically with neighbouring authorities;
- there no statutory duty to protect or maintain green infrastructure assets;
- reduced public spending has had a number of negative impacts, including a lack of funding for maintaining existing assets, let alone the delivery of new GI close to where people live. It has also reduced the number of individuals within local authorities with the skills necessary to plan, design and manage GI;
- the natural environment is still seen as a ‘nice to have’ and as a result GI is afforded a lower priority; and
- a failure to plan in the long-term and the lack of interest in strategic planning. This is particularly pertinent to GI as the benefits it delivers accrue over time.

7.3 Making best use of the existing house stock and making places more liveable was achieved in the 1970s and 1980s by funding for local authorities to implement Housing Action Areas (HAAs) and General Improvement Areas (GIAs). These enabled residents to engage in improvements to their external environments. Local people influenced change and made their neighbourhoods better places to live. If the Government could see the value of such a proactive approach they might provide funding for improvements in deprived urban areas where market values fail to attract private investment.

8.1 The historic environment is important because it helps to define the cultural identity of our nation, and also because it attracts visitors and generates income. However, the present relentless drive for growth encourages landowners and investors to develop and manage land intensively for a variety of purposes that often result in damage to the character and appearance of the landscape. Regeneration often involves new land uses and whole site clearance so the developer can start with a clean slate. But this may mean that historic character is destroyed and that what replaces it resembles any place, anywhere.

8.2 We, as a nation, certainly maximise the potential of the most famous sites; Heritage is “the main motivation of 30 per cent of all international visits to the UK” (Chairman of the Art Fund, Art Quarterly Autumn 2015). Organisations such as English Heritage and the National Trust take great care of their heritage assets because they have to answer to their members and local communities. However most individual private owners struggle to maintain less well-known historic properties and landscapes.

8.3 Historic assets covered by formal designations such as listed buildings, scheduled monuments and registered parks and gardens, are protected from damage by the need to apply for listed building, or scheduled monument, consent. Unfortunately local authorities subjected to severe budget cuts often have insufficient resource to take action when neglect/damage result in the loss of heritage assets, and have few suitably qualified staff available to deal with proposals for their development. Historic properties are being sold off as too costly to maintain, and new owners and developers then put forward ambitious plans for the modernisation of heritage assets, to local authorities that have insufficient resources to advise and inform and to require the owner to adopt a sensitive approach. In order to make more of these national assets, we suggest the following ought to be considered:
- Government should be willing to pay to protect the heritage we value. Public sector cuts mean that English Heritage can only get involved with projects impacting on the most important Grade I, Grade II* listed buildings and scheduled monuments (the majority of designated assets, both buildings and landscapes in England and Wales, are Grade II). Heritage assets that are lost can never be replaced;

- Local authorities responsible for protecting historic landscapes designated as National Parks and AONBS have a statutory obligation to adopt and implement management plans for their future planning and conservation. This should be imposed on all local authorities for designated Conservation Areas; and

- Historic England published useful guidance to support the historic environment policies in NPPF. Unfortunately the government appear to be intent on archiving documents such as these. Therefore their ‘informal’ status can be undermined at planning inquiries. This approach should be revoked.

Questions 9 and 10: Skills and design

9.1 The landscape profession is holistic. It is trained to understand the action and interaction of natural and human systems in a particular locality, and respond to these with plans and designs to secure the optimum outcome for society, the environment and the economy. However there is now a worrying lack of landscape expertise in both local authorities and Government departments and agencies, exacerbated by recent public sector cuts. This cannot have anything other than a negative impact on standards in the built environment as there are fewer officers with the necessary experience and knowledge.

9.2 Cuts and the non-statutory status of landscape are resulting in a loss of skills and capacity in local authorities, mainly through non-replacement of staff. How to address this deficiency is a challenge given the current focus on reducing public spending, coupled with the removal of ‘red tape’. While unlikely to gain Government support, addressing this might require landscape to be put on a similar statutory footing as ecology and trees, requiring job descriptions that demand professional accreditation for holistic approaches. Failing that, local authorities and the developer community need to act as ‘intelligent clients’ and demand more from interventions in the built environment through a landscape-led approach.

9.3 To support this it would be desirable if elected members received training on matters relating to the built environment in order to make informed judgement and offer objective opinion. While we accept that the squeeze on the public purse continues to pressurise local authority spending, we would like to propose that a Head of Landscape
Profession, located in the corporate centre of each local authority, to provide such
guidance and to support the commissioning of private sector input in delivering
landscape services.

10.1 The regional design review panels provide essential multidisciplinary input to project
proposals. More commitment to the use of these panels by, for example, including the
need for schemes to be brought to panels written into local plan design policies, could
ensure this mechanism was more widespread. Often landscape, the setting of the
building(s) and placemaking is a large part of the discussion at design review panels.
They give an opportunity to take an overall design approach and provide design input
from a range of experts. It is fundamental to have strong design policies in local plans.
Support for local authorities which do not have these in place yet would be beneficial.

Questions 11 and 12: Community involvement and community impact

11.1 Decision makers and developers rarely consider adequately the way in which the
built environment affects those who live and work within it. In our view, all parties
(including residents and future occupiers) are generally unaware of the potential
impacts of the built environment on health and wellbeing.

11.2 We have been working hard to promote to local authorities, elected members,
developers and public health professionals the ways in which landscape and the built
environment can be planned, designed and managed to improve public health and
wellbeing. Our position statement, Public health and landscape: Creating healthy places
(2013) outlined our ‘principles of a healthy place’, informed by an evidence review,
and designed to encourage greater consideration of landscape as a mechanism for
improving public health. We were also commissioned by the Government Office for
Science’s Foresight team to write an essay exploring this theme in greater detail. More
information can be found at the relevant endnote

12.1 Neighbourhood plans have enabled greater participation of local communities. Many
include policies related to building character, scale, design details and materials. They
allow the local community to impose additional, locally distinctive, layer of control over
development proposals at the planning stage. However uptake to date has not been

---

Page 1151 of 1964
widespread\textsuperscript{211} meaning some local communities are not as engaged in shaping their built environment as they could be.

12.2 In areas not covered by neighbourhood plans, the local plans system and the planning applications process both include requirements for formal periods of public consultation. Local authorities undertake to consult; the quality of the response depends on the capacity of the residents to understand what is being asked of them. However the imposition by the Government of strict target periods within which planning decisions must be made (with sanctions imposed on ‘failing’ authorities) means that there is little time for negotiations to achieve quality planning decisions. Resources in local authorities so stretched that effective engagement over a period of time, leading to decisions that are supported by the community, is often curtailed.

12.3 If the main barriers to effective engagement are lack of time and resources within local authorities, leading to more officer stress, less willingness to listen and few opportunities to adapt and improve initial proposals, these barriers could be addressed by adequate funding for community engagement within local authorities.

\textit{06 October 2015}

\textsuperscript{211} http://www.planningresource.co.uk/article/1212813/map-neighbourhood-plan-applications
Background
The Landscape Institute submitted written evidence to the Committee on the 6 October 2015, and was subsequently invited to give oral evidence on 29 October at which Noel Farrer, president of the Landscape Institute, appeared as a witness. This supplementary written evidence is designed to add further detail in response to questions asked by the Committee, particularly those questions which were not circulated in advance of the evidence session.

1. **Q122 The Chairman:** Thank you for coming and giving up your time. I know it is quite a lump out of your day, but we try to motor fairly rapidly through it. You have had the questions, of course. I will take the first one. What role should green infrastructure have in the planning process? How can it be effectively prioritised? What policy changes are needed to facilitate this?

1.1 Expanding on paragraph 4.2 of our written submission, which relates to the response given by Noel Farrer to Question 122 during the oral evidence session, we suggest that a new sub-national spatial planning framework for England should be developed that articulates corporate Government policy. That framework should be based on the National Character Map of England as published by Natural England. The framework would focus on the distinctive variations in the landscape and not on administrative boundaries. These spatial plans might cover more than one Character Area – an example of this is the draft Local Plan for the South Downs National Park which absorbs 11 local plans and covers two distinctive character areas. They would for the first time cover town and country by integrating economic, social and environmental imperatives. They could be administered by Joint Committees (including central government agencies) under the Local Government Act and approved by the Secretary of State. They would refocus all relevant levels of the public sector intervention on sustainable place-making to meet today’s challenges and the needs of future generations. This new spatial planning framework would help good quality place-making and encourage multifunctional green infrastructure by:

- Providing a clear corporate government policy for new development and the management of town and country, mapped spatially;
- Setting out the baseline character of all places that are valued by the population as the starting point of any new development;
Identifying the utilitarian aspects of urban spaces and land for public good;
- Providing clarity in government policy for regulators as they apply to specific places;
- Redirecting democratic intervention to concentrate on places rather than on administrations – either geographic or topic; and
- Establishing a programme of delivering sub-national spatial plans (priorities for the production of these new spatial plans based on need).

2. **Baroness Andrews**: *This is a really crude question, but in order for us to make that argument, can you quantify the benefits? Can you monetise them? Can you show that there are key developments in this country where people have bought houses that have been above the market rate because they want the green access, the green environment and all the things you are talking about?*

2.1 While this is an extremely complex matter, where it is difficult to isolate green infrastructure as the variable that made a difference in terms of commercial gains, some evidence is available. Firstly, the Committee should note the excellent report developed by Natural England, the Microeconomic Evidence for the Benefits of Investment in the Environment 2. This covers a huge range of economic benefits that can arise from green infrastructure investment. In particular section 3b explores the relationship between investment in the environment and house prices.

2.2 The often-cited research undertaken by CABE Space, *Does Money Grow on Trees?* is also worth bringing to the attention of the Committee. It includes a number of case studies exploring the ways in which green infrastructure can lead to increased property values.

2.3 Furthermore, research undertaken by Savills has shown that the features homeowners value most about their homes are not necessarily associated with the building itself, but more with the environment in which it is located. Factors such as neighbourhood safety, greenery and access to amenities are cited as more important than simply building attractive buildings. These must be created by focussing on the relationship between individual developments and the wider area or in other words, ‘placemaking’.

---

214 [http://www.savills.co.uk/research_articles/186866/181237-0](http://www.savills.co.uk/research_articles/186866/181237-0)
2.4 In 2011, the Landscape Institute published a short collection of case studies to demonstrate the value of investing in landscape from a commercial perspective. *Why invest in landscape?* features the new settlement of Cambourne, nine miles west of Cambridge on a site covering over 400 hectares. There are two aspects to this project which demonstrate the importance of landscape planning and design.

2.5 The first relates to the management of spoil from the site. From the outset, the landscape and open spaces were designed and phased to accommodate all spoil from the site. This required careful design to ensure that existing features were not buried or harmed and the resulting new landform looked natural. Upon completion, the project will have generated over 700,000m$^3$ of spoil. Rates at the time of the publication of the document for disposal off-site were in the order of £28/m$^3$. However, because of the careful landscape design at Cambourne, the cost of organising and administrating the on-site disposal was approximately £8/m$^3$, resulting in a cost saving of about £20/m$^3$ or £12million.

2.6 In addition to this, an explanation of the value of landscape from the Director for Cambourne, who was also the Major Projects Director for Taylor Wimpey, is featured in the publication:

“The real benefit to the community and added value that is reflected in a premium prices for good property in a nice environment is only realised when the masterplan is supported by first class landscape design and implementation. The combined effect of good initial planning, implementation and long term maintenance all adds to the reputation that Cambourne enjoys as a desirable place to live and this is reflected by consistent sales and ongoing delivery of homes with obvious benefits to major developers Taylor Wimpey and Bovis.”

2.7 There is wider evidence from other organisations too, such as The Mersey Forest which we expect will have been brought to the attention of the Committee already.

3. *The Chairman:* Can I just ask a question? You have triggered something in my mind. What about having a trade association for landscaping or for place makers? Well-run trade associations, such as the civil engineers’ or the mechanical engineers’, have impact, which means a lot when dealing with Government. Engineering itself has something like 50 institutions, which is what they call them but they are actually

---

trade associations. They probably would not like to be told that, but they get things done. Think of the Society of Motor Manufacturers and Traders. This is so important.

3.1 The Landscape Institute was puzzled, and slightly concerned, by this question. The Chairman’s mention of “well-run trade associations, such as the civil engineers’ or the mechanical engineers’” seems to be referring to the Institution for Civil Engineers (ICE) and the Institution for Mechanical Engineers (IMechE) because she then goes onto assert that “…they are actually trade associations. They probably would not like to be told that…” Both of these organisations are in fact professional bodies and registered charities and are governed by Royal Charter, as is the Landscape Institute. The line of questioning therefore indicates that the Chairman did not understand in advance of (or even become aware during) the oral evidence session that the Landscape Institute is in fact the Royal Chartered body for landscape architecture and the landscape architecture profession. It is not a trade body, nor are either of the aforementioned institutions.

3.2 Regardless, it is important to note that the Landscape Institute is significantly smaller in terms of membership numbers, 5,000, compared to ICE (80,000) and IMechE (111,000). Despite this, the Landscape Institute works hard, both alone and in partnership with a number of organisations, to help shape public policy, most recently on green infrastructure within the National Planning Practice Guidance (NPPG) in collaboration with the TCPA, working with the Department for Communities and Local Government.

4. Q127 Baroness Parminter: I was surprised in your evidence that you did not mention the work done by the Natural Capital Committee and its initiative to try to bring natural capital into the accounts of the nation and to have them in the Green Book by 2020. If that was achieved, to my mind that could be a very important way to encourage businesses to get green infrastructure and other natural capital on their business accounts...I wondered if you would share the view that that initiative is important. It was set up under the last Government. Should this Committee be ensuring that necessary financial resources and political support are retained for that initiative, which could have far reaching benefits?

4.1 Noel Farrer offered qualified support for the work of the Natural Capital Committee (NCC) and the idea that the concept of natural capital, if properly supported, could be useful for the green infrastructure. The NCC has achieved a great deal and should continue to receive political support. But it is disappointing (and short-sighted) that
the Government, in its response\(^\text{216}\) to the Third Report from the NCC, does not agree with the NCC’s recommendation that “The National Infrastructure Plan should incorporate natural capital in to each of the main infrastructure sectors”. This recommendation, if adopted, would have been extremely valuable in properly integrating green infrastructure alongside traditional ‘grey’ infrastructure and breaking down the frequently cited, and in our opinion valid, concerns about the ‘silo’ approach to planning and development. In its response, Government does not even offer much in the way of an explanation as to why it disagrees with the recommendation.

4.2 We understand the Government, via Defra, is in the process of developing a 25 year Environment Plan. Again, it is not clear how this will relate to natural capital, nor the National Infrastructure Plan. These strategies provide an opportunity to overcome the ‘silo’ mentality that is undermining the need for a strategic and coherent approach to land use.

5. **Q129 Baroness Whitaker:** Both of you commented in your evidence on a skills and expertise shortage in various areas. What are your ideas about how you would remedy this, including for local government?

5.1 In addition to the response given by Noel Farrer, it would be useful for the Committee to be aware that there remains a high proportion of development in this country where neither the developer or the regulatory body / local planning authority has the right expertise to deliver high quality, multifunctional landscape and green infrastructure. Furthermore, local planning authorities, increasingly constrained financially, do not have the resources to adequately enforce landscape conditions. We would like to emphasise the point made in our written evidence submission that we would like to propose that a Head of Landscape Profession, located in the corporate centre of each local authority. Such a role would provide guidance and support the commissioning of private sector input in delivering landscape services and securing the wide range of social, economic and environmental benefits that are possible from adequate, intelligent approaches to landscape planning, design and management.

Examination of Witnesses

Noel Farrer, President, Landscape Institute, and Iain Taylor, Director of Business Development, Land Trust

Q121 The Chairman: A very big welcome to this evidence session of the Select Committee on National Policy for the Built Environment. You have in front of you a list of the interests that have been declared by members of the Committee. A transcript of the meeting will be taken and published on the Committee website, and you will have the opportunity to make corrections to that transcript where necessary. Could I begin by asking each of you to introduce yourself briefly to the Committee, please? This is for the record, and everything we say or do is going to be on the record.

Noel Farrer: I am Noel Farrer. I am president of the Landscape Institute. The Landscape Institute represents landscape planners, landscape architects and landscape managers. Approximately two-thirds of our members work in the private sector. The remaining one-third work in the public sector. Our members are of a vast range; they are from master planners for both town and country, and the development and management of both. Our members are place-makers who pursue high-quality design and economic benefit, and multifunctional landscapes, in support of health and well-being. We are really a very broad church indeed.
The profession makes major contributions to the new challenge of resilience to the impact of climate change, and strongly supports the imperatives surrounding sustainability, in both development and management of irreplaceable natural resources. The profession sits at the interface between people and natural systems.

Key policy themes that we are addressing at the moment at the Landscape Institute are obviously green infrastructure, which is a huge ongoing topic for us, the awareness of that and enriching the awareness of that. Being able to be here to do that and to talk very much on that topic today is a fantastic opportunity, and actually our first. For the Landscape Institute as a professional chartered body, this is the very first time that we have been asked to provide oral information to a Select Committee. We are grateful for that, but it also shows the emerging importance of green infrastructure, which has been identified by you, which has brought us here. I hope that this will not be the last time and that we may be seeing much more of each other, as this is a particularly important issue.

The Chairman: Thank you very much for that, and thank you for your compliments.

Iain Taylor: Good morning. My name is Iain Taylor. I am the Director of Business Development for the Land Trust. We are a national open space and land management charity with about 50 sites under management in 2,000 hectares of land across the country. Like Noel, we are very interested in this agenda. This is our bread and butter. This is what we get out of bed for in the morning and what we believe in passionately, so I am very pleased to be part of this session today. Thank you for inviting us.

Q122 The Chairman: Thank you for coming and giving up your time. I know it is quite a lump out of your day, but we try to motor fairly rapidly through it. You have had the questions, of course. I will take the first one. What role should green infrastructure have in the planning process? How can it be effectively prioritised? What policy changes are needed to facilitate this? In alphabetical order, Mr Farrer first.

Noel Farrer: I always get to go first. Thank you for that. First, green infrastructure, as I just alluded to, is a fundamental piece of the jigsaw. Green infrastructure is not just green as in environmental green. Yes, it is about water; yes, it is about soil. It is about all the landscape spaces and all our public realm. Green infrastructure is not just our parks and our open spaces. It is very much also our streets and the little areas on the housing estates where we live. We
cannot conveniently just see green infrastructure as the pieces that we can lock between
dawn and dusk, somewhere down the road in the park where the children can play. The whole
of the green infrastructure agenda is where people live. It is around the houses, in the streets,
in every part of our towns and cities, and in our rural communities.
We cannot be complacent about green infrastructure in our rural communities. We are
probably going to be discussing the fact that we need to build on a significant amount of our
rural communities, which are perhaps going to become urban communities. I find in the rural
environment that walking to school is just as difficult, and perhaps even more so in a rural
village, as it is walking on a pavement in a town. Green infrastructure is absolutely
everywhere.
Answering the second part of the question about how it can be prioritised effectively and
what changes need to happen, we see that green infrastructure has perhaps lost traction in
its policy support through the emergence of NPPF from previous planning policy and stripping
out a lot of planning policy, and the party concerns with regard to top-down, bottom-up and
the sort of thinking that has happened over the last number of decades. We now have a huge
void that exists between national policy and the next layer, which is local plans and
neighbourhood plans.
We have lost a large chunk of the middle ground. We have a void there, which we believe
could be filled with some sort of national spatial strategy, perhaps based on the Natural
England landscape character areas work that has already been done. It is a piece of work
about enabling, about recognising that our landscapes are about change, seeing that as an
absolutely necessary and positive process that has to take place. We feel that guidance in that
area and work in that area are going to deliver more clarity. Where we now perhaps have this
absolute urgent necessity for larger-scale development, developers are blundering around
and do not have clarity about public/private partnership and about what it is that towns and
cities want to see delivered to give them certainty about their business planning. To give them
more clarity is going to support and enable more houses more quickly, if that is our immediate
agenda, but quality of development generally.
Iain Taylor: We see a lot of mention across the country of the value of green infrastructure.
It has had its moments over the last few years, but it has really become a second-tier aspect
of the development process. For us, green infrastructure can deliver good development. If we are in the business of sustainable development, good development and high value multi-functional development, then green infrastructure has to have a valuable part in that process.

We are very good at planning for grey infrastructure. We are very good at thinking about services, data, communications, roads, highways, streetlights, et cetera. We know how to plan, model and think about that strategically and, indeed, assess developments on their impact at local and regional level, in terms of grey infrastructure. We are very good at that.

What we do not do particularly well is think about how the green infrastructure components of development are connected into those much broader landscapes. When you are thinking about development, when you are going through a process to get approval for that development, we think it would add significant value to the end product if green infrastructure was afforded the comparable degree of importance that grey infrastructure gets currently.

**Q123 Baroness Andrews:** We heard from the TCPA and CPRE that there is only one reference to green infrastructure in the whole NPPF. In fact, Dr Ellis said that that was being heavily compromised by the pressure on development and the planning by appeal process. Is that your experience? My second question is: how often are you called in to help with master planning of major developments?

**Noel Farrer:** There is only the one reference and I alluded to that. There is a distinct weakness about that, which is clearly why we are here. It needs strengthening in that area. Perhaps it is about the clarity of what green infrastructure is. It is misunderstood. Developers see green infrastructure sitting on the wrong side of the balance sheet. At the end of the day, they sell houses and they sell floor space, whether that is commercial or whatever that is.

I am a practising landscape architect and I do a lot of work. Alluding to the other part of your question, we are not asked in early enough. It is not seamlessly integrated because it is something that developers want and wish to be able to do. That is a generalisation. As you know, there is a range of developers, as there is everywhere else, and there are some developers who are far better at this than others. Certainly it is fair to say that they do not necessarily see this just as something that is nice to have but: can we afford it, or is this
something else that we are shoving on the bottom line of a development that is going to cause us a problem in our viability?

This is why I want to see some teeth that are going to put significant pressure and raise awareness of these key component issues, so that developers see the value. There is no question that the value is more for the long-term benefit of the communities that are going to carry on, but there are genuine benefits. There is no question that green open space and the consideration of quality places where people can meet and feel safe, all these things, have a significant value. They have a significant value at the point of sale, because it just gets better and better in landscape terms.

Baroness Andrews: This is a really crude question, but in order for us to make that argument, can you quantify the benefits? Can you monetise them? Can you show that there are key developments in this country where people have bought houses that have been above the market rate because they want the green access, the green environment and all the things you are talking about?

Iain Taylor: There are so many studies that point to the quality of the environment adjacent to property. Properties, both commercial and residential, affronting high-value green spaces, parks, canals and rivers are 20%, 30% or 40% more valuable than adjacent counterparts that share the amenity but lack that kind of connection to it. We know through studies over the years the land value, the development value and ultimately the end value.

One thing that planning can do is look across the benefits of a site at the contribution that development can make to the broader community. It can take a more holistic view. Yes, a developer is looking for his exit, your landowner is looking for an exit, and even the person buying a house one day might want to find an exit, but it is our role, partly through the planning system and partly through the way we look after our affairs, to think about the wider suite of benefits in health and well-being that accrue from sites, and the whole agenda on the value of green infrastructure, which is well written and well evidenced, and bring that value to bear on the development.

One thing the Land Trust brings to this conversation is, when we think about open space, we think about it in perpetuity. We are not interested in the value of green space during the development process or while the units are being let. We think about what that value is for
ever for that community. When you ask yourself how that green infrastructure delivers its value and benefits for ever, you open a box on all the opportunities that are available, the rationale and the justification for why it should be delivered to value in the first place.

Noel Farrer: You know that it is a complicated question. You have asked it because you know it is very difficult to prove, but it has been. There is a whole range of studies. But landscape by its nature is very complex. What is the value of walking down a street that allows you to feel safe? What is the value of a view? What is the value of these key components? You know that you want to live in the house that is overlooking the park, not the one that is overlooking the Westway or a road. It is a fact that if you are living overlooking a huge piece of infrastructure, you are likely not to live as long as if you are overlooking a park. A park is not only a beautiful thing and something that gives you recreation; it is a much healthier place to be as well, so there is a lot of common sense about this.

The other point to make is that legislation was passed through DCMS in 2005, when we did Design for Play—I was involved with the urban fabric. What was very interesting about that was that the Government put together a £235 million package to upgrade our playgrounds across the country. That piece of work was based upon the fact that they were asked a very similar question: can you prove that by investing in children’s play you are going to see improvement? The reality is that, again, that is incredibly difficult to do. It is incredibly difficult to prove that it is the act of playing in a playground, in pure academic terms, that delivers an improvement in quality of life and those children’s development, but you know that it is true, and it is true.

Landscape is like that in a way. It is its complexity that is its richness and its real compelling value. You are right: we live in a neoliberal world and we have to convince the Treasury of pounds and pence when it comes to improvement. I think we can do it now. The Policy Exchange has done a number of studies on being able to really help us with this, all the way through to other studies as well.

The Chairman: Do you think the builders are convinced that this is right? They seem to squeeze new houses into plots and then do not even give decent gardens. Everybody who goes to a new house spends the first two years in their gardens getting rid of builders’ rubble.
They have no conception of the holistic approach to life. We are talking about living in a space. How can we change that?

**Iain Taylor:** The key is to recognise that landowners and developers working through these schemes all have a very different approach.

**The Chairman:** They are all working in silos, are they?

**Iain Taylor:** They all have their own approach to their business model. Some will be into a community with several sites and be looking to bring forward phased developments over 10, 20 or 30 years. They will want to build a reputation of value. They will want to build on a reputation of quality. They will want their developments to be heralded as successful, even award-winning, but developers that are small and medium, or more opportunistic, will see a development as a single development site in a single local authority area. Frankly, it is whatever they can get away with sometimes.

We therefore need a conversation that applies to all development and that is about value and quality, and at the planning stage affords the opportunity for those appraising the scheme and involved in their design to fully understand the contribution that scheme can make. Then we do not get into distinguishing between the volume housebuilders, which are building reputation, learning lessons and taking these ideas forward because they have a stake in those sites’ future, and those at the smaller end, the single-site developers.

**Noel Farrer:** I will add to that. There is no point in pretending; there is just more money down here in the south-east. Land values are higher. What people are prepared to pay and can pay for houses is higher. There is no question that there is more and better opportunity to see money being spent on landscape in the south-east. If you head up to the towns and the cities in the north, where the values are not as high, it is perfectly reasonable that at the end of the day private companies and large PLC companies acting as developers, whether they are volume housebuilders or small housebuilders, are in it for profit. There is nothing wrong with that. Legally, the number one thing that they have to do is provide a return for shareholders. When it comes to GI, the easiest point for them is, first, the private space. A private garden sits slightly on the right side of the balance sheet. They do not necessarily do it very well, and you alluded to that, Lord Chairman, by suggesting that they might just park the building rubble underneath the turf, and they do. I do not think all developers do that, of course, but it is true:
we find a lot of that and soil is not respected or looked after at all. The key point is that the private garden has some value, and sometimes they will carve whole sites into the private garden.

What is really sitting on the wrong side of the balance sheet for them, and perhaps gives local authorities problems that then have to deal with, is the public space in relation to housing. It is those areas where the real pressure comes. The reality is that it is in our streets and in those public spaces where children can play, where the elderly can meet and not be lonely, and all the rest of it, where real life happens, needs to happen safely and needs to happen healthily and well. Those areas are becoming particularly starved, and it seems to me that that is the public/private agenda. The public part of this contract, through the local authority and the strategic planning and visioning, must have absolute clarity about what they want for their places, what they want for their towns, the distinctiveness and the character of the places they want to see made. That is when the developer can at least have clarity about what they are going to have to do, so that they can get on with it, knowing what is going to need to be provided there.

Q124 Baroness Whitaker: Mr Taylor referred to a national conversation with developers. Are you talking about a role for national leadership—leadership from the centre in this case? Do you have any ideas about how?

Iain Taylor: Precisely. The issue is one of leadership. Who is our national champion for sustainable places of quality? Who is that spokesperson for this agenda? Who is arguing the corner with colleagues in education, health, environment, business and communities? We have, over time, had organisations and partnerships that were established to show leadership and show the community at large what good looked like. A lot of the advice that came through those organisations found its way into policy and into the mainstream, but in recent times we have moved away from that approach. One thing that we would call for within this opportunity and this conversation would be to extend it and to find those natural leaders, not to create new organisations, overhead or hurdles but some momentum and positivity in this conversation. That will flush out not only national leaders but leaders within housebuilders, leaders within planners and leaders within local authorities, who will step up and say, “We are doing this. We know what good looks like”, but you need somebody at the heart of
Government to give the confidence that this is time well spent and that moving forward on this agenda is worth while. It is difficult at the moment. There are a number of competing objectives and this needs to be prioritised higher.

**The Chairman:** Can I just ask a question? You have triggered something in my mind. What about having a trade association for landscaping or for place-makers? Well-run trade associations, such as the civil engineers’ or the mechanical engineers’, have impact, which means a lot when dealing with Government. Engineering itself has something like 50 institutions, which is what they call them but they are actually trade associations. They probably would not like to be told that, but they get things done. Think of the Society of Motor Manufacturers and Traders. This is so important.

We are not talking about builders; we are talking about the impact of space on our lives and the health implications, the future of our children and grandchildren, and trees on which they can have swings and things like this. It sounds idyllic, but it is doable. If it is all so fragmented and you are being played off against other competing tasks, it is not going to happen.

**Iain Taylor:** Noel will pick up on the association side at the professional level, but it is really about the agenda. We know we have 100,000 members of the Institution of Civil Engineers and 5,000 members in the green infrastructure sector. We are massively outgunned, if you like, in terms of representation. There is an issue of numbers. Over recent years, we have seen, with public local authorities’ resources being constrained and focused on statutory services, these discretionary areas of work, planning and strategic thinking about green infrastructure and open space, having to—it is not through choice but necessity—be lost from the local authority contribution to the development space. We have seen, frankly, a bit of a vacuum emerging, where we are not able to engage with those people who were in post five or 10 years ago to create some momentum. It is really about slightly nudging the agenda to imagine that green and grey infrastructure—and blue infrastructure, for that matter—being a fundamental, and I hesitate to say statutory, part of what makes our cities, towns and rural areas work.

**The Chairman:** Even if it is only a small number, you can still make a big impact.

**Iain Taylor:** Correct. I agree with that.
Lord Inglewood: I would like to put to you that perhaps the biggest problem of all is the fault of accountancy. We live in a world where natural capital and ecosystem services simply are not permitted to enter into the profit and loss and the balance sheets that are used to judge a lot of these things. That, perhaps more than anything else, may be the beginning of the problem. Following on from that, do each of you have any particular ideas about what might be done in simple terms to improve matters?

Noel Farrer: It is about accountancy, and you are absolutely right to pick that up. In a way, that is a key problem. We have alluded to it already. The private sector is where we are going to see the changes and where development is going to take place, and the private sector is therefore going to evolve around profit. Landscape is vulnerable in that world, even though we are a country of gardeners. Going back to the allusion to the different trade organisations, we have 250,000 members in the Royal Horticultural Society. We are absolutely passionate about landscape. We all recognise the value of what landscape is going to bring. It is interesting that while that is a passion it does not find its way to any statutory point.

Iain was hesitant to use the word “statutory”. Let me be a little less hesitant about it. The reality is that our park services in our local authorities are not statutory. There is no statutory obligation to maintain parks. There is no statutory obligation for local authorities to look after the green infrastructure that we are talking about. But the reality, as we now recognise—frankly, it has always been like this—is that it does not have the teeth. It is vulnerable to the accountants. It sits on the wrong side of the balance sheet, and it requires more of a commitment. The commitment has been lost in the middle ground in planning and in the national strategy. A commitment on the public side of that equation, which is where the change needs to take place, because we are talking mainly about the public benefit, needs to be re-established in a way that cannot be forgotten. It is just about accountancy. That is where the problem lies.

Baroness Andrews: Do you think it would have more impact if we could get across the fact that we are losing the battle on sustainability? You are talking about one element of sustainable development, yet sustainable development has lost purchase. It is in the NPPF. It is not in recent legislation. We had big battles over the Growth and Infrastructure Bill, because
we lost the definition of sustainability. If we could recover that in a statutory form, do you think that would help you to position what you see as so important?

**Noel Farrer:** It would help. It is interesting that in the agonies of what sustainability is, and we have all juggled with that and what it means, there is something about the complexity of that that has become the problem. It is not like, “I am an architect. I design a building”. In my profession, I am a landscape architect. If I go and speak to someone and say, “I am a landscape architect”, they say, “Why do you not come out and have a look at my garden?”. That is it. It is great to come here, talk about green infrastructure and grapple with this absolutely compelling subject, but it is a misunderstood concept. Our issue and our first and foremost piece of work as a profession is to do with awareness and the importance of this piece, which is everything from the edge of the building to our rivers, our streets, our towns and our countries, and joining all those things up, but it does not have primacy.

**Iain Taylor:** Picking up your point about the accountants’ approach and the balance-sheet narrative, one interesting component of this is that green infrastructure sits on the right side of the balance sheet, but there are five different balance sheets. It helps with school attainment. It helps with obesity and mental health. It helps with a number of balance sheets for various aspects of the Government’s work in our communities, but we do not fully aggregate that value and think about how we deliver it upfront. We try to focus on where the value is generated within the development process, because that is where the cash is.

One thing that we are thinking about is how you fund the in-perpetuity management, maintenance and capital replacement of these open spaces so that we do not get into a serial regeneration of our open spaces in towns and cities. This is a national issue. We work in parks and open spaces in the south-east, the south-west, the north and Yorkshire, so we have a broad understanding of the factors at play. Indeed, the Land Trust came out of a coalfields programme by Government, recognising that these spaces had a contribution to make for ever. There is a very nuanced view of value and how we appraise it, but I absolutely agree that it is time for sustainable development to come back and be at the heart of our processes.

**Lord Inglewood:** Is it not the same issue that Church Commissioners have identified? They have a lot of buildings that are going to be very expensive in perpetuity. In their case, their solution is to offload them on to other people.
Iain Taylor: What you do then in that process of offloading is attribute who benefits in a much more specific and direct way. We could get on to this; a later question talks about models for sustainability, but essentially if you could connect very directly those who benefit from that infrastructure and those who pay, you would create a naturally sustainable virtuous circle. We have done this for years; they are called service charges and estate charges. You would make a direct transaction between those who benefit and those who pay.

One thing that we are really getting switched on about at the Land Trust, working with the volume housebuilders in particular, is to create more of a membership or a community focus on service charges, so that we can lose this negative “It is just another bill” approach. “Actually, I pay my £100 or £150, and look at what I get. I am part of this fantastic community. They throw great events. The place looks great. I am proud to walk people around my open spaces”. Site by site, if we can restore that link between value and who benefits, there is real future in this.

Now the question is: where do you go when they exist already? One thing that we are wrestling with is whether our parks and open spaces are the right proportion, the right size, for the communities they serve. They do not all come from beautifully well-executed master plans. Some of them were flukes, accidents, by-products of clearance, et cetera. One thing we need to look at in a lot more detail is whether we can associate the value of public development with the in-perpetuity management of those open spaces so that we realise the value of some of these spaces for the benefit of the whole community. This is where it gets involved, quite technical and very local, but if we could have a national perspective on this it would create the space for those conversations to happen all over the country.

Q126 Baroness Rawlings: I fully support all the green space, the environment and everything that you have said. I am aware that costs always play a role in that. What is your view? You have just touched on parks and things. I get really upset when these wonderful parks, which are there for everybody, get used for markets and pop concerts. They then get negated for what they were meant to be used for: the peace, health and everything for everybody. What is your answer to that? You create a green space and then, before you know it, you have people planning to have a pop concert on it.
Noel Farrer: Why are they planning to have a pop concert on it? We are on the framework contract for the Royal Parks here in London. Hyde Park is regularly used as a venue. The best part of half of their income needs to be derived from their own capital receipts. Their contract was with central government, which paid for the Royal Parks. It is now with the mayor. The reality is that that sum of money is not going up any time soon. That sum of money is going down. However passionately we link those Royal Parks and the quality of those landscapes to our great city, the reality is that that goes down. How are the Royal Parks crossing that? They are doing this. Coffee is pretty expensive if you go to a franchise in the Royal Parks. You can go to pop concerts. They are allocating areas of park. The Frieze contemporary arts show is a brilliant event. Do not get me wrong; I think it is incredibly positive how the Royal Parks reconcile the types of activities that they are putting in place with what they have to do, but fundamentally they are doing it. They totally understand that. They know that there is a compromise between the maintenance of a beautiful green space, the acid grassland that is in that area, the biodiversity and the nature of the landscape that you are referring to, which we should all be able to enjoy, and then allowing 80,000 people in there for three days to enjoy a pop concert. I am perhaps less aerated about that concern, because I think it is a great use of public open space for 80,000 people to enjoy it who perhaps would not otherwise.

Baroness Rawlings: They could not go to the Albert Hall or all the other places where you can have pop concerts, like the O2 Arena?

Noel Farrer: I understand that, but the key point here is that they have to do it because they need the money and they need to be able to maintain it. In a way, that alludes to exactly the same point: how important is that, and how much money should we give to them?

Baroness Finlay of Llandaff: I have been fascinated listening to you talk about the benefits to health and to the individual, and wonder whether anyone has done any work on using the concept of QALYs, such as are used in healthcare by the National Institute for Health and Care Excellence, to show the benefit of exposure and access to green spaces, so that you begin to talk the same language on the balance sheet that is used for things like health interventions and see whether you can do the same for social cohesion, dysfunctional behaviour, costs of crime, and educational attainment. You could begin to use Lord Inglewood’s balance sheet to be much more complex but much more informative than a simple kind of in/out accounting.
Iain Taylor: We have surveyed people who visit our sites and asked them whether these spaces are of value to them, have helped with their personal circumstances and have moved things on. Unreservedly, we get positive outcomes from that.

Interestingly you can point to specific examples such as the work of Community Forests, which is a sector across this country. It has a project that it has called the Natural Health Service, which works with GP practices to provide opportunities to engage in local parks and open spaces as an alternative to medication or more invasive practices. It is using the environment in a way that is positive for its outcomes and personal circumstances. It is not simply about going for a walk. Often there are personal issues to do with perceptions of safety or insecurity that prevent people from engaging with these open spaces, so they have to be supported through it, but the outcomes are so much better.

We know that when we link aspects of the health service at a local level with the value to health and well-being that the parks and open spaces provide, we get tremendous outcomes. Of course, these are often publicly-funded two to three-year projects. They always have a start, they have a fantastic middle phase, and then they have to end at some point. That is one thing that we really fall over. We do not plan and we do not fund over the timescales that can really allow these structures to bed in.

One thing that we have talked about in relation to vision is where the long plan is for this agenda. Where is the 25-year rolling, reviewable plan that actually says what kind of place we want this country to be? As sure as eggs are eggs, you determine your value of a place and your experience of it by the natural components. Yes, the buildings are beautiful or are an issue, but you certainly get a sense of what a place is like from the blue and green infrastructure, yet there is simply no plan.

Noel Farrer: There is some interesting research that helps to start to join these things together. It is a simple, known fact that if you have a ward in a hospital that overlooks green space rather than an urban area, less morphine is used on that ward. If you have a closed ward and there are landscape paintings on the wall rather than paintings of other subjects, that is also true. That is how compelling that is.
We know this from looking at mental health issues. A number of experiments have been done with people who are suffering from depression. If you walk them through a busy shopping centre and then ask them how they feel at the other end of that, having done a 15-minute walk, or you walk them through the adjacent park in the opposite direction, they feel a damn site better when they have walked through the park. These are common-sense issues.

How compelling are they in terms of what they are going to say? I know that we can go to Abbey Orchard Estate, which is a Peabody estate on the orchard site of Westminster Abbey and is five minutes from here. We had a scheme there where we turned an empty space with 46 car parking spaces into a green courtyard with trees, and a small park space within that courtyard, with places to sit and places to play. I can introduce you to Norman, who lives in flat 8, block A. He will tell you that he was a very lonely man who did not feel comfortable about going out. He did not feel safe in the streets and was leading a particular type of life that I believe was also perhaps a very expensive type of life, with home help, meals on wheels, support and all the other aspects and support services in our society.

I can go round and have a cup of tea with Norman now, nearly eight years after we have finished our work there. He is one of the people who goes out. He does planting work and has now re-engaged his relationship with the children on the estate. He plants the plants, he works with them. He won second prize in a Westminster in Bloom competition, and in my office that is the award that we cherish most. It is that simple. We can take that stroll any time you like and I think you will find that the GI message is compelling. You are right: getting it into a condition so that we can put it on to an accountant’s sheet in an intelligent way aerates us and needs to be worked upon.

Q127 Baroness Parminter: I was surprised in your evidence that you did not mention the work done by the Natural Capital Committee and its initiative to try to bring natural capital into the accounts of the nation and to have them in the GreenBook by 2020. If that was achieved, to my mind that could be a very important way to encourage businesses to get green infrastructure and other natural capital on their business accounts.

Noel Farrer: In their assets, yes.

Baroness Parminter: Indeed. I wondered if you would share the view that that initiative is important. It was set up under the last Government. Should this Committee be ensuring that
necessary financial resources and political support are retained for that initiative, which could have far-reaching benefits?

Noel Farrer: It is very interesting. Thinking about my membership, there are slightly mixed views about this. For me personally, the notion that we have a natural capital that we absolutely value involves trying to put a financial construct on it, which is helpful. I am aware that that committee answers directly to the Treasury, which would seem to give us a route one track into the right place and being able to gain traction. There is no question that if companies can recognise the value of their asset as natural capital and it sits on their balance sheet as an asset, that means they are more likely to invest in it. I would say that in the most basic terms I am fundamentally supportive of it, and I think we are. We would absolutely encourage that.

I have a slight nervousness about putting those values together and saying, “How valuable is it?”. I have a site down the road from here where there is an oak tree on the corner of a street. This is slightly theoretical, but it is true; I have done this many times before. I do not want someone to turn around and say, “That oak tree is worth £25,000”, because I know in London that a developer is going to turn around and say, “Here is your £25,000. I am now going to chop it down”. I have a slight concern about that, because I want to say to that developer, “It is absolutely priceless and you cannot chop it down”. There is always that issue for me slightly, but the fundamental principle of the leverage of being able to value something so that we can have a conversation about it in that way is very useful.

Iain Taylor: I would build on that. There was real momentum prior to the Committee’s recommendations to understand the value of the natural environment and the functions that it provides. That has led to conversations about payments for ecosystem services and trying to articulate the transaction between those who benefit, those who provide and those who sustain. We understand that while those recommendations were positive and at the time created a huge sense that things were going to improve, there was not a great deal of recognition across Government for what those recommendations meant. They were good but not fully endorsed by Government across all departments, so that we can get on with the process of interpreting them and getting on with the job. For us, from a green infrastructure
perspective, if more actors within Government could adopt those recommendations, we think that work really would have some value in support of this sector specifically.

**Baroness Whitaker:** Is there not more to be done if we are going to scale up these considerations? The issue is that green infrastructure has benefits all round. The trouble is that a government department, if it is going to sponsor legislation or guidance, will perhaps be, say, Defra, but the benefits will accrue to the Department of Health, so they will not necessarily have the same force of argument when it is all worked out in Cabinet. Do you see any way round this?

**Noel Farrer:** Yes, I do. The problem you raise is absolutely right, and the point that we are making first is that whether you are in the Home Office and you want to make places safer and more secure through design of public realm space, whether you are in Education because school grounds and all that estate is absolutely fantastically valuable to the development of our children, whether you are in Health, about which you are very clear, across all the departments of government landscape has a key role to play, and this goes back to the silos point that we alluded to earlier, if you will excuse me. This is a fundamental area whereby GI can fall between the tracks, but its potency is about coming up with a voice that allows each and every department to recognise that their push, in a co-ordinated way, is fundamental. One piece of traction which the Farrell review proposed was the idea that we should have a built environment chief adviser in the Government somewhere. The reality is that some format of that is needed, including how education sees the value of landscape, how health sees the promotions of landscape in their piece of work, how Defra is perhaps closer to being the vehicle to be able to administer that, however that might work, and then obviously planning and planning legislation. There needs to be some way of co-ordinating that. The fact that it is not co-ordinated is a really sad loss to the potency of GI.

**Iain Taylor:** A key way to articulate the relevance and importance of any agenda is to hop on to the big one. For the last five years or so, economic growth has been the big one. Everything, frankly, has been about its contribution to economic growth. How can we accelerate economic growth? How can we support economic growth? What can we do across the land to support government’s objectives in relation to economic growth?
There are strategies that we have been a part of, such as the “Atlantic Gateway Parklands: The Landscape for Prosperity”, which make a very direct link between a long-term, long-ranging environmental master plan in support of the economy, not running against development aspirations, not taking a principled view on the economy itself, just showing, case by case, aspect by aspect, how GI and a broader natural environment can accelerate economic growth.

When you get into that space, as the Land Trust is doing, of facilitating development, understanding how to capitalise on its value, supporting the growth of towns and cities, once you get into a much more positive space about economic growth and development, you find that people want to engage in a positive non-whingeing debate. There are too many reasons to be glum, to whinge, to moan, but who has the time for it? We want to engage in a positive conversation about development. We want to make the economy stronger. The environment and GI have a role in that space, and we just do not play that card strongly enough nationally. There is some good leadership in the regions, but nationally it is not quite there.

**Noel Farrer:** It is no coincidence that Barcelona is always held up as an urban town and a very desirable place to live. On a happiness index that I have seen, the people in Barcelona seem very happy people. They are 1.4 million people there. They buy their food in their local markets; over 90% of all food in Barcelona is bought in local markets. There are 96 markets. It works on a human scale, and GI is a living, vibrant thing in that city. Catalonia represents over 75% of the entire GDP of Spain, which is why it will never become an independent nation, because Spain will never be rid of it. The reality, in simple economic terms, is that the desirability and the quality of the place are fundamentally driven by its green infrastructure and landscape considerations. It creates a place where people want to be; it creates a place that is desirable for them to wish to come to, to live in, to work in, to be innovative in, to be creative in and to generate money and economic growth. Barcelona is a classic example of that. There are many others. Beautiful cities make more money.

**Q128 Lord Woolmer of Leeds:** The way that you speak, Mr Farrer, indicates your view of green infrastructure as not necessarily green but something rather wider. A public understanding of that debate could be helpful. Do you think there is a conflict between the pressure for increased housebuilding and higher-density development in urban areas? Do you
think that is creating a conflict with providing environmental infrastructure, green infrastructure and sustainable open spaces? In practice, do you think that a conflict has emerged in recent years between the two?

Noel Farrer: I do not necessarily think there is a conflict. I sit on quite a number of design review panels. I am on the national design panel, and the reality is that we are seeing a lot of schemes coming forward that are very dense. In my personal work, I am working on a large housing extension to Bicester, which the Government called a garden city. One requirement of the eco-town principles is that 40% of the land will be designated as public open space. That is actually a huge challenge to the local authority in the future. Another requirement is that densities will sit between 20 and 50 homes per hectare, which is not enough. Actually, what seems like a good idea in planning and thinking in terms of crude rules is very constraining in terms of being able to create quality urban spaces.

The notion of density for me is that landscape is not to be viewed just in terms of its quantum area. It is not about the area; it is about the quality of that space. Just imagine that you have 100 houses on a plot of land and a developer is thinking, “That is great. I have my 100 houses at quite low density”, and then someone comes along and says, “Hang on a minute, you have to give a quarter of that away to a public open space. You have to get rid of 25% of the area for the open space”. That could be seen as crudely chopping a piece out, so I will only build 75 homes. Clearly not, but the post-war reaction, which you alluded to in the debate that I listened to when we came in, is that you could build a large tower block in the middle of a large green field. Actually, we know that that is not quality. It is not about quantity. It is all about what it is. What is the quality of that environment and the quality of the place that you are trying to make? You are then into the complexities.

We have worked on high-density schemes, which have spaces for children to play and which provide opportunities for people to be able to come out and be able to enjoy a certain amount of green space. We can absolutely employ places where people can meet, talk and do all the activities that they need to be able to do safely and in a high-quality way. I do not instinctively see a problem between density and providing high-quality GI. We also technically know about aspects of GI to do with the water, microclimate, heat sink effect in cities and increased
biodiversity. We can do this vertically, we can do this horizontally, we can do this on roofs. There is also a whole range of technology that is growing hugely as a sector.

**Lord Woolmer of Leeds:** Mr Farrer, I did not ask you whether you thought it could work together. I am asking you if, in practice in recent years, the pressure for more housing and higher density, in your judgment, has led to a deficiency in sustainable open spaces and green infrastructure.

**Noel Farrer:** In practice, the answer is yes. I suppose I was alluding to the fact that in practice it does not have to. I am very grateful to you, Lord Woolmer, for pulling me up on that, because you are teasing the answer that I want to give, which is great. I apologise for not getting there quicker. That is absolutely the reality. GI in schemes is often considered too late. It only happens because it needs to happen, perhaps to get certain developers over certain planning hurdles. We do not see enough quality investment in our present housing developments.

Moreover, a lot of the development that I am seeing in the country is building formulaic houses. They could be Windsors and Marlboroughs and whatever else you like. I can see those formulaic houses being built in the Lake District, which is where I live, or they may be being built in Derbyshire or in the south-east. That is nothing to do with GI, distinctive places or a whole range of things. The reality is that at the moment the answer is no. The conversation about raising awareness and trying to understand that public-private relationship so that we can instigate more need around GI is essential.

**Iain Taylor:** I would say that high-density and high-quality GI are not incompatible. Actually, volume and density are your friends when it comes to safeguarding these infrastructures for the long term. We have seen sites promoted of four or five dwellings, with a 40-acre country park. You think that those four or five dwellings have to have quite broad shoulders to support that 40-acre country park. When you have 2,000 dwellings supporting a 40-acre country park, if it is planned well, if it is well delivered, if it is of high quality, it will last for ever. The collective burden is unchanged, but each unit can afford it. It is an affordability issue. There is a viability issue in all of this. The purpose of having the ability to plan and think strategically, across all the sectors, is what enables you to come up with the right answer.
Q129 Baroness Whitaker: Both of you commented in your evidence on a skills and expertise shortage in various areas. What are your ideas about how you would remedy this, including for local government?

Iain Taylor: The skills shortage is an interesting general point about capacity, but actually there is a jobs shortage. There is a role shortage. We have seen that it is not about whether or not the people in post have the skills to undertake a GI conversation. It is just that those posts do not exist at all. One thing we could usefully do is to recalibrate the resource of the process, so that there is a role in which they can share skills and knowledge.

Baroness Whitaker: There should be larger cadres in local government.

Noel Farrer: There could well be. We have a specific subgroup in the Landscape Institute that is looking at the fact that the loss of people working in the public sector and the loss of landscape architects working in local authorities is a significant problem. The landscape architectural role is not a statutory role for local authorities, and local authorities are continuously pared back.

Baroness Whitaker: Do you know how many local authorities employ landscape architects? What proportion is it—a third, a half or about three-quarters?

Noel Farrer: I think it is at most a third. It is very interesting. They range enormously from local authorities that have none to local authorities that have 30. Some local authorities work in that way and get it. I am talking about Hampshire there. That is hugely variable, but it is the loss of knowledge in the role that is absolutely critical. Having someone who really understands the GI position in a local authority and can inform on the local authority side what is happening in development control, what is happening strategically across the departments of a local authority, in the same way we were discussing the silos in central government, is fundamental. We would ask that you consider the idea of recognising that the local authority needs to have some representation of GI at a senior enough level within their local authority organisation to be able to make sure that this representation exists, because they are a fundamental client role to us. They feed the quality that private sector consultants can then work to.

Iain Taylor: We work closely with universities all over the country. One in particular, the University of Liverpool, has a department of civic design to train planners. They have a
self-contained GI unit, which has become really popular with the postgraduates. About half of the people on the planning course take the GI module. That gives me a lot of hope that the next wave of professional planners, whether in private practice or local authorities, have had this kind of education in green infrastructure and elected to have that education in green infrastructure, so they are self-selecting an interest in this agenda that they can take through their professional lives. From no course to 50% is a fantastic achievement.

Baroness Whitaker: Are there any landscape architects in national government? How many are in DCLG?

Noel Farrer: There are not many. One of them was here, but there are very few. Another area where we could make a real difference here is building the knowledge. We are aware that the RTPI provides training to all members who sit in DC and on their planning committees. It would be a good idea to consider that there should be some awareness around GI for members, when considering planning applications. Again, that is further grist on the public side, as well as on the officer side, to add support to that.

The Chairman: That is a very useful point.

Q130 Baroness Finlay of Llandaff: That leads into the next question, which relates to how the positive impact of green infrastructure can be better understood by professions generally in the sector. You have put some ideas on the table. I wonder if, very briefly, you can put some others, possibly almost as a quick wish list, so that the changes needed at national policy level can come through. I say “quickly”, because we are in our last minutes of the session.

Noel Farrer: First, I would acknowledge the problem. It is true that it is not just developers who are perhaps a little ignorant about these things. That can include the consultant teams within development as well, because we want the GI or the landscape consideration to happen. It is a fundamental component of the project; we want that to happen at its earliest possible stage. I absolutely recognise that. We have identified RIBA and other organisations such as that as places where we are trying to raise awareness all of the time. I do not have a specific answer to that problem. Iain, do you?

Iain Taylor: Only that, for example, if LEPs were tasked with fully articulating the role of the natural environment or green infrastructure within their economic growth plans, it would create the space for the conversation whereby the professional community would step
forward and deliver that. One wonderful thing about the GI community, as we see from recent experiences, is it is incredibly efficient at delivering cost-effective positive outcomes for places. We are not talking about suspension bridges and motorway junctions; we are talking about relatively modest investments that yield massive impacts on local places. If we brought in GI, it would blossom.

Some parts of the country have their own GI strategies. Manchester, for example, has done its own GI strategy. Certain parts of the east of England have very clear articulations of the value of the natural environment within their local economic partnerships. It is a mixed bag across the country and they all look for guidance. All the LEPs and local areas look to government for guidance, and we need to have that confidence to provide that leadership that this is an important part of economic growth and an important part of sustainable development. Then there would be a response. I am sure of it.

The Chairman: That was a lovely positive note on which to end, but it is not quite ending yet. Lady Finlay, is there something else you wanted to ask?

Baroness Finlay of Llandaff: No, it is just that I have had a request to go and deal with a problem urgently, so you will have to excuse me for leaving. I am sorry.

Q131 Baroness Parminter: It is difficult because it is about money, so it is not often quick. Can you summarise briefly what financial models are out there at the moment to encourage investment in GI? What suggestions do you have for other financial instruments?

Iain Taylor: On the existing framework, we have a range of endowments, commuted sums, service charges, estate charges and interim charges. We have a full menu of mechanisms with which to align the costs and the value. The Land Trust was created under a programme of endowments from HCA to take on legacy sites, so we have an experience of managing funds invested that can be re-invested year on year, for management capital replacement. We have aspects within the planning system that allow for commuted sums to be paid for the transfer of grey, blue and green infrastructure, so that is a well-trodden path. We know that.

The emerging growth is in relation to the service charge/estates charge component, so increasingly developers are looking to pass on those long-term obligations for open space management to the residents, so that they can participate in that. I see that as a very positive
space. Typically you get a mix of endowments or commuted sums with service charges coming forward in the appraisal, which means that the scheme can work.

One interesting thing about the natural environment and GI accelerating development is that in order for it to accelerate development, it has to come first. The GI has to come up front and then there is usually a lag between when you have invested in the GI and when your lovely development happens. The European Investment Bank has this thing called the Natural Capital Financing Facility, whereby it provides cheap money to deliver GI and allow the developments to come forward over time, and in the normal way—commuted sums, section 106, sale or whatever—repay for those investments in green infrastructure.

One thing that really floats my boat is if we could nationally come up with a kind of forward-funding GI approach, which says that we buy into that approach that GI creates good development and it brings it forward. If you bring development forward, you are accelerating economic growth, which is the whole point of this approach to begin with. If, in accelerating economic growth, you have helped children in the local area achieve better grades, fewer GP return visits, et cetera, you are making a much fuller contribution for what is effectively a very low-cost solution. You get the money back.

**The Chairman:** That is amazing. We have a real time pressure now. I am sorry, do you think you could actually write to us on the point you were going to say? Okay, two minutes then.

**Noel Farrer:** The last point I was going to make is that the HCA is grappling with this at Ebbsfleet. Ebbsfleet has really ground to a halt, because the landowners who are there are struggling to get viability in relation to a business plan to move it forward. The Government here are putting £200 million into that scheme on GI. It will be spent on putting infrastructure together. In a way, therefore, there is an absolute recognition already that the way to pump prime development and get things going is to invest in GI. The key component is creating this longer-term vehicle to be able to get that value back for the developer. GI is fundamentally a vehicle to be able to accelerate and make change happen, and therefore deliver the quality that we need.

**The Chairman:** Thank you very much indeed. I am sorry for cutting you short, but I know that I have a few more bits of business and I will not have a quorum if we do not stop now. Thank
you both. We have been at it since before 10 o’clock this morning, but it is has been terrific, and thank you so much for engaging so enthusiastically.

29 October 2015
### Policymaking, integration and coordination

1. **Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?**

   **Response:**
   We believe that central Government should ensure that key policies are in place to recognise the importance of well-maintained green infrastructure within the built environment, with these guidelines being disseminated at a local level, for decisions to be made locally, through the planning process.

2. **How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?**

   **Response:**
   It is not well coordinated. Many of the issues are dealt with in silos. There needs to be more connection made across teams. Planning should be a cross-sector resource.

### National policy for planning and the built environment

3. **Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?**

   **Response:**
   We feel that the NPPF does not provide sufficient policy guidance for those involved. Having archived the guidance to Green Infrastructure at the beginning of 2015, which we responded to (see here), we feel that this will have a detrimental impact on communities within the built environment going forward. We believe that green infrastructure plays a vital role within the built environment, on the health and wellbeing of communities, providing climate resilience to combat extreme weather as well as supporting economic regeneration and growth. There is a significant amount of research to support these views and investment in GI at a developmental level can reduce wider costs to society, such as access to well-maintained open space contributing to a reduction in NHS spending on mental and physical health.

   By archiving the guidelines, this will make it harder for the sector to understand what is involved, the importance of GI and how to embed it into the built environment. It therefore portrays GI as a lower priority, when it should be high up on the agenda of any development or built environment project. It is not simply about creating green spaces at the expense of...
valuable development but creating vibrant, cohesive communities (commercial, industrial or residential).

In this context, we appreciate that the Government’s Localism agenda seeks to place more emphasis on local decision making. Whilst we support this move in principle, we do however have concerns about whether local planning authorities, in all circumstances, are sufficiently resourced to consider such issues sufficiently in the absence of wider policy guidance in view of ongoing pressures on public spending. We run the risk of a postcode lottery around acceptable quality and access to green space around our existing and developing communities with potential pressure on existing green spaces.

<thead>
<tr>
<th>Question</th>
<th>Answer</th>
</tr>
</thead>
<tbody>
<tr>
<td>4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?</td>
<td>Response: Yes it is. Please refer to our answer to Question 3.</td>
</tr>
<tr>
<td>5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?</td>
<td>Response: The Land Trust’s primary role is to secure sustainable long term investments in order to manage public open spaces for and on behalf of local communities and the environment. Our model ensures that the investments are in place to safeguard these public open spaces and the multi-functional benefits that they can deliver in perpetuity. Therefore, we believe that taking a long term view is a pre-requisite of sustainable development. Our own timescales for managing green spaces for example are around the 100 years minimum mark and we believe that in order to have positive impacts, planning timescales need to look this far ahead. It is vital to consider the longer term view for planning our future built environment, by using the evidence and forecasts that are already available on a changing climate, increased populations and energy needs in order to successfully build resilient environments. If the incorporation and the long-term sustainability of green space is factored in at the beginning of the planning process for a development, then an appropriate amount of green space can be allocated with the appropriate funding identified to maintain it. Early planning can prevent green space becoming an afterthought or poorly maintained and neglected in years to come. There have been countless examples where a cycle of investment of public open space has been inadequately maintained, leading to a cycle of dereliction to blight and further investment required at a later stage, making it more costly in the long term. The Land Trust was created to be the body that secures the long term sustainability of green public open space. We</td>
</tr>
</tbody>
</table>
have proven that our approach works and works best when we are involved at an early stage in the planning and development of both the green space and the funding streams.

**Buildings and places: New and old**

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

**Response:**
Central Government should be taking a lead role in guiding and coordinating sustainable development and embedding green infrastructure into the built environment. Government should also ensure that the different policies relating to land are coordinated — for example — the brownfield first policy needs to tie in with the planning policy, to ensure that there is a clear understanding around the most appropriate use of land and that Government needs to recognise that although there are pressures to build houses, it should not necessarily always be on brownfield, as this may have greater value as open space delivering greater benefits to society. Therefore, the planning policy for the built environment needs to ensure that it has measures in place to identify the right type of activity to be used on the right type of land. Our views on this can be found [here](#).

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

**Response:**
A key factor in developing built environments which are sustainable and resilient is to ensure that buildings are developed within a robust and resilient ‘natural’ environment. Green infrastructure provides the resilience, and is more adaptive than built infrastructure, has lower maintenance and management costs and provides key services to tackle climate change, including soakaways for flood prevention, heat absorption to reduce urban heat islands and pollution prevention. Securing the long-term investments of these spaces is vital, so that they can be managed in perpetuity and therefore have sufficient funding to be maintained and adapted over time.

The Land Trust’s model for investing in public spaces is to secure the investment, ensure it is protected, invest this and use the interest as the annual budget to maintain the space. By having the right funds in place, buildings and spaces will be able to change and adapt as and when required.

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?
Response:
Historic environments can teach us much about place-making. These historic environments (particularly build) have clearly survived. We need to understand why. Buildings made with materials, such as sandstone have lasted over 100 years, whereas modern constructions last 30-40 years. Therefore, we need to take a longer term view, using historic examples to learn from, and identify what is best environmentally.

Skills and design

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

Response:
The professions in this area do have the right skills, but the Land Trust feels that there is still a need for more skills in the area of long term sustainable management of the built environment. Many professionals operate in silos. More cross-professional training and experience is needed. However, as we say above (response to Q3), we believe that there are currently significant issues with regards to whether local authorities have enough capacity / skills to fully interpret the NPPF in the local context and therefore cannot be as fully involved in planning, shaping and managing the built environment as much as we believe is required. This means that uninformed decisions may be made, which can be detrimental to local communities and society as a whole.

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

Response:
The Land Trust does not believe that nationally the right tools and techniques are being used and coordinated. Since the guidance on Green Infrastructure has been archived and not yet replaced or reinstated, this has left a major gap in the planning process for ensuring the natural environment is embedded into place-making.

Central Government needs to take a leading role in ensuring that green infrastructure is taken seriously and that this is then disseminated at a local level. Equally, on a national level, leadership should incorporate working with the private sector in understanding how to overcome the barriers that developers and other place-makers see in incorporating green infrastructure into the built environment. An important factor in this is to identify how these spaces will be funded long term to ensure they are maintained in perpetuity. The Land Trust’s model of securing investments in green infrastructure is well established and we would be pleased to provide guidance and examples of where this has been successful.

There is enormous pressure in certain parts of the country to build new houses, to reduce housing pressure. However, we believe that we should be building sustainable communities and
Community involvement and community impact

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

Response:
We don’t believe that on the whole, those involved in delivering and managing our built environment do take sufficient account of the way in which the built environment affects those who live and work within it.

We work with a number of decision-makers and developers who do recognise the importance of Green Infrastructure, but they are in the minority. In these cases, they are working with the Land Trust to incorporate green spaces into their developments and add value to their developments. These businesses / organisations recognise that there is an economic case for embedding green infrastructure into developments and are aware of GI’s vital role in creating places where people want to live and work as well as providing valuable ecosystem services. These are the forward thinking developers and decision-makers who want to create sustainable developments and are the ones who recognise the economic benefits of green infrastructure within the built environment in comparison to the economic value of adding additional units.

We can provide examples of these sites, where green infrastructure has been successfully incorporated, and where this is now adding value to communities, improving health and wellbeing and creating social cohesion.

We would welcome the opportunity to give you a tour of our sites which demonstrate this.

One way that Government could add value to encourage consideration of the impacts of the built environment upon the mental and physical health of users is to include planning conditions whereby developments within the built environment must show how their development will help towards this. For example, by providing good quality green spaces within and adjacent to new developments, these areas are providing communities with access to open space, for recreation and relaxation, supporting physical and mental health and wellbeing, as well as providing for climate change adaptation.

Furthermore, there could be an increased minimum requirement of how much green infrastructure needs to be embedded into new built environment developments, with guidance on what type of green infrastructure is most appropriate and where, in order to benefit communities and wildlife.

Again, we would welcome the opportunity to discuss our model with you. As a national land management charity, our remit is to manage public open spaces within the built environment.
12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

Response:
In relation to the first part of this question, from our own experience of working closely with communities, we know that they value giving their own views on places that directly affect them. When they are consulted and involved in the process, with their views are taken on board and incorporated into designs, we know that they will then care about the space and take emotional ownership of it. This has a positive impact in the community, can reduce anti-social behaviour and contribute to improved community cohesion, leading to many other positive outcomes.

We feel that there are barriers to effective public engagement, often due to a lack of skills and resources and lack of local leadership. With our own model, where we have been involved in built environment projects, we have engaged successfully with local communities, playing the intermediary role between the developer and community. As a charity with a strong reputation, we are trusted by the community and the developer, which leads to positive results for all stakeholders involved.

We would be pleased to discuss this further and provide examples of successful community engagement in relation to built environment developments.

Financial measures

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

Response:
We operate in the sphere of long term investment in green public open spaces. Our financial model, which includes a variety of streams such as endowments, service charges and licenses, provide the initial investment to secure the management of these spaces in perpetuity. We believe that investments need to be long term, in order to achieve successful place-making and our model is a proven mechanism for this. We would be pleased to discuss this with you further and show you different examples of how we have secured the investments.

Lincolnshire Rural Housing Association – Written Evidence (BEN0021)

Written responses from the Lincolnshire Rural Housing Association to questions of the House of Lords Select Committee on National Policy for the Built Environment.

About the Association: The Lincolnshire Rural Housing Association was founded in 1986 with the aim of providing affordable rented housing on a non-profit making basis. Working mainly in Lincolnshire’s smaller rural communities, it now has just over 400 properties housing around 1200 people. Most of the properties are in Lincolnshire. A small number are located in West Norfolk and Rutland. In terms of national key performance indicators, the Lincolnshire Rural Housing Association is among the top performing housing associations. The Association has incorporated environmentally friendly energy-generating facilities into a significant proportion of its properties. Responses submitted on behalf of the Association by:

Professor David Head
Chairman, Lincolnshire Rural Housing Association

Select Committee’s Questions and Answers from the Lincolnshire Rural Housing Association

Policymaking, integration and coordination
1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

Major conurbations are currently the conspicuous focus of plans aimed at shaping the built environment. It is probably an exaggeration to claim that there is any strategic discussion of the built environment in rural areas either at national or local level. Small wonder, therefore, that we frequently hear of the “Northern Powerhouse”, but not the “Lincolnshire Powerhouse”, even though a largely rural area such as this possesses massive potential for national food and energy security. Consequently, the nature and role of the built environment in such an area, i.e. as a factor in helping realize the area’s strategic potential, is never seriously discussed.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

The Lincolnshire Rural Housing Association would welcome greater evidence of active interest in housing policy by the Department for Environment, Food & Rural Affairs. Even
though there is considerable concern among rural housing associations regarding the proposed extension of Right to Buy, combined with the introduction of Pay to Stay, which are perceived as a threat to the ability of low-income families to remain in rural communities, there is no evidence on the DEFRA website that it has any interest in ensuring that the forthcoming Housing Bill is rural-proofed. Essentially, housing policy is urban-centric in its basic principles and in its aspirations. DEFRA should be in a position to do something about this, but doesn’t appear to be showing any interest at all. Housing is such a major national issue that there is a strong case for a housing forum, chaired by the Department of Communities and Local Government, at which all relevant government departments are represented.

National policy for planning and the built environment

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

The NPPF devotes about half a page to the rural dimension of planning policy, and it has to be said that this is superficial and perfunctory, suggesting that no serious thought has gone into it. Furthermore, the NPPF’s vision of rural communities is rather limited and dated. We accept that agriculture and tourism are key characteristics of the rural economy, but – as Lincolnshire has demonstrated – it is also important to take into account industries that have an obvious raison d’être in rural areas such as Lincolnshire, e.g. food manufacturing, processing and distribution (the latter always a challenge on the distribution-unfriendly roads of Lincolnshire), and also green energy production through wind farms, solar farms and power stations using biomass. The NPPF also fails to recognize the role of affordable housing in sustaining rural communities and the rural economy, i.e. in a context generally characterized by lower-than-average pay and above-average property prices.

4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

Yes. Introducing a spatial element to national policy would not only involve a more co-ordinated approach, taking into account economic growth (real and/or planned and/or potential), natural resources and infrastructure, but also seek to (i) anticipate the character and location of key features of any region or sub-region and (ii) design the most efficient means of achieving strategic objectives.
5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

There is clearly an urgent need to address future built environment needs in so far as these serve to address the housing crisis. Conventional planning timelines such as five-year and ten-year plans are meaningless in this context. Furthermore, UK governments have been traditionally poor at looking too far ahead owing to the political cycle. We know what is causing the housing crisis: a dearth of activity in building new homes, particularly affordable ones (including rented ones). There is therefore a case for national and local government to get cracking and address the issues with practical, ideology-free solutions and in partnership with those who understand how to develop and, where appropriate, administer housing, e.g. from housing associations and local councils to high-calibre private property developers.

Buildings and places: New and old

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

The government would stand a greater chance of effectively addressing current issues of housing supply if it were less ideological and more pragmatic, engaging all main players in the housing sector, from private developers and private landlords to housing associations and local councils, in order to produce practical solutions. Current policy is excessively oriented to an ideological pledge to extend Right to Buy to housing associations while selling off council-owned properties. It is not linked to any convincing plan to increase the supply of affordable homes, which is the aspect of the housing crisis that should be exercising government most. As things stand, the government stands little chance of significantly increasing the housing supply with the measures it has in mind. The Government should also pay more attention to the skills deficit in the housebuilding industry, which will be a significant impediment to building sufficient new homes. The recent reforms proposed for the planning system are unlikely to have a major impact on rural areas, which are the main concern for the Lincolnshire Rural Housing Association, because their focus is predominantly urban. However, the Association would welcome the rural-proofing of all policies that impinge on rural housing. An identikit, one-size-fits-all approach to housing policy that is oriented largely to urban circumstances and criteria ill serves the challenge of tackling the shortage of affordable homes in rural communities.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come?
How can the best use of existing housing stock and built environment assets be made?

In certain cases, particularly in rural areas, sustainability and resilience in the built environment should derive more from making the most of what that environment has to offer in order to facilitate energy self-sufficiency and provide building materials.

The rural built environment cannot continue to thrive without people committed and able to service its needs. The continued transformation of communities within rural communities from ‘residential doers’ to a commuting dormitory type local population will only erode these communities rather than preserve them. To guard against this, the provision of real affordable housing for lower paid local people is critical.

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

Some of the historic environment is eminently habitable even as affordable rented homes, as the Lincolnshire Rural Housing Association has shown by recently restoring some listed properties. Of course, this may extend the conventionally used definition of “historic environment”, but this is probably long overdue. What constitutes the “historic environment” should not be restricted to a chocolate-box vision of the UK.

Many ministry of defence sites with historical significance have lain unused for decades (in some cases containing empty living quarters), some being heated unnecessarily, some slowly deteriorating. More innovative thinking and less red tape could have made them useful many years ago.

Skills and design

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

The key professions cannot by themselves consider the built environment in a holistic manner when government devolution policy is so haphazard and opportunistic (e.g. the “Northern Powerhouse”). However, they possess the appropriate skills, notwithstanding some architectural disasters in the urban environment. The really troubling area of skills shortage is in the housebuilding industry, where there is a recruitment crisis when it comes to bricklayers, carpenters/joiners and site managers and supervisors. In the case of local authorities, however, it would make sense for in-house expertise in housing development – particularly affordable housing – to be augmented by the expertise that resides in housing associations. In other words, there is considerable potential for an effective contribution to
this aspect of the built environment if local authorities and housing associations collaborated in a more systematic way and more frequently.

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

In the context of the acute house-building crisis, we find this question something of a side issue. However, we contend that building value-for-money homes and housing developments does not have to be achieved at the expense of good design. National leadership in this is unlikely to be a realistic option, particularly if this involves government. However, it may be possible to address the issue of “place-making” effectively and imaginatively at local level in those cases where there is strong community interest generating appropriate political pressure.

Community involvement and community impact

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

Housing associations do not get enough credit for their contribution to developing and managing the built environment, which is often progressive in design and in the extent to which it is “green”. Furthermore, they deliver a significant social return on investment (SROI). The Government is choosing to turn a blind eye to this and even appears to be dismissive of the extent to which housing associations have attached priority to SROI. Its stance therefore does not augur well for the prospects of improving the impact of the built environment on the well-being of those who live within and use it, not to mention their behaviours.

The experience of the Lincolnshire Rural Housing Association is that it pays to be ambitious and progressive when it comes to the design of affordable rented homes and the immediate environment, as the enhanced quality of life leads to high tenant satisfaction and strong tenant commitment to the Association. For instance, adequate garden space is important for families with young children, and environmentally friendly houses are likely to appeal to tenants who would also appreciate having an allotment nearby. Well-maintained public areas on developments are a priority for our tenants, too, as is the Association's zero-tolerance policy on anti-social behaviour. Reducing energy bills by improving insulation and installing energy-efficient heating equipment as well as solar panels also makes sense both in terms of tenant satisfaction and in terms of income generation for the Association (from solar power). However, energy-generating schemes linked to housing developments could be jeopardized by the extension of Right to Buy. For instance, the Association has one
recent development on which the energy is generated by a biomass system. If some of the (very attractive properties) are sold under Right to Buy and the former tenants opt out of the scheme, it will no longer be viable for the remaining tenants.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

Communities have demonstrated the ability to engage effectively and productively in the process of decision-making with regard to their built environment in the case of Community Land Trusts (CLTs) in rural areas, which are an ideal method of securing land for developing housing required by the community in question. However, much more could be done to facilitate their growth and effectiveness. As things stand, a huge amount of time and energy is required of members of the community who are active in CLTs, and this has to be a factor in slowing down the achievement of their objectives, which more often than not involve generating housing to protect the given community’s viability.

Lincolnshire Rural Housing Association has played a large part in forming and hosting a Countywide ‘umbrella organisation’ – Lincolnshire Community Land Trust (LCLT) – which has helped form local Community Land Trusts (CLT’s) or ‘Village Companies’. Two communities have achieved the development of 24 new homes in the last year on land now owned by the community. Unfortunately, LCLT is now in danger of folding due to a lack of revenue resource. A minimal injection of public funding would reap significant return in community engagement.

In the case of the Lincolnshire Rural Housing Association, the community makes a significant contribution to the process of decision-making through the Association’s tenants. They are invited to participate in regular forums linked to specific quadrants of the large geographical area covered by the Association. Issues raised by tenants at the quadrant forums are forwarded to the Board of Management for consideration. There is a tenant representative on the Association’s Board of Management.

Financial measures

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?
The Association fears that the extension of Right to Buy to housing associations will seriously undermine the work of organizations like the Lincolnshire Rural Housing Association, which concentrates on homes for communities with populations under 5,000, by reducing the willingness to make land available at below-market prices to ensure sustainability of rural communities. This is because those landowners and local councils who have made land available on such terms on the understanding that it would be used for affordable rented homes in perpetuity would feel deceived. The Association would therefore welcome legislation exempting rural housing associations from the extension of Right to Buy. The Association also doubts the merits of extending the Starter Homes scheme to rural areas, because we fear it will push up land values while not providing homes that are affordable to low-income rural inhabitants. Of course, the Government’s decision to break its agreed rent-setting formula with housing associations and introduce a four-year rent reduction can hardly be said to contribute in any way to the current issues surrounding housing and land supply. However, it does suggest to us that devolving rent-setting to individual housing associations could well prove effective in generating housebuilding.

27 September 2015
Policymaking, integration and coordination

1) Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

1. The role of national policy-makers should be to set the direction of travel or the vision for our built environment. Living Streets wants to see consistent national leadership towards resilient, smart, healthy built environments which support more walking and cycling, and journeys by public transport.

2. Unfortunately, too often what we see are reactive decisions being made at a national level which shape the built environment in the wrong ways. For example, in July 2014 the Government consulted on the removal of maximum parking standards to ensure that local authorities were more ‘flexible’ and responsive to the needs of motorists\(^{217}\). We objected on the grounds that this is a decision that should rest with local authorities. Maximum parking standards are used alongside planning and transport policies to put the right development in the right place. For example, to encourage offices (which generate a lot of traffic) to locate where they can be accessed by public transport in town centres or close to major public transport interchanges. Where there is good infrastructure for walking and cycling, and good public transport provision, limiting the number of off-street spaces enables higher density residential development. This provides more space for housing and saves the cost of providing additional parking spaces, supporting the sustainability objectives of the National Planning Policy Framework (NPPF). It also improves public health, reducing the emission of CO2 and harmful particulate matter, transforming the quality of streets and public spaces.

2) How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

\(^{217}\) DCLG (2014). Technical consultation on planning
3. Policy coordination needs to be improved. For example, one could also ask why is health not included in this list? With the transfer of responsibility for public health to local authorities, local government has a key role to play in coordinating policy across housing, design, transport, related infrastructure (e.g. health services, schools, shops and so on). This could be through the building of ‘lifetime homes’ and the creation of walkable neighbourhoods, and the location of shops and services within walking distance.

4. Coordination at the local level needs to be matched by policy coordination across the relevant Government departments. NHS England and Public Health England have recently launched a new initiative to “design and develop new town partnerships that put innovative health and social care practice at the very heart of urban planning”. There is an opportunity right now for this to be linked to the new Walking and Cycling Investment Strategy. However, we are unaware of any discussions taking place between the Department for Transport, Treasury and the Department for Health. More broadly, the Government needs to do more to address conflicting policy requirements, for example the Town and Country Planning Associations’ Planning for Healthy Weight Environments project identified potential conflict between the ‘Secured by Design’ principles (e.g. reducing permeability through residential cul de sacs) and maximising movement and active travel by all sectors of the community.

3) Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

5. The National Planning Policy Framework provides some exemplary policy guidance. Unfortunately, there are other factors within the NPPF and its supporting guidance which undermine delivery of sustainability. For example, the ‘presumption in favour of sustainable development’ means that where development plans are absent, silent or out of date development should be approved without delay unless the impacts ‘significantly’ outweigh the benefits (paragraph 14). This means that planning authorities are at the mercy of every speculative housing application that comes their way, irrespective of the design quality or the cumulative impact on the provision of infrastructure, such as schools and health services.

220 Recommendations for planning healthy-weight environments – a TCPA reuniting health with planning project (December, 2014).
221 http://interactive.securedbydesign.com/residential/
6. The core principles of the NPPF recommend that planning should “actively manage patterns of growth to make the fullest possible use of public transport, walking and cycling, and focus significant development in locations which are or can be made sustainable” (paragraph 17). Nevertheless, the supplementary guidance on Ensuring the Vitality of Town Centres makes a special case for drivers requiring local authorities to:

“...improve the quality of parking in town centres... and, where it is necessary to ensure the vitality of town centres, the quantity too. Local planning authorities should set appropriate parking charges that do not undermine the vitality of town centres and parking enforcement should be proportionate, avoiding unfairly penalising drivers.”

7. Reactive government policies also undermine the ability of the planning process to deliver quality in the built environment. For example, proposals (in 2013) to extend the relaxation of the siting of broadband boxes from 2 to 5 years took no account of the obstruction they might cause. This ignored the potential impact that obstruction of the public highway can have on the quality of life of users of the public highway including: people with prams, those with mobility issues such as older people, wheelchair users and those with visual impairment.

4) Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

8. Yes. A recent report by the Royal Town Planning Institute (RTPI) Building in the green belt highlighted the importance of introducing a spatial element to national planning policy. The report examined the likely impact on travel behaviour of proposals to build on green belt land within easy walking or cycling distance of railway stations. The assumption is often made that the majority of new residents will commute by rail to jobs in central London.

9. The RTPI analysed travel-to-work data for five medium-sized towns within the existing Metropolitan green belt, towns which are centred around railway stations and have direct connections to central London. They found that in these five towns, only 7.4% of commuters actually travel to London by train on a regular basis, despite living within easy walking or cycling distance of a station. 72% of commuters travelled to work by private vehicle, mostly driving to jobs within their hometown and to other places not in London.

223 http://www.rtpi.org.uk/media/1432483/Building_in_the_green_belt.pdf
10. Their conclusion was that instead of encouraging more rail travel into central London, a more likely outcome of releasing green belt land near stations for housing would be: “...an increase in private vehicle commuting within and between places in the Metropolitan green belt as individual settlements were permitted to expand, with negative impacts on congestion, pollution and wellbeing.”

11. Therefore: “Discussions on growth within the Metropolitan green belt need to move beyond the single criterion of rail accessibility and consider the need for polycentric public transport networks, critical size thresholds for local employment, the use of car-free developments, and policies which support sustainable modal shift.” (RTPI, Building in the green belt, 16)

12. Spatial planning allows for a comprehensive assessment of policy objectives and infrastructure requirements as they relate out the built environment.

5) Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

13. Local plans cover circa a 20 year timescale and should be reviewed at least every 5 years (Planning Practice Guidance, paragraph 8). However, as noted by the Urban Task Force (ODPM, 1999) 90% of the urban buildings and infrastructure which will exist in 30 years have already been built224. Even if the rate of change in the built environment has increased in the intervening period, this suggests that we will be living with design mistakes for decades to come. Therefore, the planning for the future should take a longer view of perhaps 40 to 50 years. This would also create meaningful dialogue around tackling the impacts of climate change and mitigation, for example, through the use of green infrastructure and promoting a significant increase in active travel.

Buildings and places: New and old
6) What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

14. Recent reforms will lead to more speculative housing applications and less say for communities. Permitted development will encourage more piecemeal and infill developments the cumulative impact of which on transport and wider infrastructure

---

is not taken into account in transport assessments prepared by the developer. The housing threshold for more detailed analysis of the capacity of junctions or highways links to cope with increased journeys by private transport is set by local authorities and can exceed 80 dwellings.

7) How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

15. Places will be more sustainable and resilient where the need to travel by motorised transport is reduced. Pedestrian and cycle infrastructure (complementing public transport) enabling access to key services needs to be designed in from the start to encourage and sustain mode shift at every stage of the life course. For this reason Living Streets support the principle of developing new towns and garden cities because these ensure that appropriate infrastructure (travel, health, education, leisure, green spaces etc) is integral to ‘place-making’ and not an afterthought.

8) To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

16. Historic environments are national assets precisely because they give areas their individuality and sense of place, and for areas which predate the car, are built as architect Jan Gehl puts it ‘at a ‘human scale’. Knowledge of a place’s history helps a community understand how it has changed – sometimes dramatically – over time.

17. Instead of just asking how can more be made of these national assets, should we not also ask what are adding to the built environment today that we will be an asset tomorrow? Too many new residential areas, in particular, lack any local distinctiveness in design or materials. Often placed on the edge of towns and shaping car dependent lifestyles, is this the legacy we want to leave for generations to come?

---

225 For example, Cambridgeshire County Council guidance on Transport Assessment does not require / expect there to be a need for capacity analysis of junctions or highways links for developments of between 50 – 80 dwellings, when considering residential proposals (pers comm.).

Skills and design

9) Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

18. Living Streets would like to offer the observation that cuts to local authority budgets mean their resources are decreasing. Planners are leaving the profession, expertise and capacity is being lost and/or outsourced, so it is increasingly difficult for them to plan, shape and manage the built environment in their areas. This underlines the increasing importance for Cabinet leads to work together across policy agendas to ensure joined up delivery of better places.

Community involvement and community impact

11) Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

19. No. For example, planning decisions in non-estate locations tend to focus on individual buildings and their immediate vicinity. However, the layout of a street can help to trap air pollution (the canyon effect) and should be considered in the planning decision. Similarly, design considerations such as filter permeability not only allow air pollution to disperse, but also creates a healthier pedestrian environment (also a low emission facility) and encourages more people to walk.

20. The environment that people walk in should be attractive and enjoyable. It is important to remember that streets are not only places people walk through, but also destinations in their own right. This was amply demonstrated by ‘Reinvigorate York’ a programme of public realm improvements and a marketing campaign (2012-14) which recognised that the majority of the city’s visitors just want to “stroll around and enjoy the ambience of York”. Public realm interventions should consider ways to make streets places people will want walk to, for example, by creating new public spaces or enabling events to take place through temporary road closures. Active, vibrant streets add to the quality of the walking experience. As stated in the Manual for Streets (2007):
“A 20-minute walk alongside a busy highway can seem endless, yet in a rich and stimulating street, such as in a town centre, it can pass without noticing.”

21. As well as encouraging active travel, attractive streets and public spaces deliver increased economic activity through increases in footfall and rateable values of high streets. Places matter, so public realm improvements should be sympathetic to local heritage and architectural features, for example, through choice of materials and street furniture. The best way to find out what matters to local people is to conduct a community street audit to find out what they like about their local area and how they would like to improve it.

22. Living Streets has been running Community Street Audits (CSA) for over 10 years in partnership with local authorities. CSAs are an important tool because they give communities a voice, recognising that residents are the experts on where they live. Their impact ranges from low cost improvements to the streetscape, such as introducing drop kerbs, to the delivery major public realm improvements, such as narrowing the carriageway, widening the pavement and the de-cluttering of Walworth Road in London and incorporating walking into regeneration of places (see, for example Southwark’s list of completed regeneration projects).

23. Walking is a physical and social activity, and is important for mental health and wellbeing. The built environment can influence incidental interactions on streets and in neighbourhoods helping to build communities. It can also make space for contemplation. Public realm design should include places where people will want to stop, chat and rest, and quiet spaces and walks with access to the natural environment, for instance, in local parks.

12) How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

24. Not very effectively. In principle the Neighbourhood Planning process derived from the Localism Act (2011) offers the means to influence the shape of the built environment for the people who live and work there. In practice:
- Communities may not have the skills or the willing volunteers to develop the plan;
- the scope of a neighbourhood plans may not allow it to address communities’

227 Manual for Streets, ibid.
230 http://www.livingstreets.org.uk/professionals/better-street-design-and-management/rethink-the-traffic and
231 http://www.southwark.gov.uk/info/200191/completed_projects/1196/the_cut
actual concerns (for example, to limit housing growth, reduce traffic and safeguard community facilities).

25. The pressure to build more homes is undermining the quality of the built environment. For example, where a local plan has not been adopted because housing requirements have been challenged (as is the case in Cambridgeshire) the presumption in favour of ‘sustainable development’ means that planning authorities and local communities have little or no power to turn down speculative housing applications.

26. Conditions attached to a development are also subject to change – so a housing development may be accepted on one set of conditions only for these to be watered down or abandoned later on. A good example of this is the development of Barking Riverside. The first homes were built in Barking Reach the 1990s with the promise to residents of trams and then a connection to Docklands Light Rail. Thirteen years later and with over 4000 inhabitants “there’s nowhere to sit and have coffee, no pub, no police station, no youth club, no football pitch – unless you hire it from the school – and the doctor’s surgery will only open when there are 10,000 people living there”\(^\text{232}\). The opening of a Morrisons local earlier this year was cause for celebration “before the shop opened in February, to get a pint of milk on a morning could take an hour in the car because of the traffic”. Residents depend on their cars – a trip to Barking town centre involves two bus rides and to the tube station it is a 40 minute brisk walk. Again, the community has no say.

Locality — Written Evidence (BEN0153)

About Locality

Locality is the national network of ambitious and enterprising community-led organisations, working together to help neighbourhoods thrive. We help people to set up locally owned and led organisations. We support existing organisations to work effectively through peer to peer exchange of knowledge and best practice on community asset ownership, community enterprise, collaboration, commissioning support, social action, community voice, community rights and regeneration.

Locality has been working with communities to develop neighbourhood plans since the powers were introduced in the Localism Act, 2011. Neighbourhood planning is a way to enable people to shape their communities, influence growth in an area, and allows local residents to set their own planning policies that reflect local priorities and deliver local benefits. We have directly supported over 1000 communities to develop neighbourhood plans.

Summary

- Communities benefit from decisions about the built environment being made at a neighbourhood level. Whilst national and regional strategy is required for coordination of policies, any decisions made at these levels require meaningful engagement with the public and affected communities. Devolution provides an important opportunity for a resurgence of neighbourhood level governance on the built environment.

- Improved coordination of government policies between departments is required, including the sharing of data and evidence to shape cross-departmental policies. In addition to housing, design, transport, infrastructure, sustainability and heritage, there is also a need to consider how the built environment impacts other areas of government policy including health outcomes and crime prevention.

- This submission makes a number of recommendations for how government can increase housing supply, including through diversifying the housing market by supporting the development of community-led housing projects. Recommendations are also made on developing the supply of affordable homes built by larger providers and integrating neighbourhood and community engagement into development.

- Recommendations are also offered on how local authorities and developments can ensure that community engagement is meaningful and impactful, including through using diverse methods of engagement such as online tools and social media.

Policymaking, integration and coordination
1) Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of Local Authorities and their partners.

1.1 The planning system in England is currently too centralised, with too many decisions taken at the national level where they would be more appropriately devolved to cities and regions. The devolution agenda is also an important opportunity to provide a renaissance in neighbourhood level governance and powers in planning. This should allow local people a greater voice in determining local priorities and a more active role in shaping the direction for the local area.

1.2 Neighbourhood forums, established in the Localism Act, offer a key opportunity to extend the role which communities have in shaping the built environment, as well as taking forward other changes such as the devolution of services which would improve wider well-being in their neighbourhood.

1.3 Over the last four years, Locality’s neighbourhood planning work has demonstrated the impact of giving local people the power to shape the built environment. Communities which had previously been ‘anti-development’, have responded very well to being given the power to make decisions for their neighbourhood on the location, type and design of development. In some cases these communities have even supported the building of more housing than allocated in the local plan.

1.4 However, there remains a role for national policy makers to provide the strategic and legal frameworks to ensure decisions at the city and regional level are properly made, as well as a strong supporting role in providing cities and regions with additional guidance and support where necessary. It is essential that national strategic planning offers a truly national perspective and is not ‘London-centric’, as has often been the case to date. When strategic decisions are made at the national level and local authority level there is a need for improved engagement with the public. Currently any engagement on decisions made at higher levels is tokenistic and has led to a growing apathy from communities regarding these decisions.

1.5 Local and national policy need to complement each other, however currently the gap between these two levels is too large. The removal of regional spatial strategies (RSS)\(^{233}\) has left a policy vacuum and there is a need for more direction at an intermediate level. The devolution agenda has the potential to address this gap. The ‘duty to cooperate’ between local authorities has proved ineffective in many cases. Only through the failure of local plans has it been recognised by Local Planning Authorities (LPAs) that the duty to cooperate is instead leading to delays in the adoption of local plans, which has led to developer-led planning in areas of high housing demand.

\(^{233}\) The CIL allows local authorities in England to raise funds from developers undertaking new building projects in the area. The money can be used to fund a wide range of infrastructure that is needed as a result of development. Where a neighbourhood plan is in place the neighbourhood portion of the levy rises from 15% to 25%.
1.6 Lack of resources in many LPAs means that delivery of centrally set targets is becoming the focus of all activity. Resource constraints can also limit the speed and impact of neighbourhood planning, and restrict the ability of LPAs to provide planning advice to neighbourhood groups.

2) **How well is policy coordinated across those government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?**

2.1 Policy across government departments is currently poorly coordinated and lacks a coherent strategy. Through our work supporting neighbourhood planning we have often identified conflict between key priorities. For example, in areas with large numbers of heritage assets there is a conflict between preserving these and meeting rural housing needs. Often the community are keen to progress sites, whilst Historic England are opposed in principle.

2.2 There is a need to collate data and evidence from all departments to ensure coordinated policy. Land and buildings are a limited resource and a number of ministerial departments have relevant responsibilities. Improved integration across responsibilities for land ownership, land use planning and policy (rather than development control or building regulations) and statutory control of the use of some building assets (such as those under heritage and environmental protection) could provide benefits for some policy priorities such as housing provision and tax revenue investment.

2.3 In addition to the above policy areas, there is a need to consider how policies related to the built environment also impact on other policy areas including health and crime prevention.

**National policy for planning and the built environment**

3) **Does the NPPF provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so what should be prioritised and why?**

3.1 The NPPF has been successful in consolidating a lot of previous guidance, which is a welcome development. However the lack of key definitions leaves crucial elements open to interpretation which can present difficulties if the LPA and the community have different interpretations. The NPPF also needs provide greater clarity on what constitutes a strategic policy and how to assess whether a policy is strategic. This is crucial when determining the scope of a neighbourhood plan.

3.2 The NPPF attempts to balance local flexibility with national policy priorities regarding sustainable development. As a result it lacks specificity in some areas and does not emphasise the importance of enforcement of development control to achieving the aims of sustainable development. In addition, the detail of infrastructure provision at local level lacks clarity, particularly those associated with social sustainability, such as play and open
space. Transport provision for developments is also a key gap within the NPPF, particularly in regard to sustainable transport.

3.3 Although there are statutory consultative processes associated with plan making which enable plans to be scrutinised from a sustainability perspective, these processes need to include higher minimum standards for building control and climate change future proofing in local plans. The NPPF should reference these statutory minimum requirements for local plans. Examples of increases in minimum standards that would help deliver sustainability include: floor to ceiling heights; residential occupancy standards; Insulation; local energy generation; Amenity and play space provision; cycle storage.

4) Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

4.1 The management of space and development in order to create better places needs to reflect local context and local conditions, and therefore needs to take place at a local and neighbourhood level. However there needs to be a strategic regional dimension which overcomes potential difficulties of local politics disrupting good spatial planning.

5) Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

5.1 Different levels of planning require different timescales and it is difficult to set a standard timescale for planning, however, in order to meet current housing needs, planning needs to account for at least the next 30 years. There are a number of factors which could impact planning needs, and therefore a need to plan for various scenarios and factor in flexibility, sustainability and mitigation scenarios into the built environment and management process. It is also important to consider other particular timescales such as those for operation of land use plans and regulatory regimes.

5.2 A generation, (approximately 25 years), is the most appropriate timescale to determine the operation of land use plans. For regulatory regimes, such as building control, five years is more optimal. A much shorter period is needed for changes to business models associated with specific land uses, such as building technology for construction and upkeep and land and building values.

Buildings and places: New and old

6) What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?
6.1 The housing market in England is currently dominated by a small number of large private house builders, reducing competition and responsiveness of the industry. In order to achieve greater housing supply, a varied and diverse building industry is required.

6.2 Diversification of the industry can be encouraged by modifying the practices of large scale providers such as housing associations, local authorities and large scale build to rent operators, so that they better reflect the needs of communities and involve communities more directly. Partnerships between community groups and developers should also be encouraged in order to balance scale with the values and aspirations of individual communities. In addition, government policy needs to encourage the emergence of small scale community led housing projects, self-build and custom build projects and the emergence of small developer firms.

*Better regulation and incentives for large providers to build affordable homes:*

6.3 Changes to tax system should be considered to encourage the development of affordable homes. For example, developers could be offered tax incentives to deliver affordable homes. In rural areas, affordable housing could be delivered through the use of rural exception housing.

6.4 More stringent planning regulations are also required to prevent the large developers from land banking and the selling off of new builds to foreign investors as a profit making mechanism.

6.5 There is a need to focus on evidence based locally defined housing need. For example, a developer might plan to build executive 4/5 bedroom homes, whilst local people need smaller units.

*Developing housing supply through community-led housing:*

6.6 Our work with neighbourhood plan groups has proved the communities want growth, they can see there are insufficient houses for older and younger people and are well aware of the need for it to be sensitively developed. However often the Local Planning Authority and organisations such as Historic England are opposed to these levels of growth. LPAs and statutory consultees should be required to work with local communities who want development to make it acceptable rather than a presumption against development.

There are a number of changes government could implement to facilitate community-led housing:

- More affordable finance for housing development could be provided through the public works loan board as well as grants to support early stage projects through options or
purchase of land and a rolling land fund. Please see Locality report on the potential of community led housing.\textsuperscript{234}

- Increase land supply by making publicly owned assets available at no cost where development is led by locally based non-profits with an asset lock on schemes of less than 50 homes.

- Further powers need to be handed to neighbourhood forums so they have equal power over the 25% of community infrastructure levy (CIL) funding that parish councils receive as a financial incentive to encourage housing delivery.\textsuperscript{235}

\textit{Changes to national policy}

6.9 Current viability assessments need to be made transparent in order to scrutinise assumptions about costs of development. A national benchmarking system could be introduced which reflects the cost of creating good standards of housing in terms of internal and external space on development sites. There is a need to build decent quality housing, rather than purely focusing on a short term quantity, which will ultimately create healthier, sustainable communities.

6.10 Higher density city development should also be encouraged, existing buildings, brownfield and greenbelt development alone will not address housing supply. There is also a need to reuse existing developments to meet changing needs, and to provide greater incentives for this.

7) \textbf{How do we develop built environments which are sustainable and resilient, and what role should the government play in any such undertakings? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?}

7.1 Sustainable environments need to be well planned and well designed. Focus is often placed on economic measures of sustainable development, to the detriment of social and environmental. A balance between all three needs to be achieved.

7.2 Resident participation in management of homes and communal facilities is essential, regardless of tenure. There is a need for participatory decision making and participatory budgeting, which allows communities to make decisions themselves, and which gives a voice to the poorest and most marginalised in society, not just the well-educated and articulate middle classes.

7.3 A higher set of national standards are required for house builders to address factors such as: sustainable drainage systems; energy generation, integrating solar energy on rooftops, capturing and recycling waste heat and wind power; and waste reduction. Although new build environments will often meet this criteria, the legacy of existing buildings and

\textsuperscript{234} Heritage lottery funding has been used successfully in this way and a loan system should be considered which takes into account conservation deficit and viability.

\textsuperscript{235} See our community assets in difficult ownership work: \url{http://locality.org.uk/our-work/campaigns/cado/}
infrastructure, constructed when standards for efficiency were much lower, needs to be addressed.

7.4 Requirements for retrofitting (refurbishment of existing housing stock to higher sustainability levels) to tackle resource efficiency are equally as important as legislation on new builds. Local Authorities should be encouraged to look at imaginative solutions for reusing old buildings or allow community groups to find new uses for old buildings. VAT levied on refurbishment for such buildings should also be reduced, in particular it should also be reduced for made more nuanced so that some building work that directly contributes to sustainable development in housing refurbishment is zero rated regardless of whether new units are created.

7.5 Enabling communities to lead local renewal projects is the most cost-effective way to ensure our neighbourhoods are fit for the future and allowing residents to thrive. Through empowering community groups to come together and work with local authorities and developers multiple benefits can be delivered. Such upgrades to the physical infrastructure not only tackle climate change, but can also deliver reliable and efficient infrastructure networks, improve health and well-being, secure a healthy natural environment, improve long-term housing supply, maximise employment opportunities and make our communities safe and more cohesive.

7.6 A further recommendation is valuation of a property or development should include environmental impact. For example the appraisal process could set out measures which take into account costs and benefits which cannot necessarily be financially measured, such as carbon use. Green book appraisals could also be extended to private sector land and building development propositions as part of the formal requirements of planning application.

7.7 Improved resourced regulation and enforcement by local government of land use planning and building regulations is also essential. In addition, to address the fact that the benefits of growth are uneven between different areas of the country, a proportion of CIL should be pooled nationally in order to share the benefits of growth.

8) To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place making? How can more be made of these national assets.

8.1 There are a number of excellent examples showing how the historic built environment is being used for a variety of purposes in England, including the visitor economy. There are also thriving communities in historic areas; the historic environment contributes to the unique character of a community and helps engender civic pride, understanding of the past and civic identity. The historic environment also contributes to planning, regeneration and place making goals by setting standards for design quality and attracting visitors.

8.2 These historic assets could be further developed by recognising their contribution and sharing experiences and best practice, enabling understanding of the economic benefits.
There should also be a requirement for community assets registers and related rights to be more widely publicised by Local Authorities. Often it is small dedicated groups that are working to save heritage assets, this work should be supported with funding, guidance and powers.\textsuperscript{236}

8.3 Historic England’s approach to conservation can often be very rigid, with an inflexible focus on preservation. Producing design guides in consultation with the community would ensure the growth which local people want is delivered in line with agreed guidance. This would enable necessary safeguards for the historic environment, whilst recognising the voice and wishes of local people.

8.4 In many cases, historic buildings are left to disrepair by their owners—despite being much loved by local people. They become a blight rather than a historic asset. Locality and Jericho Road Solutions campaigned for a number of years to raise awareness of the issue of delinquent owners and precious buildings at risk and the steps that communities can take to rescue buildings.\textsuperscript{237} In order to make optimum use of our historic assets Locality would recommend improving the use of existing enforcement mechanism and developing new powers so that neglected buildings can be taken away from owners. This could be achieved by extending compulsory purchase powers.

\textbf{Skills and design}

9) \textbf{Do the professions involved in this area (e.g. Planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could be begin to address any skills issues? Do Local Authorities have the skills and resources required to plan, shape and manage the built environment in their areas?}

9.1 There needs to be wider communication and consistency across the various disciplines involved in the built environment professions. Architects need to hold a wider understanding of the key themes and principles of the planning system and vice versa. Whilst no profession should have a monopoly on the built environment, the work necessary to ensure places are designed in a holistic manner should belong to a reinvigorated planning profession with strong urban design skills.

9.2 There is still a lack of understanding around what urban design is and why it is so important to physical and mental health, economy and community cohesion. As a result, much development in England still ignores basic design principles. Further research is needed into the impact our built environment has. Local authorities should have the legal and financial support to resist bad urban design, however cuts and lack of capacity have meant this is not always the case.

9.3 The professional chartered institutions need to address skill gaps by changing the length and content of training courses, including more field work, more independent reviews by organisations external to the statutory planning system. This would supplement LPAs in-house skills.

\textsuperscript{236} For successful examples of such guidance, see similar models in Melbourne and Copenhagen.

\textsuperscript{237} Building for Life 12 is a government-endorsed industry standard for well-designed homes and neighbourhoods
10) Are we using the right tools and techniques to promote high quality design and ‘place making’ at the national level? How could national leadership on these matters be enhanced?

Key recommendations for promoting high quality design and place making at the national level:

- New guidance which promotes high quality design and place making should be developed, by referring to specific national design guidance on how to do it.\(^{(238)}\) This guidance must be regularly updated, widely consulted on and publicly debated. It should provide a consistent message about the value of urban design, provide clarity about rules and process, and be accessible to the community.

- Legislation is required to ensure that developers are unable to play off local authorities against each other, enabling them to refuse poor design without damaging investment opportunities.

- Existing design codes and industry standards, such as Building for Life \(^{(239)}\), should be better supported by government. Growth is more likely to be accepted when policies are in place to secure better quality design and development.

- Large regeneration schemes could be required to work with Design Council CABE when developing schemes. Award schemes should be developed to celebrate best practice in community engagement.

Community involvement and community impact

11) Do those involved in delivering and managing our built environment, including decision makers and developers take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users and upon behaviours within communities?

11.1 Concerns about pollution and the health of communities originally lay at the heart of the UK planning system, however this focus has been increasingly lost. Decision makers and developers need to account for how the built environment impacts people’s lives. For example, obesity, sedentary lifestyles and isolation are growing issues, and these can be affected by the built environment through the way it encourages walking and cycling and interaction between people in the street.

11.2 Evidence should be collated on how design, housing size, and other factors impact on health and community cohesion. Findings should be incorporated into future policy and guidance.

11.3 Health and other community outcomes are often only measureable over long timeframes. For example a scheme with easy, safe and direct walking access to local

\(^{(239)}\) Neighbourhood planning is a key example of how community engagement is enabled by helping them learn about the planning system and people are more involved with the local plan as a result of this.
amenities that is rich in green infrastructure should have a positive impact on the community, but this will not be immediate.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement, and if so how might they be addressed?

12.1 Community groups are becoming increasingly aware of the potential of the principles of Localism, and are keen to get involved in running local projects. This capacity among community groups must be facilitated at the earliest point in the process of shaping the built environment.

12.2 Local authorities and developers need to prioritise community engagement at all levels. Neighbourhood planning is an effective method of delivering community representation at the neighbourhood level, but the community voice needs to be heard at a regional and national level as well. It is essential that this is built into new frameworks being negotiated as part of devolution.

12.3 Community engagement does not necessarily lead to development which meets the needs of communities, and communities can be left frustrated that their input is not acted upon. Key recommendations for meaningful engagement include:

- Communities need to be involved as early as possible and on an ongoing basis, rather than inserted at a later stage when the shape of the development will already have been decided.

- The engagement methods which are used should be diverse, including online tools and social media. This is especially relevant in targeting specific communities (e.g. BAME) as well as deprived areas or those with large transient populations. Engagement methods can often be outdated and ineffective; it is assumed that everyone is confident to voice their opinion, can speak English, or has the time to attend events, leaving only the ‘usual suspects’ involved in planning.

- Professionals and local authorities should work with the general public to ensure they are aware of the basic principles of good design. There is also a need to overcome the barriers created by technical language and ensure planning documents are accessible to all.

Financial measures

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place making by private sector developers.

13.1 Council tax should be charged for unoccupied housing at higher rates than the normal level in order to make the costs of vacancy prohibitive.

---

240 Increase residential sales values would increase land values, whilst increasing build costs would suppress land values.
241 http://www.savills.co.uk/land-index/development-land-index.aspx
13.2 Funding from public health and health education should be used for interventions in the public realm such as cycle paths and generally more walkable neighbourhoods.

06 October 2015
Locality – Supplementary Written Evidence (BEN0212)

Following oral evidence to the Committee provided by Carole Reilly, Head of Neighbourhood Planning at Locality, we are pleased to provide supplementary written evidence as requested by the Chair of the Committee.

Neighbourhood Planning

To date, 1692 areas have applied for designation as a Neighbourhood Planning area. This means they are already formally working on Neighbourhood Planning and have entered the first formal stage in the process. There are many more considering the process, but until they make formal contact with their Local Authority we cannot collect data on them.

Of these 1692:

- 1567 have been designated by their Local Planning Authority
- 239 have submitted for examination and are awaiting their examination
- Local Planning Authorities who have designated areas 230 (68%)
- 140 have successfully passed Independent Examination

Of these those 140 that have successfully passed Independent Examination:

- 110 have had a successful referendum
- 87 have been made and are now in Law

68% of all Local Planning Authorities have designated Neighbourhood Planning areas in their local authority boundary.

The average ‘yes’ vote at Neighbourhood Planning Referendum is 88%, with the average turnout being 33%. In total 240,079 votes have been cast. Turnout varies enormously, as shown in the table below:
Locality’s role in Neighbourhood Planning:

Locality has been running programmes for DCLG on Neighbourhood Planning since 2011.

In the 2013-5 Locality Neighbourhood Planning Programme we directly supported 367 groups on the ground with experts on the ground.

We awarded grant totalling £4,796,204 to 967 groups.

Since the current contract opened in 27th February 2015 we have awarded £282,992 to 538 groups and have supported 86 groups with technical support.

We have produced a wide range of toolkits and resources\(^{242}\) to support groups on the journey all of which are available on [www.mycommunity.org.uk](http://www.mycommunity.org.uk).

\(^{242}\) [http://mycommunity.org.uk/resources/?keywords=&category=&post_tag=&programme=neighbourhood-planning&sortby=date&sortdir=DESC&filterable=true](http://mycommunity.org.uk/resources/?keywords=&category=&post_tag=&programme=neighbourhood-planning&sortby=date&sortdir=DESC&filterable=true)
Locality and The Glass-House Community Led Design – Oral Evidence (QQ171-183)

24 November 2015

Locality and The Glass-House Community Led Design – Oral Evidence (QQ171-183)

Transcript to be found under The Glass-House Community Led Design
1. **About the Local Government Association**

1.1 The Local Government Association (LGA) is the national voice of local government. We work with councils to support, promote and improve local government.

1.2 We are a politically-led, cross party organisation that works on behalf of councils to ensure local government has a strong, credible voice with national government. We aim to influence and set the political agenda on the issues that matter to councils so they are able to deliver local solutions to national problems. The LGA covers every part of England and Wales, supporting local government as the most efficient and accountable part of the public sector.

2. **Summary**

2.1 A locally led planning system is the most effective way of ensuring land with community support for housing is made available. It also provides long term certainty to encourage investment in new build housing with the necessary infrastructure.

2.2 The planning system has seen top-down changes since the introduction of the National Planning Policy Framework (NPPF) in 2012. The focus should now be to allow the system to settle effectively and avoid large-scale reform in order to support the good work councils are doing to get up-to-date plans in place.

2.3 Over 80 per cent of councils have published local plans, which provide certainty to investors, and councils are overwhelmingly agreeing new developments with planning approvals at a ten year high. Almost nine in every ten applications are being approved.

2.4 There are a number of measures Government could introduce to support both councils and developers in their shared aim of bringing forward development, while also guaranteeing the necessary infrastructure to build strong communities. This includes introducing locally set planning fees, streamlining and simplifying Community Infrastructure Levy (CIL) regulations and guidance and removing the restriction on pooling section 106 contributions for strategic sites identified in local plans.

3. **Stability in the planning system**

3.1 Councils need the powers and flexibility to shape the supply of different tenures of housing to meet the needs of people in their area in line with their local plan and the NPPF.

3.2 Since the NPPF was introduced in 2012, and subsequent streamlined national planning practice guidance implemented, central government consultations have
introduced top-down changes to planning policy. This includes permitted development rights for office to residential conversions and exemptions from section 106 affordable housing requirements.

3.3 The recently published Housing and Planning Bill seeks to introduce new requirements on councils that they will have to take into account in the plan-making process. This includes a duty to promote Starter Homes, with the ability for the Secretary of State to make a compliance direction if they believe a council is not discharging its duty or if a policy contained in a local plan is incompatible with that duty.

3.4 Councils have made considerable progress with plan making. Getting plans in place requires significant time and effort and we look forward to working with Government on how the process could be simplified and locally led. It is crucial that plans are developed with the full involvement of local communities and they are not undermined by national policy changes.

4. Planning for infrastructure and growth

4.1 To create a planning system that is locally led, guarantees sufficient infrastructure for successful communities and supports housebuilding, the LGA is calling on the Government to:

- Introduce locally-set planning fees to ensure effective, responsive and fully funded council planning services. This would remove the burden from taxpayers who currently subsidise 30 per cent of total costs. Currently, nationally-set planning fees prevent councils from being able to recover the full cost of processing the 467,000 planning applications submitted on average each year. This call has been supported by the private sector and in a joint LGA and British Property Federation media statement243, the Chief Executive of the Federation said: “we would like to see Government undertake a review looking at how the private sector might be able to make additional payments to planning departments in return for a quality service.”

- Remove national exemptions to section 106 contributions and Community Infrastructure Levy (CIL), to be replaced by a more robust and transparent local viability assessment process to ensure development and supporting infrastructure meets community need.

243 http://www.local.gov.uk/web/guest/media-releases/-/journal_content/56/10180/7550608/NEWS#sthash.AL0fkQ2V.dpuf
- Ensure that local areas are able to use the Government’s Local Growth Fund to support local housing and infrastructure investment strategy.

- Enable local communities to have a say over new development on all brownfield land and the conversion of office to residential property, combined with giving councils the power to ensure developers prioritise brownfield sites.

- Streamline and simplify Community Infrastructure Levy (CIL) regulations and guidance.

- Remove the restriction on pooling section 106 contributions for strategic sites identified in local plans.

5. Turning planning permissions into delivery

5.1 Councils approve almost nine out of ten planning applications received, but many of these permissions remain outstanding with no action on the site. For example, in 2013 there were an estimated 500,000 units with planning permission that had not yet been built out.

5.2 Councils need to be able to create stronger incentives for developers to build out sites. This is likely to require a range of powers, which may include:

- Financial penalties for developers where they have sought and acquired a planning permission but then allowed it to expire. This should include a percentage increase in the Community Infrastructure Levy liability that increases every year the development has not been commenced after the first planning permission has expired. The powers should also enable councils to charge an amount equal to the estimated annual council tax take from that development every year from the point that the original permission expires.

- Stronger compulsory purchase powers where permissions have expired and development has not commenced. This should include an exemption from the requirement to purchase the land at the current market value and pay compensation to the land owner. Instead local authorities should be enabled to compulsorily purchase land at its existing use value.

245 [http://www.publications.parliament.uk/pa/cm201314/cmhansrd/cm131024/halltext/131024h0002.htm](http://www.publications.parliament.uk/pa/cm201314/cmhansrd/cm131024/halltext/131024h0002.htm)
Levies on land that is considered suitable and desirable for development by virtue of its inclusion in the local plan, but that has not been built out, may also provide an option to encourage swifter housing development.

6. Better use of public land

6.1 There is significant value to be realised through better and more strategic management of public sector land. The joint Cabinet Office and LGA One Public Estate programme has demonstrated that local government management of public land can achieve significant additional capital receipts, providing councils have the necessary powers to bring forward assets for sale and development. The Government recognised the success of the One Public Estate programme in the July 2015 Budget and allocated additional funding to continue the scheme.

6.2 The Minister for the Cabinet Office, Matthew Hancock MP, stated in a written parliamentary answer on the One Public Estate programme on 11 November 2015: “Two years on, the programme has already shown that, with small levels of investment and support, a great deal can be achieved. The 12 pilot areas that joined the programme in year 1 expect to cut running costs in the order of £21 million and to raise £88 million in capital receipts by 2018, as well as creating 7,500 new homes and 5,500 new jobs.”

6.3 Further to the programme, we are calling for councils to be given the ‘power to direct’ the strategic development and sale of publicly owned sites in order to bring forward the land to develop 180,000 additional homes. Local authorities should also be able to retain at least ten per cent of receipts from sales of surplus central government land for local investment.

7. Planning Advisory Service (PAS) support for local planning authorities

7.1 The Planning Advisory Service has a significant programme of support in place for local planning authorities. This includes a combination of online tools, advice and checklists, free for all local authorities to download and use. Sector led support where councils can learn from the experience of others is an effective way of driving local plan development. The Service also organises roundtable events for dissemination and discussion of issues and best practice, as well as providing direct on-site support for authorities.

London Borough of Barnet, Gateshead Metropolitan Borough Council and Bath and North East Somerset Council – Oral Evidence (QQ261-275)

Transcript to be found under Bath and North East Somerset Council
1. **Introduction**

1.1 The goal of the planning system, as articulated through the National Planning Policy Framework (NPPF), is to achieve sustainable development. Councils, in their role as statutory Local Planning Authorities (LPAs) with responsibility for plan-making, decision making and enforcement, are ‘on the front line’ of the planning process. As such, they are well placed to witness the impact of changes to national, regional and local policy and guidance on key issues and how industry practices are influenced by policy changes.

1.2 A number of challenges are currently undermining the operation of the Development Plan-led system, and limiting the ability of LPAs to respond to key issues such as population change, rising housing costs, economic need and environmental pressures / climate change.

1.3 As the planning system is a key area of public policy through which the built environment is shaped, these issues are relevant to the Select Committee’s call for evidence and particularly relate to questions 1 (what role should national policymakers play in shaping our built environment?); 6 (are further interventions required from the Government, and what effect will the recent reforms proposed have on housing supply?); 12 (are there barriers to effective public engagement?); and 13 (are there financial measures available which would help to address current issues of housing and land supply?).

*The Islington context*

1.4 The London Borough of Islington has accommodated very high levels of development in recent years, consistently exceeding housing targets within the London Plan and is now the most densely populated local authority area in the country. The borough’s Development Plan sets out its aspiration to continue to deliver high levels of housing and employment growth in a sustainable way, by ensuring that development is supported by sufficient infrastructure, provides housing that meets the needs of local people and addresses environmental impacts.

1.5 Despite its commitment to deliver sustainable development in line with the National Planning Policy Framework (NPPF), the borough has experienced increasing challenges to implementing its adopted Local Plan. This submission also draws from discussions with other authorities arising from the council’s involvement in various groups including the London Borough Viability Group which the council chairs.

2. **Operation of the Development Plan-led system**

2.1 Under law, planning applications are determined in accordance with the Development Plan and material planning considerations (in London this comprises of the London Plan and the Islington Local Plan). Plans are consulted on extensively, viability tested and subjected to Public Examination. They inform the public, provide consistency and direction to applicants and establish the basis of delivering sustainable development. In
short Development Plans are the key tool for authorities to address economic, social and environmental needs through the built environment.

2.2 However, frequent and significant changes to planning legislation, policy and guidance including: permitted development rights, the strong emphasis given to ‘development viability’, restrictions on small site affordable housing contributions, the vacant building credit and the ability to reduce affordable housing requirements after planning consent has been granted, have created uncertainty and inconsistency with the operation of the plan-led system. These forms of de-regulation, and other forthcoming proposals, fall outside of, and conflict with, the ‘plan-led’ process and are undermining the ability of LPAs to implement their Development Plans.

3. Implications and consequences of the de-regulation of planning

3.1 Whilst a key intention of changes to the planning system is to boost housing supply, a significant consequence, particularly in London and the south-east, has been increasing land values. This is because a reduction in planning requirements effectively increases the ‘residual’ land value of a proposal generated once development costs have been deducted from development values. This raises land owner’s expectations, making it harder for developers to bid for and acquire land, and acts as a constraint on delivery.

3.2 Figure 1 compares changes in average build costs (TPI Index), land values and house prices in London since 1997. Land value would be expected to be largely a factor of changes to sales values\textsuperscript{249} and build costs, with the trend falling between the two. However, the graph shows that in the last four years, land values have risen at an extremely high rate, far outstripping significant increases in house prices. This can largely be explained by the various changes to the planning system entailing a reduction in planning requirements in order to increase supply.

3.3 Figure 1: London land prices, house prices and build cost indices (1997-2015)

\textsuperscript{249} See for example, APSE and TCPA (2015), \textit{Housing the Nation}: http://www.tcpa.org.uk/data/files/Housing_the_Nation.pdf
3.4 A particular impact of these changes and resulting increases in land values, together with the significant reduction in the national affordable housing budget and the introduction of affordable rented housing charged at rents of up to 80% of market rents, has been to reduce the ability of local authorities to secure affordable housing that provides for those in housing need. The number of people accepted as homeless is increasing, whilst a lack of affordability is also impacting on the competitiveness of the economy. The Confederation of British Industry (CBI), London Chamber of Commerce and KPMG have for example raised concerns about the difficulties that businesses are experiencing in recruiting entry and mid-level staff due to the high costs of housing in the capital.

3.5 The impacts of key national policy changes are considered below, along with recommendations that to help address unintended consequences.

4. Development viability

4.1 The NPPF requires that the costs of planning policy requirements should allow for competitive returns to a willing land owner and willing developer to enable development to be deliverable. LPAs are required to assess the likely cumulative impacts of policies

---

252 NPPF paragraph 173

253 NPPF paragraph 174

and standards on development, which should not put implementation of the plan at serious risk, and should facilitate development through the economic cycle\textsuperscript{255}.

4.2 Since the introduction of the NPPF, viability has become a standard and increasingly dominant part of the planning system, but there are concerns with how it is operating in practice. The emphasis placed on viability in the NPPF has led to the increasing use of viability appraisals to reduce affordable housing requirements. This has created short term financial gain for land owners at the expense of the longer term value generation that could be achieved by following a plan-led approach that takes wider economic and community needs into account.

\textit{Viability appraisal inputs and assumptions}

4.3 In areas like Islington with high rates of delivery and a buoyant market, it seems counter-intuitive that the majority of schemes are said to be unviable, even where the proposed level of affordable housing is low. Part of the issue is that viability models are highly sensitive to their initial inputs. Given the financial incentives involved, it is likely that developers will opt for pessimistic but reasonable and defensible assumptions in viability appraisals. The result of this is that, whilst every individual assumption may be reasonable, collectively the inputs modelled in appraisals will be systematically biased. Costs that are cautiously high and values that are conservative will have a big impact on the residual value and the amount of affordable housing that an appraisal indicates can be delivered.

\textit{Land value}

4.4 There continue to be huge differences in the approach to valuing land, particularly since the introduction of guidance by the Royal Institute of Chartered Surveyors (RICS) in 2012 which promotes a market value approach to land value\textsuperscript{256}. The ability to lower affordable housing provision through viability arguments is creating uncertainty in the land market. When bidding for land and factoring in the uplift in value that may come from the grant of planning permission (‘hope value’), the developer who makes the most bullish assumptions around value growth, minimising affordable housing, and maximising density, will outbid others and acquire the site.

4.5 The purchase price (or an aspirational sum sought by a landowner), together with other land transactions which may not adequately reflect Plan requirements, the circumstances of the application site and assumptions of value growth (whereas planning appraisals are based on current day values), are being used as market evidence by applicants to justify inflated land values. When applied as a fixed cost in appraisals (rather than land value being the residual) it becomes inevitable that Plan policies are found to be unviable. This issue is explored in more detail in Appendix 1, which relates to a recent Public Inquiry in Islington.

\textsuperscript{255} Paragraph 2.3.1, page 12.
4.6 The justification for this is that affordable housing requirements are subject to site viability testing and so whatever land value is assumed in a viability assessment (even if based on little or no affordable housing) must be right. However, this transfers developers’ risk onto the planning system and the community without a corresponding reduction in the developer’s profit, introduces circularity and pre-determines the outcome of the assessment. It is an approach that is in direct conflict with the 2012 RICS guidance on market value which advises that site value ‘should equate to the market value subject to the following assumption: that the value has regard to Development Plan policies and all other material planning considerations and disregards that which is contrary to the Development Plan’257.

4.7 A recent RICS research paper identified this as a misapplication of the 2012 RICS guidance and warns that under this approach ‘landowners and developers can manipulate the situation to their financial benefit’258.

4.8 A further problem with the use of market land transactions to justify fixed land value figures is that, as well as making unrealistic assumptions about affordable housing provision and acceptable development density, developers make assumptions about future increases in residential values when buying land. This inflates land prices but this value growth is not reflected in planning viability assessments which government guidance states must be based on current values and costs. This mismatch between market land values (on a growth basis) and development (sales/rental) values on a current day basis again results in artificially low viability outcomes in the planning process.

4.9 Changes are needed to national, regional and industry guidance so that viability supports rather than weakens delivery of the Development Plan. This must establish an approach to land value based on existing use values with a premium (‘EUV+) to encourage release of the site, with planning requirements recognised as a pre-requisite to securing the consent from which any additional value is derived.

4.10 Local authorities also have a role to play. Guidance setting out information requirements and an appropriate methodology provides clarity to applicants and provides the right framework for robustly assessing viability appraisals. A number of LPAs are taking steps to introduce greater transparency so that members of the public are more involved. In London, a number of boroughs have formed a viability group so that they can share expertise, take a consistent approach and build up their capacity. Islington recently consulted on a draft Development Viability Supplementary Planning Document and is in the process of analysing responses received during the consultation.

4.11 On the 22nd September 2015 the RICS published a policy paper calling for the Government ‘to endorse the RICS Financial Viability in Planning Guidance in support of the NPPF’259. The paper claims that RICS has worked with the ‘industry to establish broad

---

258 NPPF paragraph 47.
agreement in understanding viability in the planning system’. Given the problems with the market value approach discussed above, which have been identified by a number of boroughs at London borough viability group meetings as well as by some RICS members at a RICS seminar held in London on 22nd September and by the 2015 RICS research paper, it is implausible to claim that there is broad agreement in favour of the approach endorsed in the RICS Guidance.

4.12 In view of the emphasis placed on viability in the NPPF, it is important to note that the NPPF also requires that LPAs will

‘for market and affordable housing, illustrate the expected rate of housing delivery through a housing trajectory for the plan period and set out a housing implementation strategy for the full range of housing describing how they will maintain delivery of a five-year supply of housing land to meet their housing target’.

4.13 Therefore, the starting point in any consideration of land value should be that LPAs have planned to meet their fully assessed housing need, including their need for affordable housing, through their five-year housing supply. Residential land is required to contribute towards meeting affordable housing need, which should have a direct impact on land value. This places a major and deliberate depressant on land value from what it would be worth in an unconstrained market at the heart of planning policy. Appendix 2 illustrates the differences between land value and affordable housing provision in constrained and unconstrained markets.

**Transparency and community engagement**

4.14 Whilst applicants are increasingly submitting viability appraisals which show that their schemes cannot viably support the level of planning obligations and affordable housing required by the Development Plan, they are also seeking to restrict the publication of their appraisals citing ‘commercial sensitivity’.

4.15 By arguing that the content of viability appraisals is confidential, applicants are excluding the public from the planning process and reducing the level of scrutiny that appraisals receive. A number of organisations and reports have called for greater transparency on viability matters, including the DCLG Select Committee in their Review of the NPPF (December 2014), the Lyons Housing Review (October 2014), the APSE and TCPA report ‘Housing the Nation’ (June 2015), the Joseph Rowntree Foundation report

---

‘Rethinking Planning Obligations’ (July 2015) and the CPRE report ‘Getting Houses Built’ (June 2015).

4.16 The lack of transparency in viability is damaging the public’s confidence in the planning system, as they are aware that schemes are being approved without a policy compliant level of affordable housing, but are prevented from reviewing the evidence that supported such departures from policy. LPA planners are put in the uncomfortable position of having to defend their recommendations to councillors and members of the public, without being able to produce the evidence that influenced their decisions.

4.17 The recent High Court decision on small sites and the vacant building credit cited an earlier judgement which considered that a fair consultation process would let ‘those who have a potential interest in the subject matter know in clear terms what the proposal is and exactly why it is under positive consideration, telling them enough (which may be a good deal) to enable them to make an intelligent response’. In cases where the public cannot view the viability information that forms part of a planning application they are not being provided with the opportunity to make a fully informed response, and may feel that they have not been properly consulted.

4.18 This was an issue considered by the First Tier Tribunal (FTT) in an appeal brought by the Royal Borough of Greenwich against a decision notice of the Information Commissioner concerning its handling of an information request made by the Greenwich Peninsula Residents Group (‘the Group’). The Group had requested copies of the financial viability reports undertaken for the Greenwich Peninsula development that led to the council’s decision to vary the S106 Agreement for the scheme and allow a reduced level of affordable housing.

4.19 The FTT’s report states that ‘one argument against disclosure of the redacted information was that those receiving it would be unlikely to understand it’. The FTT found that ‘in our experience this is never a useful objection to disclosure … it is increasingly open to question whether the public should be expected to accept the ‘expert view’ without opportunity to see the supporting factual evidence’.

4.20 As a result of the lack of transparency in the viability process, there are currently few reputational consequences for applicants and viability consultants who provide information that is designed to limit planning requirements beyond that which could

---

266 Ibid, paragraph 34.

268 Eileen O’Grady. West Berkshire District Council and another v Secretary of State for Communities and Local Government. Estates Gazette. 15 August 2015.
viably be provided. In order to combat this, there should be an assumption that information will be publicly available unless applicants can provide a robust justification explaining why it is not in the public interest to release it.

**Viability review mechanisms**

4.21 As discussed above, viability assessments are being used by applicants to remove or lower local authority requirements for affordable housing. An example of a scheme where the applicant’s assessment of viability was far more pessimistic than the independent assessment procured by the council is provided at Appendix 3. In this instance the council has been able to review the achieved sales values for the development, which show that the independent assessment was more accurate than the applicant’s, and a significant amount of affordable housing could have been provided. This demonstrates the importance of securing viability review mechanisms which can reassess viability at an advanced stage of development based on actual values and costs to determine whether additional affordable housing contributions can be made to deliver a more policy compliant scheme.

**Conclusions**

4.22 Public sector budgets have been cut severely, affecting the ability of councils to effectively carry out their functions. In contrast, developers are typically extremely well resourced and in some cases this has accentuated an imbalance within the system whereby short-term private interests seeking to maximise value on individual sites win at the expense of effective planning for the wider area and the public interest.

4.23 Together with the other forms of deregulation discussed in this submission, the current operation of viability in the planning system is disproportionately elevating landowner windfalls and developer profit at the expense of delivering planning requirements. This is undermining the ‘plan-led’ system, and the ability of local authorities to deliver sustainable development and affordable housing in the midst of a housing crisis. Even for authorities with the political will and resources, the scale of current challenges is making it increasingly hard to secure affordable housing.

**Recommendations**

- There is a need for greater transparency – the assumption should be that information will be publicly available unless it can be fully demonstrated that this would not be in the public interest.
- An approach to land value should be established based on existing use value with a premium to avoid ever increasing market land values which undermine the delivery of sustainable development.
- The use of viability review mechanisms on non-policy compliant schemes should be supported.
• The emphasis placed on viability in the NPPF should be reassessed as a matter of priority, as it is currently operating in a way that prioritises short-term gain for landowners and developers above the development of sustainable communities.

5. Small residential sites

5.1 The impact of deregulation on the ability of LPAs to implement their Development Plans is exemplified by recent national policy changes which restricted the ability of local authorities to secure affordable housing on small developments and introduced a ‘vacant building credit’. These changes were implemented through a Ministerial Statement and the Planning Practice Guidance (PPG) rather than through the NPPF or legislation and have now been found to be unlawful at the High Court\(^{269}\). Incompatibility with the plan-led system (the ‘Statutory Scheme’), together with inadequate consultation and consideration of equalities implications, were the grounds of challenge brought by West Berkshire and Reading councils and upheld by the High Court\(^{270}\).

5.2 The Department for Communities and Local Government (DCLG) have been granted leave to appeal this decision, which is creating further uncertainty for developers. This is both because land owners are unlikely to release sites while they await the decision, and because some LPAs have been trying to compensate for the loss of affordable housing contributions by making amendments to their local plans and CIL charging schedules and are now unsure of how to proceed. To end this uncertainty and facilitate delivery DCLG should not pursue the appeal, given that the challenge was upheld on four separate grounds. Small site contributions do not restrain development as they are subject to viability testing. Instead they generate funding which is important for the delivery of affordable housing.

 Recommendation

• To reduce uncertainty in the development industry and enable authorities to meet objectively assessed housing need, the appeal against the High Court decision on small sites and the vacant building credit should not be pursued.

6. Office to residential permitted development rights

6.1 Office to residential permitted development rights (PDR) are currently due to expire in May 2016 but it is anticipated that the Government will announce an extension until May 2019. It is also thought they will include a new provision permitting developers to demolish office buildings and rebuild them for residential use, provided the replacement is of a similar size.

6.2 One concern with the PDR in Islington, and other central London boroughs, is that developers are benefitting from high market values for residential properties without providing any affordable housing or contributing to infrastructure. This may be driving land values up, and not just for PDR sites. At a recent Public Inquiry in Islington the appellant used sale prices for several PDR sites to justify the amount they had paid for their site. The council had to point out that it was not appropriate to use these sites as examples of comparable market transactions, as the absence of affordable housing requirements and planning obligations makes them more attractive to potential purchasers.

6.3 Permitting the demolition and replacement of buildings under the PDR is likely to push land values up further, as developers will no longer be constrained by the layout of office buildings and will compete for buildings that can be developed free from affordable housing requirements and planning obligations.

6.4 A report prepared by London Councils lists the key consequences of the PDR which include the loss of key, occupied office space; the loss of new affordable housing supply; and the introduction of poor quality new housing. The report estimates that 39% of approvals granted under PDR were for fully occupied office buildings, meaning that the policy is affecting viable businesses. Between May 2013 and April 2015 approval was granted in London for at least 100,000 square metres of wholly occupied office floorspace, and 834,000 square metres of office floorspace in total. In addition permission has been granted for 16,600 dwellings, without any requirement for the provision of affordable housing. In Islington, two thirds of the units granted permission will be studios or one bedroom flats, which does not meet the assessed need for housing in the borough. In Croydon, the PDR has resulted in permission being granted for very small units, the smallest being just 13.4 square metres.

6.5 A report has also been prepared for the GLA on the supply of, and demand for, small offices and mixed use development in the CAZ. The report suggests that office development is now becoming more economically attractive than residential development, and that the widespread appeal of residential land use was temporary, at least in economic terms. This raises questions about the benefit of the PDR, as ‘once a building has been changed from office to residential the change is long-term, even though the economic case may only have been short-term’. To support the central London economy the PDR should be revoked, not extended.

**Recommendation**

- The Government should avoid increasing land values and promote space for economic growth by revoking office to residential permitted development rights, and in

---

271 Ibid, page 64
particular should not pursue PD rights for schemes which entail the demolition and redevelopment of buildings.

7. Sustainability and climate change

7.1 In March 2015 the Government announced the withdrawal of the Code for Sustainable Homes (Code) with immediate effect. This is another decision that undermines the Development Plan-led system and the achievement of sustainable development, as many LPAs refer to minimum Code levels within their local plans. The decision to intervene was based on the assertion that the achievement of technical standards was constraining house building 274, a point that was strongly rebutted during the 2014 consultation process.

7.2 The government’s intervention is unnecessary given the purpose of the independent examination which is to ensure that new policies will not unduly constrain development. Policies containing technical standards are only adopted after it has been successfully proven at independent examination, through the submission and consideration of evidence, that they are deliverable. The examination process provides adequate safeguards to protect housing delivery levels.

7.3 This government decision, combined with the announcements in the Fixing the Foundations Treasury paper 275 has caused significant industry uncertainty, removing clear policy directions and creating policy vacuums. The government’s zero carbon buildings policy is an obvious example. Four months after reaffirming their commitment to delivering this policy, an announcement was made that the changes intended to occur in 2016 would no longer be taken forward. This has been highly disruptive to the industry as it was preparing for the policy to be implemented, with many house builders having built the policy requirements into their business plans. Further uncertainty remains, as it is not yet clear how the Government plans to meet the EU Directive requiring all new buildings to be nearly zero energy buildings by 2020, if the national zero carbon buildings policy is not to be taken forward.

Recommendations

- Constraints on LPAs’ ability to impose technical standards on housing development should be removed.
- The Government needs to clarify its position with regards to the zero carbon buildings policy, given the EU Directive to deliver nearly zero carbon buildings by 2020.

8. Starter Homes

8.1 The Government adopted a ‘starter homes’ policy in March 2015, aimed at providing new homes for first time buyers under the age of 40 at a discounted rate. The policy suggests LPAs should identify unviable or underused commercial land that could be used for housing, and grant planning permission for these sites unless there is an overriding

274 NPPF paragraph 17
275 Peter Bill. Government’s pledge for 200,000 starter homes by 2020 looks like a non-starter. Estates Gazette. 12 September 2015.

Page 1237 of 1964
conflict with the NPPF that cannot be mitigated. LPAs should not require affordable housing or infrastructure contributions from developers delivering homes on these sites.

8.2 One initial aspect of this policy was that the Government promoted housing development on employment sites that have not been allocated for housing by local planning authorities, and may not be suitable for housing. The policy compounds this issue by preventing authorities from requiring infrastructure requirements that may have assisted in making the sites more appropriate for development. The policy also removes the ability to apply adopted affordable housing policies to meet objectively assessed housing need, contrary to the NPPF and the plan-led system276.

8.3 The presumption in favour of planning permission could also act to increase land owners’ expectations of what the ‘competitive return’ for their formerly undesirable land should be pushing up land values.

8.4 The proposed discount for the starter homes is 20% below open market rates, capped at £450,000 in London and £250,000 elsewhere. This is another aspect of the scheme that raises concerns. 80% of market rate in Islington is still very expensive, so any units delivered as a result of the scheme are likely to be at the capped rate and will do little to address the severe need for affordable housing in the borough.

8.5 More generally, new build properties routinely attract a premium of 20% above ‘secondhand’ homes277, so the discount applied to the starter homes may do little to aid their affordability in other boroughs and parts of the country. Research carried out by Shelter states that families on the new National Living Wage will be able to afford a starter home in only two percent of local authorities278. Similar research by Savills suggests that a couple on an average salary would struggle to buy a home at a 20% discount in almost half of all council areas in England279.

8.6 Notwithstanding the borough’s concerns about the affordability of the units and the unsuitability of the sites for housing, if the aim of the policy is to provide housing at more affordable prices for first time buyers, it is unfortunate that the discount is not secured on properties in perpetuity, or even on a long term basis. Instead, after 5 years owners of the units can sell them on the open market, effectively handing them a 20% windfall. The policy therefore provides a one-off benefit for developers, land owners and initial unit owners at the expense of the community and does not justify its costs.

8.7 The Prime Minister released more details about the policy during his speech to the Conservative Party Conference on 7th October 2015. Starter homes are to be included within the definition of affordable housing and LPAs will not be able to prioritise other

278 Planning Resource (2015) Sector responds to Cameron’s conference speech:

279 Inside Housing (2015) Starter Homes plan ‘will hit association housing’:
http://www.insidehousing.co.uk/business/development/land-and-construction/starter-home-plan-will-hit-association-development/7012160.article
forms of affordable housing, such as social rented housing, over starter homes during section 106 negotiations.

8.8 In response to the Prime Minister’s speech, industry figures and commentators raised the following concerns with the policy:

- It will reduce the amount of affordable rented property delivered through s106.
- It risks increasing land values, rather than supply.
- The age and price thresholds appear somewhat arbitrary.
- It will increase demand for home ownership, instead of focusing on meeting supply.
- It might not work in the context of existing local plan policies and targets, signaling that further changes to the planning system will be required.
- The cumulative effect of the starter homes policy, the extension of the right to buy and forced council house sales will be fewer affordable homes for key workers and those in need.

8.9 S106 agreements currently require developers to work with Housing Associations (HAs) to deliver the agreed amount of affordable housing. If the definition of affordable housing is changed to include starter homes, and LPAs are compelled to accept them, developers are likely to favour them over other forms of affordable housing as they can sell them directly and realise a greater profit than they can from selling units to HAs. As HAs become excluded from this process, they will have to compete with private developers for development sites on the open market if they wish to continue operating. To be able to compete it is likely that HAs will have to provide more housing for sale on the open market, further reducing the provision of housing for rent at affordable levels.

8.10 The existing lack of housing available to rent at affordable rates has led those who cannot afford to buy their own homes to rely on the comparatively more expensive private rented sector, with the result that the annual housing benefit bill has grown. The consequence of removing LPAs ability to require affordable rented housing from new developments will be to increase the number of people looking to the private rented sector for accommodation, some of whom will require assistance from housing benefit. Others will not be able to find anything they can afford, leading to an increase in both hidden and statutorily homeless households. Local authorities have a duty to house households accepted as statutorily homeless which will further increase the housing benefits bill.

---

283 NPPF paragraph 17.
8.11 Changing the definition of affordable housing to include starter homes will reduce local authorities’ ability to provide for those in greatest need. It will incur social and economic costs as homelessness and the welfare bill increase, whilst benefitting landowners, developers and households with good incomes, none of whom are in need of state assistance.

Recommendation

- While starter homes may have a role to play in increasing opportunities for home ownership for households on relatively significant incomes in London, this should not be pursued at the expense of housing for those in greatest housing need and intermediate/ shared ownership housing.

9. Automatic consent on brownfield sites

9.1 In July 2015 the Government announced that it would legislate ‘to grant automatic permission in principle’ for brownfield sites identified in statutory registers of brownfield land suitable for housing. Further details are to be provided in the proposed Housing Bill.

9.2 When the Government consulted on the possibility of introducing local development orders (LDOs) for brownfield sites in March 2015, Islington raised concerns about the ‘one-size-fits-all’ nature of the proposals. Since monitoring began in 2005, 100% of housing and employment development in Islington has been on previously developed land. The borough is fully aware of the importance of prioritising brownfield land and does not consider that specific measures are needed to ensure brownfield sites are brought forward.

9.3 Site allocations are the quickest and most efficient way to identify suitable brownfield land for housing development; this is a one-off process where multiple sites can be identified, unlike LDOs which require a bespoke approach, which evidence suggests can take around 8 months per LDO. Islington have allocated over 100 sites for housing or housing-led development. Site allocations also have the benefit of addressing issues in a holistic manner, encompassing consideration of economic, social and environmental issues in the round.

9.4 The borough is concerned that the measures do not take mixed-use development into account. The promotion of mixed-use development is a core land-use principle of the NPPF and in dense urban areas such as inner London, mixed use development is essential in making the most efficient use of land and balancing competing demands for different land-uses. The inability to provide mixed-use development, particularly on large sites, would seriously inhibit the borough’s ability to provide employment floorspace and provide for economic growth.

---

9.5 Given the borough’s reservations about LDOs, the move towards automatic consent for brownfield sites is unwelcome. Clarity is needed on how design and amenity considerations will be taken into account, as design and amenity considerations relating to residential development in mixed-use, built-up areas are much more complicated than those for relatively homogenous employment areas. There also needs to be clear guidance about how Local Plan policies should be considered through the LDO process, as without this and combined with the other planning reform measures, there will continue to be a piecemeal erosion/circumvention of the plan-led system.

**Recommendation**

- The proposal for automatic consent on brownfield sites should not be implemented.

10. **Extension of the ‘right to buy’**

10.1 In the 2015 Queen’s Speech the Government announced its intention to extend the ‘right to buy’ to Housing Association (HA) tenants. They have proposed to compensate HAs who lose units through the right to buy using money generated by the sale of ‘the most expensive’ council-owned social housing units. In London, councils will be required to sell 1 bedroom units valued over £340,000, 2 bedroom units valued over £400,000 and 3 bedroom units valued over £490,000 as they become vacant.\(^{286}\)

10.2 In high value areas such as Islington, this policy could mean that every social housing unit that becomes vacant will have to be sold. The Government has stated that units will be replaced on one-for-one basis but it is unclear how the receipts generated will be sufficient to both provide replacement HA and council properties and contribute to an intended brownfield regeneration fund. As an indication of the problem, it has not been possible to replace units sold under the current right to buy system on a one-for-one basis.\(^{287}\)

10.3 Research carried out by Liverpool Economics on behalf of the London Boroughs of Camden, Enfield, Haringey and Islington following the announcement of the policy suggested that ‘even if the new policy to replace homes worked, there would be a time lag of at least two years from the sale of a home to it being replaced’.\(^{288}\) This will exacerbate current problems with housing supply and affordability, instead of alleviating them.

10.4 Islington has its own new build housing programme, aimed at delivering homes that will meet the identified needs of its residents. The borough is unsure of the impact that the extension of the right to buy will have on newly completed units that have not yet been occupied, all of which will have market values in excess of the thresholds outlined above. Rather than creating uncertainty, the Government should be supporting local authorities in the direct delivery of affordable housing.

\(^{288}\) BBC (2015), Why can’t the UK build 240,000 houses a year?: [http://www.bbc.co.uk/news/magazine-30776306](http://www.bbc.co.uk/news/magazine-30776306)
Recommendations

- If the extension of the right to buy to housing associations is implemented, this should be funded by the government rather than through the forced sale of affordable housing by councils.
- The Government should increase capital funding for affordable housing in order to meet housing need, reduce the social and economic cost of homelessness, and housing benefit costs.

11. Delivery of consented schemes

11.1 Recent measures announced by the Government are aimed at increasing housing supply, but the delivery rate of developers also needs to be considered. Recent figures indicate that while the number of additional consented homes has increased significantly in recent years, delivery has tapered off289.

11.2 Developers, particularly the large housebuilders, can both phase the release of their sites, and delivery on individual sites. By controlling the rate of delivery, supply does not exceed demand and house prices continue to rise290. Removing planning requirements has not led to a reduction in new build house prices, but a number of large housebuilders including Bovis Homes291, Galliford Try292 and Redrow293 have recently announced record profits. KPMG’s UK chairman has spoken of the need to encourage owners to ‘let go of land banks’294, and in a joint report Shelter and KPMG have suggested that ‘getting more developable land into the hands of those with the incentive and the ability to build rapidly must be a key objective of housing supply reform’.295

Recommendation

- Measures should be introduced to ensure that consented schemes are delivered within reasonable timeframes.

12. Conclusion

- Reaffirm the primacy of the Development Plan-led system and its importance in achieving sustainable development.
- Implement measures to ensure consented schemes are delivered within reasonable timeframes.

• Require more transparency in viability appraisals, promote the EUV+ approach to land value and support the use of viability review mechanisms on non-policy compliant schemes.

• Reassess the emphasis placed on viability in the NPPF as a matter of priority, as it is currently operating in a way that prizes short-term gain for developers above the development of sustainable communities.

• Increase capital funding for affordable housing in order to address housing need, and reduce the social and economic costs of homelessness.

• Promote space for economic growth by withdrawing the office to residential permitted development right and not extending this to sites involving demolition and redevelopment.

• Clarify its position with regards to the zero carbon buildings policy, given the EU Directive to deliver nearly zero carbon buildings by 2020.

• Carefully consider the impacts of Starter Homes policy, automatic consent for brownfield sites or the extension of the right to buy and not pursue these policies at the expense of the provision of genuinely affordable housing.

• To reduce uncertainty in the development industry and enable councils to meet objectively assessed housing need, not pursue the appeal against the High Court’s decision on small sites and the vacant building credit.

• **Summary of the submission from the London Borough of Islington**

1. Development Plans are the key tool for authorities to address economic, social and environmental needs through the built environment. However, frequent and significant changes to planning legislation, policy and guidance have created uncertainty and inconsistency within the operation of the plan-led system.

2. Key changes include:

   • Office to residential permitted development rights
   • The strong emphasis on ‘development viability’ in the National Planning Policy Framework (NPPF)
   • The movement away from the national zero carbon buildings policy, and restrictions on the ability to impose ‘technical standards’ on housing development
   • Restrictions on small site affordable housing contributions and the vacant building credit
   • The ability to reduce affordable housing requirements after planning consent has been granted

3. The way viability is currently operating in the planning system is disproportionately elevating landowner windfalls and developer profit at the expense of delivering planning
requirements. A key impact of these changes has been to increase land values, whilst delivery has not matched the significant increase in consented homes, and house prices continue to rise. There are tangible social and economic costs to society as housing needs continue to grow.

4. In addition, further proposed policies will restrict the ability of authorities to deliver sustainable development and meet objectively assessed housing need which are key goals set out in NPPF. These include:

- The delivery of Starter Homes at the expense of genuinely affordable housing
- Automatic consent for brownfield sites
- Reduction in social rents by one percent per annum for the next four years.
- The extension of the ‘right to buy’ to housing association properties

5. Planning has the ability to address key modern day issues, produce good quality places and create long-term value through the Development Plan led system. To address these issues the Committee is asked to consider making the following recommendations to government:

- Reaffirm the primacy of the Development Plan-led system and its importance in achieving sustainable development.
- Implement measures to ensure consented schemes are delivered within reasonable timeframes.
- Require more transparency in viability appraisals, promote the EUV+ approach to land value and support the use of viability review mechanisms on non-policy compliant schemes.
- Reassess the emphasis placed on viability in the NPPF as a matter of priority, as it is currently operating in a way that prizes short-term gain for developers above the development of sustainable communities.
- Increase capital funding for affordable housing in order to address housing need, and reduce the social and economic costs of homelessness.
- Promote space for economic growth by withdrawing the office to residential permitted development right and not extending this to sites involving demolition and redevelopment.
- Clarify its position with regards to the zero carbon buildings policy, given the EU Directive to deliver nearly zero carbon buildings by 2020.
- Carefully consider the impacts of Starter Homes policy, automatic consent for brownfield sites or the extension of the right to buy and not pursue these policies at the expense of the provision of genuinely affordable housing.
To reduce uncertainty in the development industry and enable councils to meet objectively assessed housing need, not pursue the appeal against the High Court’s decision on small sites and the vacant building credit.

13 October 2015
Introduction/Summary
1. This submission addresses the following issues as set out in the Committee for the Built Environment’s call for evidence terms of reference:
   - Policymaking, integration and coordination
   - National policy for planning and the built environment
   - Buildings and places: new and old
   - Skills and design
   - Community involvement and community impact
   - Financial measures
These issues are primarily addressed in West Midlands and South Worcestershire context, with a particular focus on the city of Worcester and its environs in the period to 2050.

Policymaking, integration and coordination
2. In the early 2000s, policymakers in the West Midlands embarked upon a so-called game changing strategy of “urban renaissance” for the region with an emphasis on regeneration of the major conurbations and smaller cities, together with sustainable, integrated transport planning. These policies found expression in the West Midlands Regional Spatial Strategy (WMRSS), the first iteration of which enjoyed wide public support, although its revision was less well received. Notwithstanding subsequent revocation, WMRSS has left a positive legacy in the region as reflected in the growing status of Birmingham as England’s second city, and shown that there is an important role for regional planning.

3. However, this has been replaced by so-called “localism” with a “strategic” planning dimension supposedly provided by the National Planning Policy Framework (NPPF). In the South Worcestershire context, the effect of this appears to be a “great leap backwards” to the kind of development which encouraged extensive green field urban sprawl around Worcester, Malvern and Evesham during the 1980s and 1990s. Although the NPPF requires planning to ‘actively manage patterns of growth to make the fullest possible use of public transport, walking and cycling, and focus significant development in locations which are or can be made sustainable’, in practice this is difficult to achieve outside major urban areas.

4. There are a number of obstacles to achieving sustainable spatial development (which are taken up below) and these need to be tackled at the national, regional and local levels based on the principles of integrated transport. National policy-making that does not recognise this, and the important role of regional strategic planning, will simply lead to gridlock at a local level, which is precisely what is and will continue to happen in and around Worcester. Moreover, policy-making at every level must be based on good (and, ideally, best) practice,
and it is very much open to question whether the increasingly administration-led system of planning in England can maintain the status quo let alone create a better built environment.

**National policy for planning and the built environment**

5. The absence of a useful definition in the NPPF of what constitutes “sustainable development”, notwithstanding its presumption in favour of this, largely arises from the lack of a spatial perspective in national policy, as well as the dismantling of regional planning in England. Scotland, Wales and Northern Ireland each has a national spatial plan but, because of the English planning deficit, the UK is the only country in European Union without one. As a consequence, Britain will be unable to fully participate – should it remain an EU member – in the spatial investment plan to 2050, although the UK is forecast to become the most populous nation in the EU by the middle of the century.

6. Given that most of Britain’s predicted 80 million inhabitants in 2050 are likely to live in England, with a probable concentration in the southern and central areas, the lack of a spatial perspective and useful definition of sustainable development in national policy is very much a cause for concern. Basically, population growth on the scale forecast cannot be sustainably accommodated in commercial housebuilder-led urban extensions - or suburban sprawl - dependent on the private car and fulfil the NPPF requirement to ‘actively manage patterns of growth to make the fullest possible use of public transport, walking and cycling, and focus significant development in locations which are or can be made sustainable’.

7. As a matter of urgency, a spatial plan for England needs to be developed based on a number of realistic low, medium and high population growth scenarios for the period to 2050. This should focus on major urban areas, together with towns and cities that can accommodate sustainable development, as well as possible locations for small and larger new settlements. However, if strategic planning is to succeed it must be democratically accountable, and not led by quangos, and this requires a national assembly or English Parliament. In the meantime, national policy-makers should address what sustainable development means in a particular spatial context, especially with regard to transport.

**Buildings and places: New and old**

8. The ongoing focus on increasing the supply of new houses must be integrated with economic development and infrastructure provision. Despite the dismantling of regional planning, there appears to be a general consensus that the city-regions around England’s major conurbations provide the most appropriate focus for national government intervention in the spatial economy. These areas also typically reflect travel-to-work or commuting patterns and, therefore, represent the most effective level for strategic transport planning. However, there seems to be considerable resistance to such regional subsidiarity in some local areas, such as South Worcestershire.
9. Discussions of housing supply in England usually focus on the very real shortage of affordable homes in certain parts of the country, including London and the south east as well as more prosperous regions beyond these, together with many rural areas. However, there are still a significant number of towns and cities in the north Midlands and beyond where property is more affordable, although employment opportunities may be restricted, and significant numbers of houses, including social-rented stock, lie empty. The economic regeneration challenges of such areas merit serious national policy attention alongside those where housing markets are over-heated.

10. Places with strong housing markets have a range of attributes which make them attractive. This often includes a historic built environment and surrounding open countryside. New development within the existing built-up area and on green field sites can be equally sensitive and calls for high quality planning at both the policy level and in its execution. Unfortunately, the process is usually landowner and developer driven as the capacity of public agencies is usually weak outside major cities. In the case of South Worcestershire, for instance, a strategic opportunity exists to develop a new settlement at Throckmorton Airfield (a brownfield site) but incremental suburban sprawl is prioritised.

Skills and design

11. Most people working within spatial policy and planning at both the national and local levels are essentially administrators. Hard skills associated with surveying, design, architecture and engineering etc are largely outsourced to private consultants and contractors. However, there must be sufficient in-house expertise and experience for procurement, co-ordination and project management to be technically proficient and cost-effectively conducted. This is not always the case and, as a result, policy and planning administrators may find themselves uncomfortably caught between their political masters, on the one hand, and external professional and commercial enterprises, on the other.

12. The need for effective in-house strategic and project co-ordination skills is crucially highlighted where alternative options need to be assessed and appraised against a set of specific criteria, whether at the plan or individual scheme level: for instance as part of the sustainability appraisal and/or statutory environmental assessment process. In addition, because of the key requirement for public engagement (see below), technical expertise needs to be combined with high quality communication skills. If the experience of South Worcestershire is to be generalised, such resources may be unavailable to many provincial English local authorities, with sub-optimal outcomes as a consequence.
13. However, the availability of an increasing range of generally very good, and sometimes excellent, online courses relevant to spatial policy-making, urban design and planning may be a means of educating both public and civil servants at the local and national levels, as well as creating better informed political decision-making and community involvement. For example, the so-called Mooc – Massive Open Online Course – model has recently been adopted by central government working in partnership with the UK digital education platform FutureLearn to run a course on contract management. This type of arrangement could well be extended to delivering content on other relevant subjects.

**Community involvement and community impact**

14. Lack of consensus around a number of issues fundamental to delivering a better built environment, including the role of integrated and sustainable transport, requires a number of “Big Conversations” between politicians, professionals and the public. The Mooc platform lends itself very well to this type of discussion, although it’s potential to “crowd source” community involvement in planning is better developed in the United States where, for instance, Coursera has run “Technicity” for several years. This Mooc explores the role of information and communications technology in smart cities, including the potential roles of digital media for increasing public engagement in both their design and operation. (1)

16. Despite the opportunities offered by new technology, planning consultations appear to have undergone so-called dumbing-down in recent years. Whether conducted by public agencies or private developers, these are frequently marketing exercises rather than genuine efforts to engage communities in decision-making about the future of their areas. Development promoters often adopt a “there is no alternative” approach, rather than providing a range of spatial or design options for consideration. People or organisations that challenge this approach may find themselves at best ignored, or more likely ostracised and excluded from future discussions. This usually has negative consequences for all concerned.

17. With regard to the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities, key issues obviously include accessibility to employment and services, as well as opportunities for informal recreation. The importance of creating places where people can easily walk and cycle to their destinations, together with attractive, green environments has received considerable exhortation in recent years. Nevertheless, the realities tend to be somewhat different from the rhetoric. Many communities are blighted by severance arising from road construction within and around towns and cities, as well as noise and air pollution associated with this.

**Financial measures**
17. Endemic problems like the affordable housing crisis in parts of England and the economic decline of other regions cannot be solved by market-led approaches alone. As an excellent paper for the Regional Studies Association recently noted: “Ultimately, spatial economic imbalance in the UK has to do with the progressive concentration of economic, political and financial power in London and its environs. The UK has one of the most centralised systems of public finance, policy-making and political control among OECD nations” (2). The present government’s devolution proposals for England will not fundamentally alter this, nor the type of property market to which it has given rise.

18. In order to tackle the shortage of affordable housing, a number of measures are required. Given the scale of the problem in some areas, a publicly-funded building programme focussed on the development of properties for let on social rents is likely to be needed, of the kind recently proposed by the Labour Party (3). With regard to the wider housing market, there is increasing scepticism as to the ability of private house-builders to deliver the kind of homes for the future that are required. Architects and property developers such as Lord Rodgers and Sir Stuart Lipton have, therefore, proposed new policies to foster business models that discourage large-scale speculative land-banking (4).

**Conclusions/Recommendations**

19. It is the speculative nature of the property market across large swathes of England that poses the greatest single obstacle to the creation of a better built environment. De-regulation of the planning system, and related measures, of the kind pursued by the present and previous governments are supposedly designed to increase national productivity. However, such policies have often had precisely the opposite effect, and additionally contributed to the boom and bust cycles which have been a feature of the UK economy since the 1980s. Instead, better regulation and incentives are required to create high quality, sustainable development. Finally, in order to engage the “Big Society” in a more constructive debate, national and local policy-makers would do well to adapt this year’s Labour Party conference slogan and promote “straight talking, honest planning”!

Ken Mafham – Written Evidence (BEN0178)

Executive Summary

Q3 Does Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

• Planning has become formalised and standardised to the point of dysfunction. The Planning Inspectorate carries some responsibility for this.

• The principle of sustainable development, embedded in the NPPF, and interpreted by the Court of Appeal in the Hunston Judgement requires a balancing of environmental concerns with the need to provide housing for a growing population.

• A report on Housing Supply produced by Katherine Barker in 2004 *1 has dominated Government thinking since that date and tipped the scales in favour of the house building industry

Q6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

• The Barker Report was flawed in that it did not differentiate between London and the rest of the country, between market housing and affordable housing and between the very different levels of need subsumed under the heading of affordable. It also preceded the recession. The identification of planning restrictions as the prime cause of house prices rises in the country as a whole was fundamentally unsound

• The Barker Report is now out of date. It is arguable that it should be replaced by regional studies of housing supply and planning along the lines of the excellent work carried out by consultants for the Greater London Authority.

• The approach to housing land availability which adds a 20% “buffer “to deal with “underperformance” needs to be replaced by an intellectually robust process that actually identifies the causes of low house completion rates.

Q5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?
• Given the uncertainties in projecting population, households and employment the disadvantages of 20 year plans outweigh the advantages. A shorter time period, ten to fifteen years, would result in policies based on sounder evidence and option appraisal.

• Whilst local plan policies can require the development industry can contribute to meeting the need for affordable the task cannot be left entirely that sector. Revitalised Housing Investment Programmes prepared by local authorities are the best vehicle for identifying Core affordable housing needs and meeting them within an acceptable time scale.

Q12 How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

• George Osborne has used the term Nimbyism. If name calling is to part of the policy making process we would coin one to the housebuilding industry; NOOP; Not Out of Our Pocket. An industry that suffers negligible foreign competition and whose market is subsidised and enhanced by tax relief for mortgage interest and freedom from capital gains tax ought to be able to look after itself in the debate that needs to take place.

1. Introduction

Many of the questions set out in the call for evidence overlap and interact and so we have not structured our submissions by the individual questions.

The submissions are relevant to the following

3 Does Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?
12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

I am a planning consultant but these submissions are not the result of an instruction but are simply reflections on some forty five years of experience in the field in both the public and private sectors.

Context
1.1 With regard to Questions 6 and 12 Decisions on housing and planning are the responsibility of developers, local planning authorities and providers of social housing: all acting within a framework of policy constraints and incentives set by Government and interpreted in by the Planning Inspectorate. In addition the public have long taken a keen interest in planning matters and this has been actively encouraged by the Localism Act 2011.

1.2 Central and Local Government can commission expert advice. A Review of Housing Supply carried out by the economist Katharine Barker in 2004 *1 has been a major influence on Government policy towards planning and housing since that date to a very large extent.

1.3 All of the agencies involved in planning decisions are open to applications for judicial review by the High Court and the Court of Appeal. The replacement of thousands of pages of detailed planning advice and guidance by the 60 page National Planning Policy Framework has inevitably led to an increase in such applications. The criterion used by the Courts in Judicial Review are not whether decisions by local planning authorities and planning inspectors are fair but rather whether they accord with a reasonable interpretation of Government policy to such an extent that the intervention of the judiciary into the executive is justified.

1.4 If thousands of planning decisions stem from Government policy it is very important that Government policy is founded upon an up to date and comprehensive understanding of the facts and of causal relationships. The thrust of my submissions is that it is far too simplistic to assume that the environmental policies embedded in the planning system are always, or even often, the reason for the under supply of housing although that may be the case in certain areas at certain times. Dumbing the argument down does no service to either the conservation of the environment or of housing needs. The evidence is that outside London we are neither protecting the environment nor bringing forward the right number of houses.

1.5 At the heart of Government policy is the idea of sustainable development. The forward to the NPPF includes the following:

“The purpose of planning is to help achieve sustainable development. Sustainable means ensuring that better lives for ourselves don’t mean worse lives for future generations.

Development means growth. We must accommodate the new ways by which we will earn our living in a competitive world. We must house a rising population, which is living longer and wants to make new choices. We must respond to the changes that new technologies offer us.
Our lives, and the places in which we live them, can be better, but they will certainly be worse if things stagnate.”

1.6 A decision by the Court of Appeal, commonly known as the Hunston Judgement, found that at the heart of policy on housing, planning and the conservation of the countryside was the idea of a balancing of values and priorities. The NPPF makes it clear that the community should play a major part in this process “This should be a collective enterprise. Yet, in recent years, planning has tended to exclude, rather than to include, people and communities. In part, this has been a result of targets being imposed, and decisions taken, by bodies remote from them. Dismantling the unaccountable regional apparatus and introducing neighbourhood planning addresses this.”

1.7 Land use planning is a long term business and there is a tension between that time-scale and the time-scale of politicians at both national and local level. The Barker Report which we examine below has all the signs of being a response to a request for a “silver bullet” for the house price problem perceived to exist. Land use planning restrictions were identified by the Barker Report as one of the prime causes of house price rises in the period up to 2004. The very complexity of the issues made it difficult to defend the planning system against what was a pretty comprehensive attack.

1.8 In this note we do deal with some technical issues in a fair amount of detail. We accept it will be very difficult for the Select Committee to reach firm conclusions on these and be able to attribute responsibility for the current failure of the planning and housing systems to deliver housing in all parts of the country at least environmental cost. It would be appropriate for the Select Committee to look at recent experience and make judgements on the efficacy of the mechanisms that statute has established, to make recommendations for reform and then leave the correct balance between environmental, economic and social considerations to be decided on a case by case basis. What we aim to do is to establish reasonable doubt that the system we have is not working.

1.9 Our particular concern is that given the relatively vague terms of the NPPF decisions by the inspectorate and local planning authorities are easily influenced by the steer given by leading politicians who sometimes shoot from the hip. It is the privilege of politicians to emphasise the importance of particular elements of policy from time to time but it is important such interventions are well informed. In the next section we deal with a “policy” of more housing at all costs that was largely informed by the report Barker and little else. The Independent has reported

“George Osborne will pledge to tackle Britain’s housing crisis by taking on “Nimbyism” and streamlining the planning laws so that more homes can be built.

Name calling is not the right approach to what is a very complex problem.

2. The Barker Report
2.1 With regard specifically to Question 6 the Barker Report and its conclusion that planning restrictions were a major factor in the housing shortage has had a long shelf life. Research carried out in June 2015 on behalf of BBC Radio 4’s File on 4 programme by Glenigan, a leading provider of construction data, found a sharp increase in the number of houses securing full planning approval in the Green Belt. In 2009/10, 2,258 homes were approved. In 2013/2014, the number had risen to 5,607. By the following year, 2014/2015, it had more than doubled to 11,977. It is noteworthy that there was no official change whatsoever in planning policy over the period 2013 to 2015.

2.2 The Barker Report predated the recession by four years. It needs to be brought up to date in any event and so we do not wish to enter into a detailed critique. We restrict ourselves to two glaring omissions need to be any rectified in any update

2.3 The first is failure to disaggregate completion rates between market housing and affordable housing. This point is made very clearly on pages 27 to 30 of the CPRE commissioned critique of the Barker Report published in 2006. This shows that the collapse of house construction in the period to 2004 was largely due to a decline in social housing completions from around 32,000 per annum in 1993 to 13,000 in 2006. It is very clear that the mechanisms by which market and social housing are provided and the influences to which their supply is susceptible are very different.

2.4 The second factor is the failure to pay sufficient attention to the differences between London and the South East on the one hand and the remainder of England on the other. We identify a minimum of three areas that need to be looked at in the context of a strategic assessment of housing supply and the links with land use planning.

   Greater London
   The South East
   The other conurbations

2.5 We suggest that rather than a Barker II dealing with England it should be should by regional studies of housing supply and planning along the lines of the excellent work carried out by consultants for the Greater London Authority.

3. The Forward Planning Process

3.1 It is open to developers to appeal against refusal of planning permission and in those circumstances NPPF lays down strict standards against which the supply of housing land is to be assessed when individual applications are decided upon. Put simply the slower the building rate the more land local planning authorities are obliged to release. This approach shows how deeply the conclusions of the Barker Report have been embedded in the planning process. If the Barker Report is shown to be ill founded or simply out of date then this requires a fresh look at the way housing is dealt with in the planning process. It is also worth noting that statute and case law have the effect that once a residential permission has been given it exists...
in perpetuity so that there can be no real separating the sheep from the goats so far as actually developing sites is concerned

3.2 We look at whether the post Barker planning regime has resulted in completion rates that are in line with the objective assessment of housing need for a sample of areas. We do this exercise for London, the South East on the one hand and for representative areas in the rest of the country on the other.

3.3 We have looked in detail only at the period 2010 to 2015 so as to avoid the more immediate effects of the 2007 recession and because by 2010 the planning regime introduced by the 2004 Act was reasonably well bedded in. We have sought to identify

- the extent to which housing targets set out in Local Plans have been achieved and the relative scale of any shortfall or over provision
- whether any under shooting was down to the planning system, the way the building industry operate or both
- further investigations that need to be carried out
- appropriate remedial action

We have done our best with this exercise but the information’s is highly dispersed and is very detailed. There is a need in the future to aggregate the monitoring reports from the three hundred and twenty six local planning authorities into a national data base so that progress in the country as a whole and in the regions can be assessed. At the moment vast resources go into a monitoring exercise that is difficult to use at a national, regional or even sub regional level. We accept that Regional Government Offices were closed to save money but it should be possible to outsource the work; it may be that the universities have a role to play.

3.4 From a quick desk study and practical experience we suggest there is a fundamental difference between London and the South East and the rest of the country. In London and the South East ambitions about economic growth are in line with past trends. The UK is being led out of the recession by the finance activities of London. The London Plan forecasts that the number of Jobs in London will grow by 1 million 2011 to 2031 .Housing demand and the planning policies required to enable it to be met are a product of jobs growth. It is possible but by no means certain that the planning system is acting as a brake on development

3.5 Job numbers in other Cities are growing more slowly and from a lower base in many other parts of the country past rates of economic growth has been slow and the local planning authorities have made a political commitment to achieving a step change; we do not disagree with that. What we find difficult to understand in areas such as Greater Nottingham is the assumption that high rates of house building will bring about high rates of inward migration and this larger pool of labour will attract investment and create jobs. We are happy to expand on this point but in this note we are content to suggest that in contrast to London and the
South East the more likely reason for underperformance in the rest of the country is that the targets were over ambitious.

4. London

4.1 The London Plan was adopted in 2011. It set itself the task of matching the vigorous growth of jobs with a commensurate increase in the housing stock. The task of anyone trying to understand the factors at play in London is greatly helped by the excellent data base and library of technical reports available. We are also very impressed by the standard of consultancy work done for the GLA on the barriers to housing delivery. *4 and 5 The Plan was subject to alterations in 2014 which significantly increased the housing targets. The Plan is now being reviewed comprehensively.

4.2 The Monitoring Reports *3 confirm the general impression that London is booming. In the period 2010 to 2013 there was a net increase of 400000 jobs in London. This rate of 133000 jobs per year is well in excess of the average of 50000 per annum implied by the jobs targets of the London Plan and this front loading of economic growth may explain some of the higher rate of growth in house prices.

4.3 In the period 2008 to 2014 completions were 87% of target. The underperformance amounts to around 24000 dwellings for the six years less, than 1% the grand total of 3.3 million dwellings for Greater London. Nevertheless performance gave some grounds for concern and the Greater London Authority commissioned consultants Molior to “do a Barker” on London. I think they are models of clarity and relevance it is worth reading the 2014 first. They say the problem is not planning. It is (or was)

- Cost and availability of capital (much improved in 2014 compared with 2012)
- Capacity of the construction industry including small sub-contractors
- The fact that the max annual output per scheme is 100 or so dwellings regardless of the total capacity

4.4 The progress is relevant to core housing needs. In the years 2011/12 to 2013/14 34% of housing was affordable housing. Housebuilding in London has been achieved without a massive cost to the environment. More than 95% of housing development has been on brownfield land. The loss of designated open space is minimal; in fact during the period 2010 to 2014 there was a small net gain in open space as a result of development schemes in London as a whole.

4.5 Table 1 below shows that despite a fairly good rate of house completions in London house prices have grown by 17% per annum in the period 2007 to 2014 and are up 30% on the 2007 trough.
The rate of growth is far higher than the rest of the country. The rise in prices is likely to be due to a very wide range of factors but in planning terms the likely causes are

a. Under calculation of the number of new houses needed in London
b. Under calculation of housing need in the South East
c. Under-delivery of housing in the London South East
d. Obstacles to the participation of small builders in London; including lack of access to capital, knowledge of sites

4.6 The London Plan has now been amended and now includes a commitment to a target of 42000 dwellings per annum. The Mayor has stated that a figure of 49000 is achievable. These figures were not fully accepted by the independent Inspector who recommended a more comprehensive review that may have to consider meeting some of London housing need beyond the GLA boundaries.

4.7 The Mayor of London argued that London should and could meet all of its housing needs within its own boundaries. The Inspector for the Further Alterations to the London Plan in paras 55 to 57 of his Report, attached, felt there may be need to look to other authorities in the South East to meet some quantum of the need. Nobody canvassed the idea that a major upward shift in house building in other Regions would alleviate housing pressures in London.

5. The South East

5.1 From the limited amount of work we have carried out so far it appears that delivery in relation to targets in the South East is lower than in London. In Milton Keynes for example in the period 2010 to 2015 completions were only 75% of the target but in the same period and house prices increased by 19%; a mean increase of 5% per annum, far lower than in London.

5.2 An increase in the supply of housing land in London could well result in “underperformance” in the South East continuing. A careful analysis of the factors would need to be carried out and we can see no justification for the kind of knee jerk release of greenbelt sites that many have called for and the Planning Inspectorate has delivered.

6. Affordable Housing

6.1 From time to time politicians attempt to add bite to the debate on the role of planning in the housing shortage by conjuring up pictures of people sleeping on the streets. There is no doubt that some cases of housing need are extreme but an analysis of the needs assessments carried out on behalf of local planning authorities show that in many of them there is a touch of Utopia and within the overall figures there are types of household who were not housed even in the halcyon days of the 1970s and 1980s. In our view it is unreasonable to expect market housing developers to provide the bulk of funding for an affordable housing programme but this is what seems to be happening. It is reasonable to expect the public sector to play a part in what has some of the elements of welfare provision. Revitalised
Housing Investment Programmes prepared by local authorities are the best vehicle for identifying Core affordable housing needs and meeting them within an acceptable time scale.

6.2 Rather than a vigorous attack on the problem of affordable housing what we have seen is a strategic withdrawal on the part of the public sector. We offer the following assessment from a recent report. A recent report by the Joseph Rowntree Foundation The Coalition’s Record on Housing: Policy, Spending and Outcomes 2010-2015 *9 found that

- Total housing benefit expenditure increased by 9% 2009/10-2012/13.
- All other forms of government spending on housing in the UK were cut by 35% in real terms 2009/10-2012/13
- Expenditure on new house building was cut by 44% in real terms 2009/10-2012/13
- DCLG’s revenue budgets (which support spending by English local authorities on housing, such as services to homeless people, housing-linked support for vulnerable people and regulation of the private rented sector, as well as other services) for England dropped by at least 41% 2009/10-2014/15 in real terms
- DCLG capital budgets for England were cut by 54% 2009/10-2014/15 in real terms, reducing the options for local authorities to devote capital resources to housing provision.

6.3 In many parts of the country there is a demand for 30% affordable housing in an S 106 agreement attached to a planning permission. This is likely to work its way through to the price that a developer is prepared to pay for land. We have remarked earlier that in reality planning permissions do not have a limited life. If landowners do not get the price for the land they are looking for they will simply hang on to a bankable asset until better times come along. It is possible that development sites will become part of a superior vintage wine syndrome; an asset passed on from one speculator to another but never actually put to its intended use.

6.4 The production of SHMAA is in itself a growth industry. We attach two. One for Peterborough and Rutland *7 and one for Maidstone *8 we choose these simply because they are very different areas. The similarity of approach is striking.

6.5 The Peterborough example is 197 pages long excluding the appendices. On affordable housing the key paragraphs are 10.12 to 10.18 which in effect say that 50% or so of housing needs to be affordable but that maybe 35% will do. In para 7.23 the report concludes that at the present time only 2.6 % are living in unsuitable housing. Affordable needs include all households who could only afford market rents or owner occupation if more than 30% of gross income would need to go on market rents. So for an element of affordable housing we are not talking about the homeless but about households who, at least for a period of time, might have to spend more than 30% of their income on housing.
6.6 Looking at the Maidstone study, also in excess of 190 pages the % living in unsuitable housing is exactly the same 2.6% see para 7.42. The percentage of housing that needs to be affordable is 33% and it is felt this can be an achieved.

6.7 As we understand paras 7. 47 and 7. 48 of the Maidstone Study the projection of affordable housing need over the next 20 years involves projecting household incomes over that period. This has to be highly error prone and puts a question against attempting to look at such a long term view. We would favour a shorter term more robust tactical plan for affordable housing.

6.8 The Maidstone SHMA says “7.67 whilst 30% is a widely accepted and robust income threshold for the assessment, in practice, many households will choose to spend a greater proportion of their income on housing. This has to put a big question mark against the report’s detailed conclusions.

7. Issues and Remedies outside London and the South East

7.1 It is more difficult to analyse the situation outside of London because the monitoring information is nothing like as comprehensive or up to date. This is a consequence of the abolition of Regional Assemblies and Government Regional offices and also perhaps to local planning authorities having a “job done” feeling once they have adopted a Core Strategy.

7.2 The context for England beyond London and the South East is the Growth Point Initiative. This grew out of the Barker Report and was an initiative of the Blair Government but subsequently enthusiastically embraced by the Coalition. It fixed levels of growth in many area in a way that was totally outside of the planning system. In so far as many of the house price problems addressed by the Barker Report related to London the remedy increasing supply nationwide was ill conceived. It has not in fact delivered. The Growth Point initiative assumed that the supply of housing in London and the South East could not be increased to the point where prices became stable. Development in the planning of London in the last ten years show this was an ill founded assumption.

7.3 The Initiative was also meant to spread the prosperity jam more widely. It is is quite legitimate for the political leaders of cities such as Derby, Leicester and Nottingham to make a dash for growth but the difficulties in achieving a concurrent increase in the rate of job creation were seriously under estimated. I am well acquainted with the case in Nottingham where the housing figures were fed into a model and the number of jobs was an output. No attempt was made to independently assess the reality of those job targets. In the absence of vigorous economic growth it was inevitable that house completions would lag behind targets. The land supply “ratchet” mechanism to which we refer below led a gung ho Inspectorate to order the release of amounts of greenbelt land in excess of those for which the local politicians had bargained. What we have is an unnecessary release of green field sites due to conceptual inadequacies both in the formulation of the strategy and in the analysis of its failure.
7.4 We take the East Midlands region as an example. We have looked at Derbyshire, Leicestershire, West Northamptonshire and Nottinghamshire. The percentages of targets achieved in the relevant housing market area over the last four years is as follows:

- Derby: 43%
- Leicester: 81%
- Nottingham: 59%
- West Northants: 30%

We do not object to optimistic targets but rather to the response to underachievement. The NPPF prescription for this low level of performance is to make more land available. Table 8 of the Leicestershire Land Availability Report *6 and copied below shows the way the DCLG “ratchet” mechanism works.

<table>

Land that can be developed within five years has to be found for an additional 1900 dwellings over and above what is seen as available. This will inevitably be greenfield land “allocated” through the appeal system rather than the Development Plan process.
For many years Governments have considered that there should be at any time a five year supply of land for the house-building industry; at the rate set out in the development plan. We explain in paras 8.2 and 8.3 that the completion rates inferred by development plans for areas outside of London and the South East are very ambitious and Para 47 of the NPPF regards this as a crisis situation and requires additional land to be found to encourage a higher rate of completions. Past experience suggests that at a planning appeal on an unallocated Greenfield site these figures would result in an inspector granting planning permission.

7.6 It is well established that in environmental matters the precautionary principle should be followed. Two questions need to be asked before reaching for the land release button. The first is whether land supply is a significant cause of low completion rates or might it be levels of demand which might allow developments to take place but not at a rate of return the developer regards as the best that can be achieved. What clearly needs to happen is that local planning authorities should commission the type of study carried out by Molior for the GLA to produce reasons why completion rates are falling behind targets. If land supply is the main reason then it may be that additional sites have to be released. This approach is supported by the NPPG states-

“The approach to identifying a record of persistent under delivery of housing involves questions of judgement for the decision maker in order to determine whether or not a particular degree of under delivery of housing triggers the requirement to bring forward an additional supply of housing.

“The factors behind persistent under delivery may vary from place to place and. Therefore, there can be no universally applicable test or definition of the term. It is legitimate to consider a range of issues, such as the effect of imposed housing moratoriums and the delivery rate before and after any such moratoriums.”

Failure to commission such studies will inevitably result in Inspectors releasing greenbelt sites for development.

7.7 The second, more general question is whether under achievement is the crisis that the NPPF makes it out to be. Over a twenty year plan period the housing market will have its ups and downs. There will be some impact on the provision of affordable housing but since the proportion of affordable housing is normally less than 30% we are talking of 20% of 30%; which calculate as 6%.

7.8 In a climate of under-delivery applicants for additional sites will argue for an affordable housing proportion lower than that set out in the development plan; citing the need to bring the development forward quickly as a justification. The other option for an LPA is to lower affordable requirements on approved sites so as to bring them forward more quickly. What then happens is that affordable housing is provided marginally quicker but the quantum over the whole plan period is smaller.

8. Time-scales
8.1 We see Question 5 as key. In my view the single most important factor behind poor planning at the present time and in the recent past has been the insistence on long time scale for plans and that progress should be at a steady rate through the Plan period.

8.2 At first sight it might seem that producing a Plan with a time scale of twenty years is highly desirable; crucially it allows for the proper planning of improvements in infrastructure which are a consequences of the land use proposals. But the same arguments could be made to insist the Treasury to growth forecasts over the next ten years. In fact the time-scale of treasury economic forecasts is two years and Governments manage to produce a budget on the strength of that. In deed national infrastructure is planned on that basis. The forecasts are limited to two years because the inherent uncertainties involved in a longer term projections would render them worth less. The technical resources available to the Treasury are enormous compared with those of a typical local planning authority. The accuracy with which local planning authorities produce forecasts is entirely spurious; Leicester City Council is making assumptions about the future that the Treasury, rightly, fear to make. A large and profitable industry has been built up in the form of consultancy to local planning authorities on this kind of exercise.

8.3 The basis for Development Plans are population projections produced by the Office of National Statistics and the household projections produced by the DCLG. These are always wrong. They are wrong because they attempt to predict social behaviour related to such issues as marriage, divorce, cohabitation and age of child bearing in 2035. For different reasons land owners, house builders and planning consultants accept a statistical exercise the accuracy of which is spurious.

8.4 We are not arguing against long term planning but typically 80% of the environmental damage is caused by making provision for 20% of a housing requirement which is in any event based on inaccurate information. The frequent insistence by the Inspectorate that local planning authorities should release sites until the completion rates implied by the twenty year strategy are achieved is the cause of even more environmental damage. We are not aware of any District where the approach has worked. The development Plan system allows for, indeed requires, fairly frequent review. Following the precautionary principle firm and binding provision should be made for say 80% of the requirement leaving the other 20% as a broad goal for which provision will be made if the growth predictions for the long term prove well founded.

8.5 Land owners and builders will not like this. They will argue that what is being suggested involves a self-fulfilling prophesy and that the growth rates will not be achieved because the land has not been provided. This is an argument that can be examined in detail at the Public Examination of development plans in particular parts of the country. For the moment we restrict ourselves to saying that typically volume house-builders maintain a land bank equivalent to six or seven year’s completions. Taylor Wimpey are currently holding a thirteen year land bank with a capital value of £2.5 bn. It is arguable that this is capital that could more usefully be used on construction of houses, not least in London the approach we are
suggesting would firmly identify sites for at least a ten year period and so would prove no impediment to building companies operating as they do at present.

9. Conclusions

9.1 These submissions are not a consultancy report but I have tried to makes the case for a consultancy report to review and update the Barker Report. Our conclusion have to be broad and tentative. In very broad terms it seems to me that in the planning system form has superseded content. Literally tens of thousands of pages of evidence fail to differentiate between London and the rest of the country, between market housing and affordable housing and between the very different levels of need subsumed under the heading of affordable.

9.2 We have no objection to the concept of sustainable development that runs through the NPPF but alongside the principle of sustainable development we must set the precautionary principle. In the words of the Rio Declaration, to which the Government is a signatory "In order to protect the environment, the precautionary approach shall be widely applied by States according to their capabilities. Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation."[6]

9.3 This is not to give to environmental concerns some sort of trump card when it comes to balancing them against economic and social considerations but it does imply sound research and the objective interpretation of that research. A huge amount of paper work goes into the planning system. A typical Core Strategy Examination would involve perhaps 5000 pages of evidence and submissions. Nationally this would come to a million pages. So the first prerequisite has been met. In our view it has not been objectively interpreted for two reasons.

8.4 Firstly the Growth Point agenda led many local planning authorities to technically justify conclusions that they had already reached. This is a massive waste of time and money and leads to enormous frustration by those such as parish councils and amenity groups who had been led to believe by the Localism Act 2011 that they we competing with the development industry on a level playing field.

9.4 Secondly leading politicians, following the Barker Report, have put the housing “crisis” at the top of the agenda and effectively led the Planning Inspectorate to interpret balance in a rather lop sided way. There are cases where a single report has had enormous and beneficial consequences; the Beveridge is an example. The Barker report was no Beveridge.

9.5 Statements about the housing crisis by the likes of George Osborne invariably fail to differentiate between London on the one hand and the rest of the country and between market and affordable housing. People of my generation associate housing crisis with “Cathy come Home”. That type of problem still exists but it is a problem different in nature and degree to the general problem of housing supply. It is also a problem that cannot be tackled without the vigorous and integrated participation of the public sector. To suggest that by
releasing sites in the greenbelt we will solve problems such as homelessness is to take political cynicism beyond reasonable limits.

9.6 In the 1990s the planning mantra was Plan, Monitor Manage. This approach is wholly compatible with the precautionary principle. We have only done a limited amount of planning work in London but we have been very impressed by the standard of research and monitoring. It has allowed a PMM approach. The standard of monitoring in areas our outside of London has not.

9.7 The practice of adding 20 % to housing land requirements as a response to low rates of completion is intellectually bankrupt. It is the antithesis of the precautionary principle. Investigations may reveal that land supply is the problem but it may be that the targets are being proved over optimistic and then the correct response is to review the targets.

9.8 Links to documents. The recycling of urban land is a key part of Government policy but outside of London the policy is in reverse gear. Brownfield sites tend to be smaller than Greenfield but have a higher rate of development in percentage per annum terms. The involvement of the smaller builders in the development of such sites is essential. Such builders have traditionally not been well equipped to take a very proactive role in bringing sites forward. There are also capacity problems due to the severe reduction in this sector by the recession. In the studies of low completion rates that we recommend the capacity of small builder sector needs to be investigated and strategies for increasing that capacity put in place.

12 October 2015
Submission to be found under Dr Isaac Jamieson
Summary

Requirements in no particular order:

Proper resourcing of planning and conservation departments.
Equal emphasis on all three arms of sustainability: environmental, social and economic.
An end to lobbying by house builders.
Land Value Tax.
Bridge the north-south divide, and halt the Pathfinder programme.
Be extremely cautious about adverse effects of devolution.
Encourage council-house building and stop the Right to Buy for housing associations.
Value the local and implement local distinctiveness.
Improve skills training at all levels.
Insist LPAs have development frameworks or masterplans for significant areas.

Policymaking, integration and coordination

1. i There is no one right administrative level. Successive governments talk about devolution (increasing now) but continue to impose policy – housing numbers, for example – from the centre. Centrally-imposed policy is hugely unpopular at local level, with elected councillors powerless to refuse an application because, however inappropriate, it conforms with central policy (for instance the conversion of offices to housing).

1. ii Decision-making at district or unitary level varies hugely in quality, and is too open to political interest. On the whole local policymaking is reasonable but the last 30 years have seen a major exodus of skilled planners and conservationists to the point where a council with good policies lacks the ability to ensure they are carried out. These departments have been stripped of resources; decent quality planning and conservation says they must be reinstated.

1. iii The duty to cooperate between neighbouring authorities is good although it can hold up the production of Local Plans (but see below, 3.iii, on time scales).

2. i Heritage (my particular interest) is split between DCMS and CLG; this is not helpful, although it’s hard to think it could operate without the cultural dimension and is obviously integral to planning. Better delineation of the departments’ roles would help. Alternatively, as planning and conservation is so significant, it could merit its own department.

2. ii Transport invariably trumps everything, even though road-builders are often stuck in the mindset of the 1960s: tarmac everywhere. Road-building seems to be the first reaction
of any government wanting economic development, although that is actually counter-productive; roads just fill up. The definition of infrastructure seems to be fluid, from transport and energy to large housing developments; there needs to be more local involvement with these. A new infrastructure commission will not help. Much infrastructure is profoundly unsustainable, both in terms of materials use and in the way it influences behaviour.

2. iii Sustainability is also fluid; what should be about long-term environmental considerations is too often only about economic sustainability (an argument I’ve had with government since the days of Margaret Hodge as minister). And the social requirement is often forgotten.

2. iv Within local authorities, departments conceived as competing business units is unhelpful. Probably the same applies at government level. The current dominance of the Treasury and frantic pursuit of economic growth is counter to an intelligent cooperation, sufficient to avoid clashes, omissions and duplication.

National policy for planning and the built environment

3. i The NPPF that emerged in 2012 after numerous interventions by the Heritage Alliance and others was less damaging than the initial version. However last year’s Select Committee review of the NPPF seems to have been ignored. Clive Betts MP has spoken about government refusal, for instance, to collect information on the level of out-of-town vs. central retail development.

3. ii The infamous ‘presumption of favour of sustainable development’ in the NPPF is a highly political move that effectively undermines local communities. I understand the government chose not to use the internationally-agreed Brundtland definition. (See 2.iii above) For the then minister to say in his introduction that ‘Development that is sustainable should go ahead, without delay’ is to ignore the fact that what is believed to be sustainable can be subjective. It also ignores the increasing under-resourcing and de-skilling of planning departments and their ability to judge this.

3. iii The NPPF states that policy must be plan-led but some 40% of LPAs still have no plan. Over-riding decision-making in authorities still in the plan process is unnecessarily aggressive. By no means all LPAs are paragons of virtue but still they operate under such constrained circumstances that with the best will in the world, producing an acceptable plan on schedule is too much to ask.

4. i If I understand this correctly, I would say the lack of a spatial perspective is damaging. Durham had its local plan rejected because it was over-ambitious, the Inspector saying in effect, ‘you surely don’t really think all those people will want to come here.’ Other cities of similar historic importance in the south east are overwhelmed with development. Policy must acknowledge - and repair rather than continue to deepen - the north-south divide.
4. ii The new development on business rates will be even more damaging, entrenching discrimination. The introduction of a spatial element should be able to address this, while protecting the environment and natural resources that are under stress from poor development policies.

5. i On the one hand planning for sustainability and fairness needs to be done now; on the other (see 3.ii) taking plan-making out of the hands of the LPA, and especially the unrealistically short target times for decision-making - when planning departments are under-resourced - is undemocratic.

5. ii There are some areas - historic settlements particularly - where policy should be protective in perpetuity. Councillors and others spend ludicrous amounts of time and resources fighting the same battles again and again. Smithfield is a good example. Developers should be told that ‘no’ means ‘no’.

Buildings and places: New and old

6. i Housing is currently a disaster zone, and cannot be addressed by the planning system alone. Extending Right to Buy to Housing Associations is a nakedly political act that should be subject to legal challenge but it appears the sector has no stomach for that. Forty percent of council houses sold under RtB are now buy-to-let, and - here in Winchester - over 300 family houses on a good-quality estate are now let to university students. The expansion of higher education has combined with inadequate planning and social policies to cause damage to the remaining community and increase the local housing shortage.

6. ii It’s tempting to say that ‘further interventions, properly coordinated at central Government level’ would be a good thing, but for that the government has to be trustworthy. Given the lobbying power of the volume house builders, and their astonishing profit increases of recent years, that cannot be said to be the case.

6. iii “Affordable” has, through government policy, come to mean up to (and so almost invariably) 80% of market rent. It can also mean subsidised purchase, which merely puts up the price. In desirable areas 80% of market rent is not remotely affordable to anyone on an average income. This is a linguistic distortion which should be rectified. The only answer is for councils to be encouraged to build, but even where they aspire to, the problem is land. The landbanks of the large house builders - and the large supermarkets and others - should be centrally acquired for social development. Community Asset Transfer exists for heritage assets; centrally owned redundant land (the defence estates, for example) should be released at minimum cost for subsidised housing. Real need - for subsidised housing - is different from being obliged to plan for what someone fancies for investment.

6. iv The recent West Berkshire decision, on thresholds for social/affordable housing, is welcome but I understand the government is likely to appeal it.
6. v Some commentators - Simon Jenkins, Professor Danny Dorling - say there is no shortage, only a flawed distribution. Certainly local authorities should be allowed to levy additional council tax on second homes and empowered and encouraged to act harder and faster on empty properties. But overall nothing will change until the towns and cities of the north (far beyond the Northern Powerhouse) are made attractive and developers in London and the south are made to comply with social and affordable housing commitments. Currently it is far too easy to evade s106 obligations by citing 'viability', the assessments of which are hidden from the public and apparently too confusing for councillors.

7. i A sustainable and resilient built environment is a mixed community, intelligently located with regard to public transport and employment, with a good mix of building types. Jane Jacobs' famous line, 'new ideas need old buildings' should be carved over the portal to the civic centre. Her belief that the old buildings need not be smart is still wholly relevant - see the creative regeneration of everywhere from Folkestone to Shoreditch, before the prices rise and the artists are pushed out.

7. ii Apart from a small academic lunatic fringe suggesting that every pre-1919 building should be demolished and rebuilt on eco grounds, most people actually prefer older houses, even outside conservation areas. Inside conservation areas, higher prices reflect this. I was no fan of the Green New Deal, believing it to be as badly constructed as some of the 'green' buildings, but conservationists must make the case for the historic fabric and the embodied energy it contains. Work done for HM Courts Service on this is admirable, demonstrating that historic buildings are more efficient, in part because people use them differently. Government could help with this by, for instance, not encouraging temperatures in public buildings - schools, offices - that allow people to work in shirt-sleeves in February. The onslaught of minimally-skilled or qualified insulation installers unleashed by the Green New Deal will not be missed.

7. iii The most sustainable way to develop is by using what we already have. The traditional by-law terraced house found in all towns and cities is wonderfully flexible - see work carried out by the Heritage Trust of the North West in Nelson, Lancashire; by Assemble Architects (now candidates for the Turner Prize) in Liverpool; or research by Michael Hebbert at Manchester University. The Pathfinder (Housing Market Renewal) Programme staggers on, despite promises by government to halt it. It should be stopped immediately. A sensible and equitable programme of north-south rebalancing using this housing stock would solve a great many problems. Research by Professor Anne Power at LSE has demonstrated how repair and reuse of old buildings keeps money in the community, while newbuild exports it.

8. i I’m unhappy at the question asking about ‘national assets’. Local ones are important too. The majority of recent housebuilding is devoid of any sense of local distinctiveness, despite the term cropping up in the NPPF and so in local plans. Policies prioritising the use of brownfield land have been watered down, and are too readily dismissed by developers who prefer a clear green field. Yet the built remains of old industries, for instance, are awash with local distinctiveness and their careful reuse for housing should be prioritised. This applies even in the south: see for instance the remains of the old airship hangar in the
redevelopment of the Farnborough Air Services site. Where almost any building, designated or not, survives from an earlier age, leaving it in the redevelopment scheme acts like the grain of sand in the oyster, and produces the pearl, a better result - not least because the architect is required to think harder.

8. ii Legislation (in the Localism Act) regarding community assets was also watered down. The right to express an interest hardly compares with the right to acquire, which was initially suggested. This is a useful tool that could be made more of.

Skills and design

9. i No. Quite simply. Education is so far from holistic that the professions seldom have any insight into other aspects of the built environment, historic or otherwise. It is possible to study architecture for seven years without ever considering heritage or conservation. Remedying this should start in school, with more emphasis on creativity. With the downgrading of non-core subjects there is a risk that children are never taught how to look, to understand their surroundings. Other countries manage this better. Many of the best architects came from the old Poly system. Technical education needs to be reappraised and revalued. Erosion of further education funding should be reversed.

9. ii Few local authorities still have an architects’ department, and planning departments have invariably been slashed. Even historic cities may be without a proper conservation officer. While this pertains, there is no hope for planning, shaping, etc. the built environment decently.

9. iii You only mention the ‘professional’ skills. There is also the matter of skills shortages in conservation and even ordinary traditional building. The bricklayers who built the stunning new Saw Swee Hock centre at LSE would not have been ordinary semi-skilled brickies. The techniques required for too much modern building (e.g. cheap timber frame) are not those that will ensure the building lasts and ages well, and so is sustainable. Again, technical education needs to be reevaluated and proper apprenticeships put in place. The National Trust has a good system and the HLF funds training in conservation. Government should learn from them.

10. i The LSE building above notwithstanding, too many LPAs (and developers) want to see ‘landmark’ or iconic buildings. Most places have no room for them, and they are out of context in a historical setting. Good modest design, decently proportioned and with sound materials will last better, be more flexible and better to live in. The RIBA, CABE and others are concerned that we are building the most undersized housing in Europe. Government has allowed standards to be eroded; reintroducing Parker-Morris would be an excellent move. Instead PLAs allow what are in effect back-to-backs to gain permission as they are cheap to build. Planning committees and some officers should have at least a couple of educational sessions on architectural history and basic design. National leadership could insist on that. And architects should avoid ego-trips.
Community involvement and community impact

11.i No, again. Architecture is the one art form that cannot be avoided, yet miserable quality design and building is allowed to impinge on people’s lives. There is a fine balance between suburban sprawl and unacceptable urban density. Urban extensions to towns should not be built at suburban density, wasting land, but on the other hand a dense development needs to be finely detailed and well provided with amenities. Too many LPAs are resistant to the idea of a development framework or masterplan, instead allowing developers to pick off sites piecemeal. Not only does this undermine the provision of social/affordable housing (lots of small sites under the threshold) but it also results in a visual hotchpotch. Every conservation area or every historic town or (small) city should have a masterplan. In larger cities it should be on a neighbourhood or borough basis.

11. ii I’ve mentioned the shortage of conservation officers; tree officers and arboriculturalists are also threatened. Treeplanting and landscaping, and the spaces between buildings, are as important as the building design, and are known to promote good health.

12.i If people want to become involved, they risk being labelled nimby. If they don’t become involved, they are called apathetic. The erosion of local authority powers by central government has called into question why anyone would want to become a councillor, with a resultant drop (in my experience) in quality of members. This means officers - not planners or conservationists etc. - take control, not always to the public benefit. Governments over the last 30 years or more have conveyed the impression that only losers work in public service. This is obviously harmful, making it hard to get good quality staff. Devolution might help here but too many authorities will be so scarred by the loss of Revenue Support Grant that they will probably have no officers anyway.

12. ii The NPPF says ‘local planning authorities should work proactively with applicants to secure developments that improve the economic, social and environmental conditions of the area.’ Central government cannot slash council funding and cut quangos such as CABE and expect there not to be problems. Neighbourhood Plans are a good way of engaging communities but the community needs to be determined - especially if officers are opposed. Planning by Design, Community Architecture, charrettes - there are other less arduous ways of reaching out to harder-to-reach communities. Where it can be done, the public buy-in is great and social cohesion improved. But funds for the network of Architecture Centres, that typically did this work, were cancelled in 2010. Civic Voice does sterling work with civic societies but the membership of the All Party Parliamentary Group on Civic Societies is mostly notable for its invisibility (Laura Sandys is much missed).

Financial measures

13. i This has been thread throughout. Historic England is consulting on how to do more with less but there comes a time when there is so much less that little worthwhile can be done. Ideally before being forced to survive on this starvation diet, there would have been
all necessary conservation area reviews, Article 4 Directions issued, local lists compiled, interesting unlisted buildings designated (not just when the wrecker’s ball is poised) and the historic estate at all levels would ideally have been in decent shape. Then the cuts wouldn’t be so damaging. Instead they are damaging the thing that the country is known for most of all, its heritage.

13. ii  Land Value Taxation.

13.iii Abandon the appeal against the West Berkshire decision and ensure developers play a proper responsible role in the communities where they build, through s106 obligations - which should be for provision on-site, not off-site contributions when it is the land that is at issue. And no more poor doors. No more hiding behind confidential viability assessments. The Lobbying Act should have prevented the developers from pulling government’s strings, but has failed to do so. Not many private sector developers will contribute to the public good unless they are obliged to do so.

06 October 2015
McCarthy & Stone – Written Evidence (BEN0218)

KEY POINTS

- **A radical review of local and national housing and planning policy is required to deal effectively with the impact of the UK’s ageing population.** The current system limits the supply of retirement housing as it does little to recognise demographic change, account for the unique nature of specialist housing for older people, or proactively encourage this form of accommodation across all tenures.

- **The right planning policy could encourage the provision of retirement housing and increase supply from just 7,000 units per year currently across all tenures to 18,000 per year (Savills, EAC, 2015).** The majority of what is currently being built is for social rent, while 76% of older people are homeowners (JRF, 2012). Indeed, just 1,919 owner-occupied retirement units were registered with the NHBC in 2014.

- **This would make a sizeable contribution (c13%) to overall housing supply (currently c140,000 units per year).** Unlike Starter Homes and some other forms of housing, building retirement housing also releases dependent properties, creating a ‘two for one’ benefit.

- **There is a rising demand for retirement housing.** 58% of UK homeowners aged 60 and over are interested in moving home and one quarter, over 3.5 million people, have a particular interest in buying a retirement property (Demos 2013). Yet only around 128,000 retirement properties have been built for owner occupiers in England and Wales (Age UK, 2014). 60% of all household growth over the next 20 years will be by older people (DCLG, 2015), suggesting this is where the focus of policy should be.

- **The UK faces a significant demographic challenge affecting all areas of public policy, and housing and planning policy should evolve to meet this challenge.** The number of people aged 65 and over is set to grow by over 50% by 2033 (ONS), placing increasing pressure on public resources, health and social care. Retirement housing provides significant social and economic benefits; including freeing up local family housing, improving the health and wellbeing for older people, supporting local high streets, creating jobs and improving the energy efficiency of homes. It can therefore save public funds, particularly in the areas of health and social care.

- **Planning policy needs to urgently look at how it can meet the accommodation needs of the ageing population.** National planning policy covers this issue in passing and very few local authorities have suitable policies in place to encourage retirement housing across tenures.

POLICY RECOMMENDATIONS
- Recognise the role and benefits of suitable housing for older people, including retirement housing, by publishing a national strategy to encourage its supply across all types and tenures
- Require local authorities to proactively plan for retirement housing across all tenures and to monitor both the policies that are put in place locally and the delivery of this form housing
- Review the impact of planning obligations to provide affordable housing, Section 106 and Community Infrastructure Levy policies on owner-occupied retirement housing and how they restrict supply of this form of accommodation, including exempting retirement housing from CIL payments and lifting affordable housing requirements on new developments to increase provision
- Introduce a ‘Help to Move’ package, like Help to Buy, that removes the financial restraints on older people downsizing, including a Stamp Duty exemption for those moving to a retirement property.
ABOUT MCCARTHY & STONE

McCarthy & Stone provides 70% of all owner-occupied specialist retirement and Extra Care accommodation for older people in the UK. We have built c.50,000 dwellings across more than 1,000 developments nationwide over the past 37 years.

We deliver three award-winning types of specialist housing for older people:

Retirement Living (since 1977) – Similar to traditional ‘Category II’ type sheltered housing, but built to Lifetime Homes Standards. It comprises self-contained one and two bedroom apartments and includes a House Manager, communal lounge, communal laundry, CCTV camera entry system, 24 hour emergency call system, guest suite and lifts to all floors. Residents have active, independent lifestyles in a safe but private environment. Developments are for those aged 60 years and above and the average resident age at purchase is 78 years.

Assisted Living (Extra Care Housing) (since 2000) – We are the largest provider of Extra Care Housing for homeowners in the UK. The accommodation is as above but is designed for the frailer older person; is to full wheelchair housing standards; and includes additional services such as 24-hour staff attendance/oversight, a table service restaurant, function room, spa/treatment room/hairdressing salon, and one hour per week of domestic assistance, with optional/flexible domestic and personal care packages available from the on-site team. Developments are for those aged 70 years and above and the average age at purchase is approximately 83 years. Schemes are managed by a CQC-registered joint venture between McCarthy & Stone and Somerset Care Group.

Ortus Homes (since 2014) – These developments are for the more active retiree who doesn’t want to downsize into a traditional retirement housing scheme. Apartments are also built to Lifetime Homes Standards and are ergonomically
designed with innovative features to support residents as they age and prevent them noticing their physical age day-to-day. These developments typically have fewer units of accommodation than Retirement Living or Assisted Living schemes, consisting predominantly of two bedroom units with increased car parking provision (minimum of 100%). Developments are for those aged 60 years and above with the average age of purchaser being 71 years.

**THE DEMOGRAPHIC CHALLENGE**

The number of people aged 65 and over in the UK is set to grow from 11.4 million in 2014 to 17.2 million by 2033, an increase of 51%, while the number of people aged 85 and over is set to grow from just over 1.5 million in 2014 to almost 3.5 million in 2033, an increase of over 131%.

There are currently 24 local authorities with more than a quarter of their populations aged 65 and over, and the figure is expected to increase to 83 by 2022. The trend of growth of the populations aged 65 and over applies across all UK regions, with an average of over 20% growth expected between 2012 and 2022. This will place significant financial pressure on public resources, health and social care services.

While there is a widely reported general shortage of housing, with the total number of households who need a home in England growing by approximately 250,000 annually, this is particularly acute amongst older people as 60% of total household growth to 2033 is expected to come from households headed by someone aged 65 or over.

Empty bedrooms in the homes of retirees are forecast to exceed 10 million by 2026, which will be a growing stimulus for those who want to downsize.

**MISMATCH BETWEEN SUPPLY AND DEMAND OF RETIREMENT HOUSING**

58% of UK homeowners aged 60 and over are interested in moving home but many feel restricted by a lack of supply of suitable alternative accommodation. Other reasons cited

---

297 Source: Population projections by the ONS (2012 based)
299 Source: DCLG (NPPG, 2015)
300 Source: Intergenerational Foundation: Hoarding of Housing (October 2011)
301 Source: Demos: Top of the Ladder (2013)
for not moving include the cost of alternative accommodation and the cost of paying Stamp Duty and land and buildings transaction tax.³⁰²

Research by Demos shows that one quarter of UK homeowners aged 60 and over express particular interest in buying a retirement property, a total of 3.5 million people, for reasons that range from moving closer to family, to reducing the risk of accidents by moving into purpose-built accommodation³⁰³. This research is also supported by many other reports. The 2006 Wanless Review concluded that 27% of older people would consider this form of accommodation if it was available³⁰⁴. In 2012, a YouGov poll for Shelter said that 33% of people over 55 are interested in it.³⁰⁵ Shelter noted that if demand for retirement housing remains constant, supply will have to increase by more than 70% in the next 20 years. The need to look at encouraging this sector is therefore indisputable.

The ability to live independently was voted one of the highest essential factors for those choosing a new home in retirement³⁰⁶. Furthermore, those aged 60 and over hold approximately £1.2 trillion in housing equity, with £400 billion of this tied up in homes of those who want to downsize, which indicates that alongside a strong inclination to move, providing the options to allow them to access this wealth through downsizing, could help older property owners to address the challenge of funding care in later life³⁰⁷.

As of April 2014, there were only around 128,000 retirement properties built for owner occupiers in England and Wales³⁰⁸. In 2014, the NHBC recorded just 1,919 new retirement property registrations, compared to a total of c140,000 new housing completions³⁰⁹, with just 7,000 units delivered across all tenures.³¹⁰ The UK has one of the lowest downsizing rates of any developed country and only 1% of the population aged 60 or over is living in specialist retirement housing, compared with 17% in the US and 13% in Australia and New Zealand; all of which face similar demographic trends³¹¹.

THE BENEFITS OF SPECIALIST RETIREMENT HOUSING:

1 Freeing up local housing:

³⁰² Source: Legal & General and CEBR: Last Time Buyers (2015)
³⁰³ Source: Demos: Top of the Ladder (2013)
³⁰⁵ Shelter (2012) A better fit? Creating housing choices for an ageing population

³⁰⁷ Source: Demos: Top of the Ladder, 2013)
³⁰⁸ Source: Age UK: Buying Retirement Housing Factsheet (April 2014)
³⁰⁹ Source: NHBC figures (2014)
³¹¹ Source: Knight Frank: Retirement Housing (2014)
On average, McCarthy & Stone customers release a dependent property back onto local markets worth £303,772, and in the process release £58,853 worth of equity from their purchase of their new property. For every 5,000 purchases of retirement properties, larger housing worth £1.5 billion is freed up.

Most of our homeowners free up a family home when moving to one of our schemes, with 60% moving from homes with three bedrooms or more. On average, customers move from within 4 miles of the development, so schemes help to free up much-needed family homes in the local area, and ultimately help first time buyers through the trickle-down effect in housing chains.

Houses that are freed-up are often refurbished and made more energy efficient by their new owners.

Retirement housing also makes efficient use of previously-used land (for instance, all of our 1,000 developments and c50,000 unit sales have been on centrally located brownfield sites, in response to our homeowners desire to live in well-connected, urban areas).

2 Improved well-being for older people:

64% of residents in retirement housing said their health and well-being had improved since moving.
92% said they were very happy or contented.
83% believed they maintained their independence for longer.
51% of residents report lower or noticeably lower heating bills.

Specialist housing is able to address many of the challenges of late life through careful design.

3 Improved health for older people:

Residents have fewer visits to local health professionals and find it easier to return home after stays in hospital.

✓ 75% of residents in specialist retirement housing have not stayed overnight in hospital since moving. 60% who had stayed in hospital said that they had found it easier to return home since moving\textsuperscript{319}.
✓ One of the NHS’s biggest costs is overnight stays of older people.
✓ The annual cost of falls among older people is £1 billion each year and almost two thirds of general and acute hospital beds are occupied by people aged over 65.\textsuperscript{320}
✓ Each year a resident postpones moving into residential care, the state can save on average £28,080\textsuperscript{321}.

4 A positive economic impact and supporting local high streets

✓ Older people are essential to the health of a local community. Most of our residents have family and friends in the locality, and the average distance moved by purchasers of our properties is 4 miles or less\textsuperscript{322}.
✓ Specialist housing sustains local shopping and other services. More than 70% of residents said that their development was more convenient for local services and 78% used local shops more than once a week\textsuperscript{323}.
✓ Each development injects on average £8.64 million into the local economy through jobs and materials during construction, and £343,000 in New Homes Bonus payments\textsuperscript{324}.
✓ These same schemes average £670,000 per year in local spending by residents, £125,000 more than a general needs housing scheme, and £69,000 in council tax for local facilities\textsuperscript{325}.
✓ Around 60 local companies are employed during construction, supporting local jobs, with additional job opportunities created when the scheme opens. 17 jobs are created from a typical Assisted Living (Extra Care) development\textsuperscript{326}.
✓ Funding for owner-occupied specialist housing can be provided through the release of the £1.2 trillion of housing equity held by older people\textsuperscript{327}.

5 A sustainable form of development:

✓ Low parking requirement and built on centrally located brownfield sites.

51% of residents report lower, or noticeably lower heating bills\textsuperscript{328}. Houses that are freed-up are often refurbished and made more energy efficient by their new owners. High density / efficient use of land. By providing much-needed new specialist housing for older people and consequently ensuring more beneficial use of the existing housing stock, there is less pressure to release greenfield and other more sensitive sites for new housing development.

WHAT IS RESTRICTING SUPPLY AND WHAT CAN BE DONE?

A lack of national and local planning policy focus

The House of Lords’ 2013 report ‘Ready for Ageing’ highlighted how pressing this issue is in policy terms, observing that “Central and local government, housing associations and house builders need urgently to plan how to ensure that the housing needs of the older population are better addressed and to give as much priority to promoting an adequate market and social housing for older people as is given to housing for younger people.”\textsuperscript{329} Yet from a national planning policy perspective, the importance of addressing the housing needs of an ageing population is only acknowledged in passing in both the National Planning Policy Framework (NPPF) and National Planning Practice Guidance (NPPG). Given that 60% of all household growth will be in this area, the housing needs of older people should instead be the focus of both documents, which is what we would like to see and what society as a whole should want.

Due to this lack of national focus, evidence suggests that the importance of this area is not well-communicated to local authorities. A recent review of planning policy within the top 30 local authorities in England that are expected to have the greatest share of those aged 65 and over by 2037 found that only 6 councils (20\%) had strong policies in place regarding the needs of the ageing population\textsuperscript{330}. In addition, a report by the Homes & Communities Agency in 2014 found that just 14\% of councils had a policy in their Local Plan for encouraging owner-occupied retirement housing\textsuperscript{331}. This clearly demonstrates how behind the curve a considerable number of local authorities are regarding the needs of an ageing population within adopted and emerging planning policy.

\textsuperscript{328} Source: University of Reading, M Ball: Housing Markets and Independence in Old Age: Expanding the Opportunities (2011)
\textsuperscript{329} Source: House of Lords, Committee on Public Service and Demographic Change: Ready for Ageing (March 2013)
\textsuperscript{330} Source: Barton Wilmore: An ageing nation – Are we planning for our future? (September 2015)
\textsuperscript{331} Source: HCA: report for the Vulnerable and Older People Action Group (2014)
Due to this lack of planning, few local authorities take the specialist nature of this provision, or the benefits that it provides, into account (this is explored in more detail below), and this in turn results in a lack of encouragement for developments in this area, as well as a difficult ride for planning applications that do come forward.

**Without greater policy encouragement, housebuilders will not look to develop in this market.** Local authorities need to urgently review how they can meet the accommodation needs of the ageing population through their local planning policy. We believe this will only happen with a dedicated national strategy to address this issue. In addition, we would like to see the Housing & Planning Minister write to all Local Authorities to ask them to focus on the housing needs of older people, including the delivery of owner-occupied retirement housing, and to report back on current and planned activities and policies within this area.

**Viability constraints caused by CIL and Section 106 payments**

It is very difficult for retirement housing to compete with mainstream housing development because the Community Infrastructure Levy (CIL) and Section 106 system are not designed to accommodate or support the unique viability features of this form of housing. Planning contributions are the biggest cost on new development in this sector after land purchase and construction, and so have a major impact on the success or failure of new developments. As a result, older homeowners are being denied the opportunity to live in specialist housing that better meets their needs and aspirations in later life, and overall UK housing output is also restricted. Addressing these issues by removing CIL and Section 106 obligations (as is being done with Starter Homes) would help to increase provision in this important area.

CIL charging schedules, where they refer to “residential uses”, set a charge based on the square meterage of gross internal floorspace. While this rate may meet the viability test for standard residential sites, retirement and older people’s housing have very different densities, build costs, sales rates and include the requirement to provide communal and staff areas that are not a feature of typical residential development. This undermines the viability of many sites and risks preventing delivery of older people’s housing, and the aims of the Government. As such, any CIL charging schedule should properly assess the viability of specialist housing independently to standard residential development. **Better still, specialist housing should be viewed in the same light as Starter Homes and other forms of affordable housing and thereby be fully exempt from the burden of CIL.**
However, to-date most local authorities have not carried out a viability appraisal of retirement housing as part of the evidence base which supports the CIL charging schedule. Those local authorities who have undertaken a viability appraisal have appraised Extra Care but not sheltered housing and have generally found that, like care homes and other C2 uses, new build sale Extra Care housing cannot support a CIL payment. To address this, we would like to see:

- A CIL exemption for communal areas within specialist housing for older people across all tenures. This is already the case in social housing, but it is not the case in owner-occupied retirement housing. We also note that Starter Homes are completely exempt from CIL payments to encourage this form of housing; given the pressing need to build more housing for older people, the same incentive should be extended to owner-occupied retirement housing.
- At the very least, retirement housing needs to be correctly tested as part of the process when local authorities prepare their Charging Schedules, and we would like to see new guidance issued accordingly to Local Authorities and the Planning Inspectorate.

A more detailed paper on the impact of CIL charging schedules is available if needed.

With regard to Section 106 payments, planning policy is currently used to encourage the provision of affordable homes for groups particularly disadvantaged in the current housing market, as this has clear social value. But building homes for older people that improves their health and wellbeing also has obvious social value.

Recent reports by Demos and the University of Reading have recommended that owner-occupied retirement housing should be treated as a form of affordable housing, and given ‘enhanced planning status’ alongside low-cost home ownership for younger households because of the need for this type of housing and its associated social and economic benefits. Demos suggest that developments of retirement properties should be exempt from paying Section 106 charges towards affordable housing, and a proportion of the charges levied from other private developments should be put towards helping develop older people’s housing. This would in turn reduce the costs of these properties, making them more affordable, and stimulate new developments and support those who wish to downsize.

---

332 Source: Demos, Wood C: Top of the Ladder (2013)
333 Source: University of Reading, M Ball: Housing Markets and Independence in Old Age: Expanding the Opportunities (2011)
Currently the additional costs of Section 106 charges are often passed on to the buyer in the form of higher prices, and research by the University of Reading concluded that as a lot of affordable housing provides accommodation for younger people, elderly middle income households were subsidising younger buyers and the process was ‘discriminatory’ against older people.334

There are also many other challenges with delivering this form of housing over and above traditional housing, which are worth outlining in some detail. This includes the need for specific design features and services, such as building to Lifetimes Homes Standards or above, including HAPPI design features, ramps, lifts, large shared areas, wider corridors to allow wheelchairs to pass, laundries, guest suites, restaurants, lounges, mobile scooter storage rooms, secure entry systems and CCTV. Some c30% or more of a specialist housing scheme for older people is communal space and thus non-saleable.

In addition, schemes typically need to be completed before sales are made as older people are less inclined to buy ‘off plan’ without seeing a dwelling, the communal facilities and/or meeting staff, meaning the sales process can take longer, and phasing is not possible as with general needs housing as developments are typically apartment blocks. There is also on-site care and support provision as well as the need for individual care packages and developments with higher levels of care often receive most of their income over the life of the scheme. A considerable amount of up-front working capital is required before revenues come on-stream.

Schemes are more than simply bricks and mortar – it is the “lifestyle” provided to the residents who chose or need this type of housing that ensures a successful housing scheme. So the planning requirements are therefore significantly diverse and few providers can be successful in this market which is the main reason for under provision – unless special planning provision is made.

Specialist housing for older people also needs to be near shops, services and transport links, where residents wish to live, and this impacts on land prices. Good sites are: hard to find; in short supply; in demand by a variety of uses including leisure and office uses (which do not pay affordable housing contributions and often have a lower CIL rate); in higher value areas; and tend to have higher development costs (often in conservation areas, in need of decontamination, or with archaeological interests that needs appropriate protection). Hence, when seeking to secure sites for development, retirement housebuilders are significantly disadvantaged as they cannot operate on a level playing field with others who are competing for the same type of sites.

334 Source: University of Reading, M Ball: Housing Markets and Independence in Old Age: Expanding the Opportunities (2011)
Taken together, providing this form of accommodation is very different from general housing. We feel these points, as well as the social and economic benefits noted above, mean that the appropriateness of levelling S106 obligations against specialist housing for older people should be reviewed, as is being done with Starter Homes.

There would also be significant economic benefits which would outweigh any loss in affordable housing contributions. Professor Ball at the University of Reading notes that the UK needs to build many more specialist homes for older people than it does at present, with the potential of generating a build rate of 16,000 such houses a year – which at time of a dearth in house building cannot be overlooked. Such an increase would provide additional construction jobs as well as free up much-needed family housing and release it back onto local housing markets. Savills also notes that if supply of retirement housing could be encouraged it could reach 18,000 units per year\(^{335}\).

**Disincentives in the tax system preventing older people from moving**

Costs of moving in later life are a major disincentive to downsizing. They include legal and surveyor fees, Stamp Duty and removal costs. A number of organisations\(^ {336}\) have suggested that Stamp Duty should be scrapped for downsizers to support those who want to move, while the Institute of Public Care (IPC) has also suggested there should be a council tax abatement for those downsizing or for buyers of specialist retirement properties\(^ {337}\). The costs of such measures would be recouped by a housing chain reaction, generating additional Stamp Duty as families are able to move into properties vacated by older people.

A Stamp Duty exemption for older people downsizing into specialist accommodation would cost little but would greatly encourage the take-up of specialist housing and increase the number of people downsizing, as well as free up under-occupied housing. The number of housing chains this would create (with sales further down the chain still qualifying for Stamp Duty) would more than offset any loss of income for the Treasury. A 2014 review by the Institute of Public Care noted that exempting older people from Stamp Duty would benefit them and the housing market, whilst the benefit to the HMRC would be significant – an achievable 20% increase in the number of older people moving, netting the revenue an estimated additional £644m per annum. Neither is this a new concept as abolishing or

---

\(^{337}\) Source: Institute of Public Care: Identifying the Health Gain from Retirement Housing (2012)
offering relief on Stamp Duty has been introduced before - there was a Stamp Duty “holiday” for first time buyers from March 2010 through to March 2012.

In addition, the All Party Parliamentary Group for Housing and Care for Older People published a report in 2014 that called for a ‘Help to Move’ package for older people, along the lines of DCLG’s Help to Buy policy for first time buyers, calling for three key measures to help older people move:

- An equity loan, based on the Help to Buy approach, for those facing affordability issues in later life. The Group found no reason why the Help to Buy facility of an additional loan, on the same terms as Help to Buy, might not be targeted more directly at older people (e.g. through improved awareness raising and advice schemes) to kick-start an enlarged housebuilding programme for older downsizers. The difficulties older people encounter in accessing mortgage lending, even when they can afford the repayments, excludes many older people from moving. A Help to Move equity loan would address this problem.
- Stamp Duty exemptions for older people, as discussed above.
- Comprehensive financial advice, linked to the new duty on local authorities to provide advice under the Care Act from April 2015, and which should incorporate guidance on newly introduced pensions freedoms.

We call on the Government to introduce a ‘Help to Move’ package, like Help to Buy, that removes the financial restraints on older people downsizing, including a Stamp Duty exemption for those moving to retirement housing. Such a policy would send a clear message from the Government that older people choosing to move to more appropriate housing is a socially positive and beneficial act, and is likely to encourage more older people to proactively consider their housing options in later life.

Evidence from England’s Community Forests

Background to England’s Community Forests

England’s Community Forests are Government approved programmes with a track record of environmental regeneration in and around our towns and cities.

Over half of England’s population lives within easy reach of a Community Forest. Our maturing woodlands are improving health and wellbeing, tackling a changing climate and setting the scene for future growth and prosperity and an essential part of the sustainable development of our towns and cities.

Each Community Forest is strategically located to support the jobs and growth agenda across key city regions and urban clusters. Our footprint includes the Northern Powerhouse, M4 Growth Corridor and D2N2.

As our woodlands have grown up we’ve developed a range of answers to the complex problems of our towns and cities. Our Forests: enable sustainable development, creating an attractive green framework for town and cityscape - places to live work and play; boost health and wellbeing; help adapt to climate change; connect people to their landscape each other and their communities; support economic growth through timber and biomass production and tourism through the outdoor visitor economy; help to reduce crime and anti-social behaviour.

We have achieved sustainable improvements to the quality of life and place in some of the most deprived parts of England, as recognised by national planning and environment policy.

The quality and functionality of our built environment relies to a large degree on the quality, quantity and distribution of trees and other green infrastructure elements.

Trees in and around our towns and cities provide a broad range of benefits that can no longer be taken for granted including the recognised positive impacts a green environment has on property values.

Where trees are lacking we can identify “pinch points” to sustainable development.

We are pleased to provide comments on the role we think Community Forests play and can continue to play in the built environment.

Evidence
Below are set out the questions in the Call for Written Evidence followed by the response of the Urban FWAC Network

**Policymaking, integration and coordination**

Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

- Trees and other green infrastructure types are an essential part of any discussion about built environment. GI needs to be planned in the same way as other infrastructures a fundamental consideration of how places function.
- Need for decision making at several levels, but clearer links between high level strategic planning and Local Authority level. Need for greater flexibility and ambition for local and neighbourhood plans and policy. We support the TCPA calls for a national strategic land use plan – to include forests and trees (Lie of the Land, 2014, TCPA).
- The need for a national GI plan that crosses planning authority boundaries. Community Forest Plans, are good starting points in the areas where they exist. These plans should be used more frequently in local decision making, using the links top NPPF and the strong links to community aspiration for their local areas.
- There needs to be some stability in plans and policy. The past 20 years has seen too many restarts/reset for plans and policy making. This has resulted in some places having started the planning process multiple times, confusing communities, wasting resources and leaving a policy vacuum.
- The natural element of the built environment requires longer term planning (stability) that can be adaptive in nature to respond to the changing demands in towns and cities.
- The Natural Capital Committee 2015 report makes a strong case for community forestry, identifying major cost: benefit returns and supporting key agendas such as housing growth, health, education and creation of attractive places for investment.

How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

Government policy and implementation is not well integrated. There is a clear need to identify a lead department and establish a co-ordination team that brings in all relevant government departments to oversee delivery of GI so it is integrated into infrastructure planning for urban areas. Policy needs to be integrated once it is issued. Policy needs to have been consulted on internally before leaving government with all relevant Government Departments.

National Land use policy can help to inform the work of the coordination team, and provide a framework for monitoring alongside Natural Capital accounts.
National policy for planning and the built environment

Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

There is need for better, integrated policy guidance on natural environment – at present it has many strands and no unifying language, nor plan.

What is required is high level Natural Capital policy and GI policy, delivered locally through GI Plans, community forest plans and ecological frameworks - all of which have shared objectives.

Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

As a minimum, consideration should be given to our urban areas as different to our rural areas. They are the most densely populated areas with the most social, economic and environmental problems. There are also critical interrelationships which should be recognised, for example, maintaining flood plains and wooded areas up stream of rivers leading into urban areas to reduce the risk of flooding.

There should be national Green Infrastructure planning policy and guidance to making our cities towns and villages more liveable.

Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

Need for long term, stable plan and policy for natural environment in the built environment. These plans can be adaptive. The Community Forest plans are 40 year plans. This has worked well; it is a good model to use as the basis for planning for the built environment.

Green Infrastructure Plans will include many elements (including community forests) reflecting the multiple benefit and the partnership implementation. Delivery will be over many decades and will include projects relating to urban trees, green roofs, sustainable urban drainage, new green cycle ways, river and floodplain restorations etc. The long term integrated maintenance of this schemes also need to be considered as the project “grow” and multiply their benefits.

Buildings and places: New and old

What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level,
required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

The built environment should be adapting to Climate change and the development of Green Infrastructure Plans and SUDs proposals are integral to these. GI will promote resilience, sustainability and economic benefits to urban communities that can come from GI not only amenity. GI Plans can be retro fitted to existing built areas and planned as part of new urban areas.

Ensure CF Plans are supported, where they exist, in local plans. Strengthen existing policy in NPPF to encompass all features of CFs in planning, not just in greenbelt issues.

Historic and Heritage environment create a sense of place pride. Understanding the history of where we live often leads to community involvement and community coherence. Trees and woodlands are part of the historic environment and can massively increase the value of an urban area. Historic trees and avenues in the urban areas are highly valued and add to the economic as well as aesthetic values of an area.

**Skills and design**

Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

There has been a skills drain in the public sector, with the removal of the experienced planners, surveyors, architects, engineers, resulting in poor design being implemented by unskilled or poorly qualified. Local Enterprise Partnerships and other skills agencies may have a role to play to reskill our public players. Critically we require multi-disciplinary practitioners to plan urban areas who understand architecture, landscape, climate change, engineering, drainage, pollution etc.

Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

England’s Community Forests, The Landscape institute, the RTPI and other national bodies have a leading role to play in advising Government. These organisations have been an ardent supporter of GI and multi-disciplinary planning and their energy and passion should be channelled into Government policy making.

Page 1293 of 1964
Community involvement and community impact

Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

There is a good evidence base to support high quality green infrastructure improving the quality of life and place. These interventions, if well planned and coordinated, can be lower cost solutions to some of the problems that our towns and cities face now and in the future with pressures from projected climate change and demographic shifts.

Setting clear framework nationally and maintaining up to date plan and policy database of good practice would be helpful (planning and forestry portal was part of Env White paper – but now going out of date due to lack of resources (http://www.forestryandplanning.org.uk/)

How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

The reduction of the public sector work force through declining budgets has placed more pressure on the planning system. Consulting communities on shaping their built environment requires a resource that currently is not there or is present at a reduced capacity. To facilitate effective public consultation resources will need to be provided to the public sector to engage in long term sustainable solutions. These need not be large amounts but could be used to draw in third sector partners to facilitate this process.

Financial measures

Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

- There should be a re-examination of the use of tax credit to support sustainable environmental improvements to unlock housing and other land use pinch points. There is emerging evidence to show how good quality GI can accelerate development on approved sites and lead to accelerated returns on investment. This can, income retention - BE Group - accelerate investment
- Consideration of European mainland financial models and approaches to housing and urban development eg where where infrastructure goes in prior to development.
- Government should investigate Green Bank investments into City or town Centres, which elevate the value of land and produce a return on that investment through increased land values.
Government should be looking at sustainable incomes rather than one-off capital payment. Incomes should be related to other incomes such as the Community Infrastructure Levy or the Landfill Communities Fund where a percentage of the payments help maintain the public realm into the future.

05 October 2015
INTRODUCTION

This call for evidence on our National Policy for the Built Environment is welcomed.

- Many believe that the planning system has become focussed on reacting to events, with minimal emphasis on proactive town planning:
- The public has minimal involvement in the evolution of developments, and often sees development as something to object to:
- Developers are perceived as all-powerful: big schemes seem to be pushed through, but small householder projects are delayed:
- The built heritage is not being seen as a resource but as an obstacle:
- The architectural and urban design quality of much of what we produce is abysmal:
- Planning offices are largely becoming short-staffed processors of planning applications, with little creativity, trying to avoid being judged “under-performing”.

There is much to consider if we are to return to the more positive and proactive and imaginative approach which underpinned the setting up of our planning system.

Suggested responses to some of the Committee’s questions are as follows.

2 How well is planning policy co-ordinated between Government departments?

2.1 Housing provision appears to be a stand-alone subject, not linked to the provision of open space, community and education facilities, employment, infrastructure and other uses, all of which need to be balanced and inter-dependent in a properly planned way.
“Infrastructure first” should be the approach. But the funding regime for these “support” services appears to be based on “running after the problem once it has appeared”, rather than the whole planning package being integrated.

The capturing of some small amounts of social housing, or section 106/CIL payments as part of the application process is clearly not sufficient, and comes too late. Some Councils are misusing this funding to defray local running costs, rather than creating the new infrastructure to support new housing.

Government initiatives and funding are seen as “silos”, unrelated to each other or to a coordinated and unified national policy.

3 The NPPF: is its policy guidance sufficient/right?

3.1 The introduction of the concept of “viability” in the NPPF has been disastrous. The private sector developer tables “confidential” figures in discussion with planning officers. These cannot be checked by the public nor by Councillors. The officers then appoint outside firms (who often advise developers on other schemes) to check the figures. The end result is the reduction of community benefits and social housing being provided in the scheme.

2 The practical effect therefore is to increase the developer’s profits, increase the price paid by the developer to the landowner, largely eliminate the social gains that were intended to flow from the development. And significant public disquiet.

Removing this “viability” reference would return us to the previous situation where, if a developer claimed that their project was “uneconomic”, the planning office would simply say (as we did many times) “come back when it is”.

And all the secrecy, delays, extra fees and work that result could be eliminated.

3.2 The NPPF should make clear that the major reason for having a planning system is so that the public voice may be heard, as a balance to the voice of the developer. This means that the principal “client” of the planning system is not the developer, as seems to now be assumed by HMG, but the public.
One should remember the phrase: “Whose town is it anyway?”

3.3 The NPPF guidance on Heritage is weak, and fails to provide the robustness and clarity that are needed to underpin a local Council’s planning policies.

3.4 It also fails to give enough emphasis to the protection of Flood Plains, with the result that new housing for example, which is classed as a “vulnerable” use, is being accepted and indeed encouraged in the defined 3B and 3A zones, contrary to what the Environment Agency (and the NPPF annexe table 3) says.

The Environment Agency seems to lack the firmness and “teeth” to ensure that development that compromises flood plains is prevented.

3.5 Green Belt (GB) protection needs to be modified in at least three ways.

It should be made clear that the GB policies apply equally to the Metropolitan Open Lands (MOL) in the major conurbations.

This is specified for example in the London Plan, but should be integral to the NPPF.

Also, the GB itself would gain from having a more systematic analysis of why each part is designated: for example, the reasons include the separation of settlements: the quality of the agricultural land: the visual protection: nature protection and green corridors: historical and heritage elements, and so on.

And the so-called gummer law, that allows houses of supposed special architectural merit to be built in the GB, should be scrapped.

Either the GB needs to be kept clear of new development or not.

And no-one can sensibly claim to be able to say that project X is of high architectural quality. Remembering that the Shell Centre beside Waterloo was designed by the then President of the RIBA.
3.6 The operation of the Community Infrastructure Levy (CIL) is not fit for purpose. As a basic concept, it was simple to understand and well thought through, but it has been watered down. The current scheme is now far too complex and expensive for planning authorities to administer. It is also likely to yield minimal financial benefits.

HMG seems to have been over-influenced by the development industry, with the result that the public, expecting to see some significant community benefits coming from such a scheme, are now to be disappointed. An example that it takes more skill to make a simple scheme than a complex one. And that when it comes to clever salesmanship, the development industry has few equals.

3.7 Land Value Capture (LVC) needs to be an integral part of the planning system. When the public sees a landowner of agricultural land, valued at £10k an acre, being offered £3 million or more an acre so that it can be developed, there is a justifiable disbelief.

Such an enhancement in value is created by the public (ie the planning system), and the enhanced land value should accrue to the public purse, and be used to fund the infrastructure, the education, social and community facilities, heritage and open spaces that such a development will require.

6 What should HMG do about housing supply?

6.1 “Solving” one problem (housing shortage) by creating others (for example by automatically allowing change of use from non-residential use) is not the answer. Lack of employment floorspace locally means that workers have further to travel. Allowing housing into commercial areas, with all the environmental and noise problems is storing up future difficulties. This dismantles one of the basic amenity and public protection standards underpinning land use planning.

6.2 Land value capture, and the dropping of “viability” from consideration (see 3 above) would encourage Councils to be more pro-active in designating land for future development.

HMG should consider funding Councils to purchase new land for both social housing, and housing for sale. By Compulsory purchase if required.
And the basis for compensation to the landowner should reflect not only the current use, but a significant additional amount for disturbance.

Such land acquisition may need to be vested in a “parallel to the Council” public body, to ensure that the financial sums generated are used appropriately.

8 How to make optimum use of the Historic Environment?

8.1 There is a major difference in performance between the works to historic buildings carried out or funded by “heritage bodies” such as English Heritage, National Trust etc (which are exemplary), and the works carried out by the development industry, working with the local Council’s planning office staff.

This is because the majority of the latter have inadequate expertise, and are working to tight financial deadlines.

The lack of planning fees for such applications is also a significant factor.

Few local Planning office staff have either the time or the expertise to monitor, advice, and if necessary enforce control on the quality of “heritage” works.

(The basic drawings that have been approved do not of course usually show the complexity of works needed when old structures are opened up).

The need for skilled staff in a planning office, who understand the construction and frailties of old buildings and how to respect them, is clear.

8.2 Currently many planning offices have only two of the three essential sections in place: Development Control (which gleams some fees and is a statutory function), and Policy which is needed to produce up-to-date plans.

Until the 1990’s most progressive planning offices had the vital third section, where
positive planning ideas for the future, design and imagination, were the norm. And where the knowledge of the historic environment was inbuilt.

This was, and perhaps should be, the main public face of the modern planning office, dealing with and briefing developers, producing the innovative ideas, leaving development control to handle process.

This aspect of creative planning has largely atrophied, driven not only by Councils cutting back expenditure, but also by the lack of suitable staff with the required qualifications.

It has impoverished the creative side of planning, and meant that staff with experience of how historic buildings are made, how they can be repaired, how they can be respected and enhanced have not been available.

8.3 The number of planners who are qualified in this area is minimal: architects with their ability in building construction and design (town planners are not designers) were an essential part of the planning profession, but now are extremely rare.

For the planning profession to be able to take on any task that society requires of it, the skill range has to include design and heritage. It is not practicable to expect every single planner to have the complete range of skills, so the profession needs to ensure that all members of the institute have the basic planning skill, and then that many should have an additional specialism, be it design, valuation, heritage, construction, statistics etc.

Currently it is virtually impossible to attract architects into the planning profession, and this needs to change. A planning profession without proper design skills is what we have currently. Should an HMG grant aid for initial training be explored?

8.4 Grant-aiding historic building works by local planning authorities or English Heritage is now, apart from some bijou projects, largely defunct.

The reason given is lack of financial resources.

Alternative positive approaches seem to receive little encouragement from HMG.
For example, a Heritage Grant scheme which provided 10% of the cost of external repairs to listed buildings and houses in conservation areas, would be self-supporting financially if it were grant-aided by HMG.

This is because when the project is implemented, the normal (c20%) tax (and VAT) paid by the building industry to HMG on each project will more than cover the initial cost of the grant. Specialist heritage firms also gain from the additional workload. Local Council planning office staff would run such a (simple) scheme using the HMG grant and their own running costs would also be covered.

We know from personal experience that such a scheme works, is simple to administer, and delivers benefits to heritage areas and historic buildings.

All that is needed is some positive thinking by HMG.

- Because listed buildings applications provide no fee income (the same being true for Article 4 Directions) LPA’s give them low priority, and fail to employ staff who are qualified to deal with design and heritage.
- If HMG does not wish to see fees paid, then it should consider making grants to the LPA to match the number of such heritage cases they deal with.

9  **Does the planning profession have the required skills?**

9.1  No. As explained above, town planners are not designers, and the profession needs to broaden its skills base.

It is no good parachuting in “an architect” to give some design input.

We have had experience of these, with no proper understanding of planning, spending their time altering the elevations of other architects – a total nonsense.

We need far more “planner-architects” in the profession.

10  **Are we using the right techniques to promote high quality design?**

10.1  No. The present method of working is that the developer arrives at the planning office with their proposal drawings. The planning staff are then supposed to instantly
respond, even though they may not know the site in any detail. The scheme architect is nowadays often seen as merely a support act, with the developer and a skilled “negotiator” doing all the presentation. (The architect is often hired just to “get planning permission” and is then dropped from the scheme).

Not surprisingly, the scheme gets off to a poor start and the planning staff have to try to get it back on track when they have had an opportunity to see the site etc.

Also, all these pre-application discussions are confidential, so the public has no knowledge of what is about to happen in their town, nor any input.

And when the application is submitted, the public has just the 3 weeks to comment, on what they see as a fait accompli, with the developer in the D&A Statement claiming that the scheme has been “agreed” with the planning staff. Unsurprisingly, the public often sees the planning staff as part of the problem, having been “won over” by the developer.

10.2 What should happen instead?

The developer should identify the site to the planning staff, and ask for a briefing. The planning staff then produce the basic urban design and planning brief.

This is seldom more than a single page of A4, and will have basic design/planning advice, such as building lines, height limits, tree respect zones, neighbour daylighting/privacy requirements, access options etc. This is then made public.

Local people will (a) have advance information that something is to happen, and (b) can contribute their own thoughts/proposals at an early stage in the design process, cutting down on last ditch objections. The architect then has the basic building envelope and planning parameters to work within.

Whether the architect follows the urban design and planning advice or not is their decision. The planning office must deal with whatever application is submitted. But it should be clear that the scheme would be measured against the original urban design and planning criteria.
And the design should never be “negotiated” or “agreed” with the planning office, which is there to offer advice: only the Council can “agree” a scheme, not the staff.

Such an approach puts the architect back into leading the design process, and marginalises and hopefully eliminates the need for professional “negotiators”. Better design should result.

**10.3** There should be no discussion about “architectural style”, which should not be a concern of the planning system (there may be minor exceptions for listed buildings). The NPPF (and its predecessor documents) in effect says this, but the reality is that Planning Committees (and planning office staff) still tread heavily into this aesthetic minefield. And unfortunately promote and support crude pastiche rather than innovative modern design.

(Style and design are two very different concepts, but are often confused. Style is essentially merely fashion, design is integral to the character and nature of a building, and allows buildings of many “styles” to co-exist).

The result of this interference is that the relationship between the planning and architectural professions is poisoned, the output by the architect is unsatisfactory, and mediocre buildings are the result. For proof of this “look out of any window”, to see what we are all currently delivering to the public.

**10.4** The basic principle should be that the planning system has to design and plan the town: no-one else can do it, certainly not the architect or the developer. The architect then has to design and plan the building, within those planning parameters. Not the other way round.

**10.5** Some of us know from past experience that this alternative approach (ie setting the basic urban design and planning parameters, and then keeping off the “architecture” as above) delivers a better result.

Better in that the architect takes sole responsibility for the detailed design.

The quality of the buildings is better, as is the building’s relationship to the locality. And the relationship between the two professions is more positive and clear cut, improved immeasurably, with fruitful collaboration being possible.
And the delays that result from a late “change of heart”, or aesthetic meddling by the planning staff are minimised.

And giving the public far more time to understand and respond and contribute to a development proposal is not only more productive, it is also more respectful.

12 **How effectively can communities engage with the development process?**

12.1 All pre-application discussions between developers and planning staff should be public, apart from genuine financial balance sheets (see above).

When this is done, the community can put together and suggest its own views on how a site should be developed, well before any application is submitted.

This could help the developer to understand local issues at an early stage of the development process. The public, with its close knowledge of local history and character, should be seen as a resource, not an obstruction.

Remember: “**Whose town is it anyway?**”

12.2 Policy-based plans are very difficult for the general public to understand. Instead of being 100 pages long, with eloquent reasoning, all plan policies should be able to be summarised onto a popular version, say 4 sides of A4.

12.3 To balance these written documents, much more should be done to encourage basic 3D plans for village and town centres, which could bring to life the sometimes dry and technical-speak plans and policies.

06 October 2015
1. Introduction:

The Mineral Wool Insulation Manufacturers Association (MIMA) welcomes the Select Committee on National Policy for the Built Environment inquiry and the opportunity to engage in this important area.

The UK’s housing stock remains amongst the leakiest in Western Europe. This has far reaching implications for consumers and is resulting in fuel bills being higher than necessary and over two million fuel poor homes which costs the NHS an estimated £1.3bn per year. This is despite of a 30% reduction in gas consumption, that DECC believe were part driven by home energy efficiency schemes. There are further implications for the UK’s energy security, the need for additional energy infrastructure investment and also climate change.

As part of National Policy for the Built Environment, there is a clear opportunity for the Government to improve the UK’s existing housing stock and fully insulate our 27 million homes.

However to date, Government policy in the area of energy efficiency, retrofit and improving our housing stock has not succeeded in raising sufficient awareness of the benefits of investing in our stock or in driving demand from consumers. Both have had unwelcome consequences for the stability of the insulation industry and the overall success of these policies.

With this response, MIMA would like to focus on addressing policy shortcomings and provide economically viable and workable solutions that bring clear benefits to the UK Government, UK consumers but also delivers for the UK’s built environment.

2. Summary:

To date, Government ‘boom and bust’ policies to improve the energy efficiency of our housing stock, such as ‘cash back’ have not generated enough consumer demand for energy efficiency retrofits. It has created an unstable supply chain with consequences for the quality of workmanship in some cases.

MIMA believes that driving the energy efficiency of the UK’s housing stock to prevent energy and money being wasted must be a central plank of the government’s economic, energy and climate change policy. This must be supported by a commitment to a stable,
long-term (at least ten-year) programme with investment in energy efficient housing as an infrastructure priority. Such an approach would:

- **Improve the quality of our homes:** Our homes are part of our national infrastructure and should be a source of pride – not the leakiest in Europe.

- **Reduce energy bills and fuel poverty:** Energy efficiency can permanently reduce energy bills by £300 each year and lift 9 out of 10 homes out of fuel poverty.

- **Deliver demonstrable benefits to health and wellbeing:** Energy efficiency can improve health and wellbeing, reduce excess winter deaths and lower NHS and social care costs.

- **Drive down carbon emissions:** Buildings are responsible for almost 37% of all UK carbon emissions. Energy efficiency can reduce carbon emissions to meet carbon targets and combat climate change.

- **Drive economic growth and creates jobs:** Investing in energy efficiency can generate significant economic growth in all regions of the UK and double the number of jobs across the UK in the sector to 260,000.

- **Increase energy security:** Energy efficiency can improve the UK’s energy security and reduce our reliance on imported gas.

3. **Policymaking, integration and coordination:**

   a) **Policymaking:**

   There are two areas of policy that MIMA would like to raise in this response – the Energy Company Obligation (ECO) and the replacement for the Green Deal.

   i) **The Energy Company Obligation (ECO)**

   - Clarity is urgently needed on the ECO post 2017.

   - MIMA supports moves for the ECO to be targeted towards the fuel poor, provided there is also a commitment to put in a place a solid, long-term plan for the able to pay market.
• Care must be taken to ensure the ‘new’ ECO is not too narrowly focused. Otherwise the identification of eligible households could become as costly as the installation works.

• An area-based element should also remain based upon the CISCO/LSOA and HHCRO to cast the net wider.

• HHCRO delivery should ensure energy efficiency measures are installed wherever a heating system is upgraded to avoid wasted heat.

• However, in the long term, Government must review whether the energy companies are best placed as ECO’s delivery agent. The current model adds costs to energy bills and also results in the delivery of energy efficiency measures being based solely on cost, rather than focusing on quality installations and ensuring people who need measures the most are able to access them.

• Lastly, Government must not withdraw support/make wholesale changes suddenly or the supply chain will be decimated (again).

ii) The Green Deal replacement

Recently, the Secretary of State, Amber Rudd has signalled the end of the Green Deal, by ending funding for the Green Deal Finance Company however also called on industry to work with the Government to deliver a structure that provides value for money to the exchequer, tackles the priority issues of fuel poverty and carbon reduction and empowers consumers to keep their bills down. There is a clear opportunity to get policy right and to deliver for our homes in the UK.

Despite this withdrawal of government support for the Green Deal Finance Company and the Green Deal Home Improvement Fund, MIMA wants to see the continued use of some aspects of the architecture set up to deliver the Green Deal and the ideas behind it in new policies.

The experience of the last 2-3 years clearly demonstrates that government policies such as the Green Deal which simply ‘enable’ energy efficiency are not sufficient to drive consumer demand on their own.
MIMA strong advocates policies that not only enable people to take up energy efficiency measures (such as pay as you save schemes or low interest loans), but also drives them to want to do it. We think drivers such as tax incentives or nudges are absolutely critical. In our view, the focus on enablers in the Green Deal was one of the fundamental problems. Therefore we support moves to encourage take up through tax incentives, and wish to see future policy take the following shape:

1) Commit to a long-term (ten-year) programme with energy efficient housing as an infrastructure priority.

2) **Drive demand** by rewarding energy efficient homeowners with lower stamp duty or other tax incentives (which are cost neutral) By also requiring that inefficient homes should have higher levels of stamp duty, the approach becomes cost-neutral for HM Treasury. This incentive has the additional benefit of making energy efficient homes more attractive to buyers and triggers action to improve energy efficiency at a time when people are already thinking about refurbishing or upgrading homes i.e. when they are looking for a mortgage, re-mortgaging or a loan for home improvements.

3) **Enable** householders to see it through with low interest loans for energy efficiency improvements and other financial support to reduce up-front costs (fuel poor and able to pay). Loans would be offered by retail banks and other financial institutions with a ‘shop window’ i.e. such as high street banks. They have high visibility and an ability to reach out to consumers. Simple to understand, low interest energy efficiency retrofit loans to households have been very successful in Germany for 15 years. It would help to move the industry off the reliance on subsidies. Consumer research in the UK[338] and from other countries[339] supports this.

4) **Support** supply chain capacity and high quality delivery.

This is similarly reflected in the Respublica[340] report ‘After the Green Deal: Empowering people and places to improve their homes’ and commit to investing in delivering better homes and better lives’:

339 Mintel, Policy changes are putting a chill into the thermal insulation market, October 2014. [http://www.mintel.com/blog/mintel-market-news/policy-changes-are-putting-a-chill-into-the-thermal-insulation-market](http://www.mintel.com/blog/mintel-market-news/policy-changes-are-putting-a-chill-into-the-thermal-insulation-market)
• Government should introduce a financial incentive for consumers at a key trigger point: when buying and selling their house. Stamp Duty Land Tax (SDLT) should be reduced in line with each Standard Assessment Procedure (SAP) point a property reaches above the mid-point of revenue. Conversely, SDLT should be increased for each SAP point a property is below this.
• Introduce a ‘Help to Improve’ scheme, where Government guarantees the cost of a property’s investment in energy efficiency retrofit and provides funding through an intermediary to reduce the interest rate of the loan.

In summary, any successful government policy for the able to pay market must have two vital elements – both the engagement of consumers and enabling them to improve their homes, to keep their bills down and homes warm. By recognising that our homes form an essential part of our national infrastructure with a coherent programme which deliberately drives demand, and then enables consumers to ‘see it through’ will succeed to ensure connection with consumers and secure policy success.

b) Government department integration/coordination:

Historically government departments have not worked together holistically on policies in this sector and cross departmental coordination has been limited or even lacking. For example, there has not been a transparent, cross-departmental approach to adding new, high-performance measures to government energy efficiency programmes. This has hampered innovation and penalised companies for going beyond minimum standards.

MIMA would like to see government seeking a better way of working across departments, especially where these negatively impact upon the policy outcomes and stakeholders involved with the built environment. We would welcome active participation on seeking a practical solution that delivers outcomes for government, industry and UK consumers.

4. Building and Places: New and Old

The stop start approach of Government policy in this area has had unintended consequences for the insulation industry but also the overall success of these policies.

The building insulation market contracted by 22% in 2013,\textsuperscript{341} as the installation of cavity wall insulation fell by 46%, the installation of loft insulation fell by more than 87%, and the

installation of solid wall insulation fell by 30%, compared with the number of measures installed under the Carbon Emissions Reduction Target (CERT) in 2012.\footnote{Energy Performance Certificates (EPCs) are a measure of the level of energy efficiency of a home. The ratings span from A to G. A-rated homes would have relatively low energy bills, whereas G-rated homes would have high energy bills, and be expensive to heat. An EPC band of C represents a reasonably good level of energy efficiency. The average EPC rating in England and Wales is currently D. Increasing the energy efficiency rating (or EPC) delivers a warmer, healthier, and more comfortable home for the resident, whilst reducing the energy bills.}

To ensure a sustainable and resilient built environment we must realise the clear opportunity to improve the UK’s existing housing stock and insulate the 27 million homes.

This can be realised by a radical new approach to home energy efficiency as outlined in the Verco report\footnote{C. Liddell, Estimating the impacts of Northern Ireland’s warm homes scheme 2000-2008, University of Ulster, 2008. http://eprints.ulster.ac.uk/26173/1/FPcostbenefitsonweb.pdf} which calls for all low income homes, by 2025, to be retrofitted with energy efficiency measures to achieve a mid-band C on an Energy Performance Certificate (EPC),\footnote{Chief Medical Officer, 2009 Annual Report, 2009. http://www.sthc.co.uk/Documents/CMO_Report_2009.pdf} and for all other households to be offered 0% interest loans to improve them to an equivalent EPC standard by 2035; delivered as part of a major infrastructure investment programme. In the original report, detailed modelling assessed the economic, fiscal, and environmental impacts of this programme. It concluded that the economic case for making the energy efficiency of the UK housing stock a national infrastructure priority is strong.

In addition to making all low-income households highly energy efficient, and reducing the level of fuel poverty, the modelling has established that this energy efficiency programme would deliver:

- **£3.20 returned through increased GDP per £1 invested by government**
- **0.6% relative GDP improvement** by 2030, increasing annual GDP in that year by £13.9bn
- **Improved health and reduced healthcare expenditure**, due to warmer and more comfortable homes, and improved air quality. For every £1 spent on reducing fuel poverty, a return of 42 pence is expected in National Health Service (NHS) savings.\footnote{http://www.energybillrevolution.org/wp-content/uploads/2015/09/Frontier-Economics-Energy-Efficiency-an-Infrastructure-Priority.pdf} \footnote{http://www.respublica.org.uk/our-work/publications/after-the-green-deal/}
• **23,138,000 homes to be retrofitted under the scheme** including England, Scotland, Wales and Northern Ireland (not all homes in the UK require retrofitting to this standard)

Recently, this report has further been strengthened by independent research by Frontier Economics\(^{347}\) which confirms that an energy efficiency programme should be classed as an infrastructure priority. This approach helps to free up capacity in the energy network just as effectively as building new energy supply. It also provides a public service by reducing health costs and cutting carbon emissions in a highly cost effective way.

The research reveals that a programme to make UK homes energy efficient would provide net economic benefits of £8.7 billion. This is based on the Government's own economic analysis, delivering comparable economic benefits to infrastructure initiatives such as HS2 Phase 1, Crossrail and new roads.

5. **Community involvement and community impact**

MIMA supported a recent innovative report by, Respublica (REF)\(^ {348} \) ‘After the Green Deal: Empowering people and places to improve their homes’ which sets out a number of ambitious recommendations at a devolved level to realise a community based approach:

- Government should enable city regions to retain the revenue generated from Stamp Duty Land Tax, and harness this new power to introduce more local and bespoke incentives for people to improve their homes. This approach should initially be trialled within a leading city region, and then rolled out to other cities and local authorities over time.

- As part of ongoing city devolution deals, a portion of national infrastructure funds should be devolved to cities to invest in energy efficiency schemes via an open competition.

- Government should devolve revenue from a range of low carbon taxes and levies to City Regions. This should initially be piloted with a percentage of the overall amount. A portion of these funds should be used to deliver home energy efficiency schemes.

\(^{348}\) Ekelund, U et al. American Journal of Clinical Nutrition, 2015; Physical activity and all-cause mortality across levels of overall and abdominal adiposity in European men and women: the European Prospective Investigation into Cancer and Nutrition Study (EPIC) [http://ajcn.nutrition.org/content/early/2015/01/14/ajcn.114.100065.abstract](http://ajcn.nutrition.org/content/early/2015/01/14/ajcn.114.100065.abstract)
• Government should encourage Local Authorities (LAs) to designate ‘Warm Home Zones’ to help target areas where low EPCs and poor public health outcomes coincide. Within these areas, LAs should introduce additional incentives for home owners and stricter regulations on landlords. The quantifiable benefits to health and social outcomes in each area should be re-invested locally.

• Revenues generated from carbon taxes and levies on energy bills should be retained locally. City regions should be able to invest this money in local home energy efficiency projects.

6. Conclusion:

The House of Lords Select Committee on National Policy for the Built Environment inquiry provides a clear opportunity to recommend a policy environment that will build a long term, stable energy efficiency policy that contributes to a sustainable, resilient built environment but most importantly improves our current built environment.

This inquiry should start by recognising that our homes form an essential part of our national infrastructure. Investment in this infrastructure will bring real economic benefits to the UK – both boosting UK productivity and significant job creation, as well as energy security.

However it is vital that for any government policy to succeed it must have two vital elements – both the engagement of consumers to drive demand and also enabling them to improve their homes, to keep their bills down and homes warm.

MIMA would welcome an opportunity to expand on these solutions during the inquiry.

7. About MIMA:

The Mineral Wool Insulation Manufacturers Association (MIMA) is a trade body providing an authoritative source of independent information and advice on glass and stone wool insulation. MIMA actively promotes the benefits of mineral wool insulation and the contribution it makes to the energy efficiency of buildings and the comfort of their occupants.

We represent four of the leading insulation companies in the UK - Isover St Gobain, Knauf, Rockwool and Superglass.
Ministerial Advisory Group for Architecture and the Built Environment for Northern Ireland (BEN0039)

HOUSE OF LORDS SELECT COMMITTEE ON NATIONAL POLICY FOR THE BUILT ENVIRONMENT

Evidence from MAG

MAG is Northern Ireland’s Ministerial Advisory Group established in 2007 under the Architecture and Built Environment Policy to advise the Minister for Culture, Arts and Leisure as the government’s design champion.

http://www.dcalni.gov.uk/index/arts.../ministerial_advisory_group.htm

MAG presents the following evidence in response to the questions posed by the House of Lords Select Committee on National Policy for the Built Environment.

Although devolution means that the Select Committee’s findings and recommendations will relate primarily to England, MAG’s experience in a recently reformed system of local government and planning may be of relevance.

Some principles that have been developed and promoted by MAG’s work appear to resonate with issues identified by the Select Committee and may offer a different approach that may inform the Committee’s work.

Providing evidence in relation to the Select Committee’s questions is also useful to MAG in advising on the continuing review of the Architecture and Built Environment Policy for Northern Ireland, which is now over nine years old.

On behalf of MAG we present a six page summary of our answers to questions, including some internet links that amplify the answers.

MAG advises that we must ‘Connect the unexpected – and sometimes the obvious – by design’.

MAG would be pleased to provide further detail and additional references about its evidence, upon request.

Arthur Acheson
Architect + Civic Planner
Chair of MAG

Andrew Haley
Landscape Architect + Urban Designer
Ministerial Advisory Group for Architecture and the Built Environment for Northern Ireland (BEN0039)

Member of MAG and Chair of Landscape Subgroup of MAG

Policymaking, integration and coordination

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

MAG Evidence 1A:

The Commission for Architecture and the Built Environment (CABE) had a remit: ‘Design, Manage, Maintain’. MAG invited CABE to present at a symposium in Navan, County Armagh in 2010, ‘Planning for Places’, and found psychological benefit in reversing the word sequence to ‘Maintain, Manage, Design’.

MAG Evidence 1B:

Maintain + manage = ‘stewardship’ (defined by the Social Capital Group in Boston USA as ‘active caring’). ‘Civic’ suggests people and places. The Social Capital Group offers us three techniques, ‘action learning’, ‘connecting’ and ‘aligning’. MAG used these with District Councils and launched an interim report at a Belfast symposium in 2013.

Stewardship can be tried out very quickly to inform and develop the ‘software’ of a place. The software needs to be designed just as its ‘hardware’ (its built form) is designed. The potential for change is rapid and universally accessible. Changing software is a quick, cheap, easy and reversible way to improve all places, from the worst to the best. Understanding the ‘place software’ can then inform the physical design. This makes for better design briefs.

MAG Evidence 1C

Successful delivery of civic places requires wide-ranging organisations and individuals to have common objectives. For larger initiatives, this requires alignment of departmental and community priorities. Development of the Masterplan for Colin Town Centre, through the Office of the First Minister and Deputy First Minister (OFMDFM) Urban Village Programme, demonstrated the benefit of a ‘national’ policy providing the context within which a number of public departments/authorities were required to work together to make the area a ‘priority’. The active and passionate involvement of the community was galvanised by the expectation that the much needed changes were likely to be realised and that they as a community were central partners.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?
Ministerial Advisory Group for Architecture and the Built Environment for Northern Ireland (BEN0039)

MAG Evidence 2A:
During a period of Planning Reform in 2008 an independent expert, Professor Greg Lloyd, advised the Minister for the Environment in Northern Ireland, calling on government, professions and society to adopt a more collegiate approach. MAG wanted to know more. After detailed experimental work, MAG defined collegiality as ‘Organically changing leadership and support in pursuit of a shared objective, retaining the independence of all participants.’ The model is the geese crossing a great ocean in V-formation. All the birds are independent but in flight the flock is measured as 80% more efficient than a bird flying alone. It is physically not possible for a lone bird to make the journey, but by changing onerous leadership and less onerous support organically during the flight, a flock of birds flies non-stop for thousands of miles. There is always one in the lead but it is not always the same one.

MAG Evidence 2B:
MAG now uses collegiality to lead where appropriate and support where possible. Such leadership and support allows MAG to support organisations who have devoted much time to researching a particular topic (for example an urban road junction layout or a procurement issue) and to naturally lead on other areas (such as its work on civic stewardship with small, cheap or free interventions making a huge difference to places in even a single day). Mentoring on areas where MAG has demonstrated leadership can then be provided strategically to central government, local authorities and the private, voluntary and community sectors.

MAG Evidence 2C:
There is significant evidence that the application of joined-up policy requires strong leadership, not just of an organisation, but through the passion, skill and commitment of a ‘champion’ who can come from the public, private or community sector. Northern Ireland examples include leaders, in places such as Laganside and Connswater and in the adaptive re-use of heritage buildings by the private sector, who have been prominent ‘champions’. All are adept at solving problems and removing impediments to projects, in a way that ‘organisations’ are not. It is important to recognise that the energy required to be a ‘champion’ is not unending and therefore the collegiate approach to succession is vitally important.

National policy for planning and the built environment

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

MAG Evidence 3A:
Northern Ireland does not have a NPPF; instead it has a series of Planning Policy Statements which will gradually be replaced by a single Strategic Planning Policy Statement (SPPS) that was launched on 28 September 2015. MAG support for the NI Department of the Environment led to the inclusion in the SPPS of specific references to urban and civic stewardship. MAG’s advocacy during the consultation on the SPPS recommended that a hierarchy of principles be adopted in the SPPS under the Guiding Principle – ‘the Planning Authority must operate in the public interest’, followed by a further Hierarchy of Principles, the importance of firstly eco-systems, secondly people, thirdly places and only fourthly policies, legislation and regulations, including economics and transport. This allows evidence for the decision to be measured to respect the public interest, which is of course ultimately a political and legislative decision. This approach may be helpful in considering the shape of any future NPPF. It is noted that there is currently a policy vacuum, in relation to the lack of a Land Strategy. This is considered important as the means of articulating a shared understanding of how competing and complementary land uses can be reconciled in spatial planning terms.

4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

MAG Evidence 4A:

Spatial planning is about the quality of places and how they might stay the same or change for better or worse. It depends on spatial appreciation. This is best achieved by being there – not only at times that specialised expert consultants may appear during the working day but also at other times – in the long summer evenings, on a rowdy weekend, during a cold spell when communications may be reduced, waiting for a bus, or helping a lost soul with directions when the satnav hasn’t worked properly. In other words, local people are the experts. What is good in this place and should not be interfered with? What is bad here and needs urgent attention? What changes can happen immediately with a change of habits? Which changes need longer?

MAG Evidence 4B:

MAG has shown officials and elected representatives that change (including a change of attitude) can happen very quickly. A recent ‘Six week Ward Vision’ brought together local people to explore their place; they reported in ‘six weeks’. They wanted a sensory garden to brighten the lives of children with autism. When they heard that normal timescale for a new public garden would be about 12 years they agreed that sensory wheelbarrows in the main street could be a good experimental start. By Week 2, the planted barrows were there with lovely signs saying they were a gift to the townspeople from the children’s autism
society. Why wait? Plants, including sensory plants, grow and reproduce. Perhaps there will be more sensory barrows or a sensory Main Street, well before the normal 12 year timescale because people ‘just make it happen’ and ‘don’t take “No!” for an answer’.

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

MAG Evidence 5A:

All timescales can be taken into account. Action Learning happens in a single day. MAG’s civic stewardship interim report describes over 30 techniques. Some already exist, some are new, instant and free and some are low cost but take a little longer. In many places, knowledge and skills have been gained from generations of good stewardship but designers often miss or dismiss these. They can instead be appreciated, encouraged and developed by design professionals – provided they take time to look for them. They can find out how places work, not by ‘consultation’ but by involvement, and by using the civic stewardship technique of ‘connecting’. Skilled designers can gain huge benefits by, for example, trying out a street closure to see how it feels to sit there. It might feel cold and windy most of the time, so maybe fixed benches are a waste of time; perhaps tables and chairs should only be brought out on great summer days. Now, with some direct action learning, can we talk to shopkeepers, councillors, officials and residents about this? Having learned by action and having connected, is there anything we now need to align? Were there obstacles that need a change of software? Do we need to involve the police, traffic wardens, street cleaners, event managers and restauranteurs? Do we need to change the by-laws or is legislation required to align experimental findings with policy and practice? Action learning is quick. Connecting takes a bit longer. Aligning may take months or years. But all create and build upon real evidence, not designers’ surmises or their bright illustrations.

There is an urgent need for those tasked with delivering regeneration to think differently about the process of spatial planning and how to effect the desired changes. It is important to plan change relative to timing holistically. A Masterplan is important to inform strategic decisions, facilitating the delivery of meanwhile uses, interim uses and the long-term vision, recognising that at any and every point in that process there should be good stewardship that involves people and creates a continuing sense of place.

Buildings and places: New and old

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

MAG Evidence 6A:
There are many empty houses in England and across the UK. Depending on their location they may have become affordable but unpopular. Civic Stewardship (active caring for people and places) can help. Firstly, by using and thereby maintaining places, often with simple cheap techniques that are implemented by local people with modest encouragement, the perception of a street, square or rural place can be changed. Suddenly places feel brighter, less intimidating, lose their ‘run down’ appearance and become places where people may actively choose to live and work. Secondly, by managing places, perceptions can change quickly. Belfast city centre is positively different during its annual ‘Culture Night’, for example. Two ‘European Heritage Open Days’ open a church at unexpected times – presenting true delight in places for little or no cost. Where districts with houses in public ownership have become ‘unpopular’, there are schemes such as ‘homesteading’ which have been successfully employed to avoid demolition and conditionally devolve responsibility for properties to new ‘repairing owners’ to agreed standards which can include sustainable renovation. Self-build housing can be encouraged.

All this software has already been designed and is fully operable. The next design brief is to make the software available in a local and timely manner to people who care about their places. ‘Housing crisis – 1 million new homes pledged’ is today’s headline - but ‘new home’ does not necessarily mean ‘new build’. Providing a million new homes may just need a more intelligent use of our huge stock of underused and empty existing buildings. Artists in lofts in New York showed us how.

Public authorities could give active organisations guidance on removing obstacles, such as how to obtain public liability insurance for just a pound or two per day on an annual basis. Designers can be encouraged to appreciate the software that already exists for events and activities and contribute to making it more widely available. Any physical designs that follow can be informed by appreciating the operational systems of the place, making possible designs that respond to actual proven usage. During this process, people learn to use places creatively and have been given permission and encouragement to do so. It is not hard to imagine that with such well used places, leading to better design, public and private sector employers will see a place in a new light and want to locate in attractive and perhaps unusual or previously ‘unfashionable’ places with plenty of land and even lots of empty houses. Not everyone needs to live in the ‘hot spots’ where demand exceeds supply. Jobs and other necessities of life locating in and beside places where there is an oversupply of housing (not because they are forced to but because they want to – fashion – remember?) naturally helps to balance the supply and demand for housing, creating greater affordability and reducing the inflationary pressures on currently popular housing areas because there are indeed choices that work elsewhere. Government in particular, as a large employer, can encourage far fewer people to sit in rows at computers in offices and can instead design new ways to use improved communications, including the vast scope for remote working, as part of place making. If a support (or ‘back’) office can be located in the Far East, it can
certainly be located in the ‘near north’, west, or east of the country, where housing is available and affordable. Digital start-ups have taught us to work differently.

Housing in rural communities requires careful consideration. Strategic decisions are required in relation to those places where population centres should be planned to grow, relative to sustaining or underpinning the case for a new facility, such as a school or health centre. This must also relate to the planning of and investment in rural public transport infrastructure, either public transport or one of the many schemes for sharing private transport by trusted friends and neighbours. So building trust is just as important as building roads or houses – ‘active caring for people and places’.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

MAG Evidence 7A:

At normal rates of development, over half the built environment and almost all big infrastructure will still be here in 50 years’ time. It is not therefore a question of developing built environments that are sustainable and resilient but rather of using our built environments better to make them sustainable and resilient. The government should creatively promote the multi-functionality of places at different times and seasons and simply not accept ‘single function’ anything. This applies equally to rural and urban areas and to large and small settlements.

MAG Evidence 7B:

MAG was asked to advise whether an upper floor of a former factory would offer a suitable location for a proposed ‘Cultural Hub’ in a community which had ‘no resources’. Yes, MAG’s architect found that the accommodation would meet the requirements. However, MAG advised looking at alternatives. Unbelievably, in spite of having ‘no resources’, there was a youth club just across the road which was unused before 3.30pm each weekday. Around the corner was a brand new school that was not used after 3.30pm on weekdays and on weekends. The local place had public resources but each was being managed independently, by a different public agency. Proper local management, along the lines of ‘One Public Estate’ could readily accommodate the proposed Cultural Hub with no extra buildings.

MAG Evidence 7C:

In complete contrast to 7B, another school was visited where the school secretary had identified an unused piece of land in the school grounds, contacted local people to find out their needs, applied for and obtained external funding, overseen the installation of a new floodlit artificial grass pitch with changing rooms, included a bowling place for older
accompanying adults and set up the management system to have an employee available for evening and weekend use by the local community. This used already available insurances and is a community pitch with a small cost per user and a little extra for floodlighting at night. Places must learn from each other’s stories.

MAG Evidence 7D:

MAG responded to a public consultation on the handover of ‘Off Street Car Parks’ (mostly in town centres) from central to local government during the recent reform of public administration.

MAG pointed out that these are not just ‘off street car parks’ but are in fact valuable ‘public open spaces’, often in critical central locations, that happen to have been used to park cars for perhaps 60 of the available 168 hours per week. So if a place is needed for midnight soccer or to have a market or to run an art show or an exhibition, why are ‘car park rules’ applied for all 168 hours? The natural environment is not mono-functional and MAG has developed a principle of challenging single functionality in the built environment, saying ‘No more single function anything please….’

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

MAG Evidence 8A:

Resources are devoted centrally in Northern Ireland every year to developing and enhancing the software to open hundreds of great buildings for two days for ‘European Heritage Open Days’. Yet the software is not made available to local passionate communities of interest who could multiply the attendance at these historic places by many times throughout the year, all with voluntary endeavour or at a very low cost of some essential expenses only.

MAG Evidence 8B:

‘City Tour £4’ was printed on the back of his red anorak. People followed him, listened to his words of wisdom, charm and wisecracks and paid him £4 each. When he died recently, he had over 30 colleagues with similar anoraks and he had made a business out of the city and its ancient walls, enhancing the experience of the place for citizens, visitors and tourists alike. Some of this stuff is really easy, really obvious, but missed by serious public authorities in the melee of policies, projects and….. politics.

Skills and design
Ministerial Advisory Group for Architecture and the Built Environment for Northern Ireland (BEN0039)

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

MAG Evidence 9A:

The professions need to understand collegiality as described in MAG Evidence 2A and 2B. The essential requirement to maintain the detailed professional skillsets has to be augmented by developing a shared client and designer ethos that encourages and rewards challenge in the public interest. Earlier deployment of design professionals into projects enables creative challenge before the investment in a project has made it financially irreversible. Indeed government recognises that the ‘million pound mistake is made on day one’. ‘Day one’ is often before the appointment of a designer. Procurement advice offered to clients needs to recognise the benefit of design input from the earliest recognition that a project may be forthcoming. Future terms of appointment should require and include sufficient funding for designers to challenge the brief as given. Currently, designers are often appointed too late to challenge and have little opportunity to look ‘beyond the red line’ of the site ascribed to the development. Bad briefs lead to poor design quality, frustrate designers and produce a downward spiral of aspiration, resulting in the all too typical disjointed and depressing environments which sterilise valuable land behind locked gates or barriers in the name of the single function of being a ‘Health Centre Car Park’ or a ‘School Grounds’. Such places create fear after dark, encourage bad behaviour and cause ill health. Their underuse is wasteful and they do not inspire joy or delight. Mixed use schemes may appear to be more complex to initiate and manage but evidence shows that those parts of the city which are mixed use areas, operational for perhaps 18 hours a day, 7 days a week, are safer, brighter, happier and more efficient than single use places that close up at 6.00pm and need ‘security’ – more costs and more waste because the real issues are not tackled and fences are seen as a ‘solution’.

Procurement processes are inherently restrictive, seeking to avoid change and yet at the brief-writing stage it is unlikely that a Client will have a full understanding of the potential of a project. Procurement should facilitate flexibility to prototype, test, learn and inform designs in an iterative way that is currently not required or encouraged and therefore unlikely to happen. This would save time and money, but requires assured, experienced clients who understand the skills and benefits that the various professions bring to the project and who are capable of managing, rather than avoiding change. Local and central government authorities need to be those ‘clients’, in the public interest.
10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

MAG Evidence 10A:

MAG responses to government consultations indicate continuously that decisions are taken on a project by project basis with timing to expend funding within a certain financial year being a most important determinant of a project’s perceived ‘success’. This has led to a senior government official in regeneration stating that the application of funding is not to achieve regeneration but instead to account appropriately for funding expended during a specific period. Indeed the term ‘accounting officer’ is often applied to the most senior person in a public sector organisation, confirming the perceived supreme importance of accounting for expenditure.

MAG Evidence 10B:

MAG discovered that one town is seeking the creation of a new public square while a similar town is saying that its new public square should be taken away because it is causing anti-social behaviour, including being a place for drug dealing. The reason is of course that the hardware of the new square was built (likely on time and on budget....) with a covered stage, stage lighting, storage, toilets, disabled access, natural stone walls and copper roofs, but without any associated development of software, no programming, no events, no advice for users about insurance etc. and prospective honest and well organised users were discouraged from using the square by being told that they needed £10 million of public liability insurance, without being told how to get it.

It is usual for a place to become a regeneration focus for a moment in time. A ‘Masterplan’ is developed, which supports investment in a priority project, subsequently delivered. There is a lack of stamina to continue the process, continually referring back to the Masterplan and the next steps. As the place changes, the Masterplan should be updated, to continue to be relevant. There is a tendency to not keep Masterplans up to date and they become forgotten and ultimately irrelevant, rather than continually evolving and providing the strategic vision for a place and its people. A Village Plan in Glenariff included a ‘Village Handbook’ for people to keep, so like the ‘Captain’s Log’ it is updated. There is a reluctance to programme revenue funding for public realm projects. This can lead to projects being delivered, with the best intentions and with intended uses in mind, but it is essential that there is continued investment in the form of personnel and funding, to continue to care for the place and promote opportunities for uses, including ones which had not been foreseen at the outset. Such investment can most effectively involve stewardship volunteers every week, like the Audubon Society’s work in USA.
Community involvement and community impact

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

MAG Evidence 11A:

MAG worked closely with Ulster University who analysed public consultation for a new public open space in Belfast. It was found that in just three hours of trying out the open space experimentally, over 30% of the reported responses were received. During this concentrated period of creative consultation, real people did ordinary things like having lunch, playing music, drawing and reading poetry. This compares very favourably with the remaining 12 weeks of ‘normal’ consultation when illustrative boards were placed in public places and written comments invited. The experimental real use of the space led to the identification of significant issues with the proposed design, including proposals for fixed seating in cold, windy places and a giant screen that blocked sunlight from the space. In effect, the conclusion of the experiment was that the open space should be redesigned for more active uses. This could have been discovered much earlier in the process; the design brief would have been realistic from the start, saving time, money and resources and producing a workable city place with a good chance of success.

MAG Evidence 11B:

MAG’s creative consultation techniques achieved more responses in a single day than the standard illustrative boards achieved in 12 weeks and tested the actual effects on the town centre of closing a street on a Saturday afternoon.

MAG Evidence 11C:

MAG agreed with Northern Ireland’s Strategic Investment Board that consultation processes were too static, too rigid, too unimaginative and too uninvolving to be of any real benefit to a project. SIB commissioned MAG to prepare a Creative Consultation Toolkit which is now available online. It comprises a pdf document that simply describes good consultation and its methodologies, a section with exemplary case studies that is easily updated to a template, a check list for consultation requirements at various stages of a project and a calculator that allows financial and time resource costs of good consultation to be assessed early so that its cost can be properly allocated in total project cost estimates. http://toolkit.creativityni.org/
12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

MAG Evidence 12A:

MAG proved that consultation processes can be creatively adapted even a month before the consultation begins. The creative consultation process in a town centre public realm scheme indicated that people can be directly involved with their place with very positive effects. Finding over 400 passionate communities of interest (as distinct from local communities) in a town of 30,000 people was an immense realisation of the pool of interest and talent there is everywhere. Discovering that over 100 of these passionate communities of interest were arts groups led to a 150 event arts festival stretching across 4 months and allowing people to interact with their town centre in the evenings when it had been previously underused.

MAG Evidence 12B:

The nicest part was that the council arts officer’s rather beautiful chalk graphic design, drawn on a plain blue background to announce the arts festival, was removed by another branch of the council, presuming it was graffiti.....

MAG Evidence 12C:

Blackboards improvised with sandpaper, primer and blackboard paint on existing display panels announced (and enabled citizens to announce) cultural and other events in a town centre. The blackboards won an all-Ireland award for arts marketing (total materials cost was under £40) and the blackboard chalk is washed off every time it rains (no cost for washing). http://www.voluntaryarts.org/2014/03/24/creative-citizens-programme-launch-ballymena/

MAG Evidence 12D:

‘Did you get permission?’ my wife (a former school teacher) asked when I told her I had been playing badminton outdoors with our grandson in the city centre pedestrian areas with a net strung up between bollards. Total cost was £10 for a kids’ badminton set and net. Did we need permission? Who knows? Who cares? We did no harm; we had fun and entertained others too.

Financial measures

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

MAG Evidence 13A:
‘Housing’ and ‘land supply’ issues are all connected to a much wider range of factors, vary dramatically across the country and are driven by people’s perceptions of the desirability of places to live and work and the choices that they can make. Mobility varies according to circumstances. Many people in this country see themselves as fixed to their place because of history, family, work and other social reasons. Migration happens within countries, continents and beyond, affecting and being affected by housing and land supply. People move to find the best possible combination of good work and decent living conditions in acceptable places. Government can encourage better places as noted in MAG Evidence 6A. Technology means that people can work from more remote places where housing supply and land supply are not issues. Finding new ways to work is therefore a most significant financial opportunity. Reducing journeys to work can be achieved by devising systems that use electronic communications rather than physical travel. Living affordably in a good place (or in a place which can be made good by better stewardship) creates a fairer and better country with fewer ‘crises’. Available and affordable connectivity is a significant investment opportunity for government and communities. No part of the country should have to struggle with low speed or no broadband. Satellite systems are unreliable, lack privacy and are expensive. Individuals in the north of England have produced a scheme known as ‘Broadband for the Rural North’ to help to remove the ‘digital divide’. “The purpose of the project is to take a new approach to the ownership, financial and deployment models used traditionally, and still proposed by, telecommunications companies.”

http://b4rn.org.uk/#sthash.6nocDif2.dpuf Installing fibre optic cables to ‘remote’ places in the north of England can help the ‘housing crisis’ in the south east – connecting the unexpected – by design.

02 October 2015
Responses as per numbers listed in document entitled ‘Call for Written Evidence’.

1. Not nationally much more inclusion at local level. Present district level ok but must demonstrate they have listed to local level.

2. Policy is poorly co-ordinated, particularly with regard to infrastructure and transport. Heritage seems ignored and overridden under present plans, much would and will be destroyed. The above points should be a condition of planning not an afterthought. No real co-ordination between local housing plans and its impact on highways generally. No consideration of impact on historic villages.

3. There is no or little protection for the natural environment or the built. Houses are prioritised over communities. There is no relevant scale to development compared to existing built environment, eg – development that swamps villages is allowed and yet 50 houses in every village would not.

4. Generally if the Neighbourhood Plan is adhered to it would solve a lot of the issues regarding planning, especially large developments close to existing villages, ie – the spatial perspective.

5. Yes, the needs and requirements must be planned by NOW. Building is soaring ahead of ANY plan.

6. More use of brown field sites and co-ordination in an area to gather information on brown field sites used in preference to green spaces. Councils are reluctant to spend time testing and co-ordinating brown field sites. They find it EASIER to develop green field sites.

7. Create new towns/villages with adequate resources and services. Build services before or during housing build so there is less strain on existing facilities in nearby areas. All new houses to have some solar panels.

8. Development should be sympathetic to historic environment. Historic buildings could be regenerated and keep their historic perspective. Old factories into flats.

9. Local Authority has no pressure to be holistic. Local Authorities do not have the skills. There are too many influences affecting their decisions and the commitment to manage is not there, as they are significantly pressurised by builders. They need new guidelines and a reason to stick to them.

10. Are we using ANY tools? Houses are built to a price, not high quality design. Why don’t ALL houses have SOLAR panels? Should be national standard of quality design.
11. No. Those involved pay lip service to the way in which the built environment affects those who live and work in it. Noise and light are not adequately controlled. Developers also pay lip service. Many houses are being built next to very noisy roads. They are ok inside, but no outside space to use because too noisy. Street furniture, traffic calming, flashing lights, noisy crossings, nobody cares that it affects existing properties and communities. Mistakes made by builders are not put right because Local Authority do not have the incentives or the funds to take on the builders.

12. Parish Council forward comments for or against local building issues but quite often they are overruled or ignored, only later to be proved correct. More openness and accountability. No pressure on Local Authorities to act on the wishes of the community.

13. More incentives for brown field. Not aware of any financial incentives that are available to address the current issues of housing and land supply.

06 October 2015
Submission from: Prof Nick Wareham (Centres Director), Dr Jean Adams, Dr Soren Brage, Prof Andy Jones, Dr Pablo Monsivais, Dr David Ogilvie, Dr Esther van Sluijs, Prof Martin White, Dr James Woodcock. Contact: Oliver Francis,

Executive Summary

- This submission principally addresses question 11 in the Call for Evidence – with regard to improving consideration of the impact of the built environment on those who live and work within it, particularly their physical and mental health.

- Changing health-related behaviours requires policy and interventions that act at the individual, social, community and environmental levels. The built environment, therefore, has an important role to play in promoting health and healthy behaviours.

- Interventions in the built environment can potentially target whole towns and communities. Such population-level prevention initiatives have the potential to be more cost-effective and equitable than those aimed only at high risk groups.

- Built environment interventions to improve health require multi-sectoral delivery, support from academia, and a clear mandate from national policy and government.

- The built environment can be an important ‘nudge’, driving behaviour change triggers that are outside conscious (or at least explicitly recognised) awareness.

- Creating supportive environments for physical activity is an important priority for local authorities in transport and town planning – and requires that national policy allows sufficient room for local innovation and evaluation.

- The neighbourhood food environment has a potentially powerful effect on diet choices. Whilst food availability is often related to use of existing buildings, new neighbourhoods also need to be planned with consideration of food availability and dietary health, particularly with regard to health inequalities.

1. About the submitting organisations

1.1 The MRC Epidemiology Unit is a department at the University of Cambridge. It studies the genetic, developmental and environmental factors that cause obesity, type 2 diabetes and related metabolic disorders. The outcomes from these studies are then used to develop strategies for the prevention of these diseases in the general population. [www.mrc-epid.cam.ac.uk](http://www.mrc-epid.cam.ac.uk)

1.2 The Centre for Diet and Activity Research (CEDAR) is studying the factors that influence diet and physical activity behaviours, developing and shaping interventions, and helping shape public health policy and practice. It is led by the MRC Epidemiology Unit, and is a partnership between the University of Cambridge, the University of East Anglia and MRC Units in Cambridge. It is one of five Centres of Excellence in Public
2. The impact of the built environment on health

2.1 The built environment can have direct effects on the health of individuals – from air pollution to housing conditions – and is also an important determinant of health-related behaviours such as physical activity and diet. Interventions in the built environment aimed at improving mental and physical health occur in the context of the ‘socio-ecological model’: behaviours are influenced by a combination of factors related to the individual, their social relationships, community, wider society and the environment. Influences are shown to be context and behaviour specific – e.g. influences on walking to work differ from those on cycling to work or walking for leisure. Interventions in the built environment should not, therefore, be considered by policymakers in isolation. Strategies that target only a single aspect of the socio-ecological spectrum are unlikely to be successful: multiple barriers often need to be removed to achieve substantive change, and interventions need to be sustained rather than short term ‘projects’. A better joining up of legislative areas that impact on the built environment is required, together with an approach of ‘health in all policies’.

2.2 Interventions in the built environment have the potential to affect whole populations. Efforts that can shift the population distribution of health behaviours are likely to be more cost-effective overall, and strategies that involve changes in infrastructure and systems have the potential to reach large sections of the general population rather than just those at highest risk. Furthermore, by reshaping the poorest neighbourhoods, improving the built environment can also help tackle underlying factors affecting health inequalities.

2.3 Whilst continued research on the health impact of the built environment is required, current gaps in research should not be taken as an excuse for inaction. The interventions to be prioritised for piloting are those that appear promising based on existing evidence and theories. These interventions must then be properly evaluated so that best future practice and policy can be more readily identified. Whilst randomised controlled trials are rarely possible when changing the built environment, multiple and parallel developments across local authorities present a ‘living laboratory’ in which interventions can be tested. Local authorities, with their responsibilities for public health and influence over many aspects of the physical environment, are ideally placed to develop, implement and evaluate policy and practice in this area, supported by scientific evaluation of selected interventions in partnership with academia. Any national policy needs to both empower local authorities to act in this manner, and facilitate and collect learning at a national level.

3. Evidence use in practice

3.1 The MRC Epidemiology Unit /CEDAR has brought academics together with professionals in public health, transport, urban planning and sustainability to explore the multi-sectoral policy response required to create health-promoting built environments. In local authorities in particular there is a tension between, on one hand, the new goal of delivering public health benefits across sectors, and on the other, pre-existing delineated roles and budgets, and the variety in scope and priorities across sectors. Multi-sectoral delivery requires individuals who can breach silo-working, can locate evidence from a variety of disciplines, and can find a common language to integrate such evidence clearly into business cases. Practitioners would welcome help from academia to translate evidence into actionable recommendations, and to evaluate interventions. From national built environment policy they would welcome clearer mandates for health as a priority in all remits, which would strengthen their efforts to integrate health benefits in business cases and promote multi-sector cooperation.

4. The built environment and physical activity – walking and cycling

4.1 One prominent area in which the built environment relates to health is that of physical activity through travel. The myriad benefits of physical activity to health are covered in more depth elsewhere, but the scale of the possible health benefit from physical activity is exemplified by a study of over 330,000 individuals in the European Prospective Investigation into Cancer and Nutrition (EPIC), which indicated that doing exercise equivalent to just a 20 minute brisk walk each day would take an individual from the inactive to moderately inactive group and reduce their risk of premature death by between 16-30%. The impact was greatest amongst normal weight individuals, but even those with higher BMI saw a benefit.350

4.2 Given that the average journey to and from work in the UK takes 28 minutes each way,351 a necessary level of gain in physical activity to improve health could easily be achieved by accommodating walking or cycling as at least part of the daily commute and other journeys. Emerging findings indicate on average 20% of the journey to work for those travelling by bus, park-and-walk or park-and-cycle, is spent in physical activity of at least moderate intensity.352 Evidence from the iConnect study of Sustrans-led walking and cycle routes in Cardiff, Kenilworth and Southampton showed that adults whose active travel increased over the course of a year reported about two hours more physical activity per week on average, whereas those whose active travel

352 Martin A et al, Journal of Epidemiology and Community Health, 2014; Impact of changes in mode of travel to work on changes in body mass index: evidence from the British Household Panel Survey http://dx.doi.org/10.1136/jech-2014-205211
decreased reported about two hours less. Importantly, there was no evidence of a compensatory decrease in recreational physical activity.

4.3 Active travel specifically has been shown to be associated with reductions in body mass index, and improved subjective wellbeing. Health impact modelling further demonstrates the potential of gains from increasing physical activity in travel. When considering active travel scenarios developed by the Visions 2030 project, even the most conservative scenarios produced reductions in a range of diseases, including reducing the burden of heart disease and stroke by over 7%, and dementia by 5%. Population level benefits are greatest if activity can be maintained at older ages when disease risks are highest.

4.4 Whilst the additional £214 million announced in 2014 for investment in cycling infrastructure is welcome, it stands in contrast to the £15 billion announced in the same year for road building. It is vital that these larger infrastructural changes support active travel as well as motor vehicles: for instance integrating bike lanes into new roads, improving walking routes when creating bypasses, and so on. Similarly, investment in the rail network must be accompanied by cycle provision. When changing or planning new neighbourhoods, it is important to consider distances and routes to work, school and local amenities, as well as the presence of green spaces.

5. The built environment as a driver of behaviour change

5.1 Improving the built environment for walking and cycling has clear potential to encourage physical activity if it reduces barriers to walking or cycling (such as actual and/or perceived danger from motor vehicles); or if it provides more direct, convenient or pleasant routes. Proximity to infrastructure is also important, and its effects may take some time to have an impact. Two years after the routes in Cardiff, Kenilworth and Southampton were developed, people living 1km (0.6 miles) from the routes had increased their time spent walking and cycling by an average of 45 minutes per week more than those living 4km (2.5 miles) away. In terms of potential negative health effects of nearby infrastructure, a study of the M74 motorway in

358 Traffic and Health in Glasgow Study
Glasgow is exploring whether living near a new motorway promotes car use, and reduces physical activity and mental wellbeing.\(^{360}\)

### 5.2 Car parking provision may also have an important influence on travel behaviour.

Research in Cambridge has shown that workplace parking charges are associated with a decreased likelihood of regular car commuting\(^ {361}\) and are particularly strongly associated with an increased likelihood of incorporating walking or cycling into a longer car commuting journey.\(^ {362}\) Depending on local factors, these findings suggest an intervention strategy could involve charging for on-site workplace parking while providing free off-site parking within walking or cycling distance.\(^ {363}\) As well as increasing physical activity for some people, approaches such as this could also help reduce urban traffic congestion and pollution, which could benefit everyone.

### 5.3 It has been recognised that much behaviour is automatic, triggered outside of conscious awareness and cued by multiple influences.\(^ {364}\) Recent research has confirmed that the influence of the built environment may be more powerful in driving behaviour change than any explicit conscious change in perceptions of the physical and social environment. In analysis of the data from the iConnect study researchers found that although residents’ perceptions of pleasantness, crime, lighting or safety improved over 2 years, these mostly didn’t explain their changes in walking, cycling and physical activity. In fact the large majority of the changes could be explained by a simple causal pathway driven by the use of the new routes. This suggests that the physical improvement of the environment itself was the key to the effectiveness of the intervention.\(^ {365}\) Interviews with local authorities, cycling groups and building contractors suggested that the visibility, scale and design of the schemes and the contrast they presented with existing infrastructure may also have influenced their use.\(^ {366}\) Ultimately, even though its effect is powerful, infrastructure alone is unlikely to overcome all barriers to physical activity: a supportive environment is likely to be ‘necessary but not sufficient’, and many interventions to improve the environment for walking or cycling have been too tentative to have any effect.\(^ {367}\)

5.4 Active travel in children can be supported by many of the infrastructural interventions that favour adults. Furthermore, provision of safe streets or natural and challenging outdoor environments for children to engage in activity is associated with more physical activity. Whilst community playgrounds could form part of this environment, activity does not necessarily have to be formally organised: research using GPS data has found that children who spent more time outside the home were more active.\textsuperscript{368} Children are more active in school if grounds are more supportive (playground markings, playground equipment, marked sports pitches and tracks, wildlife garden etc.)\textsuperscript{369}

6. The built environment and diet

6.1 As with physical activity, greater consideration is required of the impact of the built environment on diet. Food availability is often related to how existing buildings are used, for example through licencing decisions. However, new buildings and neighbourhoods are planned with consideration of food availability, so it is important that dietary health is taken into account by planners, particularly because of the potential effect on health inequalities

6.2 An example is the proliferation of takeaway food outlets. Over the past decade, consumption of food outside the home has increased by almost a third\textsuperscript{370}, and the rise in the number of takeaway food outlets has been greatest in areas of socioeconomic disadvantage. For instance, in Norfolk between 1990 and 2008, the number of takeaway food outlets rose by 45%, from 265 to 385 outlets, equating to an increase from 2.6 outlets to 3.8 outlets per 10,000 residents. The highest absolute increase in density of outlets was in areas of highest deprivation, which saw an increase from 4.6 outlets to 6.5 outlets per 10,000 residents (a 43% increase). This is in contrast to areas of least deprivation, which saw an increase from 1.6 to 2.1 per 10,000 residents over the time period (a 30% increase).\textsuperscript{371}

6.3 Data from the MRC Fenland study reveals how the density of takeaway food outlets relates to health. Individuals in the dataset were exposed to an average of 32 takeaway food outlets (and as many as 165), with exposure greatest near workplaces. Those with the highest exposure consumed an additional 40g of calorific food per week (equivalent to half a small portion of takeaway French fries), relative to the least exposed. Those with the highest takeaway exposure were also almost twice as likely

\textsuperscript{368} Cabinet Office, 2008; Food: an analysis of the issues. \url{http://webarchive.nationalarchives.gov.uk/+/http:/www.cabinetoffice.gov.uk/media/cabinetoffice/strategy/assets/food/food_analysis.pdf}

\textsuperscript{369} Maguire ER et al, Health & Place, 2015; Area deprivation and the food environment over time: a repeated cross-sectional study on takeaway outlet density and supermarket presence in Norfolk, UK, 1990 – 2008. \url{http://www.sciencedirect.com/science/article/pii/S1353829215000325}

\textsuperscript{370} CEDAR Evidence Brief, 2014; Are takeaways adding pounds? How takeaway food outlets where we live and work may affect our health \url{www.cedar.iph.cam.ac.uk/resources/evidence/eb7-takeaways-obesity}

\textsuperscript{371} Burgoine, T et al, Does the association between neighbourhood takeaway food outlet exposure, diet and body weight differ by level of educational attainment? In submission.
to be obese as those least exposed.\textsuperscript{372} Data also showed that highest takeaway food outlet exposure was only significantly associated with likelihood of obesity among those least educated. This suggests that neighbourhood takeaway food environment modification may be particularly effective for groups of low socioeconomic status, which may help to reduce health inequalities.\textsuperscript{373}

\subsection*{6.4} National Child Measurement Programme and ONS data also indicate that children living in areas surrounded by fast food outlets are more likely to be overweight or obese.\textsuperscript{374}

\subsection*{6.5} Spatial distribution of supermarkets and other food stores does not disadvantage poor consumers overall in urban areas. However, some consumers (older, with limited mobility, without access to a car) remain disadvantaged.\textsuperscript{375} The proliferation of supermarket convenience stores with more limited and expensive food ranges than out of town stores therefore requires examination for its impact on food choice.

\subsection*{6.6} This evidence all adds to the case for the role of both national and local action on shaping the food environment. The health-impact of takeaways is recognised by a number of policy bodies including the Greater London Authority\textsuperscript{376}, NICE\textsuperscript{377} and Public Health England\textsuperscript{378}. A number of Local Authorities, including Waltham Forest and Barking & Dagenham, are already regulating the proliferation of new takeaway food outlets. As with physical activity, a stronger national framework for consideration of dietary health within the built environment would be welcome.

1. The National Federation of Roofing Contractors (NFRC) is the UK’s leading trade association for the roofing industry. The Federation has over a thousand contractor and associate members and is an active member of the International Federation of Roofing Contractors. With a turnover of £1.6bn, NFRC members represent 70% of the UK roofing market by value. Companies vary from the very smallest local company to some of the largest in the country, carrying out new build, repair and maintenance on existing buildings, and heritage work. The NFRC is also a key member of Build UK (formerly the National Specialist Contractors’ Council and UK Contractors Group) and TrustMark.

2. The NFRC has been authorised by the UK Government to run the first Competent Person Scheme for roofing, CompetentRoofer, which allows roofing contractors to self-certify on Building Regulations for roofing refurbishment work. The scheme aims to help to marginalise the less professional roofing companies that exist in all markets.

---

Introduction

3. Conservation of the UK’s heritage in the built environment is critical and needs to be strongly encouraged. With so many of our country’s finest estates controlled by all four heritage bodies within the UK it is absolutely vital that they take a lead in ensuring that our heritage buildings are correctly maintained and repaired. The long term sustainability of these buildings can be assured by correct workmanship.

4. As well as a need for this building stock to be maintained appropriately, there is a need to ensure that sufficient levels of training are made available and supported, and that relevant apprenticeships are in place. Without ensuring that those coming into the building profession are trained in the correct specialist skills to work on heritage buildings, the availability of these skills will become scarce, and our heritage buildings will suffer.

5. The NFRC believes that at present the Government in Westminster and the devolved administrations (and their agencies) do not take a sufficiently strong enough lead on insisting that repairs and maintenance to its traditional buildings use correctly skilled workmen. In order to preserve our national treasures this must be reversed.

Training

6. Without encouraging incentives for contractors to train in the skills needed for this sector, the skills will eventually die out and our traditional buildings will be ruined by work completed incorrectly. For as long as the Government and Heritage Agencies do not make
the commitment to only use appropriately skilled craftsmen in all disciplines, there will remain a reluctance from contractors to commit time and resources to training a workforce in these core skills.

7. NFRC therefore calls on all Governments to set a deadline date, after which it will only use CSCS cardholders for building work. This will give all specialist trades time to ensure training is in place and that demand can be met. All publicly funded projects must contain a stipulation in the contract that only appropriately trained professionals will be used. This will assist the heritage agencies to fulfil its responsibility for protecting and enhancing the historic environment. Without this lead from such organisations, these skills will become redundant.

8. The lack of appropriate traditional skills in Scotland is reflected by Preliminary Repair and Maintenance Skills: The Research Report undertaken in 2003 (as referenced in Traditional Building Skills379), which identified only 30% of those working as “tradesmen” were suitably qualified, for example with 33% of stonemasons qualified, 33% in training and the remainder having no training.

CSCS Carded workforce

9. For the Government to make possession of the Heritage Skills CSCS Card a requirement for working on one of their properties, there must be a critical mass of cardholders. In working with the Lead Contractors Association and the National Heritage Training Group, English Heritage has demonstrated that this critical mass can be reached (approximately 75% of lead workers hold a CSCS card). The requirement for all specialist lead workers working on significant projects on the English Heritage estate to hold CSCS cards has begun.

10. With the guarantee from English Heritage to use CSCS carded workmen only for leadwork, the industry has also made the commitment to ensure there are sufficient numbers of correctly trained workmen. It is vital that this practice is expanded.

11. This is an excellent example of how industry and heritage bodies can work together to ensure that the heritage workforce is appropriately skilled. Heritage bodies should be encouraged to use the appropriate CSCS carded workmen to carry out all roofing and construction work, and government should set a positive example by doing the same.

Impact

12. The impact of a deteriorating Built Heritage is manifold – our magnificent heritage attracts huge numbers of tourists and should they not be repaired in a sympathetic fashion, this will detract from their appeal. Additionally, the overall energy efficiency of older buildings

379 Fair Energy Transition Towards Nearly Zero Energy Buildings
must be taken into consideration as we try to meet carbon reduction targets and improve the fabric of the building in a traditional manner in order to meet these demands.

Conclusion

13. Ensuring that there are sufficient numbers of correctly trained craftsmen to service the heritage properties in the UK is vital. Industry will take its lead from the Government and its agencies and, as it has been shown with the Lead Contractors Association in England, it will commit resources to ensuring there is training provision if there is a demand for those skills.

14. Additionally, the NFRC feels that the role that the Government and Heritage Agencies could have in giving advice to those seeking to undertake work on non-Historic buildings could be ground-breaking. They can strongly advise private property owners of a) the benefits of using correctly skilled craftsmen and b) the potential impact both financially and in terms of the overall upkeep of the property in not employing appropriately skilled workmen.

15. The Government must take the lead promoting the skills required to repair and maintain the UK’s Built Heritage for future generations which will also have a positive impact on tourism and energy efficiency.

05 October 2015
About NHBC

NHBC is the leading warranty and insurance provider for new homes in the UK, covering 80% of the new build housing market and providing consumer protection for over 1.6 million homebuyers.

Buildings and places: New and old

1. To sell homes with NHBC Buildmark cover, our registered builders must comply with the NHBC Standards, which set out the technical requirements for design, materials and workmanship in new home construction. NHBC Standards are consistently developed, reviewed and revised to ensure new homes adapt to changing needs and circumstances. This is particularly relevant to ensure new housing stock within the built environment is resilient and sustainable in the years ahead. The climatic extremes of early 2014, for example, severely challenged the house building industry and from roofs to basements, NHBC examined some common causes of defects. Our recently published 2016 edition of NHBC Standards has been enhanced to help our registered builders meet the continual climatic challenges in the built environment.

Skills and design

2. A number of specific recommendations to address skills issues are outlined in the NHBC Foundation’s A career of choice report published in March 2014. A good starting point in addressing the skills issue is the use of language around it. The report found that positive language related to the role and contribution of house building significantly raised the level of interest in careers in the sector.

Communications experts could play a role in developing specific narratives that will be influential with young people at different ages and of both genders. The report also suggests house building companies could actively explore the development of creative partnerships with schools and colleges.

06 October 2015
Introduction

The National Housing Federation is the voice of affordable housing, representing over 1,000 housing associations in England. We welcome the opportunity to provide written evidence to the Select Committee, following our appearance before the Committee to give oral evidence on 10 September 2015.

Housing associations currently house 2.3 million households in England and they play an important role in shaping, managing and regenerating the built environment in order to create liveable and sustainable neighbourhoods. The sector builds thousands of good quality homes a year across all tenures. At its heart is a commitment to meet housing need by delivering great homes that are genuinely affordable to people living on every level of income. Last year alone, housing associations delivered 40% of all new homes built and the sector wants to significantly ramp up this number over the course of this Parliament and beyond.

They are ready to work in partnership with government to build the homes needed to meet the growing demand for housing. Housing associations are among the most effective private-public partnerships in England’s history. For every £1 invested by government, associations put in over £6 of their own money. They have secured £76bn in private investment since the Conservative Government’s landmark Housing Act in 1988 which has allowed them to deliver desperately needed homes in every part of the country, across every tenure, and add £13.9 billion to Britain’s economy every year. Not only do they deliver great homes, housing associations also invest to make communities stronger and economies grow by helping people to live independently and by supporting tenants to find work.

We welcome the shift in planning policy through the publication of the National Planning Policy Framework such as the presumption in favour of sustainable development and the emphasis on good design and place-making. These principles lie at the heart of our members approach to designing new communities and revitalising existing ones and are so important to ensure we create resilient communities, and a built environment that we are proud of. We also welcome more recent announcements such as the zoning of brownfield land, and the introduction of land commissions to identify public land that would be suitable for development. These policies will help to remove barriers and encourage more house building. However, as we outline in our recommendations and detailed responses below, more needs to be done in order to improve housing associations’ ability to build new homes and create great places.
Key Recommendations

1. The duty to cooperate policy contained within the National Planning Policy Framework (NPPF) should be strengthened encouraging authorities to work collaboratively and plan across boundaries. Strategic planning powers that are devolved across England will help to achieve this, but in areas without devolution deals, strengthened guidance is needed to encourage and incentivise the exercising of the duty.

2. Local plans are a key tool for local authorities to use to shape development and plan to accommodate growth in their area. The Government’s welcome push will hopefully see more authorities adopt a plan, but duty to cooperate guidance needs to be strengthened to incentivise local authorities to work together and plan strategically to meet assessed housing need.

3. Local authorities should be encouraged and incentivised to regularly review and update their local plans and five year supply. Doing so will ensure the planning system remains planned, and means that local authorities are more likely to plan for, and meet, their housing targets.

4. The initiative to zone brownfield land that is suitable for housing should be extended to any sites suitable for housing. This will create certainty for developers and local authorities, and will see competition for land based on design and quality rather than price.

5. The process of demonstrating viability should be more transparent and more flexible approaches to encourage policy compliant schemes should be explored. This could include re-phasing development and the use of clawback mechanisms so that planning contributions, including affordable housing, are not automatically waived.

6. The importance of rural exception sites should not be underestimated as an increasingly important tool for providing affordable homes for communities in rural areas ensuring that homes in rural areas are available for future generations.

7. The existing Affordable Homes Guarantee Programme should continue indefinitely. To make more effective use of the Government’s strong balance sheet, and the confidence funders have in the sector, government backed guarantees should be extended to cover refinancing of existing debt. Using guarantees to help restructure balance sheets would allow housing associations to lower the cost of historic debt and take on more private finance to fund affordable housing.

8. Local authorities need enhanced powers to incentivise developers and landowners to bring sites forward. This could include the ability to charge a levy on sites unreasonably held back, alongside streamlined compulsory purchase orders.
1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

1.1 The National Planning Policy Framework (NPPF) sets a useful framework for decision making across England and clearly places the onus on Local Authorities to prepare a local plan to guide development within their area to avoid inappropriate development. This is the correct approach and gives local people the power to shape the development of their area. Several areas of the framework do need to be strengthened, however, such as the duty to co-operate along with incentivising local authorities to get a plan in place.

1.2 Giving local authorities the power to zone land suitable for housing will help to create certainty for both the local authority and the developer, and will see developers competing for sites on the basis of design quality rather than the price of land, helping local authorities to control the development that comes forward within their areas.

In addition, the emerging devolution is a welcome step in promoting further decision-making at the local level. We discuss these issues in more detail in later questions.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

2.1 The approach to policy, particularly related to housing and infrastructure, is variable across Government departments. There is often disconnect which is evidenced by local opposition to housing development typically due to concerns over supporting infrastructure. This is also evidenced in the Government’s failure to see housing as nationally significant infrastructure.

2.2 Classifying housing as infrastructure would mean that it is considered holistically and alongside other essential infrastructure that would be required to support new communities. The recent announcement that infrastructure schemes with an element of housing will be determined through the Nationally Significant Infrastructure Regime (NSIP) is welcome, but we hope this will be extended to all major housing schemes.

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

3.1 The Federation welcomed the introduction of the NPPF and National Planning Policy Guidance as having the potential to deliver a step-change towards a simpler and more positive planning system that supports housing and growth. The presumption in favour of sustainable development sets a clear ambition for the delivery of new housing and growth,
and the NPPF clearly places power in the hands of the local authority in terms of plan and decision making which we believe was a positive step forward.

3.2 A Local Plan is the key tool for Local Authorities to use to promote and shape growth, and is fundamental in making sure that the planning system remains plan-led (a core principle of the NPPF). Government figures show that, since the 2004 Planning and Compulsory Purchase Act came into force, 82% of authorities have adopted a local plan. However, research from Savills has shown that 76% of local planning authorities outside London and national parks do not have a post-NPPF plan in place. This is an important distinction given the policy test introduced in the NPPF for local authorities to plan to meet objectively assessed need in full.

3.3 We welcome the encouragement for Local Authorities to adopt a local plan, and the timeframe of early 2017 to allow this to happen before the government intervenes and prepares a local plan on behalf of an authority that has missed this deadline. However, this should go one step further and require authorities who do not have a post-NPPF plan in place to also update them, and where they do not, the Government should also intervene. Having suite of a post-NPPF plans adopted across the country is vital to ensuring that housing targets are based on objectively assessed needs using up to date population projections and household formation statistics.

3.4 When the Government does intervene, it should work with the authority, local communities and key stakeholders in order to prepare a plan that has mutual agreement and accords with their aspirations. Targeted and more flexible intervention would be the most productive way to intervene as some authorities may only be held up on certain policy areas of a plan – most commonly on planning to meet objectively assessed need in full and also the duty to co-operate. In these instances, intervention could help solve these individual sticking points whilst ensuring local ownership of the plan overall. Government should also encourage the introduction of ‘local public bodies’ comprising of councillors, landowners and other stakeholders as a way to of speeding up the release of allocated sites and the delivery of housing on publicly owned land.

3.5 We are particularly supportive of the NPPF’s explicit requirement for local authorities to plan fully to meet the objectively assessed affordable housing need in their area, and we believe this is one of the most important factors of the NPPF. Planning based on objectively assessed need ensures that local authorities plan to meet the full needs of their area – including for market and affordable housing. Occasionally, some local authorities will be unable to accommodate all growth within their boundaries, due to certain constraints such as the green belt. Where this is the case, the duty to cooperate is another important factor that requires authorities to collaborate and work together proactively to accommodate growth across boundaries.

380 National Audit Office - 'Impact of funding reductions on local authorities'
3.6 In theory, the outcome of this would mean that where an authority identifies that it will not be able to accommodate all growth within an area, it would be distributed across the relevant surrounding authorities. In reality, this has not been the case, and has been a reason why some Local Plans have not been found sound, thus delaying plans and leaving authorities at risk of non-policy compliant schemes coming forward within their area, on which they have little power to refuse or negotiate.

3.7 We therefore welcome the Government’s recent announcement in the Productivity Plan on strengthened guidance to operationalise the duty to cooperate. We believe that this guidance will encourage local authorities to plan across wider areas beyond their boundaries, and collaborate with other authorities to prepare joint local plans. This will help join up planning for new housing, and focus on strategic growth areas. Duty to Cooperate guidance should incentivise local authorities to:

- Collaborate and identify a sensible boundary based on housing and economic market areas;
- Prepare a joint local plan, paying particular attention to housing, which attempts to meet the housing needs of the entire area in full and is based on up to date evidence and objectively assessed need;
- Work together to identify public land for release, and work with developers and landowners to make it available for appropriate development;
- Regularly review housing delivery against targets, and update plans as necessary.

3.8 A key part of the NPPF is the requirement for local authorities to demonstrate a five year supply of land for housing. This joins up the land required to meet the target identified within the local plan, and ensures that housing is directed to the most suitable locations. All too often, the five year land supply that is submitted with a local plan for examination in public remains the current document for numerous years following adoption of the plan, and is not updated regularly enough. Where this is the case, it leaves local authorities vulnerable to unwanted development which is difficult for them to refuse and where they do, often leads to appeal decisions in favour of the applicant.

3.9 Authorities should have a duty to update key documents such as the five year land supply to ensure that it remains a reliable document for all stakeholders. This would bring increased transparency and certainty and would speed up decision making when policy compliant schemes come forward on sites identified within the five year supply.

3.10 Viability has always been a planning consideration and local plans are viability tested before they are adopted to ensure that policies and targets are deliverable. The NPPF introduced a policy relating to viability which saw a step change in the way that planning schemes are considered. This has resulted in an overemphasis of viability from the point of view of the developer at the expense of policy compliance and tipped the balance in favour of the developer at the expense of affordable housing.
3.11 Viability is a valid consideration, but there should not be a general assumption that planning requirements and contributions, including affordable housing, can be lost if it cannot be immediately afforded. Instead, schemes should re-designed or re-phased in order to capture uplift in values that hadn’t previously been taken account in initial cost studies and viability assessments. Increased use of clawback mechanisms in Section 106 agreements would achieve this and should be mandatory where planning contributions cannot initially be made in full at permission stage.

3.12 Finally, rural exception sites are increasingly important tools for providing affordable homes for communities in rural areas ensuring that homes are available for future generations. The importance of rural exception sites should not be underestimated, and government should remain supportive of such sites where they help to sustain rural communities.

4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

4.1 Since the revocation of Regional Spatial Strategies (RSS), England has lacked any form of strategic spatial planning. Although we welcome the emphasis on localism, and putting decisions into the hands of local people, the lack of a spatial element in the planning system has resulted in a highly fragmented system, which is not co-ordinated, and leads to very different outcomes across the country.

4.2 Introducing a spatial element to the planning system would enable a strategic, joined-up approach to the provision of housing and infrastructure at a regional level, and across economic and market areas joining housing growth with job growth. It would also assist in identifying regional differences in terms of growth and delivery of housing and could assist in strengthening the duty to cooperate, particularly for those authorities who are combining and plan-making at the supra-local area.

4.3 Increasingly, as housing and planning powers are devolved, we are seeing combined authorities replace the regional tier of planning. These authorities would still be bound to fulfil the requirements of the NPPF by proactively planning to meet objectively assessed need and planning at such a scale would make this requirement much easier to fulfil.

4.4 Combined authorities would also have the benefit of pooling resources, and joint evidence base documents, making plan preparation more time and cost efficient. Less evidence base documents would also have the added benefit of being more easily updated, allowing the regular updating of plans. This is vital to ensuring the planning system remains plan-led, is meeting local need, and avoids planning by appeal.

4.5 The recently established land commissions in London and Manchester to map all publicly owned land are a welcome start to adding a spatial dimension to the planning system. We would welcome this approach being adopted across the country, particularly if a single database was used to record and display all public land. Layers could then be added showing committed and planned infrastructure, high growth areas, and housing need against
housing delivery. This would complement the National Planning Policy Framework by adding a truly spatial element to it.

5. **Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?**

5.1. Looking ahead when plan-making is crucial for taking into account issues such as population growth and household formation, and the period of 15 years that a Local Plan usually covers is a sensible approach. What is equally, if not more, important is the frequency of which the plan is reviewed and updated.

5.2. Regular updating of plans and their associated evidence base documents is critical in ensuring that authorities are planning for the growth within their area. Regularly reviewing Strategic Housing Land Availability Assessments (SHLAAs) and five year supply, site allocations and zoned land is also vital to ensure that housing need is matched with land availability. This would be the most effective way for Local Authorities to deliver the requirement to plan and meet objectively assessed needs.

5.3. Although no longer a formal requirement, many authorities prepare Annual Monitoring Reports (AMRs) in order to report on housing delivery and assess how effective adopted policies have been. This would be an ideal opportunity to revise and update the evidence base documents such as the SHLAA and five year supply in line with which sites have come forward and those which are currently going through the planning process. It would also be an appropriate opportunity to identify new sites that would achieve the housing target for that year.

6. **What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central government level required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?**

**Government role**

6.1. In a planning context, Government should provide a framework for local authorities and developers, allowing them to plan how best to meet their local needs. The NPPF does this, and the encouragement to get Local Plans in place is welcome. Intervention such as planning reform is not an effective way of increasing supply, especially when compared to the approach within the NPPF to provide local authorities with both freedom and responsibility given by the NPPF. Rather, it creates a long period of uncertainty as developers and land owners re-evaluate schemes, and local authorities process updated legislation and interpret the implications for development.

6.2. Recently, the planning system has been deregulated making it easier for developers to build new homes which are not scrutinised by local authorities, and which are exempt from providing any contributions. Whilst in theory this should lead to an increased supply of
housing, there has been no material increase in supply, but uncertainty has increased, leading to poor quality development and pushing up the price of land.

6.3. We welcome the High Court’s recent decision following the legal challenge by Reading Borough Council and West Berkshire District Council, and the subsequent annulment of the small sites exemption and vacant building credit policies. Research commissioned by the Federation shows that the national threshold would affect around 52% of authorities nationally and therefore these policies should not be replaced. The Government should also cancel the office to residential permitted development right. This right has the potential to create substandard housing as local authorities will not have control over important details such as space standards, dwelling mix and tenure.

6.4. Instead, established policy should be retained and local authorities allowed the flexibility to plan for their area. This should include setting an appropriate threshold for affordable housing. This is the only way that sustainable development can be achieved.

Recent announcements

6.5. We welcome the introduction of a brownfield register to record publicly owned land in London. Devolved regions such as Greater Manchester are also using registers as an opportunity to bring forward publicly owned sites for development and we hope that other regions will follow suit. In order for registers to be as helpful as they possibly can be, we believe the following information should be included:

- Size of the site
- Current use, and proposed use (if allocated within the Local Plan)
- Details of which public bodies own the land
- Indicative dwelling capacity and mix

6.6. Following on from the register, we welcome the introduction of zoning giving automatic planning permission on all suitable brownfield sites that was announced in the Productivity Plan. However, there is only enough brownfield land suitable for housing to meet need in full for four and a half years so whilst it will have a positive effect on supply in the short term, other policy options are needed to ensure supply increases in the long term.

6.7. In areas where zoning is successful, and further land is required for housing, we believe that any sites suitable for housing could be identified and zoned and we believe that there are plans to take this approach forward. Zoning could be embedded within local plans and prepared concurrently, and include clear requirements for each site, including permitted uses, the affordable housing required and density. These could be set on a geographical basis in a similar way to the Community Infrastructure Levy.

6.8. This will have the effect of creating more certainty over what will be delivered on an approved site, send clearer signals to the land market over pricing, ensure planning requirements are properly factored into the price paid for land, remove the scope for
negotiating down affordable housing on the grounds of viability and speed up planning decisions.

6.9. Enabling major infrastructure projects that include elements of housing developments to be fast-tracked through the Nationally Significant Infrastructure Project (NSIP) regime is welcome news and reflects the Federation’s long standing calls. We believe that this should be the first step towards full integration of major housing schemes within the NSIP process.

Further suggestions

6.10. Tightening the planning performance regime would help to speed up decision making. This could include introducing a dispute resolution mechanism for section 106 agreements, and limiting the use of pre-commencement conditions in order to facilitate a quicker start on site. Speeding up and simplifying the planning process is important in reducing uncertainty for developers and getting more homes built, particularly in light of the proposed extension of the Right to Buy to housing association tenants and the requirement for one to one replacement within two years.

6.11. It is important that speed is balanced with high quality decision making on applications and section 106 agreements. Draft Section 106 agreements should be submitted as part of the pre-application process, front loading the negotiations. If it is evident from this that the parties do not agree on the level of contributions required or proposed, then a dispute resolution service could be used in order to speed up negotiations. The process would be binding to both parties to ensure that the service is useful, effective and ensures that applicants do not renegotiate and reduce obligations following planning permission.

6.12. It is not just about the sheer number of homes that are built, but about the right type of homes in the right locations. The 2013 Growth and Infrastructure Act allows developers to renegotiate the affordable housing contribution following the grant of planning permission if it is believed that the proportion, or contribution, that was originally offered makes the scheme unviable. The provision also contains a sunset clause allowing developers to renegotiate the proportion of affordable housing that would be delivered or funded as part of a development. We believe that the power within this clause should be exercised in April 2016, requiring developers to provide a wide range of tenures, in line with planning policy.

6.13. Together, these would help housing associations increase the supply of affordable homes.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of housing stock and built environment assets be made?

7.1. High standards of environmental performance for new buildings are vital for the long term sustainability and resilience of our built environment. As the proposed 2016 energy efficiency standards have been rescinded, a national strategy is required to bridge the gap
between the current standards and the European target for all new buildings to be ‘Nearly Zero-Energy Buildings’ from 2020. Housing associations, as organisations committed to improving energy standards and lowering fuel costs for residents, would welcome the opportunity to participate in any review of building standards.

7.2. 70% of 2050 housing stock nationwide\textsuperscript{381} is already built and ongoing investment is imperative to ensure it is both affordable to live in and fit for purpose in a changing climate. Fuel poverty is endemic in the UK and energy efficiency policy must focus on improving building fabric efficiency of existing buildings to bring down energy bills and provide affordable warmth to the most vulnerable. A wide range of households should be able to access energy efficiency measures, based on effective targeting and a range of relevant, good quality, and affordable products. Well-designed national policy will also drive the retrofit industry in the UK towards market viability and away from subsidies. The UK’s reduced rate of VAT for energy saving materials, which helps to reduce the cost of energy efficiency improvement works, should be preserved.

7.3. Energy efficiency policy could better deliver government’s aims on fuel poverty reduction, energy security and enhanced consumer protection via more effective engagement with housing associations. 11% of England’s housing stock is managed by housing associations and ownership is highly concentrated, presenting a simplified route for delivery of large scale projects. Providing more freedoms and flexibilities to housing associations, including flexibility in how they set rents, manage and value assets, would allow them to fund improvements in existing homes without raising overall costs for residents or requiring financial support from government. For example, flexibility over rent setting would allow housing associations to charge higher rents for more energy efficient properties, where energy bills will be lower.

7.4. Planning policy should accommodate and encourage innovative approaches to improving energy efficiency. The Dutch Energiesprong programme, which is now being replicated for the UK market, provides a good example of how this can be achieved. This market transformation approach delivers fully integrated refurbishment packages supported by long term performance guarantees, aiming to make the solution commercially financeable and scalable. For this model to be effective in the UK it is essential that planning systems are simplified for energy efficiency/retrofit measures.

7.5. Sustainable communities are about more than buildings. Deprived areas that may have lost their traditional economic focus need concentrated and sustained government investment for them to re-launch and reach a successful and sustainable position. Housing associations’ physical investment in quality homes and open spaces together with their neighbourhood investment in employment and skills initiatives, education and health and wellbeing all make big differences to areas needing regeneration. They help people into work, they revitalise local economies and invest in local communities and local economies over the long term.

\textsuperscript{381} DCLG - Planning Applications January to March 2015, p.3
7.6. However, housing associations cannot do it all or alone. Towns and neighbourhoods also need investment in local infrastructure and employment opportunities to generate economic growth. Focussing investment on a strategic and streamlined approach to capital funding would enable local strategic partners such as housing associations to invest more in revitalising local communities, promoting economic growth and ensuring that local communities and ensuring that the built environment is sustainable and resilient in the years to come.

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

Skills

9.1. Local authority planners are required to consider an extremely wide range of criteria when determining planning applications, from design to drainage and sustainability to landscaping. However, one area in which they are not trained, and where authorities often lack the resources and skills is to negotiate on viability. The required expertise is often contracted to a consultant and the process of negotiating takes much longer than it would be if the expertise was available in house.

9.2. Currently a significant number of applications are decided at committee level. Political pressure on members of these committees often leads to them voting against the planning officer’s recommendation, even where a scheme fits with the local plan. Inevitably this leads to costly and time consuming appeals.

9.3. The Local Plan process should always begin by engaging with and getting buy-in from the local community. Once this consultation is complete, the finished plan should represent the agreed vision for development in the area. Therefore, schemes that fully comply with the development plan should be approved by officers under delegated authority, rather than having to be seen by the council’s planning committee. We believe this would largely take politics out of the decision-making process and, ultimately, speed up decision making; free up the planning committee to focus on more complex non-compliant schemes; and provide a powerful incentive to developers to submit policy-compliant schemes. Where schemes are decided by the committee, members should receive training to ensure decisions are focused purely on planning matters relevant to the proposal.

9.4. There is a wider role for strong local leadership to set a strong and clear vision for the area and to provide an advocacy role between landowners, developers and the local authority to ensure that the best development outcomes are achieved.

Resources
9.5. Planning departments have seen a 46%\textsuperscript{382} cut in funding between 2010/11 – 2014/15. This has led to large cuts to the number of planning officers, whilst the number of applications received has remained consistent\textsuperscript{383}. At the same time, the Government has introduced a monitoring scheme which measures local authority performance on the basis of how many applications are determined within a prescribed timeframe.

9.6. This target-driven culture can put pressure on officers to make a decision, rather than guide an application to ensure the right outcome. This can often lead to policy compliant schemes being refused or withdrawn to ensure that authority targets are not compromised. Although the Federation welcomes the drive for decisions to be made in a timely manner, this should not come at the expense of reaching the right decision, even if that means extending a deadline.

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

10.1. High quality design in the built environment is extremely important. The NPPF provided a step change in policy on design stating that ‘good design is a key aspect of sustainable development, is indivisible from good planning, and should contribute positively to making places better for people’.

10.2. Design is not just about how buildings look, but about how places function to make the lives of communities better. Often, a Local Plan is a key tool to shape the way places change based on the policies contained within the NPPF and can influence the amount of open space required for new developments, the internal space of new housing and, to some extent, how new buildings are designed.

10.3. With increasingly fragmented land ownerships, a more proactive approach to good design and place-making could see a heightened role for masterplanning. This would provide a local authority with the opportunity of predating certain elements of the built environment such as layout, building height and density providing a starting point for developers when undergoing the feasibility stage of a development.

\textsuperscript{382} BRE - Cost of Poor Housing
\textsuperscript{383} MOU to support joint action on improving health through the home
10.4. Local partners such as housing associations also play a key role in place-making through maintaining and regenerating their stock and surroundings, as the case study below shows.

**Case Study: Housing associations’ role as ‘place-makers’**

The Regenda Group have a 10 year vision to regenerate Limehurst Village in Oldham by pulling private and public partners together to transform the neighbourhood through employment and training opportunities, health initiatives, and community development, as well as building new homes and improving existing homes. Residents are at the centre of this process, and have played a key role in shaping the 10 year vision for the area, which guides the whole project.

Regenda have partnered with Oldham Council, social enterprises and local businesses to bring economic opportunities to the area, and so far have supported 66 people into full time employment, 67 people into part time work, and helped 10 people to develop successful small businesses. Their long term commitment to Limehurst has secured over £5 million of new investment, with a further £12 million proposed over the next 5 years. There are now investments in the arts, sports and physical activity, wellbeing, public spaces and the environment.

Regenda have worked with residents and other local partners to create a sustainable community where people want to live because they feel safe and secure, and have access to good economic opportunities.

10.5. National leadership should encourage the relationship between local authorities and local partners to be nurtured, focusing on the benefits that they can bring and how they can assist in delivering the strategic vision at a local level, particularly where local partners such as housing associations have invested in communities for the long term.

11. Do those involved in delivering and managing our built environment, including decision makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it?

11.1 The Care Act 2014 sets out that the 'suitability of living accommodation' is a core component of the wellbeing principle on which social care is based. The critical role of housing in people’s health and wellbeing is recognised throughout the Act. Poorly designed housing, or damp, overcrowded homes can significantly impact on the mental and physical health of individuals and communities. The Building Research Establishment\(^{384}\) has calculated that poor housing costs the NHS £1.4bn per year.

---

\(^{384}\) Financial benefits of investing in specialist housing for vulnerable and older people, Frontier Economics (2010)
11.2 Whilst at a national policy level this has been recognised through the Memorandum of Understanding between health, housing and care leaders, there is still some way to go to ensure that decision makers and developers take sufficient account of the impact of the homes and communities that are built. Measures that could improve the delivery of homes and communities that help people live healthy lives include:

- Involving those responsible for Joint Strategic Needs Assessments and Health and Wellbeing strategies in the process for developing key local planning documents and guidance to ensure housing reflects accurately local assets, needs and demographic trends.
- Ensuring design standards incentivise good quality, accessible housing being built to meet a range of different aspirations across local markets, in both specialist and general needs stock.

11.3 In addition, the crucial role that housing associations can play in supporting tenants and communities to improve their health and wellbeing should be recognised and supported.

11.4 Housing associations play a major role in supporting their customers to be healthy. In addition to the delivery of affordable, warm homes and good quality green space which prevent poor health, our members provide specialist housing and services for older and vulnerable people.

11.5 The specialist housing, care and support delivered by housing associations allows people to live independently, reach their potential, and prevents further ill health. We know that supported housing delivers net savings to the public purse of around £640m for all client groups, or £6,764 per person per year for people with learning disabilities.

11.6 Our members’ work improves health and wellbeing outcomes for a number of vulnerable groups, including people with learning disabilities, people with mental health problems, and older people. Working with partners in the health service, housing associations help the NHS to meet its public health objectives at a time of reduced public funding.

Case study: Innovative solutions to hospital discharge

385 Based on average costs of mental and physical health treatment in Hard Edges: mapping severe and multiple disadvantage, Lankelly Chase Foundation (2015), for an estimated 58,000 people (ibid)

386 When the World Commission on Environment and Development (Brundtland Commission) published its report in 1987, it presented a new concept - sustainable development. The concept became one of the most successful approaches to be introduced in many years. In fact, it helped to shape the international agenda and the international community's attitude towards economic, social and environmental development.

The Brundtland Commission’s report defined sustainable development as “development which meets the needs of current generations without compromising the ability of future generations to meet their own needs”.

Housing and care provider Midland Heart has worked with both acute and community trusts to develop re-ablement units. Each of the units is a refurbished ward, created to reflect a more homely and less clinical environment. Through a joint trusted assessment team, older individuals deemed medically fit for discharge and who do not require an acute bed, are placed into the Midland Heart service.

The re-ablement team then create a personalised support plan, to meet the social care needs of the customer whilst continuing their discharge journey home. Midland Heart’s team of reablement workers delivers a programme of activities which focuses on wellbeing, confidence building and independence, as well as ensuring that an ongoing care package is arranged or necessary adaptations are fitted to make the transition home as smooth as possible.

11.7 Housing associations’ health, care and support services are invaluable to communities across the country and to the future of the NHS. Among many interventions, housing associations are able to integrate housing and care for older people; prevent costly hospital admissions; help people with learning disabilities to live outside of institutional settings; and prevent homelessness. The operating environment is increasingly challenging. We would like to see a new approach to investment in care, support and integration:

- **A new framework for preventative support services** - the Federation proposes a new outcomes-based funding framework for support services. This would pool existing funds from across government departments, including the Department of Health, Department for Work and Pensions, and Ministry of Justice, to be targeted at preventative services that help people avoid the crises that lead to high cost interventions. The pooled budget would be match-funded locally, and a proportion of payments would be tied to particular outcomes being achieved. This approach aligns to the model Big Society Capital has advocated in its own submission to the Comprehensive Spending Review to improve outcomes for people facing particular barriers, such as homelessness, mental health issues, NEETs and others.

- The health service spend for people with complex needs is estimated to be £6,188 per person per year - that's £358,904,000 in total for all of these clients. The Federation’s proposed framework aims to reduce the need for this spending by funding services which promote people’s independence, help them to secure work, and prevent the need for them to visit A&E.

- **A Transformation Fund** - Integrated approaches to services and funding are key to ensuring that health, care and the home are coordinated around the needs of people. The Better Care Fund (BCF) was established in June 2013 to facilitate this shift. However, we believe to truly achieve the levels of service reform needed an additional Transformation Fund, as advocated by the King’s Fund, is necessary to support large-

---

scale service changes and manage the transition between old and new models of care. Crucially, a Transformation Fund could support efforts at a devolved level to fully integrate health, housing, care and support around the experience of individuals.

- **Continued Department of Health investment in supported housing** – Department of Health investment in specialist and supported housing should be continued for the long-term as a key cost-saving intervention. With an investment programme that spans several years, housing associations would be better able to strategically plan to meet the housing needs of older people, people with mental health problems, and people with learning disabilities.

### 12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

**Plan-making**

12.1. Generally, consultation processes are reactive rather than proactive. Proactive consultation such as workshops and exhibitions can facilitate discussions between those members of a community who otherwise may not engage with plan making.

12.2. Evidence shows that innovative methods in community planning can greatly benefit the speed of the planning process, execution of development and integration into the existing community. However, vociferous and well informed sections of the community must not be allowed to be represented at the expense of those who are in housing need, especially if they are not already part of the community.

12.3. When preparing Local Plans, more could be done to encourage key stakeholders such as Housing Associations to take an active role in the shaping of policies. As the case study below demonstrates, when partners collaborate in plan making, this can lead to positive outcomes that meet an identified need within a community.

<table>
<thead>
<tr>
<th>Case Study: Involving communities in development projects</th>
</tr>
</thead>
<tbody>
<tr>
<td>Midlands Rural Housing worked in partnership with Stratford-on-Avon District Council to use their “Local Choice” initiative to involve the local community in their development plans, and as a result 13 new affordable homes were built in a nearby rural area as part of a Section 106 agreement. The “Local Choice” initiative is an innovative approach which allows members of the community to promote development plans that meet their identified local housing needs. The community chose the land for development, contributed to the design of the properties to ensure they were in keeping with the surrounding properties and the atmosphere of the village, and the tenure mix and timetable for development were agreed with the Parish Council taking into account their concerns and the needs of the local area.</td>
</tr>
</tbody>
</table>
Neighbourhood planning

12.4. Neighbourhood Planning offers communities to take ownership of development and regeneration in their area by writing and adopting a Neighbourhood Plan, though it must be in general conformity with the Local Plan to be found sound. Where a local authority has a CIL Charging Schedule in place, 25% of the levy revenues arising from development within the neighbourhood area will be given to the community to spend on infrastructure, giving an added incentive to prepare one.

12.5. Neighbourhood Planning is resource intensive and not all communities will have the finances or resources needed to prepare one. Grant funding is available to communities, but this does not necessarily make it easier for them to produce a Neighbourhood Plan. More direct support should therefore be available to communities who wish to make a plan that is affordable, if not free. Local stakeholders such as housing associations would be well placed to assist communities in navigating the process of producing a plan, and this should be encouraged.

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

13.1 There are a wide range of fiscal and financial measures that would help increase housing and land supply. Equally, there are associated and complementary mechanisms which would encourage better design and place-making. Within these, there are a number of interventions that would make a real difference to housing associations’ capacity and help them realise their ambitions. These should be addressed together and not viewed in isolation. Only by doing this will they deliver the biggest impact and enable housing associations to maximise their contribution.

13.2 In the first instance, there is a clear and compelling case for continued upfront capital investment to drive an increase in house building. It is the most effective way of guaranteeing new housing supply. And the most efficient form of public subsidy in the medium to long-term and is better value for money. It allows housing associations to plan and build affordable homes at a predictable and continuous rate over the medium to long-term. Counter-cyclical support will ensure housing associations can continue to build even when the market fails, support supply chains and smooth out delivery over the long-term.

13.3 To ensure public investment maximises value for money for the taxpayer and has the greatest impact, the current complexity and fragmentation must be tackled. The multiple funding streams should be consolidated into a single challenge fund. This should be used more flexibly and strategically to deliver tailored, place-specific interventions. It should
ensure the funding fits the project, rather than vice versa, and encourage genuine partnership working between national government, local authorities and housing providers.

13.4 The existing Affordable Homes Guarantee Programme should continue indefinitely. To make more effective use of the Government’s strong balance sheet, and the confidence funders have in the sector, government backed guarantees should be extended to cover refinancing of existing debt. Using guarantees to help restructure balance sheets would allow housing associations to lower the cost of historic debt and take on more private finance to fund affordable housing.

13.5 To increase the supply of land and improve access to that land, there are a number of steps government can take, some of which build on interventions they have already made. So, where local authorities (or combined authorities) can demonstrate they are making the most effective use of their own assets, they should be empowered to identify and map all public land and property in a local area, bring it together, assess its potential and set out a coordinated strategy for its release. This should include pooling public land and joining up estate and asset planning processes, building on the successful One Public Estate pilot.

13.6 To increase planning certainty, government should build on the announcement in the Productivity Plan that brownfield land, suitable for housing, should be given automatic planning permission, under a zonal system. Zoning should be extended beyond brownfield land, so all sites suitable for housing should be identified and ‘zoned’ in local plans. This should replace site allocations and be embedded in the local plan. It would have the same weight as outline planning permission and set clear requirements for each site – permitted uses, density and affordable housing requirement. This would help increase certainty, send clear signals to the market on price and speed up planning decisions. Together these measures should incentivise land coming forward and speed up housing delivery.

13.7 To help ensure a fair price is paid for land, Treasury guidance on best value, when public bodies dispose of land, needs to be updated. Too often this is interpreted as achieving the maximum upfront receipt, rather than the wider social, economic and environmental value. Change here would facilitate the sale of public land at a fair market value. Under this approach the price could be agreed using the residual land value model, fully costing the minimum planning requirements of a site, which could be more explicitly defined through zoning. So, instead of competing on price, competition would focus on who can deliver the highest quality, for the agreed price. Prospective developers will be assessed on the basis of how well they can deliver the minimum zoning requirements, in addition to the quality of design and any other social, economic and environmental benefits they could unlock.

13.8 Local authorities need enhanced powers to incentivise developers and landowners to bring sites forward. This will include the ability to charge a levy on sites unreasonably held back, alongside streamlined compulsory purchase orders (CPO). Placing time-limits on zoning will give local authorities the basis for taking action on stalled sites, but by creating certainty and value uplift for landowners should incentivise them to bring land forward within the agreed timeframe. Whilst a streamlined CPO process could help local authorities acquire sites
directly or make them available to other developers, there will be strict limits on how the price paid under CPO is set. It will be determined by the planning requirements of the site’s zoning. A credible CPO process should act as a disincentive for holding onto sites, ensure more sites are implemented and help stabilise land prices.

Conclusions

Housing associations are ready to boost housing supply, meet the housing needs and aspirations of people on all levels of income, and drive economic growth both nationally and locally. They are also heavily invested within the communities that they serve and are committed to long term investment within them.

The sector is committed to developing a stronger, long term partnership with the Government to end the housing crisis, and with the right conditions and policies in place, they can exceed their already impressive track record to deliver the quality homes and places this country needs.

New Garden Cities Alliance (CIC)– Written Evidence (BEN0108)

Authors Philip Ross and Elizabeth Wrigley
Founder members of the New Garden City Alliance
Registered CIC

1. This submission to the House of Lords Select Committee of Inquiry into National Policy for the Built Environment is made in response to their invitation of July 22, 2015 to the public to give evidence.

2. The submission may be made public and reflects the views of the New Garden Cities Alliance (NGCA) of which Philip Ross and Elizabeth Wrigley are both founding members.

Founders of the NGCA are listed on our web page at: http://gardencities.info/

Policy-making, integration and coordination

1P. Are the decisions that shape England’s built environment taken at the right administrative level?  No – The NGCA seeks a more meaningful involvement at citizen level through mechanisms of ownership and commonhold of land

What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?  The Garden City movement requires this more fundamental citizen-led development process, without which the Government should not be able to use the term “Garden City/ Garden Suburb/ or Garden Village”.

2P. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage?  No sign of real coordination to ensure the policies join up.

How could integration and coordination be improved?  No comment

National policy for planning and the built environment

3P. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment?  Policy at a national level alone will not be sufficient, as it is not guided by the citizens who are directly affected by it.

Are some factors within the NPPF more important than others?

If so, what should be prioritised and why?

4P. Is national planning policy in England lacking a spatial perspective?  No National Policy could address all the diverse local spatial issues in England adequately.

What would be the effects of introducing a spatial element to national policy?  No comment.
5P. Is there an optimum timescale for planning our future built environment needs and requirements? *Timescale should be intergenerational to meet the Brundtland definition of sustainability*. How far ahead should those involved in the development of planning and built environment policy be looking? *As above.*

**Buildings and places: New and old**

6P. What role should the Government play in seeking to address current issues of housing supply? *Government role should be indirect by providing facilitating legislation for sustainable development as recommended above.* Are further interventions, properly coordinated at central Government level, required? *No comment.* What will be the likely effect upon housing supply of recent reforms proposed for the planning system? *No comment.*

7P. How do we develop built environments, which are sustainable and resilient, and what role should the Government play in any such undertaking? *Introduce mutual ownership and control of urban sites and seek to implement the principles of commonhold – mutual ownership of sites and assets and delivery of services in new developments. Examples of this could be the Co-operative Land Bank model proposed by Shann Turnbull, who has also submitted a response to the Select Committee.* Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? *Not efficiently unless a process is started as described above.* How can the best use of existing housing stock and built environment assets be made? *It requires a case-by-case analysis to reconsider the ownership and control of sites and services.*

8P. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? *No comment.* How can more be made of these national assets? *No comment.*

**Skills and design**

9P. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? *No – because they lack awareness of the invisible structures of urban environments and lack an education in how to design their governance infrastructure.* How could we begin to address any skills issues? *As above. The New Garden City Alliance is in discussions with the following professional organisations on the way forward to improve skills: TCPA; Landscape Institute: RIBA; RTPI: Permaculture*
Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas? No skills or resources are available to plan or shape the forms of governance to deliver this invisible architecture of ownerships and responsibilities.

10P. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? See 9 above.

How could national leadership on these matters be enhanced? See 7 above.

Community involvement and community impact

11P. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? No – because they have no knowledge of network governance, and lack the skills – see 9 above.

How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviour within communities? Introduce network governance to promote political, economic, social and resource self-sufficiency and self-governance. Skill-up those who will lead the process.

12P. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Cannot be as effective as it could be because the above network governance is not adopted, and they also lack the necessary skills.

Are there any barriers to effective public engagement and, if so, how might they be addressed? Public engagement cannot be meaningful without this local governance of the public ownership of assets.

Financial measures

13P. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Yes, introduce legislation to facilitate “Locally-led” initiatives to adopt self-financing mutually owned land ownership and control as recommended in 6, and 9-12 above.

Are there financial or other mechanisms that would encourage better design and place-making by private sector developers? Yes, by encouraging locally led bottom up feedback inherent in the governance architecture the New Garden City Alliance recommends.

Philip Ross and Elizabeth Wrigley NGCA
Submission to be found under Dr Kerry Burton
A BETTER BUILD ENVIRONMENT.

Evidence for consideration by the House of Lords Select Committee.

The following evidence is submitted on behalf of citizens who live on Limetrees, Pontefract, because of recent experiences with planning approval of residential development neighbouring where we live.

POLICYMAKING, INTEGRATION AND COORDINATION on issues such as local planning approvals that has significant impact on the quality of lives of people, of all ages, has to be taken at local government level, in accordance with the responsibilities advised by the Department of Communities and Local Government (DCLG). Currently it is apparent that the building and development does not have serious regard for environment issues.

Improvement in the quality of life and happiness of stakeholders neighbouring/involved in the development site location can be made good, if citizens and locally elected members views and opinions are seriously considered in arriving at agreed conditions of planning approved recommendations for a development.

The meaning of Localism has to be seen in any planning of a “Build Environment” With most people wanting to have a say, and many want to play an active part, in making sure that the design of their city, town or village is good and worthy of its citizens.

To achieve localism the Government needs to;

- Make improving the quality of the public realm in our cities, town and villages a priority.
- Give all citizens opportunities to actively shape the future of their place.
- Give local communities the powers they need to enable their town and city centres to prosper.

COMMUNITY INVOLVEMENT AND COMMUNITY IMPACT.

We do not object to the building of houses on this site, our objection is with the access to the site which impacts severely on the quality of life and introduces fear and danger to older people who live in bungalows along the street where heavy and very large vehicles is planned to gain access to the site, vehicles that are taller than the bungalows. The enclosed photographs illustrate clearly our concerns.

There are other possible access and entrance means into the site.

There are two bends in the street that serves our homes. At around 11.20 am on Friday 7th August 2015 Lady Jean O’Brien was driving along the street to her home in Limetrees when a digger was leaving the proposed site and they met on the bend in the road, Lady Jean had
to swiftly steer on the footpath to avoid being struck by the digger, this is not the kind of environment old people should have to endure with new housing development.

To achieve a ‘build environment’ with all its meaningful aims and objectives community involvement is paramount, with any development of any type and size there can be visual, mental and physical impacts upon communities, particular where older people live.

Investment in housing must include investment in infrastructure. Schools, Medical services, Roads, Public Transport, sewers and water supply, are all essential to meet the demand of thousands of new houses, for developers to continue to rely on and couple into the ageing services is testing the environment in communities.

Recent experience locally is to receive notice that a developer has applied to build 84 2, 3 and 4 bedroom houses adjacent to the area where we live, and the means of access to the site is use the street where we live.

A local farmer has cultivated the land which is the proposed site for development for 30 years, not once using the street in Limetrees to gain access his fields once but uses a track to the south of the estate, this action by the farmer is a fine example of protecting the environment of citizens.

The farmers track is available for the developer who refuses to use it for access which is a clear example of total disregard for a ‘Build Environment’.

DRAINAGE AND FLOODING.
A survey reveals that the site given approval, falls to a low point from the proposed access point where foul water drainage surface water drainage to gravity into soakaway drains is not possible. Alternative solutions has to be agreed with the water authority and the contractor to meet satisfactory drainage of the site.

Flooding and the possibility of surface water from the site contributing to an already Wash Dike which often floods necessitates issuing an order on the discharge of water into the system of a maximum of 5 litres per second. A number of pumping stations has to be constructed to handle the water discharge which is most unsatisfactory and is not good environmental planning.

New and additional surface water drainage measures should be introduced to meet the environment protection.

This is a clear measure of the requirement of the build environment principle to ensure in planning approvals that the drainage infrastructure is adequate to meet the needs of the development and that drainage problems are not allowed to be passed on the future generations.
Following representations to the water authority assurances are given that any new developments which are added to the existing network do not have any detrimental effects, and certain adopted requirements do need to be met.

It is the measuring of those assurances that require serious considerations.

To assist in achieving a better build environment there has to be investment in the infrastructure required for development.

We do address mildly the question of National policy for planning and the build environment and we consider officers involved with considering planning approval must have training to develop better Skills and design.

The citizens of Limetrees, Pontefract welcome this opportunity to contribute to the creation of a ‘better build environment’, and look forward to reading the report of the Select Committee.

With very best wishes.

Sir William O’Brien

19 October 2015
Dr Fabiano Lemes de Oliveira – Written Evidence (BEN0086)

1. I hereby respectfully answer the call for evidence invited by the House of Lords Select Committee on National Planning Policy for the Built Environment. I am a Senior Lecturer at University of Portsmouth School of Architecture, with specialism in urbanism and green space planning. I am currently completing an academic monograph titled *Green Wedge Urbanism: History, Theories and Practice*, to be published by Bloomsbury.

Q4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

2. Although the National Policy Planning Framework (NPPF) indicates that local planning authorities should ‘plan positively’, this is still open to interpretation. A stronger link between positive planning and spatial planning needs to be developed. The Farrell Review rightly identified the ‘desperate need for more proactive planning’ and to be visionary.  

3. The introduction of a spatial element would be welcome. This would be instrumental to develop clear and shared long-term visions and fill the gap between traditional planning and urban design.

Positive planning of green belts and strategic gaps

4. In 2014, 9% of the land in England was developed, while approximately a third was protected, 13% as designated Green Belt. This shows that Green Belt land has a vast transformative potential to improve the quality of life in urban and rural settings across the country.

5. There must be a positive approach to planning Green Belts into networks of high quality green and, if appropriate, blue places. Green Belt land has been so far conceived as a ‘negative’ space: at the same time as it has focused on avoiding growth and protecting the character of places around it, it has so far mostly renounced its own place potential.

6. Policy needs to update the purposes of the Green Belt in light of current societal needs. The NPPF states that the Green Belt currently serves five purposes: to check unrestricted sprawl, to prevent the merging of towns into one another, to safeguard the countryside from encroachment, to preserve the setting and character of historic towns and to assist in urban regeneration. Most of this refers to development control, rather than positive planning for high quality green and blue places that address contemporary needs and challenges. Recreation must be explicitly included. In addition, policy should include, as purposes: interventions aimed at mitigating the impacts of climate

---

change,\textsuperscript{391} the promotion of sustainable city-regions and the generation of renewable energy.

7. Research has shown that a negative definition of a landscape typology can hardly be successful in protecting open spaces in growing city regions. Instead landscape has to have a positive definition. If a large green structure’s main reason for existence is to avoid development and has very little associated recreational use attached to it, its social values would be poor and it will be more susceptible to pressures for encroachment. Proactive planning, on the other hand, which addresses social values relating to our need for contact with nature, is the key to the positive safeguarding of green spaces. Public engagement in this process is crucial.\textsuperscript{392} Furthermore, non-integrative solutions for the demarcation of protection areas, which do not take into consideration the implications for socio-cultural activities, can have a detrimental impact in the socio-spatial cohesiveness of communities.

8. The integration between city and nature has a number of benefits, ranging from mental and physical health, environmental quality and levels of happiness. The recreational function of green spaces is pervasive. It directly addresses the human need for contact with nature, presenting both psychological and physical benefits. Research found statistically significant relationships between the use of urban green spaces and self-reported experiences of stress, suggesting that the more often a person visits green spaces, the less stressed he or she will be.\textsuperscript{393} The psychological benefits of passive or active social interactions that happen in public green spaces cannot be disregarded. The social functions of these spaces contribute to help meet people’s need to be gregarious, influencing directly their wellbeing. Community participation in, for instance, communal gardens and allotments offer behavior settings in which interaction across ages and social groups lead an enhanced sense of belonging, social cohesion and satisfaction with the local area. In terms of physical health, green spaces can help in a number of ways, including facilitating recovery from illness\textsuperscript{394} and encouraging physical activities in all age groups.

9. The provision of high-quality green and blue spaces, their distribution and ease of access is a requirement of contemporary cities, rather than ‘nice to have’. On top of the commonly associated benefits of green spaces to recreation, health, ecology and environment, they become key assets of attractiveness in competitive global cities, both for highly skilled professionals and investment. This acknowledgement is a common feature of international regional and city plans, such as the Helsinki City Plan 2013: vision for 2050, the Stockholm RUFS 2010 plan, the Copenhagen FingerPlan 2013 and the Randstad 2040.

\textsuperscript{391} Patrik Grahn and Ulrika A. Stigsdotter, "Landscape Planning and Stress," \textit{Urban Forestry \& Urban Greening} 2, no. 1 (2003).
\textsuperscript{393} Steve Carpenter Carl Folke, Thomas Elmqvist, Lance Gunderson, CS Holling and Brian Walker, "Resilience and Sustainable Development: Building Adaptive Capacity in a World of Transformations," \textit{Ambio} 31, no. 5 (2002).
10. Green Belts should be positively planned for a systemic integration of socio-ecological and environmental services. Cross-scale interactions must be considered. This approach suggests the overcoming of old dichotomies between man-made and nature, arguing for a dynamic relationship between systems, each one impacting the other. 395

11. Change must be allowed in the green belt. Adaptive capacity and diversity are pre-requisites for resilience. Furthermore, the possibility of positive transformation will unlock the Green Belt’s potential to accommodate a network of diverse and high-quality places. High diversity increases the range of possibilities that a system has to keep its functions and structures or to adapt and find new states. 396

12. Large-scale green spaces are able to accommodate diverse landscapes and a large range of ecological habitats. Wildlife migration is also better supported through the continuity of ecological corridors. A variety of landscapes, experiences, functions and activities enrich the physical and socio-cultural environment catering for diverse human and ecological needs. These in turn contribute to an area’s resilience – its ability to withstand or adapt to change.

13. London’s green belt and a number of ‘strategic gaps’ between towns in the South East are to a large extent locked in a straightjacket of non-action. Certainly this approach has its role in localised circumstances, but is wasteful. A holistic integrative view needs to be considered. Adding values, experimentation in the definition of activities and interactions, proposing hybrids can support generative processes.

14. Strategic gaps between towns and cities should also be positively planned. An example of that can be seen in the Randstad 2040 vision, which intends to transform former buffer zones into metropolitan parks. They are part of a green and blue regional infrastructure plan. 397

15. Policies that support flexibility, dynamism and change should be encouraged to make our large green spaces, and therefore our cities, more adaptable and responsive to our changing needs. For that to happen, top-down and bottom-up need to meet and control and decision-making negotiated.

Green Wedges

16. **Green Belts’** criticism includes the fact that most of the green space it contains is concentrated around the city and therefore away from where most people live, for the poor quality of its spaces, its fragmentation and lack of access to the population. 398

17. The Barker Report on Planning Use399 commissioned by the Prime Minister to review the planning system in England suggested a change in planning model to allow cities to have a larger footprint and more urban green spaces within the urban boundary. Moreover, the report stated that the government should review the merits of other models of green space provision, such as green wedges.

18. Green wedges should be considered in addition to Green Belts. Green wedges are ducts of green space from the countryside right into the centre of a city or town. The model presents many social, economic and environmental benefits, such as: a direct connection to the country from the inner urban areas, interconnected high-quality green and blue spaces in direct proximity to people’s homes, thermal regulation in the inner city, improved air quality due to trees and the ‘flushing’ effect of polluted air away from urban areas, use for sustainable urban drainage systems, and enhanced biodiversity in cities.

19. The Green Wedge model has a long history in UK planning thought. England pioneered the promotion of the idea in the early twentieth century. 400 Sir Patrick Abercrombie’s plans for London, the County of London Plan 1943 and the Greater London Plan 1944, defined frameworks for the implementation of green wedges in association with green belts.401 In addition, green wedges were key features of many New Towns. These plans could offer valuable insights into how to better articulate green belts and wedges into a cohesive green and blue infrastructure plan today.

20. Whenever possible they should follow natural features such as rivers and valleys. A flexible implementation of green wedges in consolidated urban fabrics is necessary. Milan’s ‘Raggi Verdi’ plan and Hamburg’s Green Network shows that combining historical green paces, geographical features and newly created greenery even in the most urbanised areas of the city can be a recipe for success if there is political will and public support. These plans are key strategies in these cities’ visions of a healthy and sustainable future.

401 Beyond Retail Report

Policymaking, Integration and coordination

1. All decisions that shape our built environment, roads, housing, commercial, industrial or landscape & agriculture are taken by central Government. This is the cause of most of our problems, there is no delegation of decision making only responsibility down the pecking order.

Local authorities are too scared of not following Government dictates not spending money and leaving the office to visit villages or sites that are in remote locations.

Central Government must delegate the decision making process to those who live and work in an area. County Councils do not consult with residents of Parishes affected by the decisions placed upon them, by Government.

District Councils are similar to County Councils in attitude and consultation. If we have any partners we never see or hear from these. Parish Councils are by enlarge ignored, as far as their recommendations for major Planning Applications.

2. Policy across Government Departments appears to be non-existent.

Housing - Policy build them anywhere that landowners and developers want them. See decisions by Planning Inspectors and Secretaries of State

Designs – There appears to be no consistent policy on design, our towns, roads, etc. are littered with examples of poor design especially with respect to growth. Quantity of our housing stock in recent years has deteriorated as builders aim to minimise cost, and maximise profits, so we use the cheapest of materials etc. to comply with its ever changing and increasing level of regulation by Government.

Transport – If we have a policy on this, where is it. Except carbon emissions item appears to be no coherent policy.

Infrastructure – We have the most expensive by road tax and fuel road system in Europe, the least well designed and maintained. There is no common sense used by Government, specifiers, planners, designers, contractors, etc, just blind compliance to regulations and red tape. Our road system ignores the requirement for the growth in housing and warehousing by Government. For example Northampton needs a ring road before any further expansion takes place. A ring road that meets the expectation of residents not Government.
Railways very expensive ineffective rail system that was very good when UK population about 5m. Now inadequate HS2 should be designed as a “maglev” to meet 22nd century requirements not Victorian.

Utilities only interested in the cheapest systems therefore all the work they carry out on housing estates, roads etc. take so long and cost so much.

Sustainability needs clear definition. Heritage appears to be totally ignored reference the Overstone Hall in Overstone Park.

Delegate decisions on roads and houses to those most affected by those decisions. Classic example of no joined up thinking by Government. We need a water grid from North to South, we dig up the M1 +M6 for months for a new central reservation. Why not bury a water main at the same time?

**National policy for planning and the built environment**

3. National Planning Policy Framework (NPPF) is treated by Local Authorities (L.A’s) and those proposing developments as a regulatory framework not guidance. Therefore it provides little scope for objections to poorly conceived developments. Examples of this situation can be found throughout the surrounding areas to Northampton. There is little or no interest by LA’s for the protection of the built and natural environment where development is concerned. Agricultural land, avenues of trees, woods etc, are destroyed in Northamptonshire due to developments for roads, houses and warehouses. The factor in the NPPF in favour of development is treated by central and local Government as the most important “regulation”. Thus this takes president over and above everything else.

The priority must be land conservation and infrastructure. We are fast running out of productive land in the South East and food production will be a big issue in the future. Our roads cannot cope with traffic volumes, schools are inadequate in number and quantity, hospitals are sprawling in efficient developments, see Northamptonshire General.

4. If a spatial perspective was added to the NPPF it will need to include a rural perspective. This must include a provision for the protection and conservation of our agricultural lands. If this is not done soon in the South East of England, so much of this productive agricultural land will be lost to development that we will have even higher food imports that we currently have.
5. We need to look 50 years into the future, and plans for the needs of our society. The policy makers must consult the current LA’s and Parish Councils to obtain a balanced view of the future. Particularly as they pay a high price to live where they do in terms of taxes, stamp duty, rates, etc. Our countryside needs to retain its character and we know from our experiences, that the Government alters studies it commissioned to suit its requirements see “Northamptonshire Landscape and Green Infrastructure Study”. Only sheep can graze in hilly or mountainous terrain, i.e. moors, dales, etc. Minton application refused by the LA, but overturned by the planning inspector, yet this development is less than 100m from Sywell Aerodrome.

Buildings and places: New and old

6. Build high rise flats in the centre of our towns, like most of continental Europe. Interventions by Westminster, only ensure their policies in favour of developments, are adopted. (See decisions by Planning Inspectors) Minton site, Sywell Aerodrome.

7. Define = sustainable!! Nowhere in the Government information, is a definition. Sustainable is by definition food. This is ignored in current Westminster thinking.

Resilient – Definition recovers from shock!!

The government must meddle less in the development of the countryside. Existing buildings can be adapted and changed if government both local and national had a more flexible approach to changing/upgrading buildings, particularly those listed or in conservation areas. Use of modern materials rather than a blinkered approach.

8. We make very poor use of our historic environments. Our Grade II listed Mansion in the village was severely damaged by a fire at the Overstone Hall, 10 years ago. Daventry District Council’s (DDC’s), lack of interest and worries about racism have delayed the restoration of this building. The building owners took the insurance monies and moved out. The local authority have shown little or no interest in the restoration of the building.

Skills and design

9. We have the architects, engineers, surveyors and planners in this county to sort out the mess we are in. However, because the Governmental/Political side of the Country, does not understand or is not interested in the opinions of the people in
the locality, where development is proposed, then we end up with a country in disarray. First sort out the infrastructure, roads, we pay the most for the worst roads in Europe. Same with railways, utilities, gas water, electric all ex-Governmental companies, overcharge for a poor service.

Local Authorities have the resources but have no idea how to manage anything. They blindly follow dictates from central government.

10. Why do you have this obsession with national leadership. This has lead to poor design, and poor planning. Stop controlling from Westminster. It is a failure, that there is a lack of trust in enabling areas to look after themselves. Why have you an obsession with targets for only houses.

Community involvement and community impact

11. They take little or no account of the effects of their decisions on the people who live near any developments. Consult and ignore is the mantra for urban sprawl. With Government idea’s of Village Design Statement, ours took 6 years, 4 different Planners ideas and comments. Months of time spent by Parish Council volunteers, only to be ignored. Localism Act, Neighbourhood Plans cost up to £30,000, takes 2-3 years for compliance, consultation and approval. However, the Neighbourhood Plan must comply with the “Government Plan” otherwise it is not accepted by the LA. Rather than the idea of having a say in what happens to one’s environment. To improve the situation as far as impacts are concerned, for rural areas listen and act upon the recommendations of the Parish Councils.

The “Federal Society” that the Government has created in this Country by its “Politically Correct” policies towards discipline, crime, education and infrastructure, needs strong locally organised and authorised communities to reduce antisocial behaviour.

12. Most people particularly, on Parish Councils are very able and willing to engage with the process of decision making. However, because their opinions and desires are generally totally ignored because of Government dictates, many are totally apathetic. The barriers to effective public engagement are created by the Government who do not really want the opinions, particularly of those living in rural areas, as they might conflict on houses, warehouses, windfarms, PV Panel farms, etc, that blight our countryside. Also Government alters reports, even those it
commissions to suit their requirements, i.e. “Northamptonshire, Land Use and Landscape Study”.

Financial measures

13. Yes, encourage high rise, developments in towns and cities within limits. Reinstate the “green belt”. Reduce the tax on land and house sales, get rid of the carbon emissions requirement for houses after 2016. There is plenty of land available however, the best land to use is that within towns and cities. Above railway yards, many of which are redundant. Above supermarkets and their carparks. The Government can encourage these developments by giving tax incentives. Better design will be achieved when cost is not the major driver, particularly for houses, warehouses, shopping centres, etc. Place making by developers, after the Community Infrastructure Levy (CIL’s) etc. there is little money left to achieve place making. If they do, the LA does not maintain it. See Northants roundabouts, verges, roads all up-kempt, or potholes.

06 October 2015
The Parks Alliance

1. The Parks Alliance (TPA) is the voice of UK parks, representing the people and organisations that create, maintain, invest in and use the public green spaces that we are proud to have at the heart of British life. We campaign at local, regional, UK and EU levels to ensure that parks are properly funded, their roles recognized and developed, and that the benefits that they provide are clearly understood and recognized.

2. TPA is a not for profit company working to promote and protect the public parks. The UK-wide Alliance includes 40 organisations and senior park industry figures from local government parks services, private contractors, industry bodies, NGOs and volunteer and park friends groups. The Parks Alliance works to:
   - Protect and improve the country’s public parks for future generations.
   - Increase understanding among national politicians and policy makers of the value of public parks to the current and future quality of life and health in the UK.
   - Increase understanding among national and local politicians and decision makers that parks are a crucial part of social and physical infrastructure supporting education, flood control, health improvement, social cohesion, wildlife and helping us adapt to climate change.
   - Secure and boost the existing world-leading skills and expertise delivering UK parks as well as quality training and employment opportunities.
   - Influence national, regional and local policies and funding decisions that impact on parks.

A. Policymaking, integration and coordination

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

3. The built environment embraces the natural environment and parks should therefore be considered as part of the Committee’s inquiry. Parks are an integral part of places where we live, relax and work. Urban parks have a positive impact on physical activity and reduced obesity; property prices; local cooling and biodiversity.
4. Victorian parks were established as places to seek fresh air and respite for urban populations; the innovative tree-lined suburbs of Port Sunlight and Bourneville were planned so as to enhance residents’ sense of wellbeing; while Frederick Law Olmsted’s ambitious Emerald Necklace in Boston, USA, was designed to improve water quality and reduce the number of deaths from cholera. There is an honorable tradition that links places and public health.

5. The Heritage Lottery Fund’s report ‘20 Years in 12 Places’ gathered facts on the role parks play in people’s lives. The report shows parks have the greatest impact on residents’ quality of life, with 69% of local residents who were aware of selected parks for the survey, believing their personal quality of life to be a little better or much better as a result of having them in the area.

6. The Fabian Society’s ‘Places to Be’ report provides further evidence about the importance of green spaces in the community lives of an increasingly urban lifestyle. The report makes the case for providing parks when it says:

   “Our open green spaces more than ever provide a crucial community ballast, where we can come together, build relationships and reverse the long-term trend towards individualism and isolation.”

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

7. The Parks Alliance believes Government can create the right conditions by focusing on land assembly, infrastructure and providing quality public realm, including parks. Much more policy coordination is needed. This inquiry is a good example of the need for coordination as green infrastructure (GI), place making and the role of good public realm and parks and open spaces does not feature explicitly.

8. The TPA calls for greater emphasis on national policies that feed into local policy. For example sustainable drainage systems (SUDS) and green infrastructure (GI) policies are still considered in many cases as an after thought in developments by both public and private sectors. GI is not even considered in the London Enterprise Panel (LEP) and European Regional Development Fund (ERDF) funding as a means to include and develop holistic approaches to inclusive GI in infrastructure projects.

9. Parks cross over parish and local authority divisions and the benefits of green spaces and green infrastructure cannot be confined by administrative boundaries.

10. The Parks Alliance is concerned that until recently it was unclear where responsibility for parks lay within Government. It is still uncertain whether the appointment of a Minister for Parks can ensure a good understanding of the sector or recognition of
the contribution parks have to a number of different departmental objectives, for instance in public health. It is essential given the benefits that parks bring to public health, recreation and to sport are recognised and we are concerned there is no coordination between departments.

C. Buildings and places: New and old

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

11. As well as ‘grey’ infrastructure (transport, utilities, services), getting the green infrastructure right is a key component for any successful public project. New housing developments need green spaces included. For example:

The Queen Elizabeth Olympic Park shows the value of a long term master plan with investment in green and grey infrastructure. Design of green infrastructure was included in the master plan and proved to be crucial. It enabled the creation of walking routes, cycle ways, places to play, surface water drainage and the space for people to commune with nature.

Manor Fields Park in Sheffield was integral to new housing developments with a SUDS scheme for the surrounding housing. During the floods of summer 2007, the scheme reduced the impact on the River Don by containing floodwater, and was able to reopen shortly after as a community open space once again.

Birmingham’s new Eastside City Park was built with the intention of complementing new housing developments which are to be built in the surrounding area.

12. Planning for growth should have overall government oversight to ensure quality, resilience, GI and spatial planning with regards to where not to build on flood plains for example. There should be incentives to reclaim brown field sites before green belt development and more incentives for land ownership mapping on local levels.

13. The future of the Green Belt; local versus regional planning and the issue of how can we identify the quality of a landscape are all important. We would call for the creation of a national standard to map and measure the quality of all green spaces.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstance in the years to come? How can the best use of existing housing stock and built environment assets be made?
14. Housing quantity cannot be divorced from housing quality and cannot be ignored. Research from the Local Government Association’s New Housing Developments Survey\(^\text{[i]}\) (2010) identified potential barriers to housing delivery. It found that 61 per cent of local councillors considered public opposition to be a significant barrier to housing development. When asked what would make housing development more acceptable to local communities, the following responses were given:

- Ensuring housing came with improved local services and facilities (including green space) – 82 per cent;
- Involving local communities in early discussions about design – 56 per cent;
- Ensuring a commitment to excellent design – 65 per cent

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

15. We need to ensure that other professionals and developers understand the nature of green spaces and the intrinsic value they bring fiscally as well as emotionally to any place. That the management and maintenance of any public realm needs ongoing budgets and needs to be addressed from the onset of any developments. Green and open spaces should be at the heart of any development, not last minute additions.

16. Registered parks and gardens, are protected from damage by the need to apply for listed building consent, or scheduled monument consent. Unfortunately local authorities subjected to severe budget cuts often have insufficient time or resources to take action when neglect or damage result in the loss of heritage assets, and have few suitably qualified staff available to deal with proposals for their development.

Skills and design
9. Do the professions involved in this area have the skills to consider adequately the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

17. Professions should work together and need to understand and accept the value of green infrastructure. Parks, green spaces and GI should not be viewed as desirable additions but as integral to any developments. The green infrastructure approach demonstrates the value of Natural Capital and is a good way of demonstrating that parks are integral in developments.

Community involvement and community impact
11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

18. No. Designing places that considers the human scale work best. That design should consider creating places that are walkable, accessible, have clean air, and are enjoyable, beautiful and well managed.

19. The management of parks is a non statutory responsibility for local authorities. This means parks are particularly vulnerable as cuts continue in local authority budgets. Yet this comes at a time when city populations are increasing and the multiple services that parks provide are needed more than ever.

20. Local councils need to retain their role as guardians of public assets but partnership between local councils and local communities is crucial. Green spaces have the potential to engage people in community life, but volunteers need to be supported. Effective management of green and open spaces requires a level of skill and experience beyond most volunteers.

Financial measures
13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

21. The Natural Capital Committee has shown that green infrastructure makes a good return on investment but is mostly voluntary or piecemeal and led by profit margins. Natural England estimate that if every household in England were provided with equitable access to quality green space then savings of £2.1bn could be achieved every year in averted health costs.

22. Parks face an uncertain future if austerity measures continue to undervalue and damage the fabric of our public parks network. The Heritage Lottery Fund’s State of UK Parks, released 2014 estimated that 45% of local authorities are considering either selling parks or green spaces or transferring their management to others.

23. We all need to explore different funding mechanism to maintain parks in the future. For instance a recent Policy Exchange report ‘Green Society: Policies to improve the UK’s urban green spaces’ called for the creation of Park Improvement Districts to help fund long term maintenance. They also thought that any new green spaces planned as part of a built development should be required to include a long term funding plan, which could include endowments part funded by developer contributions as part of the planning application.
24. The concept of Natural Capital is little understood and we would urge the Committee to visit and study UK parks’ enormous value not only in recreation but in public health, property prices and sustainability.

Rob Pearce
Business Manager

06 October 2015
Response by the Partnership for Active Travel, Transport and Health (PATTH)

About PATTH

The Partnership for Active Travel, Transport and Health (PATTH) is a collaboration of Professional Institutions and other partner organisations drawn from the specialisms of health, engineering, environment, architecture, planning and transport (listed in annex 1 to this evidence). PATTH offers a diverse range of expertise to assist in the development and delivery of effective, efficient planning and transport policies and measures, focused on the potential for improvements in public health.

General

PATTH welcomes the opportunity to respond to the House of Lords Select Committee on National Policy for the Built Environment. This is an issue of vital national importance as there are a number of challenges which can be strongly and positively influenced by the implementation of a robust policy for the built environment with a higher prioritisation of active travel. It is worth noting that the highway constitutes 80% of the public realm. Whilst the focus of this response is that of transport and mobility, this is set in the context of how this relates to the whole built environment.

The built environment shapes our behavioural patterns, which in turn largely determine our physical health, mental wellbeing, perceptions of and exposure to risk, security and productivity. Well over 80% of the UK population live in urban areas, yet the built environment has been neglected for decades in terms of its strategic importance to the health and productivity of the nation.

In England there is a legacy of automobile-centric development, after those responsible for developing policy for the built environment considered the automobile as the most efficient and effective mode of transportation for both people and freight. This approach can divorce people from their surroundings and promote a lack of physical activity with emerging large scale associated health impacts, social disintegration and unfulfilled economic potential. Urban design should be optimised to promote walking and cycling at the local scale and accessible public transport provided, therefore minimising reliance on personal road transport.

Healthy and vibrant, productive built environments require the movement of their inhabitants. Yet the nature, scale and mode of such movement is critical to the overall health of the communities working, visiting and residing in them. The fact that our environments effectively dissuade many people from incorporating physical activity into their daily lives impacts on each of them as individuals, but also on the national economy.
The All Party Commission on Physical Activity noted a cost of £20 billion per annum arising from inactive lifestyles.

There is a wealth of evidence in existence which illustrates that enhancing opportunities for active travel is beneficial on a wide range of levels, often demonstrating large benefit: cost ratios. We commend to the Committee the 2014 report of the Active Transport for Healthy Living Coalition (which has since become part of PATTH) which details some of this evidence.

Detailed responses to specific questions posed by the Committee

Policymaking, integration and coordination

Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

Residents should be core to local development and infrastructure decisions as they may often be far better informed on the performance of their immediate environment than decision makers who operate more centrally. In theory, decision making is set at appropriate levels with local decisions facilitated through the Government’s localism agenda. However, leadership at a national level ultimately sets the policy framework to reflect the changing attitudes and aspirations of society.

The built environment and its communities are suffering from a market failure in which costs associated with poorly conceived and delivered development are borne by communities and not developers. It is unlikely that a profoundly deregulatory, market-driven approach favoured by the current Government will address these market failures. Indeed the current direction of policy, with further deregulation of the planning system (falling building standards, increased permitted development and Local Development Orders), is only likely to perpetuate recent trends.

How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

The level of policy coordination referred to above does exist but not at the kind of level required to achieve high quality built environments, effective and efficient sustainable transport and healthy communities. Investment in effective coordination to properly achieve multiple benefits from development is highly likely to drive far greater economic benefit across a range of sectors (including health) in the longer term than a deregulated approach. Policy and delivery appraisal should be far more robust to consider whether these benefits are being achieved.

National policy for planning and the built environment
Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

PATTH considers that the NPPF provides much in the way of strong and positive policy guidance as described, for example paragraph 17 on sustainable transport and the way in which it references the significance of healthy communities (section 8). As health was one of the few new policies added to the NPPF (the development of which was generally focused on simplification and deregulation), it is a strong indication of the importance government intended health to have within planning, but local authorities generally lack confidence that this emphasis is fully accepted by the Planning Inspectorate.

Whilst the core policy principles (page 5) are strong, others such as those relating to viability are weakly defined. We are concerned that it is often easier for developers to argue that proper (good quality) development is unviable, than it is for them to find imaginative ways to comply with a certain planning condition. We consider that the role of strong government (at all levels) is fundamental here when there are so many interrelated factors to consider, a number of which are not properly reflected by the market. A good example of leadership is that in Wales with the Active Travel Wales Act 2013.

Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

The existence and present scale of challenges around health, housing provision, the economy and the environment is such that there is a very real need for development to be more carefully considered in the context of these strategic issues so that new and innovative solutions may be identified and implemented effectively.

National planning policy in England lacks a strategic component which makes the delivery of the overall policy aims of the NPPF (as well as wider government and social priorities) difficult to achieve. It means that development is too often considered out of the context of its impact on local, regional and national priorities (particularly smaller developments which may have minimal impact on such factors individually but when combined, cumulatively they can be highly significant). The system should become more strategically-driven with the promotion of active travel as one of the strategic goals.

Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

Planning cycles across a range of different sectors are increasingly looking forward between 20 and 100 years to identify long-term (strategic) trends and priorities. Organisations which take this approach regularly are often most extensively informed, forward thinking and resilient. We consider that there is a need for future built environment needs (and the
interaction of these with national strategic objectives) to be subject to this approach at both
local authority and central government levels.

At the same time, the question is not necessarily the appropriateness of the time horizon
chosen, rather it is the capacity of planning policy to react constructively to changes in
societal need. Manifestly it is failing to do so at the present time, given the problems faced
around shortages of housing supply, health problems associated with inactivity, and
environmental damage. All too often the long term is seen as something that will happen in
due course, however the longer a strategy will take to have effect, the more urgent it is to
start addressing it immediately.

The Government’s Foresight programme, with its 25- and 50-year horizons, is an admirable
exception to the generally short-term approach to policy development enforced by the
electoral cycle and party political priorities. The current ‘Future of cities’ study has looked at
planning and the built environment and we commend this to the Committee. See in
particular “Active travel and the city of the future”.

Buildings and places: New and old

What role should the Government play in seeking to address current issues of housing
supply? Are further interventions, properly coordinated at central Government level,
required? What will be the likely effect upon housing supply of recent reforms proposed for
the planning system?

The Government should encourage town centre sites and ensure that full use is made of the
potential for locating housing at or close to bus stations and railway stations. It should not
permit piecemeal erosion of greenfield sites and urban sprawl, but should instead expand
rural settlements to enhance their own economic and community viability. New settlements
should be designed to optimise walking and cycling at the local scale and provide accessible
public transport to minimise reliance on personal road transport.

We are concerned that existing planning policy implementation and its recent reforms,
together with the ongoing reduction in funding to local authorities will only facilitate the
construction of poor quality houses in inappropriate locations dependent on road traffic.
This will not assist the Government’s aims to increase productivity and economic growth. A
deregulatory, market-driven approach to the challenge of housing need is unlikely to
achieve a satisfactory long-term outcome for society, if there is any ambition to ensure that
any such provision does not perpetuate other important problems around health and the
economy.

How do we develop built environments which are sustainable and resilient, and what role
should the Government play in any such undertaking? Will existing buildings and places be
able to adapt to changing needs and circumstances in the years to come? How can the best
use of existing housing stock and built environment assets be made?
It is entirely possible to develop sustainable and resilient built environments and there are good examples internationally where this is being achieved (for example Malmo and Lund in Sweden, Freiburg in Germany). They should follow a number of principles relating to self-sufficiency and economic viability, health, activity and community integration. Because of the inherent market externalities which continue to impact the environment and sustainability, it will be necessary for the Government to drive the required change through strong policy, implementation and an appropriate balance of regulation and incentives.

It is important to encourage the use of new technologies, such as earth-sheltering, green roofs and green walls, roof gardens, and light pipes. These make it possible to find acceptable solutions to problems which might otherwise have required a choice between conflicting important considerations, for example more housing versus the protection of greenspace.

Well-designed and connected development is likely to be inherently more sustainable, resilient and adaptable than that which is of poor design. Existing buildings will need to be adapted to meet changing needs and circumstances. The alternative - large scale replacement - would be cost prohibitive. Much existing building stock is appropriate and adaptable but equally it is important to recognise where some is of poor design and replacement would be the more appropriate solution. This discussion emphasises the importance of good quality design and conception.

It is worth noting that academic evidence is beginning to demonstrate that cities which seek to design physically active living into their built environment may also benefit in terms of global profile and economic competitiveness. See for example studies by Active Living Research in the USA, or the sophisticated analysis in the KPMG ‘Magnet Cities’ project.

To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

There is also much that can be learnt from the historic environment. Historic environments are often attractive to residents and visitors alike because they are often characterful and, because they pre-date the automobile, are often inherently people-centric in terms of their design resulting in a quieter and safer environment. Given the shift in the global population towards urban living and the considerations around carbon emissions and climate change, some of the best models for future urban living may be well designed, compact historic cities which were highly self-sufficient and walkable.

It is important to maximise all features and contexts when place-making. Not only historic and apparently valuable assets. Careful design and sensitive development will make places attractive, setting context, retaining interest, yet making space for the new and innovative. This is where policy and legislative frameworks can support, obliging designers and developers to seek out features that will make even the most mundane place attractive. For
example, carefully considered and designed streets and features can be both functional and attractive, within reasonable budgets.

In other contexts, there may be opportunities to subsidise heritage railways to offer fuller commuter and community services which would usefully expand the rail system, albeit on a small scale.

Skills and design

Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

There are a number of professional institutions involved with PATTH and we consider that the appropriate skill sets do exist within the relevant professions and professional institutions are key in developing and transferring these skills and knowledge to a wider range of professionals to consider the requisite issues in a sufficiently holistic manner. However awareness may be lacking within the professions on how their work impacts on public health and how to optimise public health benefit.

A greater issue is that of local authority access to such skills and resource as they are limited by their own available resource. To consider the range of issues in a properly integrated way is no small task but with present levels of investment is unlikely to occur and developer contributions may be insufficient to bridge this gap.

Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

Quality can be promoted through policy and legislation and some championing by politicians and leaders is required. PATTH considers organisations must be required to show strong design principles, which address all social requirements (not just short term economic ones) to win funds and contracts.

Although evidence is available and being assembled continually, the case for good urban design is already proven and requires leadership and appropriate investment, not further research. It is important to bear in mind that people will walk further if the walk is pleasant and so aesthetically attractive designs, incorporating greenery, artwork or interesting architecture actually have a health value.

Good economic assessment tools exist. The WHO Health Economic Assessment Tool allows calculation of the benefit values from schemes to increase walking and cycling (and has informed the development of the Department for Transport’s own Transport Assessment Guidance). Transport for London has recently produced its Valuing Urban Realm Toolkit.
Community involvement and community impact

Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

Health should be strengthened as a material consideration in planning applications and more attention should be paid to comments relating to the impact upon public health. This requires a strategic national and local perspective to achieve the health and wellbeing benefits that the built environment can provide. Ultimately this will translate into more considered urban design, including layout, public space provision, attractiveness and pedestrian friendliness of streets and integration with sustainable transport options.

Improving the impacts of the built environment on health and wellbeing requires policy emphasis and that this is actively enforced through development control. It is such considerations which often risk being omitted or reduced in developments, or compromised over time via permitted development, on the grounds of commercial viability. Quite simply this is about the prioritisation of policy and its implementation. More benchmarking and post-delivery appraisal is vital but must be allied to consequence, for example identified failures should lead to improvement and good practice should be required.

Evaluation of the health benefits investment brings could better influence funding decisions. The local planning system should take account of health in its decision making. Relevant government departments should work together on guidance promoting health and wellbeing and subsequently informed local decisions (through Health and Wellbeing Boards, Local Enterprise Partnerships and Clinical Commissioning Groups) on the approach to the built environment can be made.

Authorities are often put off asserting the primacy of these goals by the fear that the Planning Inspectorate will take a different view and award costs against the authority. The law only provides for the award of costs on a planning appeal against an authority when the authority has acted unreasonably. We would suggest that it can never be unreasonable for an authority to reject an application, or attach conditions, if the genuine reason is health grounds supported by its Director of Public Health.

How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

The Localism Act 2011 and the Neighbourhood Planning Process in principle provides communities with the opportunity to play a very active role in shaping their local built environment. However in practice this is subject to communities’ ability to mobilise themselves and to the skills they may have at their disposal to produce a plan to the
required timescales. The process is potentially open to undue influence by vested interests and therefore the opportunities presented to communities may be quite difficult to realise beyond some relatively exceptional cases.

Public projects are generally well consulted yet private sector developers may often be more cautious in engaging with local communities, depending on the nature and size of the project. We consider that there should be a greater role for appropriately skilled planning professionals to assess proposals, facilitate informed public engagement and to direct development in a direction which is in the best interests of local communities and their place in a larger spatial and strategic context.

Governments, both local and national, are elected to act in the best interests of society and given that most people’s local environment has the greatest bearing on their health and wellbeing, optimising the quality of local environments should be a primary priority for the Government.

Financial measures

Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

There are a range of market externalities which result in insufficient priority being attached to many factors which are of most social benefit within the built environment. These externalities are well understood so we consider it is appropriate to provide fiscal measures to help shift the market towards healthier development and provide additional funds to invest in properly resourced development control and social and affordable housing. It is important that these externality charges are not considered to be “just taxes” but that they are legitimate market correction tools for the public benefit.

Crowd-funding may have a role in leveraging local businesses investment into street and place making. This would build a partnership between the residents/users and the local businesses, to provide a high quality and sustainable built environment.

Other opportunities might exist in the context of developing new communities and their transport infrastructure together, with one supporting the other as was the case with the North London suburbs and the Metropolitan Railway. This might offer a valuable way to start the process of developing the rail/cycle combination as a major transport mode in its own right. There have been some recent rail schemes in Canada in which capturing the benefit of enhanced land value has been more prominent than fare revenue in the actual business case.
Appendix 1. Membership of PATTH

Members of PATTH are taken from the following organisations. Their naming below does not constitute formal approval of this response in every instance.

The Association of Directors of Public Health (ADPH)
The British Medical Association (BMA)
The Chartered Institution of Highways and Transportation (CIHT)
The Institution of Civil Engineers (ICE)
The Chartered Institution of Water and Environmental Management (CIWEM)
The Transport and Health Study Group (THSG)
The Royal Institute of British Architects (RIBA)
New London Architecture (NLA)
The Royal Town Planning Institute (RTPI)
The Town and Country Planning Association (TCPA)
The Faculty of Public Health (FPH)
Sustrans
The Chartered Institute of Logistics and Transport (CILT)
The Chartered Institute of Environmental Health (CIEH)
The Transport Planning Society (TPS)
Living Streets (LS)
British Heart Foundation (BHF)
MacMillan Cancer Support (MacMillan)
UK Health Forum (UKHF)

05 October 2015
Dear Sirs,

Paulerspury Parish Council was of the opinion that it was unable to have any effective engagement with the process of decision making. Barriers are there which make it powerless.

Yours sincerely,

Maggie Down

25 September 2015
Members present

Baroness O’Cathain (Chairman)
Baroness Andrews
Lord Clement-Jones
Lord Inglewood
Earl of Lytton
Baroness Parminter
Baroness Rawlings
Baroness Whitaker
Baroness Young of Old Scone

Examination of Witnesses

Sunand Prasad, Penoyre & Prasad Architects, and Quinlan Terry CBE, Quinlan & Francis Terry Architects

Q64 The Chairman: Good morning to everybody, particularly our two witnesses. Welcome to this evidence session of the Select Committee on National Policy for the Built Environment. You have in front of you a list of the interests that have been declared by members of the Committee. A transcript of the meeting will be taken and published on the Committee website, and you will have the opportunity to make corrections to that transcript where necessary. Could I begin by asking each of you briefly to introduce yourself to the Committee?

Quinlan Terry: I am a practising architect; I have practised for 55 years. I sat on the Royal Fine Art Commission for three years.

The Chairman: We are being broadcast. Mr Prasad?

Sunand Prasad: My name is Sunand Prasad. I am also an architect. I have not been practising quite as long as Quinlan, but nearly—40 years. I was president of the Royal Institute of British Architects for two years between 2007 and 2009. Although I was not involved with the Royal Fine Arts Commission, I was a founding commissioner of its successor, the Commission for Architecture and the Built Environment, and was there for a little while. Currently, I just enjoy doing architecture.
The Chairman: It is not a bad job to do, is it? Thank you both very much. The first question I am going to ask deals with place design and heritage. What is your view of the quality of new housing and commercial developments over the past 30 years? Will the designs of today have heritage value in the decades to come? Are we doing well enough when it comes to making good places?

Quinlan Terry: We were talking outside. I think we have to say that over the past 30 years we have failed miserably. The question I should like to ask, not just to you but architects generally is: can you give me an example of a successful public space that has been designed over the past 50 years that is in any way comparable with Parliament Square, even Bedford Square, or the centre of Oxford, Cambridge, Bath or Edinburgh? The real problem is that we do not have a public space that is successful and has been built over the past generation.

The Chairman: Why do you think that is? Have the great British public suddenly decided that they just want blocks everywhere, or just want and need houses so badly that there has had to be a quick build and get on to the next lot?

Quinlan Terry: I think it comes on to other questions that you have raised about architecture, architectural training and taste. You ask in one of the questions whether we should do more to support good architecture. Of course, it gives rise to the question: what is good architecture? Unlike medicine, law or a lot of the other professions, architecture is in a state of tension between the traditional way of doing things, like the building we are in at the moment, and modernism, which is turning its back on historic traditions and doing the opposite. That has taken over the whole of our generation, so that, generally speaking, government, the schools and royal societies such as the RIBA, the Royal Fine Art Commission and the Royal Academy all heavily support modernism, thinking that this is the way forward. I think it is time that the Government reconsider their loyalty to the whole modern approach.

Q65 The Chairman: This question is not on the list of questions, but it strikes me: do you think that if we had been sitting around this table 50 years ago you would have made that sort of statement—that we would not be able to do anything—or do you think they were planning to build the Bedford Squares, Parliament Squares and Baths and all the rest of it?

Quinlan Terry: I think 50 years is not far enough back. Lutyens was vehemently against architects being qualified, because they get into an institution where they are brainwashed.
Really, you learn by working with an architect, which is what we ought to be doing. If you look at the great architects of the past, Palladio was a stonemason, Michelangelo was a sculptor, Raphael was a painter. Even thinking of this building, Pugin was an assistant to Nash, as was Barry. Barry was a draughtsman and expert on ancient buildings, which he went to measure, Vanbrugh was a soldier and dramatist, Wren was a mathematician and his clerk was Hawksmoor. I wasted five years at the Architectural Association and came out knowing less than nothing, but then I worked with the last serious classical architect, Raymond Erith. I was apprenticed to him and everything I learnt was practical. I watched him; I went to stonemasons and joiners, and talked to them. That practical world, which we see all around us in buildings like this, is not taught in schools.

It sounds a bit awful, but I think we would gain an awful lot by encouraging young people to work in an architect’s office, even a modernist, because they can see how it works and have their own point of view. We would gain an awful lot by getting rid of the schools that have taught nothing. What have any of the architectural schools achieved? I went to the best one and that was a waste of time, because it becomes a place where you employ architects who cannot do. I have probably said enough about that.

Sunand Prasad: I am going to be relentlessly cheerful. I do not want Quinlan, rather than the Committee, appointed to be the questioner, but he has made a number of points that are very well worth talking about. I start by agreeing that the condition of our public spaces, especially the more neglected areas of our cities, not necessarily the centres, is abysmal. We have very little to be proud of in the mass housing built even in the past 30 years. There are very few places of which you can genuinely say that the results of the planning system, the architecture and the patronage, whether public or private, are something to be proud of, to leave behind as heritage.

Having said that, the past 30 years are a very interesting slice of time. A great deal has been changing in the past 30 years. To start with public spaces, one of the real advances in schools of architecture, as well schools of planning, and also in practice and the public bodies that guide these things, is a real understanding of how much public space matters; how much the space between buildings is important; and what actually makes public space. Is it the geometry of it, the look of it, the way it is used, where it is or the connections, for example?
It is the sophisticated art of city-making and place-making that we are finally coming to grips with, after admittedly a period in the desert of tabula rasa architecture where good things were swept away, and there was little care for the spaces in between buildings, and where quasi-monumental buildings were built, whether for housing or something else. This is a radical transformation like, for example, the change in Trafalgar Square with the public space created in front of the National Gallery, or the removal of the concrete collar around Birmingham, the new setting of Selfridges and St Gilbert’s church and the sheer liveliness that has brought about. This is not an architect’s view. It is people who are voting with their feet to occupy these fantastic new spaces. Those are just a couple of examples.

I think style is a complete red herring in this debate. The quarrel between modernism and classicism, or current and traditional architecture, is really about style. There is so much to be learnt from history and classicism, from Pugin, Barry, Lutyens and all those forebears. We do stand on the shoulders of giants. I genuinely think that what is to be learnt from them is not necessarily or entirely the appearance of buildings—the motifs, the decoration and ornamentation—but the sublime combination of usefulness and beauty. How do we match that? The past is like a challenge. How can you do it as well in your own times with your own materials with new discoveries and new pleasures that are available, such as large glass walls which nevertheless can be managed to control the sun? There are large glassy outlooks and indoor spaces seemingly blending with the outdoors without interruption. This modern discovery is sublime and as fantastic as a Palladian villa or a Michelangelo piazza, if properly done. However, it is not very often properly done. One of the tragedies of modernism is that while there are some great practitioners, and every year we produce some fantastic buildings, they are very few in comparison with the mass of what is built. The mass is way behind the best, and that is because copying modernism is often a disaster, whereas copying classicism generally leads to success. I am using “classical” as shorthand. When you copy all the canons of traditional architecture—whether it is gothic, classical, Romanesque, Indian or Egyptian does not matter—you are unlikely to make too many aesthetic mistakes because they are an established language, whereas modern architecture is hard to copy and do well. I hope you do not mind me rambling on like this.

The Chairman: It is not rambling on, but we do have a timetable.
**Sunand Prasad**: To some extent, we have to catch up with the world as it now is. This quarrel and debate is almost in the past already. There is a generation of architects now who were never indoctrinated with modernism; even their teachers were not exposed to the hagiographies of the modern masters. They are genuinely dispassionate in this subject. I am interested to see what they are choosing. What they are choosing is a new synthesis of the old and new and the past and present. It is not either/or any more. I was party to the Farrell report. One of the most interesting and probably hidden chapters of that is this idea. It is not either/or any more, and we must seize that. It is a glorious thing to have happened. That argument has withered away. I am all for Quinlan’s architecture getting more air time, but it is not the Government who will decide; it is the market.

Can I say one final thing in defence of schools of architecture? Talking about trades, it would be wonderful if everybody learnt a trade before they became an architect. I have always believed that. I myself learnt a trade. Those who learn a trade may well become modernists because they may be inspired as much by pre-classical societies, by peasant construction, or vernacular architecture. The primitive hut is the origin of all architecture, where you put one thing on top of another and construct a simple shelter. In a way, that is nearer to some of the modern thinking about architecture than the classical language.

**Q66 Baroness Whitaker**: I want to pursue the question of the public realm. I would like to ask Mr Terry what he thinks of modern spaces such as More London and other areas of the South Bank, but my general question is this. The more iconic public realm buildings—magnificent places such as Trafalgar Square—have been very well done, but have the places where ordinary people live and work, in particular the relationship between where they live and where they work, been relatively neglected? Tourists have a marvellous impression of London—anybody who walks around the centre of it does—but the huge numbers of people who live in and around London do not get such a good deal from the current system. What is the view of both of you on that?

**Quinlan Terry**: It is a difficult one to answer. I would recommend, if they have not done so already, that everybody here familiarises themselves with the work of Create Streets. You may have heard of it. Create Streets is doing a great deal of research into exactly what you say about the place where Mr Average lives and the sort of place he can find to live. What has
come out of that is that it is not a question of density. They realise that there has to be dense building. In the old days there had to be a density of 200 persons per acre. They have found that the planning authorities seem to prefer multi-storey estates. They give lots of examples of the experience of people who live in those estates and their much greater preference for traditional terrace houses and streets, which is the more traditional way of doing things. The evidence is very convincing. We have to listen to these public consultations. They do MORI polls and things of that sort that show what people really want. I think that is important.

From an architectural point of view, crowds love to go to beautiful cities like Venice, Florence, Rome, Oxford, Cambridge and Bath. These are the cities that have been left alone, generally speaking, by modernist architects, and of course there is a limit to building height. You say the argument is over. Those cities have a very strong policy about the height of buildings, which sadly London no longer has. What one sees on the periphery of London with the permissions that have been given for very high buildings is a real tragedy.

Having recommended Create Streets, I would also recommend that more people, particularly government, listen to one man who my profession ridicules. His Royal Highness the Prince of Wales, who spends more time and effort than almost anybody on trying to make pleasant public spaces and areas for people to live in. If you have not visited Poundbury, I would encourage you to do so. It is not encouraged by the architectural profession. I suppose I am an interested party because I have done some of the work. It is a living community; 5,000 people live there. They have work, they have affordable housing and commercial housing, they do not have a high crime rate maybe partly because it is in Dorset. It is certainly worth moving forward and giving a lot of developers an idea of how they could develop, which we will have to do in the future, and take more seriously what Poundbury has done and what the Prince of Wales has said.

The Chairman: That is interesting. We have discussed trying to get him here as a witness, but I do not think that is possible. We have also spoken about writing to him.

Quinlan Terry: I know The Duchy would love to take you round. If you want it I am sure that could be arranged.

Sunand Prasad: I agree there is a greater problem outside the thriving centres of cities. We still have not understood how to make spaces between houses and buildings that are
genuinely loved by people, partly because we have not yet quite solved the problem of the car. Developments are still very car-dominated. In addition, the skills in dealing with the external spaces and landscape are undeveloped, and external space is underfunded. Nobody picks up the tab. That is a bit of a reflection on the extent to which our society feels collective responsibility for shared things. Public space is shared space and has to be funded. We have to find ways of properly funding it and making it of good quality. The classic example is that you have a private estate with Yorkstone paving and an adopted public highway that has tarmac on the paving. Tarmac is cheaper both to lay down but also to maintain. When the utilities come along and dig it up you can just dump a bit more on top and smooth it over. There is a lack of being ‘house-proud’ collectively; a lack of a real sense of what public space is and how important it is to people. That is missing.

**The Chairman:** Yesterday most of the members went to Elephant Park at Elephant and Castle in the rain and all the rest of it. I was very struck by the very point you make about place. The space did seem to be very inviting. I even remarked to you when we were walking back on the flagstones into building areas and hiding cars. Maybe things are beginning to get there. It has been a rush to try to get up to 400,000 new homes per year. This has been absolutely central to successive Governments. I remember the first meetings in the 1960s when I worked as an adviser to Tarmac. In mitigation, I do not think that the general populace does not care about it but that other things have taken precedence.

**Sunand Prasad:** Previously, yes, but we have been failing to build houses in such numbers.

**The Chairman:** We must get on.

**Q67 Lord Inglewood:** We have been talking about this very much in the abstract. Architecture is about concrete examples. Could each of you give us a couple of examples of good and bad so that we can physically look at it?

**Sunand Prasad:** I have given you a couple of recent examples of good public space already. One way to answer the “bad” question is: drop anyone from a helicopter almost anywhere on the outskirts of any town in the UK and they will see only highway-dominated spaces, poor spaces, business parks and retail outlets. Those are terrible; they are just not for people. They are there for the hermetic idea of arriving by car, getting into the shops and going out again. There is no care for the public space. Those are two examples.
The Chairman: Mr Terry, do you have examples of good and bad?

Quinlan Terry: I thought I had given a lot of examples.

The Chairman: You have given us the good: Poundbury. What about the bad?

Quinlan Terry: I can think of one awful one, which is Harlow new town by Sir Frederick Gibberd. It is always a knighted architect who does it. I can think of very little good work that has been done.

The Chairman: Thank you. If you do think about it, perhaps you could give us a hint.

Baroness Young of Old Scone: I was very interested in the anxiety about the current fashion for taller blocks. Do you think local authorities are doing them because they want to make buildings that are statements rather than functional, or are they building higher because they need to realise the value of the land as land values increase? How easy is it to get to those sorts of densities they are approaching with traditional build?

Quinlan Terry: It has been established—this is why I recommend Create Streets—that you can get the density required with a more traditional type of building. Five or six-storey buildings designed in terraces will give you the density that a point block will give you with lots of space all round it. I do not find the argument for high buildings very convincing. The other thing is that people hate living in them, with the lifts and the crime that goes on inside those spaces, whereas if it is more public, as it would have been in Georgian times, with Georgian squares and terraces, people are much happier and the space works.

Sunand Prasad: I would refer to a couple of things. One is a report called Superdensity, which is produced by a consortium of practices working in this area for a long time that started to become alarmed by the trend towards higher and higher density and taller buildings. It is a very thoughtful piece. It is not anti-tall building, but it approaches the whole subject in a very rational way, starting with the numbers. I am also a member of the London Mayor’s Design Advisory Group. We are currently completing a piece of work called “London’s Growth and Form”. A whole section of that is about tall buildings and the problems raised by their construction.

The tall buildings currently being built are very attractive to buyers, especially overseas ones, but this is slightly exaggerated. In the end, well under 10% of the actual built volume is being bought by overseas buyers. Savills and others have done the numbers. It is not the state
stipulating tall buildings; it is developers who are driving up these densities for very complex reasons. We have certainly heard evidence from Create Streets, many of whose principles I very much share, but it is not possible in the available land in London to meet the need for 50,000 more houses per year for 1 million people in the next 10 years or so—we do not know what happens after that—with three or four storeys and low-rise houses. If we went more for the pattern of Ladbroke Grove and Notting Hill, where there are beautiful streets with communal shared areas at the back, going up to eight, nine and even 10 storeys, but extraordinarily still making streets and public space, we would have a much greater chance. The identification of land in London for developing is a very big subject, but it has been thoroughly considered because of the now desperate need to build more houses. I refer you to those pieces of work.

Q68 Lord Clement-Jones: You have already mentioned the Farrell review, and I am sure you are both familiar with its conclusions. One of its concerns was that the built environment policy was not sufficiently well co-ordinated across government. I take Mr Terry’s point that it is difficult to define good architecture, but do you think that the Government are doing enough to support good architecture and design? If so, what more would you like government to do? For instance, one of the recommendations was that the Government should appoint a chief architect. Is that something that appeals to you?

Sunand Prasad: If I may answer the last point, there are three broad areas where government can be extremely influential in the outcome of our built environment. One concerns the money raised through taxes that is spent on buildings by Governments, not necessarily central government, as they devolve powers to the NHS and others. Taxpayer money is being spent in a way that you could say that the public estate is the biggest single client for all our built environment, amounting to as much as a quarter of annual construction expenditure. Do not quote me on the numbers—I am rusty on those—but it is a very significant number, billions of pounds of public money that is spent. If every one of those projects set out to be exemplary in the way they are commissioned and the client side is handled, government would revolutionise our world. It would have a knock-on effect and set such high standards. One of the biggest frustrations—I am sure Quinlan shares this—is that we know there is talent and ability out there that simply is not being captured for public benefit and the benefit of our
built environment. If government as a purchaser of architecture says that it wants to find the best but also to a cost, we can certainly say how that can be done. People have said over and over again that procurement has to be reformed. Some of the rules and laws will have to be looked at again, but that is a huge thing that government can do. There is no reason not to do it, because it would not cost any more money.

The second point is in the realm of regulations and so on. A classic example of how not to do it is the way the entire energy and thermal comfort regulations have been mishandled after a promising start towards zero carbon, for example. They have become overcomplex but diluted at the same time, with the result that the renewable energy sector is in disarray, and we as architects also lose ground when project managers say, “We don’t have to do that. Why make it more sustainable?”. There is another question about sustainability further down. The Government could do a lot.

The third point as regards potential government action refers to another of the questions that we received about the capacity of local authorities. In the end, central government delivers relatively little building. The vast amount of our taxes spent on buildings are channelled through the NHS, local authorities and so on. Local authorities and those bodies also deal with the whole of the private sector. There is undoubtedly a lack of skills. I appreciate that there is a problem here about how much central government can spend. I think central government could do a lot more to help devolved public bodies, administrations and local authorities to raise their game enormously at the very low end just by making best practice more prevalent; generally acting as a hub that can communicate best practice from authority to authority and from this to that NHS trust; and, more ambitiously, by directly intervening to help where we can see local authorities lack the skills. Local authorities do lack skills. They have been starved, and there is a huge chunk of work to be done there, and the Government could be very helpful.

**Lord Clement-Jones:** Chief architect?

**Sunand Prasad:** Yes. We have a chief medical officer, a chief planner and a chief construction adviser, which has just been abolished. That abolition is not a good signal.

**Lord Clement-Jones:** Sitting where?
**Sunand Prasad:** I would like them to sit in DCLG as the best of a number of unsatisfactory options in some ways. The chief construction adviser sat in BIS. That makes sense, but in a way that is why the place leadership council has been proposed in the Farrell review. There needs to be some mechanism to bring it together without creating some super-ministry or new cumbersome quango-type body. I am for a chief architect, or architectural adviser, but in the context of joining up with planners and constructors.

**Lord Clement-Jones:** I would like to hear from Mr Terry. Are you more sceptical about the power of government in these circumstances?

**Quinlan Terry:** Yes, I am. You want more freedom. Get back to the 18th century where you left architects alone, or important people did certain things. As to a chief architect, I made the point earlier, but it has not gone in, that there is a huge tension in architecture between good-quality traditional building and modernism. If you made me chief architect I would have a field day; if you made Richard Rogers chief architect he would do the complete opposite. Do not trust architects, because they are very opinionated people. You really want the clients to say what they want and choose the architect they want. It is not like going to a doctor; doctors are all pretty good. When you say, “I want a skyscraper”, fine; you go to someone like that. If you want a classical house that you want to live in you go to a different sort of architect. You cannot say that of any other profession.

**Lord Clement-Jones:** You would not have a chief government architect because they would be one side or another.

**Quinlan Terry:** They would definitely be one side or the other. There is no such thing as an architect who is not of one extreme or the other. You have two of them here.

**Sunand Prasad:** I could imagine a chief government architect whose role was not to arbitrate about the kind or style of building but it would be about process.

**The Chairman:** What would his role be?

**Sunand Prasad:** I talked earlier about how government can be a great client. I think the role of such a person would be to help government be a great client and put policies and, for example, research ideas in place.

**Quinlan Terry:** But it is not an architect. An architect feels about form and place.
The Chairman: We do not have fisticuffs here. All of us want to get involved in this particular debate.

Q69 Baroness Rawlings: To go back to sustainability, or the long-lasting, Mr Prasad, do you think the Government should be preserving good old architecture and converting old classical buildings, rather than making it cheaper to pull them down and give tax incentives basically to build new? What is your view on the tax position and pulling down all these buildings just to build something new because you do not have to pay VAT?

Sunand Prasad: Absolutely. Most of us would be unequivocal about this. If you are going to pull down a building, you must have a very good reason now, not only from the point of view of heritage, which is in itself an enormous reason. Look at what is happening round the world and the way heritage is being destroyed. We are going to emerge in centuries to come as the only place in the world with something like that still left, and we have to hang on to it.

Baroness Rawlings: They are pulling them down to build new because of VAT.

Sunand Prasad: The impact of VAT is catastrophic. I am completely opposed to charging VAT on refurbishment while there is zero VAT on new homes. The RIBA has been campaigning to get that changed since I was president. We have not succeeded. We have even found some evidence that tax revenues would go up if you equalised VAT because so much avoidance is happening because of this rule, especially with the higher rates now. From the point of view of sustainability you have to make a very good argument indeed to pull down old buildings and lose the embodied energy and carbon in them, but from just the historical point of view these are lodestones; they set standards that we need to aspire to.

Quinlan Terry: This is one thing on which I think we do agree. On sustainability, people do not realise that, generally speaking, modern construction and materials produce a building that lasts a few decades, whereas traditional materials—load-bearing masonry—produces a building that lasts for centuries. Whatever the talk about sustainability, if you are to have steel and glass buildings that have a few decades of life, you have to take that into account in the equation. A recent American report was done saying that the useful life of a steel and glass building is 25 years. Traditional buildings last for centuries and they can be repaired, but for a lot of these steel and glass buildings the whole problem is that the materials used in them—glass, plastics, aluminium and steel—have a very high coefficient of thermal expansion. When
the sun comes out it expands, when it freezes it contracts, and you have to have an expansion joint, which is its total weakness because water gets in. Therefore, you have a structure that will not last for centuries; it has to be constantly repaired with plastic seals over the gaps and glass having to be redone. The whole question of sustainability is part and parcel of the traditional versus modern tension.

**Lord Inglewood**: Is it desirable that every building should be conceived as being something that will endure for a very long period? Surely, in a quickly changing world there is an argument that with a lot of these sheds in 25 years you start again and do something completely different in line with the requirements of the world that number of years hence.

**Quinlan Terry**: I would say this building is a very good example of something that is built to last.

**Lord Inglewood**: I am not saying that nothing should be built to last, but is it right to start from the proposition that everything should be built to last?

**Quinlan Terry**: I agree there may be cases involving factories, but I live in a house that is 200 years old; my office is 400 years old. The office was also used as a shop. I have designed schemes. My Richmond scheme is mostly offices, but parts of it are retail and parts residential.

It is really a matter of what goes on behind the sash windows: a bed or a desk. Therefore, the traditional way of building in this country, which has gone on for hundreds of years, should continue in the way it did previously.

**The Chairman**: Do you not think that people are now accustomed to seeing this glass, steel and all the rest of it and would not want to go back? They think it will be retrograde to go back to the 18th century.

**Quinlan Terry**: There is no doubt at all about the place in which they prefer to live. This takes us back to Create Streets. They would rather live in a terrace Georgian-style house or construction than a glass skyscraper.

**Baroness Whitaker**: Are Frank Lloyd Wright’s houses now obsolescent? Have they collapsed?

**Quinlan Terry**: When you have a one-off architect like that it is difficult to say, but you are right; they are. Fallingwater is now falling apart. You can rebuild a glass building, but it means virtually starting again. It does not have the life that it would have if it was built with stone or brick and lime mortar, or slate roofs—all those traditional ways of the past.
**Sunand Prasad**: Can I put in a plea for this to be evidence-based and not rely just on views as to what does and does not last? I leave it to you. Please be evidence-based. We have a science of assessing buildings and doing post-occupancy evaluation to understand what is going on. It is not sufficiently widely deployed, but if we go back and learn from buildings, which we are doing, we are already collecting a lot of evidence that can bring some light into this debate.

**The Chairman**: Can I assure you that everything that we do in these scrutiny Committees is evidence-based. A lot of research has been done by the staff, so we are putting our own feelings in, in my case anyway because I am not an architect or anything like it. I can assure you that we would not quote anything or do anything if we had not tested it. If when you read the scripts you feel that this has gone wrong, perhaps you would highlight the points that you think we ought to think about as the reverse of the situation that you have described. Have I made my point clear?

**Sunand Prasad**: That is absolutely lovely.

**Q70 Baroness Andrews**: There is obviously a big issue for both of you about exactly how government can be effective. You talked about procurement. I very much take the point you made, Mr Prasad, about the integration of the historic environment with modern challenges and so on. I think it has been very successful in public space but not in out-of-town developments, estates, new build and so on. What government has been guided by and put some careful thought into is the construction of the National Planning Policy Framework. Indeed, over the past 30 years we have had statements about the value and importance of design in other bits of legislation, such as the Housing Act 2004 and then 2008. It is not that government has been unaware of the importance of design; there has been a massive disjunction between what government has hoped would be achieved without its own intervention and what has actually happened. The NPPF says quite clearly, “Planning policies and decisions should address the connections between people and places”. That is exactly what you have been about and what we would all like to see; it is about community building, building character, and building definition and belonging into places, but the only choices you have are planning, policy making and place-making tools. What else can we do within these legal and political frameworks that compensates in a way or incentivises people like yourself and those who implement these policies to get it right on the ground?
Sunand Prasad: I wish I knew the answer to that, because I came here thinking, “What new is there to say?”, because so many people have been tackling this subject. The formation of CABE was a very significant step. The realisation of places and spaces and the importance of those, rather than buildings, and the mistakes of modernism of the type practised after the war had already been revealed. What more can we do?

Policy is one thing, but I think actively building capacity is neglected. It is easy to make policy; it requires resources to help build capacity and have the right training so that, for example, when somebody applies for planning permission, or a group of people get together to develop a neighbourhood, those who are going to apply the policy levers know what they are doing. Policy without the means of implementing it is not going to get anywhere. We may well have good policies, but we are very short on real implementation of them. We have very good sentiments in many places, on the face of it, in legislation, but they are honoured more in the breach than the observance.

Baroness Andrews: Should we campaign for the restoration of CABE?

Sunand Prasad: We should campaign for the restoration of a body that achieves the kind of things CABE did, but not necessarily all of it. It may not be CABE if that is politically difficult, but many of us lament the disappearance of CABE and its very large and nationwide network of people who were beginning to champion locally the making of places.

Baroness Andrews: Design teams?

Sunand Prasad: Yes. My own view is that CABE became too large. It started delivering services to DCLG rather than remaining more of a knowledge, design and process-focused organisation. It became more of a delivery vehicle that had to hit targets. There would probably be little point in having a chief designer or chief architect as well as CABE. There are two or three ways of kick-starting all this. One of those would be to have an architecture policy of the kind RIBA recommended in Designing a Better Britain, which is another document that I am sure you have before you. The other one is to set up something like CABE, and another is a Farrell review-type option. I am evenly divided on those. It is the outcomes I am interested in. I think it could be achieved in one of two or three ways, but as to your sentiment about whether we should we have something like CABE back, yes.
Q71 Baroness Parminter: You mentioned earlier that we would come to the question of sustainability. This is it. Can I ask you to consider sustainability not just in the sense of longevity, which is an important part of it, but also in terms of minimising environmental impacts and tackling climate change? Do you think the criteria that the present Government have in place are sufficient to encourage environmental and business sustainability? If not, what particular criteria would you like to see? You mentioned zero carbon homes earlier, so perhaps both of you could touch on that.

Quinlan Terry: In a way, I think I have answered the big question, but your question is the more detailed one. Double glazing and all those things that reduce the dependence on burning fuel are achievable and are good. I think it is right that it is being done, but part of it is that sometimes the legislation brings in other problems. For instance, double glazing depends on a seal that has a guarantee of five years. Quite often it last 20 years or more. Nevertheless, in the case of buildings that are not owned by rich clients, in certain parts of America the double glazing in buildings has failed and people do not have the money to re-glaze them, so you are worse off than having single glazing. Like all these things, it comes down to a practical issue.

My main concern is about the traditional way of building. I need not repeat myself. If you have a building that lasts for centuries you have far fewer problems than if you have to rebuild and start again. There is not only the environmental process but the damage to the environment. Steel requires furnaces. Concrete, plastics and all these things need a vast amount of fossil fuels, bricks less so. Stone is in the earth and slate is there. The old world managed on a much less dependence on fossil fuels. In a sense it worked, although a lot of the details we now have are worth incorporating.

Sunand Prasad: I am dismayed by the way the whole picture of regulation and action on climate change has gone, especially in the past five or six years. I think there was real optimism shared by industry generally and a willingness to rise to the challenge of building really low-energy buildings and learning from the past as well as the possibilities of the present. That has gone from Government. A huge amount of action can be taken in this area if we really are to achieve this, by what I would describe as a society that genuinely learns from nature and that there is no such thing as waste in nature. Nature creates and when things die they help
regenerate the next cycle of life. The ultimate goal of creating a built world would be to match that ability and have a world without waste. There is an interesting slogan from WRAP, which is a government-funded programme, though I cannot remember what the acronym stands for.

**Baroness Parminter:** Waste Resources Action Programme.

**Sunand Prasad:** The slogan is: “Working towards a world without waste”. I think that is a fabulous slogan. Initially, it sounds like dustbins and things, but it is much more profound than that. You can see how materials are mined and harvested and can be recycled once they are used, and how you can use every single thing fully.

As to the criteria that you mentioned, we can work back from that and look at reducing energy to the minimum, reducing dependency on fossil fuels—i.e. having the energy we need come from non-fossil fuel sources—and changing our behaviour and being much more sensitive to the way we use energy and resources. Resources are not only about digging things out of the ground but also transporting them, the cost of transporting them, the fuel to do that, and how we handle the waste. Although the BREEAM technique, which all of you will know, is now a very important part of trying to make buildings more sustainable, it is too complex. It is too easy to game complex systems like that to achieve the results you want through adding bicycle parking or taking an action, whereas the focus should be on the main headlines of energy, water, waste and resources, and draw up criteria where they are the ones that matter. We need to develop a kind of literacy about such things so we understand, just like everybody understands how much houses cost, the implications and impacts of what we do in the language of tonnes of carbon, kilowatt hours, the volume of water we are using or the resources we are using.

**The Chairman:** Consumers’ bills are the biggest indication of the lot.

**Sunand Prasad:** Yes.

**The Chairman:** This is why renewable energy has such a bad name. You see your bill going up from, say, £150 a year to about £1,500 in the space of about six years.

**Sunand Prasad:** Meanwhile, in Holland there is a programme of the mass retrofit of buildings. If you like, it is a green deal properly executed and then put on steroids. Their stock does not have some of the great examples that we have. Many of the buildings we have cannot be
subjected to precisely the techniques they are using, but we can learn from it. In 10 days, with
minimum disruption to the occupant, they genuinely make their homes zero energy. Fuel bills
disappear; there are no fuel bills. Then it does not matter how much fuel costs because you
do not need any.

The Chairman: The great problem is that we are running out of time. Do you think you could
give us the evidence or reference for that?

Sunand Prasad: They are called renovation trains.

Q72 Baroness Young of Old Scone: We have already heard that you think that architects
need to be trained in a different way, in particular that they have exposure to other crafts and
skills. Is there anything more you would like to tell us about the need for changes in the way
architects are trained?

Quinlan Terry: The ideal is for them to go straight from school into an architect’s office, as
architects, like Pugin and Barry, always did in the past. I think that the five-year training of
architects is misconceived, because it is a practical subject. You are sitting down listening to
lectures by academics about all sorts of things, but when you get out of the institution after
five years you have to do working drawings of buildings. The architectural profession is now
saying that they find people coming out of the schools are almost unemployable. For instance,
in my office we have boys and girls who have gone to the local technical college, so they are
taught one day a week—we pay for that—and they do evening classes for three years, and
yet they work in the office. They are seeing what they learn in the evenings and one day how
it works out in practice on the drawing board, computers and everything else. Most of my
staff are invaluable; they have been with me for 30 or 40 years. They have never been through
a process of thinking that they are going to be designing the next multi-storey tower. They
have a humbler approach to what is expected and the really bright ones, like Barry and Pugin,
get to the top.

It would be helpful if government realised that, unlike other university courses—obviously
law, medicine and everything else have to be taught in an academic way—architecture is
much more practical. The high proportion of people who go through schools of architecture
who then do not do architecture means that an awful lot of money is being wasted on the
whole process of training. The best people can survive. In addition, you do not have to be an
architect to practise. You have to be a qualified doctor or dentist to practise, but you do not need a qualification to practise architecture; builders can put up a building, which is right and proper because, as in the old days, you wanted someone who had done something before. You would say you wanted a house or building like that. It is a long shot for government to understand that, but more people should realise that architectural training is not training like it is in medicine, law, languages and those things.

Baroness Young of Old Scone: I can see Mr Prasad leaping up and down.

Sunand Prasad: I disagree profoundly with that. We get the most fantastic young people coming to my practice after completing an architectural degree. They are some of the most passionate, engaged and open-minded people who in three years have learnt the fundamentals of a very difficult art, which is to understand the world through the medium of design. Design is not just the concoction or forming of something; it is about understanding the deep structures behind how things work, and then to deploy them to make something new. As to the teaching of that critical understanding about design, the schools of architecture in England, Scotland, Wales and Northern Ireland are probably the best in the world. People come here from all round the world. British architectural education, with the RIBA’s mark, is world renowned for very obvious reasons. I am a huge champion of architectural education. Some of the best schools give their students real hands-on experience. Architecture is not only about making buildings; it is about understanding communities, how cities work and the interaction between infrastructure and transport. The hands-on engagement of some of these students is exemplary in some schools of architecture.

However, we do have a problem. We are very poor at collaboration and working with fellow disciplines, because somehow the academisation of architecture, which I also partly lament—there I do agree with Quinlan—has denuded the profession of some softer skills of leadership, such as learning to work with others to realise how to marshal a whole team to get the best out of it. These things should be taught in schools of architecture. There is a lot of merit in a foundation course, or an early year, where all the disciplines work together. It is very difficult to do. People are trying, however. I would refer you to a couple of reports: the Edge report on collaboration, which I am sure you have, and the SCHOSA report on pathways and gateways. That is a revolutionary idea about changing the structure of architectural
education. It would be the first major reform since the Oxford conference of 1958. It is changing things so a student may not need five years of academic study. There would also be other ways into architecture, including on the tools and through practice and part-time ways, which would make the profession more aware of all the different ways of doing things and collaborating with others.

One of the big changes I would like to see is for the Architects Registration Board to be absorbed into the RIBA, with the RIBA also putting in place the right kind of governance to make sure it is not captured by the profession and there is lay oversight. We have the schools of architecture, we have the regulation of education and we have the gatekeeping of entry into the profession. There would not be the current three-cornered arrangement where ARB sits over here as a mini-quango, the RIBA sits there and the schools over there, with a confusion of roles. It would clarify the whole thing and make the RIBA more accountable for architectural education and entry into the profession. At the moment it can say, “ARB is responsible for taking into account European laws. Somebody else is causing this problem. We could reform everything tomorrow if it was not like that”. Let it be their sole responsibility and hold them to account for the quality of architectural education, which is fundamentally sound but hugely lacks a number of things such as collaboration, awareness of cost and the implications of what you do. You go through a school of architecture without ever designing a building to a cost. This seems barmy. Clients want to know from an architect what is possible within their means and resources, and architects must respond to that.

The Chairman: Can I thank you both most sincerely? I am afraid that old Father Time has killed us off. I think that reflects badly on the Chairman not being able to manage it very well, but it has been so interesting to all of us. The two issues we have not managed to tackle are the health of buildings and buildings for health.

Baroness Whitaker: If we could have a note on providing skills in local authorities that would be helpful.

The Chairman: I was just about to get to that.

Baroness Whitaker: That came before.

The Chairman: I am working back. The big thing is consultation to get the public involved. Several sessions have emphasised this. I think there is unanimity in their approach, but we
will have not got a real handle on how it should be done, and whether it is going to be of any use. I have probably overloaded you with suggestions. If you could get in touch with us, even with just a three-liner, to direct us to so and so, it would help. You can see that we are finding our feet. We still have a lot of time before we finish evidence sessions. We do not have to finish the report until 23 March, which sounds an awfully long way away, but there is so much. I want to thank you particularly for coming here. It has been terrific, inspiring and fun. Thank you very much.

17 September 2015
Introduction and context

This submission by Peter Brett Associates recommend that future built environment policy be more integrated to meet two major challenges with one integrated policy response. The two challenges are the housing crisis and the future of our town centres.

Peter Brett Associates (PBA) is at an advanced stage on a project for DCLG on overcoming fragmented ownership. This came about as a result of the firm’s Thought Leadership paper on getting investment back into the High Street. The outcomes will be reported in due course.

This submission comes from the author of that report and outlines the challenges and suggests that the Localism agenda provides the potential for a new kind of process to restructure and adapt town centres that are fit for the future, while accommodating housing growth.

In terms of the questions, we would comment:

1. Government should set out a clear statement (say in a Written Ministerial Statement) that recognises that structural change is necessary in our town centres and that an asset management approach, as advocated here, is part of the answer. Action should be local within the context of a supportive national policy framework.

2. Policy for housing and town centres should be better linked.

3. The NPPF could be more specific about the measures necessary to tackle town centres.

4. No comment

5. Retail forecasts in plans can be reasonably robust over 5, even 10 years, but need reviewing every 5 years. This ties in with housing assessments.

6. A major constraint on housing supply in urban areas is land assembly. This submission focuses on that acute constraint in town centres.

7. Government needs to recognise that some form of intervention will be necessary to overcome land assembly constraints, in the context of local support for such action.

8. No comment

9. Yes

10. No; in relation to town centres and housing this submission advocates new tools.
11. This submission advocates taking advantage of the neighbourhood planning process to attack the twin challenges. Encouragement to local business communities to focus on their town centres is needed.

12. The processes are there. Local authorities could give more direct support.

13. The biggest obstacle to restructuring our town centres and accommodating more housing is fragmented ownership and thus land assembly – Government needs to be more encouraging about the use of current tools (like compulsory purchase) to overcome them. The response to the recent CPO review would be a real opportunity.

The High Street Challenge

There are significant macro-economic forces (the pace of which are increasing) putting pressure on our town centres – not least, polarisation, retail portfolio restructuring, the internet. All are posing serious challenges to our town centres’ ability to adapt: to deliver space suited to demand, to secure a better occupier line-up, the ability to respond rapidly to change, improving overall experience.

Many retailers need fewer physical outlets (and focused in bigger boxes, often in bigger centres or on retail parks); some retailers are not surviving at all; some don’t need any space; and major players increasingly care about their neighbours, dictating ‘pick lists’ on who they would like to be next to.

These trends accentuate a growing challenge to town and city centres’ ability to successfully adapt to change. There are too many town centres where vacancies are high, performance is sub-optimal, the experience is poor and, with too many shops (and often too many are too small); and with many parts of our town centres looking tired and much of the established centre in need of investment.

Our High Streets have been shaped by the past, they are now trapped in their current configurations and are in poor shape to face the future.

Shaped by the past, trapped in the present, threatened by the future.

The retail/leisure/property/investment sectors are agreed that the future of town centres is no longer mainly about retail. It is more likely to be as much about leisure, living, learning and local services.

A core obstacle to change, and attracting the investment to enable adaptation, is fragmented ownership. At the heart of this report is the development of a model to overcome this barrier and at the same time create a basis for attracting investment back into the High Street: an approach we have called Town Centre Investment Management.

---

Restructuring town centres

In many town centres there are simply too many shops, especially in tertiary areas. Often the geography of the centre is too strung out and dominated by vacant or underperforming units. In some town centres there is a need for reduction. That requires re-structuring, potentially on a significant scale in some cases.

There are opportunities, however, in these areas for new and complementary activities and facilities that could serve a more compact core—new housing, open space, education, local services, even a surface car park:

![Diagram of town centre restructuring](image)

Redevelopment of peripheral areas – the report later refers to this as Zone B – is likely to be the most effective means of restructuring these areas, which can present a significant opportunity for accommodating housing growth, or adding missing leisure facilities.

Planned decline might be managed through use of the planning system, such as Local Development Orders, for example.

Adapting town centres

Take a typical struggling High Street - a poor environment, some empty shops, and sub-optimal mix, with no related parking or toilets. There is often too little scope to adapt the stock, re-allocate the space (curating), improve the environment and create a better overall
offer because most of the units are in separate ownerships, some even in the hands of an absentee landlord.

The basic idea of moving from a struggling to a successful High Street is illustrated in the Policy Exchange’s Report[^403].

![Diagram of Struggling High street vs Successful shopping centre or high street]

Source: Policy Exchange - 21st Century Retail Policy

Town Centre Investment Management (TCIM)[^404] is a tool to overcome fragmented ownership and harnessing the power of an asset management approach to achieve the transformation. It involves pooling a critical mass of assets that allow the investor to adapt the stock, curate the occupier mix, asset manage the investment and market the destination to improve the area's performance.

This approach is only currently achieved in shopping centres and, in very limited locations, conventional streets (see Technical Report case studies). Such an approach involves creating a new holding vehicle of the newly pooled assets that attracts new investment - a key to the successful future of our High Streets.

**Accommodating housing growth**

Town centres are accessible places suitable for densification and accommodating more housing. There is considerable scope for combing the restructuring of our town centres – principally focused on ground floor activities – with developing new housing.

In 2014 the Greater London Authority (GLA) commissioned Macceannor Lavington with Peter Brett Associates to address the twin issues of retail reconstruction in town centres and

[^403]: Investing in the High Street: Town Centre Investment Management and its role in delivering change. A Thought Leadership paper - Peter Brett Associates. 2013
the need to find more land for housing. The report\textsuperscript{405} showed the way the twin issues of restructuring town centres and increasing housing might be tackled.

Source: Macceannor Lavington, architects

Town Centre Investment Management was one of the solutions recommended as a means of overcoming the common obstacle to assembling sites for housing in town centres and retail/commercial uses, is fragmented ownership.

\textsuperscript{405} http://www.wolvertonpark.co.uk/wolverton-park.html
Town Centre Investment Management

The essence of Town Centre Investment Management (TCIM) involves adaptation through asset management. This is achieved by pooling a critical mass of assets, which enables their asset management, marketing, and curation as a single entity. In doing so, it overcomes fragmented ownership.

Town Centre Investment Management involves the pooling of a critical mass of property assets into an investment vehicle that allows the stock to be adapted, the mix of occupiers to be curated, the investment to be asset managed and the destination to be more effectively marketed.

By the creation of a new entity – a partnership, company or REIT typically - it becomes an investment vehicle that can attract funds into the project and thus back into the town or city centre.

TCIM process

Asset management is quite distinct from facilities management: Facilities management involves town centre management techniques, which typically focus on “crime and grime”, and often involving public realm improvements, shop front upgrades, security, cleansing and events, often run by a town centre manager, a Town Team (or equivalent) or Business Improvement District (BID). However, these cannot address the fundamental structural weaknesses of many centres, such as too many shops, poor configurations or sub-optimal occupier line-ups. Currently, outside London investors are not members of BIDs.

The opportunities through localism
The Localism agenda provides a significant new opportunity to tackle the serious and pressing current issues of town centre restructuring/adaptation and accommodating housing growth. There are two min tools:

1. The preparation of Business Neighbourhood Plans offer significant advantages - the involvement of both business and local residential communities, resulting in a statutory development plan and the delivery of a mandate for change via a Referendum.

At present too many communities are failing to focus on their town centre, rather preparing general plans for a wide area.

2. Where TCIM-type interventions are planned, the local community can make Neighbourhood Development Orders (NDOs), granting consent for physical and land use changes and adaptations.

The essence of the TCIM model is the pooling of a critical mass of freeholds in a given area of the town centre, to gain dominant position, together with selected leasehold and other interests sufficient to implement the required degree of change.

However, the pooling of fragmented ownerships may not always take place voluntarily and so compulsory purchase may be necessary as a backstop. The process of preparing a plan and its support through a referendum means that any compulsory purchase action is promoted from the bottom up and involving those affected — not some bullying tactic from above.

06 October 2015
Introduction

1. The Place Alliance's submission looks at how the Alliance is addressing the future challenges and priorities for built environment policy, the primary focus of the Committee. It reflects on the role that Place Alliance could play to help fill the design / place leadership gap left by the demise of the publically funded Commission for Architecture and the Built Environment (CABE). In doing so it addresses question 10, as posed by the Select Committee: “Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?”

The Place Alliance: A Movement For Place Quality

2. The Place Alliance is a new movement which emerged from the Farrell Review of architecture and the built environment. It brings together organisations and individuals who share a belief that the quality of our built environment has a profound influence on people’s lives. Place quality has a value - cultural, economic, environmental, social - that needs to be recognized by everyone. The Alliance believes that through collaboration we can create and maintain better places. We aim to establish a culture whereby the quality of our places becomes a national priority.

3. By place quality we mean the recognisable and desirable qualities that the most successful parts of our villages, towns and cities share. They are: friendly (open, cherished and characterful); fair (inclusive, healthy and low impact); flourishing (adaptable, dynamic and diverse); fun (vibrant, playful and stimulating); and free (safe, accessible and democratic) (see Place Matters).

4. To promote better place quality, Place Alliance supporters share knowledge and support each other to demand and realise buildings, streets and spaces that enhance the quality of life for all. Together we aim to:
   • Inspire and raise aspirations for places
   • Support dialogue and collaboration to improve place quality
   • Build and share evidence, knowledge and resources
   • Influence policy, practice and behaviour to achieve better place quality
   • Be open and accessible to all interested individuals and organisations.
5. The Alliance is pursuing self-support mechanisms to exchange and coordinate, harnessing the power of innovation and technology. As a voluntary association of supporters we operate in a network sustained by a
   - Core supporter group, hosted by University College London (UCL)
   - Management group at UCL
   - National network of universities, and
   - Regional networks and regular national meetings ("Big Meets").

6. In its first year, the Place Alliance has covered much ground. It acts through multiple working groups which promote exchange between people across the country who are working in groups on Place Quality initiatives. Current working groups taking forward several post-Farrell Review activities are:
   - Design Literate Leadership: this group led by Councillor Sue Vincent is producing a primer to support local government in their vital role in place.
   - Healthy Places Group: is looking at the links between good design and good places and people’s health and wellbeing, and is chaired by Debbie Sorkin. A draft Healthy Places Manifesto has been produced[^406].
   - Urban Rooms Network: this group provides a network to bring together the diverse initiatives that are starting to emerge. It is chaired by Carolyn Butterworth, University of Sheffield. As well as sharing practice and offering support, it promotes the value of Urban Rooms to others.
   - Place/Design Review: sharing expertise, skills and resources to review and help improve the quality of place across the country, chaired by Ben van Bruggen.
   - University Network: developing universities’ many roles in place quality, with teaching, thought leadership, campus and city estates, as well as cross-disciplinary working and public outreach.
   - Housing Group: the latest group to be established, chaired by Steven Bee.
   - Artists and place-making: a comparatively new group chaired by Robert Powell, it has produced a "New Manifesto for the Public Arts" (to be launched 16th October), with the aim of launching a national debate on the arts and place.

7. Apart from its working groups, the Alliance is working on a programme that includes:
   - Establishing a Place Alliance website [https://www.bartlett.ucl.ac.uk/placealliance](https://www.bartlett.ucl.ac.uk/placealliance)
   - A national survey to map the 'place sector' and its resources
   - Developing and trialling a tool to promote dialogue about place, "TalkPlace!"
   - Drafting and agreeing a new vision for place quality, Place Matters
   - Building a network of local Place Alliance hosts using universities

• Exploring the viability of an Open Source Place Resource website, based on the Trip Advisor model
• Engaging with government
• A twice yearly programme of Big Meets

8. Big Meet 4 (27th October) will address issues of housing design quality, and devolution and the place agenda. The event will be a chance for Place Alliance supporters from across the country to get together for networking and exchange. We look forward to welcoming the Minister for Housing and Planning, Brandon Lewis MP, as a speaker.

9. The third ‘Big Meet’ of the Place Alliance was held on 24th February 2015, at UCL. Big Meet 3 was well attended with 104 people coming from as far as Scotland and Cornwall. They represented 81 different organisations, and several independent individuals. The minister of state for the Department for Culture, Media and Sport (DCMS), Ed Vaizey MP, opened the event with a short address and then took questions.

10. First results of the mapping exercise were reported, as well as the progress of work towards the common goal of improving place quality and the Farrell Review. The whole Big Meet discussed the national survey or ‘mapping exercise’, put forward future trajectories for Place Alliance work, and participated in the first of the nationwide TalkPlace! exercises.

11. Throughout the year outreach work has been carried out, and meetings have been held with many organisations including the British Academy, Commonplace, The Design Council, Heritage Alliance, Heritage Lottery Fund, the John Muir Trust, Landscape Institute, Royal Institute of British Architects, Royal Town Planning Institute, and many more most of whom are now formally supporters of the Alliance.

Place exemplars

12. In advance of a meeting with Brandon Lewis MP, in July 2015 the Alliance asked its supporters to suggest exemplars of initiatives where local communities have been successfully brought into the planning, development and design of their areas, and where local powers have been used to positively shape places. The report, "Place exemplars as nominated by Place Alliance supporters", compiles the resulting collection of exemplar projects into three categories:

1. Housing and mixed use developments
2. Streets and public spaces
3. Local place shaping processes.

A link to the report is provided in the Annex section at the end of our evidence.

Five key lessons for place quality
13. As stated in the report, together the exemplars reveal five simple lessons for place quality:

- **Key lesson 1:** it is the holistic qualities of place that matter, rather than stylistic preferences; places should be friendly, fair, flourishing, fun and free.
- **Key lesson 2:** national Government sets the tone (through policy and action) that others follow. Government needs to demonstrate greater leadership on place quality.
- **Key lesson 3:** good place-making almost always involves positive public sector involvement and clear local leadership. Design capacity in local government is key.
- **Key lesson 4:** good place-making almost always occurs within a context of joined-up professional thinking and collaboration.
- **Key lesson 5:** a long-term commitment to place implies engaging the community early and considering the on-going stewardship of place.

Good places do not happen by accident, they need to be well designed with sustained investment from the public and private sector. When this happens, they deliver long-term economic, social and environmental value to communities. This has the potential to repay the initial investment many times over.

14. While the examples in the report seem good models, we do not know how representative they are, or how widespread good practice is. We are not aware of anyone doing research in this area, so we do not know if the situation is as bad as generally believed. We believe some sort of survey of what is going on is needed.

**The role the Alliance could play**

15. The Place Alliance is an embryonic movement, with significant potential to lead a new focus on place quality. The Alliance offers the means to bring together the multiple agencies of government who share responsibility for place quality, enabling a national conversation about place quality, and to support local leadership.

16. The Place Alliance has delivered its programme with a tiny budget of some £25,000 in its first year (the majority provided by UCL) and through sharing resources with its supporters.

17. As identified in the Farrell Review, and UCL research\(^{407}\) there is a leadership gap where the quality of the built environment is concerned. As an alternative model to the establishment of the role of Chief Architect as proposed by the Farrell Review or a new CABE-type

\(^{407}\) [bit.ly/EvaluateCABE](bit.ly/EvaluateCABE)
organisation, the Alliance offers a more representative and holistic means of providing that leadership, bringing together as it does all built environment disciplines, and all those with an interest in place quality.

18. The Alliance has asked the Government to formally recognise the importance of place quality, by engaging positively with the Alliance and publicly acknowledging its role, and consider working with the Alliance in developing policy through our networks. We are pleased to say this engagement has been positive; we have held meetings with the Minister for Housing and Planning, Brandon Lewis MP, the Chief Planner at the time, Steve Quatermain, DCLG and DCMS officials. Brandon Lewis and Ed Vaizey MP have attended Alliance events.

19. However the Alliance's role could be developed if more organisations became involved, and if there was greater official endorsement of what the Alliance is doing. Developing national place leadership through a collaborative economy model is an experiment, but the movement that has grown out of this in just 12 months and with virtually no resources is inspiring.

20. Whilst UCL has supported the establishment of Place Alliance through offering space and resourcing its administration for two years, this generosity cannot last. The model has been tested and found to be viable and now Government should be called upon to 1. Emphatically support the work of the Place Alliance 2. Enable its further development as a potential national place leader for England through providing funding in order to grow the movement and fully test the collaborative model.

Annexes

A. "Place exemplars as nominated by Place Alliance supporters":

06 October 2015
Submission to be found under Beam, Farreells and The Place Alliance
Places For People – Written Evidence (BEN0066)

Places for People is one of the largest property management, development and regeneration companies in the UK. We currently own or manage more than 140,000 homes and provide services to over 500,000 people. We have assets of more than £3.3 billion. Our vision is focused on ensuring successful places and enabling people to reach their potential. We have a long track record of successful development and a solid reputation for delivering large-scale development in towns and cities. Our approach goes much further than simply building homes. We look at what an area needs to be able to thrive — whether it is new schools, shops, leisure facilities, job opportunities, and access to learning and training or specialist support services. We were named Housebuilder of the year 2013 and Landlord of the year 2014.

We welcome the opportunity to submit evidence to the Committee’s inquiry into the development and implementation of national policy for the built environment. Any queries with regards to our submission should be addressed to:

David Cowans

Our response

Policymaking, integration and coordination

Question 1: Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

1.1 We believe decisions should be made at the most local practical level and we support the government’s continued approach towards devolution of responsibility for planning, for example to City Deals. However, Local Authority Planning Committees are not always well placed to understand the wider geographic and political context and there can sometimes be conflict between neighbouring localities. In these circumstances Government has a role to support negotiations.

Question 2: How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

2.1 There needs to be greater join up, including more effective data sharing, across all those Government departments and agencies which have a role in matters such as housing, design, transport, infrastructure, sustainability and heritage. The NPPF and related planning process has improved cross working but it is essential that some of the silos at local level are broken down to ensure more strategic cross working.
National policy for planning and the built environment

Question 3: Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

3.1 Yes, although it is often used as a guideline but not always enforced. The NPPF had a presumption in favour of sustainable development and clear guidelines on the built and natural environment. We need to ensure planning guidance reinforces the standards.

Question 4: Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

4.1 People want to live where the jobs are, and this can place huge pressure on housing supply, infrastructure and services. Whilst there are benefits to having a more spatially driven planning system, we recognise we are in an age of localism. It is worthy of note that Scotland has a national plan which drives economic investment.

4.2 The pressures on housing in London and the South East suggests a complete review of the location and function of Greenbelt should be undertaken to set robust, long term boundaries.

Question 5: Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

5.1 In our experience planning is often too short term, reactive, and driven by low levels of resources in local planning authorities. However we recognise there has been some positive movement following the introduction of the Five Year Land Supply, and local plans, which are welcomed. Government should ensure all local plans robustly plan for the whole plan period.

5.2 We would like to see longer term planning but we recognise this can sometimes be difficult to realise given unforeseen changes in the external environment and government policy.

Buildings and places: new and old

Question 6: What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government
level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

6.1 Land release is key to meeting the country’s future housing needs and we would urge government to put in place more effective measures to review and assess all land which might be available to meet local housing needs. However as the market becomes more buoyant, there is a danger local authorities will not have the resources to deal with increased planning applications.

6.2 Central Government could boost the supply of new housing through targeted tax incentives. Tax incentives work at scale in other countries. In France and the US in particular tax breaks are available for all types of suppliers and investors to boost the provision of affordable rented housing. They come with incentives to supply good quality accommodation for those in housing need. We have carried out extensive research in this area, with our partners, DeMontfort and Cambridge Universities which has convinced us that there is merit in exploring how such an approach could work in the UK.

**Question 7: How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?**

7.1 Whist Permitted Development Rights have produced good opportunities to accelerate short term housing delivery by setting them up outside of the local authority planning system, this means a Local Authority’s ability to work within the developer to secure long term social, infrastructure, amenities and governance arrangements are often limited.

7.2 The concept of lifetime homes and neighbourhoods can change but we now should perhaps look at other technology as well as design innovation to help ensure neighbourhoods and home care meet their future residents’ needs.

**Question 8: To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?**

8.1 Heritage assets have a key role in defining the character of a place, however it is more expensive and time/resource intensive to develop these sites. One way to overcome this barrier could be to use tax incentives (eg VAT) to maximise the use of the historic environment in terms of future planning, regeneration and place making as it can be more expensive.

8.2 Places for People has preserved the heritage and history of Wolverton Park in Milton Keynes, turning the shed which once housed The Royal Train and the surrounding area into
award winning homes, restoring the original ethos of community that once defined the area. You can find out more about this development here.408

8.3 Success stories such as this need to be shared publicly to encourage more redevelopment projects of this kind.

Skills and design

Question 9: Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

9.1 We believe the level of skills of the current workforce are generally sufficient to consider the built environment in a holistic manner, however the issue is local authorities are cutting their planning departments as a direct result of budget cuts.

9.2 Lloyds Bank has produced a report ‘Building for Growth’ (Sept 2015) which shows a severe skills shortage within the housebuilding industry could hinder plans to create thousands of new jobs in the industry in the next 12 months.

9.3 We welcome the Government’s commitments on apprenticeships. These are a vital part of the work to demonstrate successful career paths in the construction and design industries in order to grow and attract talent into the sector.

Community involvement and community impact

Question 11: Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

11.1 Housing impacts on life expectancy. The placemaking and housing system needs to focus on securing health outcomes through the planning process. Through our investment in Places for People Leisure we have strengthened the relationship between health and wellbeing and housing and neighbourhood sustainability.

11.2 We support the work the TCPA has done on re-uniting health with planning and we would encourage government and developers to use the resources which have been developed as part of this work.

408 The Farrell Review, 2014, p.75
Question 12: How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

21.1 There are few barriers to high quality public engagement, however time and cost could be seen as a barrier for some organisations. A common issue is communities not being involved at the right stage. Failure to engage communities early in the planning process can often result in them objecting to planning applications after decisions have been taken. Developers need to engage communities at the planning and decision making stage as this could then accelerate planning applications.

Financial measures

Question 13: Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

13.1 Volume house builders, by focusing on housing for sale, will always prioritise short term profit over long term investments as they see this as a cost burden. We have shown through our developments how investment in well designed, high quality homes with upfront investment in infrastructure and public realm, does demonstrably deliver a value premium. As more long term investors such as pension funds and institutions enter the residential market, the value creation seen in the rental and commercial sectors which drive stronger, long term yields, will almost certainly influence the specification of new homes.

13.2 We recommend the Government establishes a Housing Innovation Fund where a small amount of resources are available to try new ideas in the field to support a constant stream of innovation and research in practical ways to identify and trial better ways of providing supply and demand solutions in the housing market. This could be implemented quickly within existing resources to demonstrate a commitment to bringing new and innovative thinking into the sector.

13.3 There is also some merit in some pump prime funding to support innovation in housing production for example supporting growth in the self-build market; exploring innovative financing mechanisms; and mainstreaming off site construction techniques (which also have the capacity to impact on UK global competitiveness).

Planning Inspectorate – Oral Evidence (QQ276-282)

Members present
Baroness O’Cathain (Chairman)
Baroness Andrews
Lord Clement-Jones
Lord Freeman
Lord Inglewood
Earl of Lytton
Baroness Parminter
Baroness Rawlings
Baroness Whitaker
Lord Woolmer of Leeds
Baroness Young of Old Scone

Examination of Witnesses

Mr Chris Shepley CBE, former Chief Planning Inspector and Chief Executive of the Planning Inspectorate (1994-2002), and Ms Katrine Sporle, CBE, former Chief Planning Inspector and Chief Executive of the Planning Inspectorate (2003-11)

Q73 The Chairman: Good morning and thank you both very much for coming here. Welcome to this evidence session of the Select Committee on National Policy for the Built Environment. You have in front of you a list of the interests that have been declared by members of the Committee. A transcript of the meeting will be taken and published on the Committee website. You will have the opportunity to make corrections to that transcript where necessary. I begin by asking each of you briefly to introduce yourselves to the Committee, please, for the purposes of the transcript.

Mr Shepley: My name is Chris Shepley. I am a former Chief Planning Inspector, between 1994 and 2002. Before that I had a career in local government and since then I have been a private consultant.

Ms Sporle: Good morning; I am Katrine Sporle. I, too, was Chief Planning Inspector and Chief Executive of the Planning Inspectorate, between 2003 and 2011. Prior to that I was Chief Executive of a local authority, Basingstoke and Deane Borough Council. Since then I have
been, for the last four years, the Executive Director and Chapter Clerk of Salisbury Cathedral, dealing with the major repair programme, the Magna Carta celebrations for 2015, and the masterplan for Salisbury Cathedral. I have recently been appointed as the Property Ombudsman, and I now deal with alternative dispute resolution for citizens’ redress in the property sector for the retail sector, for lettings and sales, removal companies and other things besides.

The Chairman: Is that national or is it local to the Salisbury area?

Ms Sporle: It covers the United Kingdom, with some international jurisdiction as well.

The Chairman: The United Kingdom of Great Britain and Northern Ireland?

Ms Sporle: Indeed.

The Chairman: Well, thank you very much for giving up your time to come and see us. The first question is from Lord Freeman.

Q74 Lord Freeman: Good morning. I am going to ask a question based on your distinguished past service in planning. What role should the Planning Inspectorate play in the planning system and how does this contrast with the role it actually plays?

Mr Shepley: The Planning Inspectorate plays a variety of roles in the planning system. Its fundamental role is as a quasi-judicial decision-making body, a dispute resolution body, which sorts out the problems that arise in all parts of the planning process, whether through the development plan or planning appeals or whatever else. When the Planning Inspectorate is dealing with development plans, it operates a kind of quality control mechanism. The Planning Inspectorate ensures that local plans and development plans are properly prepared, that there is proper consultation, compliance with national policy, the duty to co-operate and so on, and no doubt we will talk about all of that later. Only a relatively small number of cases come to appeal but, when it deals with appeals, obviously it is a dispute resolution process which deals with the most difficult cases and which tries to resolve them on the basis of the evidence. When it deals with strategic infrastructure projects, it has a slightly different role. It seems to me that all of those things are a pillar of the planning system: they are crucial to its operation. They maintain a level of quality, ensure there is proper research, proper background to policy, that things are thought through properly when appeals are dealt with. It brings a discipline to the appeal process. It ensures that local authorities do not make
ridiculous decisions, by and large, and that applicants, by and large, do not make ridiculous planning applications because they know there will be a proper examination at the end by a professional planning inspector.

Finally, underpinning all of that, my own view when I was doing the job was that it was the quality of and respect for those decisions that the Planning Inspectorate offered, effectively—it was the thing on which the whole Planning Inspectorate was based. I had many tasks but I saw my main one as being to maintain those standards of professionalism, integrity, openness, fairness, impartiality, timeliness, all of that; so, although there are always going to be disappointed parties at the end of any planning appeal, and disappointed people at the end of local planning inquiries and so on, none the less, they at least respected the decision and understood that it was professionally and properly made.

Lord Freeman: Therefore, in an ideal world, would you like to see any changes in that role—any enhancements or developments in particular aspects of it?

Mr Shepley: No. The second half of that question is interesting: how does the role that it plays contrast with the role that it should play? I think the role it plays is the right role. I do not see any problem with that. It is a changing role, and there is another question about that later. New things come along and the Planning Inspectorate has to adapt, and will continue to adapt. When national strategic infrastructure projects come along, you have to understand and implement new procedures but none of that is a problem. Given the way that the inspectorate has underpinned the planning system for over 100 years now, I do not see any current need significantly to change the way it operates.

Ms Sporle: I have to say I agree with all of that. What I can add, from my own perspective, is that what it is not is a national planning authority and, in my view, it never should be. Those two things are partly about fine lines, although I think it is really important to keep clarity of thought on the matter. I do think there are lots of areas of the Planning Inspectorate where there is real expertise that could be used better on a national basis, but that is different from the Planning Inspectorate being a national planning authority, as I say, which it is not and should never be.

Lord Freeman: Could you give some examples of how it could be used better?
Ms Sporle: I think there is an enormous scope for influence for the Planning Inspectorate but, where there are sensitivities and suspicions, you get an awful lot of interference in allowing that expertise to come forward. I can remember, as Chief Planning Inspector, being watched very closely to make sure that I did not have meetings with a particular part of the development industry. At the time it was particularly the wind farm industry, which wanted to make sure that I could never speak to anybody without them knowing what I spoke about. There was also a lot of: “Surely she doesn’t speak to the Secretary of State about a Secretary of State case. Well!” These are silly things, because there is a need for open dialogue and, of course, some very experienced inspectors have a wealth of expertise that they would share.

The Chairman: But do they?

Ms Sporle: They do not tend to. Inspectors feel they must keep anonymous to a large degree. For whatever reason, there is less emphasis on the learning from the inspectorate that could be shared, and that goes across the piece.

Baroness Whitaker: I would like to ask a more fundamental question, and if you would rather consider it and write in later, that will be perfectly acceptable. I would like to know how the Planning Inspectorate should conceive of the public good. Is it, for instance, the resolution of conflicts of interest or is it better place-making? Could those two concepts militate against each other?

Mr Shepley: How should the Planning Inspectorate take into account the public good?

Baroness Whitaker: No, how should it conceive of it. What is your idea of the public good? You are a public organisation, after all.

Mr Shepley: I step back a little from that. We are in a complex area here, between the policy-making area and the quasi-judicial, decision-making area. The Planning Inspectorate is not a policy-making body. Government and local authorities make policy, and the Planning Inspectorate adjudicates on the issues that arise from those policies, the interpretation of them and the issues surrounding them. It is those policies which are of concern, and I have a lot of views about them and I spent a lot of time in local government place-making, as it were, but in my role as Chief Planning Inspector it was not really my job to do that. That is not to minimise the importance of it. Particularly when an inspector is dealing with a Local Plan, their role is to ensure that there are proper policies across the board covering the kinds of
issues that you have talked about and, based on the evidence they have and the views put forward by the public, representative bodies, voluntary associations and so on—and the development industry, for that matter—the Inspector, against the background of understanding what the national policy is, in the NPPF or wherever else it might be, will seek in the public interest the best solution possible. It is not for the Inspector to suggest, “Why don’t you put this in your plan or put that in your plan?” That is the role of the local authority.

Baroness Whitaker: It is basically fair implementation of policy.

Mr Shepley: It is a bit more than implementation. I said at the beginning it is a quasi-judicial body. It is a decision-making body, and it is crucial that there is somebody who does that—that underpins, as I said, the whole system to make sure that the quality of the plan, the planning application or the infrastructure project is as high as it can possibly be, and the decision is properly made and all the evidence is there. But it is not for the inspectorate to determine how the infrastructure project, or the planning appeal or application, should be presented. I hope you understand; it is quite a fine distinction.

Baroness Whitaker: I do. It is helpful, yes, thank you.

Ms Sporle: Taking a slightly different tack, the vast majority of inspectors come up through local authorities. They are local-authority trained. They are public servants. They are there because they are concerned about the public good. I do not think anybody who works in any part of the planning system is not considering the public good and the community aspects of what they are doing. That is what a professional planner is all about, so I would say the public good is inherent to the planning system.

Baroness Whitaker: That was not exactly my question, which was about the “how”. I really do not want to hold things up now, but we ought to pursue this at some point.

The Chairman: Would you be able to give a quick answer, and then we will see if we need any more information?

Ms Sporle: In terms of how the Planning Inspectorate plays that out? I would say exactly as Chris has said. It plays it out through its role, through being clear that it is there to look at what local planning authorities have developed on the ground, and everything goes back to having a good Development Plan or Local Plan—whichever the current terminology is—and in that should be embodied public good.
**Q75 Baroness Andrews:** I should declare an interest. I had the privilege of working with Katrine as the Minister responsible for PINS for five years. I think it was a very productive relationship, and I got to learn in the process how very important the independence of PINS was, but how subtle the relationship is between PINS and Ministers. Sometimes you have to take the advice of the Chief Planning Inspector, and you have to be able to rely, and you can always rely, on that independent, scrupulous judgment that has been a consistent feature of PINS for over 100 years.

Things have changed since we worked together. There are two big changes which I think may qualify a little of what you have said. One is the National Planning Policy Framework, which has a presumption for development, and the inspectors have never worked under a presumption, to my knowledge, in that way before. What impact do you think that presumption has had on the way inspectors now respond to their need to be impartial and to make balanced judgments? This is all about balance within the planning system. The second thing is about infrastructure. In my time, we constructed the notion of the Infrastructure Planning Commission, in which PINS had a very different role; it was going to have a more proactive role. That has been done away with now. My sense is, however, that when it comes to infrastructure projects, the Planning Inspectorate still has a bit more influence to correct or to inform than it had previously, so I think the role has changed a little.

**Ms Sporle:** I am sure it has. I am always very careful: things change so quickly you have to be careful not to say, “I am a continuing expert in this field”, so I know it has changed. There are two things, though. I do not think it is for the Planning Inspectorate in any shape or form to criticise the policy of the government of the day. Different governments of different days will have different priorities and, in a sense, the presumption towards development is actually a policy of the Government of today. In my day it was slightly different: it was housing, housing, housing, at all costs housing, and when I was there, there was the beginnings of the five-year housing supply, which has been developed since. Inspectors are perfectly able to treat whatever policy is on the table in the right way and allow it to inform the decisions they make. The decisions they make are still always informed by the Local Plan, which—provided, again, as I always say, it is a good and up to date one—

**Baroness Andrews:** Or if it exists at all.
**Ms Sporle:** —or if it exists at all, that is the starting point. That is the responsibility of local planning authorities. It is for local planning authorities to get their act together and to put a proper Local Plan in place, and the arguments that some local planning authorities still put up for not having one I think are unacceptable. If local planning authorities want inspectors to take the right decisions in their areas, then they must have a Local Plan, and it must conform to national policy. I accept there are different things but I do not personally believe—Chris may disagree with me—that it changes the role of the Inspector.

**Baroness Andrews:** One of the differences, you say, was housing, housing, housing, and I agree with you, but it was never in a national plan. It was policy, and the difference is that in the NPPF we have this presumption for sustainable development, which in fact is translating into housing rather than enterprise, and it has been codified. Do you think that is making a difference to the nature of the decisions that are being made?

**Ms Sporle:** I am sure it is, because that is what it is designed to do.

**Baroness Andrews:** Exactly.

**The Chairman:** It would not be working if it did not.

**Ms Sporle:** Indeed, but I am really interested in this debate. I still think, though, that it is in the same category as policy; it is policy-driven.

**Mr Shepley:** I do not disagree with that but I would stress one of the points that Katrine made—that this is a significant change, but there have been significant changes in policy over the years before. There was not a formal presumption in favour of development in the 1980s but there was a pretty strong presumption in favour of development in the late 1980s. Then there were significant changes, limiting, for example, out-of-town retail policy, and there have been significant changes in policy ever since. These things happen all the time. They have happened rather more rapidly recently, and maybe some people have greater difficulty in keeping up currently. None the less, it is not anything particularly new, so planning inspectors are quite capable of coping with that sort of thing. Katrine is quite right to talk about the importance of a Local Plan but, on that basis, the presumption in favour of development is just another of the matters that planning inspectors have to take into account.

Do you want me to say something about the infrastructure side?

**Baroness Andrews:** Yes, please.
Mr Shepley: Almost the same point, in a way. This was a very new process, particularly the pre-inquiry part of that process, which I think everybody welcomed. I was at the Planning Inspectorate when the Heathrow fifth terminal inquiry was happening, and there were all sorts of problems with that, not all of which are well understood, but the new process got over a great deal of that and I welcomed that. I think it is now with the Planning Inspectorate. I see the inspectorate is having no problem whatsoever in taking on a new process like that, which is done in a very different way. It has the expertise, the staff, and, I hope, the resources—I do not know but I assume it has the resources to do that—and it seems to be working quite well. We still have not had a huge number of cases, but those we have had seem to have worked pretty well. I think the public have some issues with the degree of consultation the new process involves, which some people think is perhaps less comprehensive than before, but I guess that is part of the balance between speed and efficiency on the one hand, and delay on the other.

The Chairman: Do I detect a certain amount of irony in your statement about how it works? Do you really think it works?

Mr Shepley: I do think it works, yes. I apologise—I do think it works. As always, as a planner and former planning inspector, I try to put both sides of the argument. There are those who think that the truncated inquiry, which is very short now—and the opportunity for people to get involved very early in the process—means overall that public engagement, involvement and influence on major infrastructure projects has been reduced. I am not making that argument myself, but that is a view.

The Chairman: You do not mind that I made that qualification?

Mr Shepley: Not at all.

Lord Inglewood: The theme that runs through everything you do is even-handedness and a quasi-judicial approach to the policy and the parameters that are set. Is that right?

Mr Shepley: Absolutely right.

Baroness Young of Old Scone: The point was made that if local authorities do not have plans, it is their own stupid fault. We have heard from local authorities that, in the face of shifting housing targets and the resulting need to recast plans, or challenges to whether the duty to
co-operate has been fulfilled, they are constantly sent back to the planning stage to recast their plans and have been unable to get them through. Are you saying they are incompetent? **Ms Sporle:** Yes, in a word. I have no sympathy whatsoever with local authorities for not having an up-to-date Local Plan. They have professional people. They are there all year round. Local Plans were introduced—when?

**Mr Shepley:** The current system, in 2004.

**Ms Sporle:** But they have been around for many years. Policy is a changing landscape, it always has been and it always will be, and I have no sympathy. I say that as a former Chief Executive of a local authority who found it difficult to produce a Local Plan. There are many reasons why you cannot produce a Local Plan but there are no excuses for it and, in my view, there is no excuse and local authorities should get on with it. That is one of the things we will come on to in the changing world of the Planning Inspectorate, because if local authorities cannot do for themselves what they need to do for the common good, for the right community reasons, they should be helped or coerced, one or the other. I am sorry if that is controversial.

**The Chairman:** I think you have left us in no doubt. It is absolutely clear and we understand it. Thank you very much.

**Q76 Baroness Parminter:** What are the reasons for the increase in planning by appeal and what national policy measures could be introduced to counter that?

**Ms Sporle:** If I can start on this one, it is quite interesting that, again, there are some set answers to this. If there is a higher rate of refusal at local level, you are likely to see a higher rate of appeal. If you have a lot of frustration at the local level with the local authority, you will see a higher propensity to appeal. If the system is very slow, you will see a higher propensity for appeal, but I am not sure, if you really look at all the statistics over a long period, that there is necessarily a sustained higher rate of appeal, because I think the figures go up and down. What you need to do is look at the trends instead. If you look at the trends and the percentages, it is still the case that only a very small percentage of planning applications go to appeal—from memory, some 3%. It is really very small, much smaller than anybody ever realises, and of that 3%—I will check the figures—consistently over the years only about a
third are successful at appeal, and actually, the big developers and planning professionals look at those figures and they know that. They know that they will not go to appeal unless there is a real reason, because it is costly. I am not sure that there is a big drive towards that end of the system, but I know there are peaks and troughs. For example, I know there are actually less in the appeal system now than when I was a planning inspector. We were dealing up in the 23,000 region, and it is now down to about 17,000, so one has to look at these things over time and in context, but it is more important to look at the trends.

**Mr Shepley:** I agree that the proportion of cases that goes to appeal is very small, and it is very difficult to work out from the trends what it is that influences the trends. Clearly, the state of the national economy will probably be the most important factor, and when there is a recession the number of appeals goes down, and so on, and the number recently has gone up a little bit. I think planning by appeal is a danger. First, if policies are vague and difficult to understand, which sometimes happens, people will appeal, in effect, because they think their chances are better or because they do not understand the policy. They are trying to get the policy defined, and policies tend to be defined through appeal decisions and through the courts. If you have policies that are difficult to understand, you are more likely to have appeals. I think the statistics show that if you have policies that are more generous to development—looser policies—you tend to get more appeals.

I will go back into history here. There was a period in the mid to late 1980s when the proportion of appeals allowed—and Katrine is absolutely right; it has always been around a third, because that is how people calculate their chances of winning and losing—went up to about 40%, in 1987-89. That, I believe, was because there had been a loosening of planning policy and local authorities had not caught up with that, basically, and applicants were wanting to push the boundaries, as happens. There is nothing wrong with it; factually, that is one of the things that happens.

A third reason, I think, is the problem of resources in local government. In the light of recent policy, local authorities are finding it more difficult to carry out the sort of pre-application discussions and consultation with applicants that used to happen as they went through the development management process. Given that they have pretty fierce targets, there are sometimes cases where local authorities will refuse an application which, had they had more
time and resources, they might have been able to negotiate, and that becomes an appeal. The fourth reason is the absence of Local Plans, and we have already talked about that. That leads to more appeals.

**Baroness Parminter:** I have a supplementary question. Developers obviously have a right of appeal. Do you think there is a case for a community right of appeal? I have to declare that in this Chamber, I have moved an amendment to one of the various planning Bills in recent years to secure that.

**Ms Sporle:** This is a community right of appeal against an approval?

**Baroness Parminter:** Against something that has been approved but that is contrary to the Local Plan.

**Ms Sporle:** I have a lot of sympathy with that, because many people who do not understand the planning system find it bewildering if a decision comes out that looks to be contrary to everything they were told was going to happen. The way in which local authorities are required to consult and advertise that they are against the Local Plan is a bit shallow. I think one end or the other needs to be strengthened. My answer would always be to strengthen the front end rather than the back end, so, if it is contrary to the development plan, there should be something in place that allows much more debate than is perhaps currently the case.

**Mr Shepley:** I was grateful for that qualification about “contrary to the plan”. The only problem I have with that is it is not always easy to determine whether something is contrary to the plan or not; as you well understand, where there are criteria-based policies, there can be differences of opinion as to whether something is in line with a plan. I would just put very briefly the point that the system originated effectively in 1947, when a right was taken away from some people, namely landowners and applicants, and a right was given to other people, namely the local authorities and, through them, the community. Therefore, it was felt that those who had had something taken away should be able to appeal against having it taken away but that the community, having gained something—the right to object and so on through the local authority—did not need to have that given to them.

That is a long time ago, over 60 years, and the world may have moved on and there may be a case for doing it, but an unlimited third party right of appeal would be unworkable. There are
other systems in places like Ireland and Jersey which limit it, for example, to people who have previously objected—I am sure you know that—or to people within a certain geographical area, so there are ways of limiting it to something that might be more manageable. The cost would none the less be very considerable.

**Baroness Young of Old Scone:** Some would try to say that the gross reduction in the number of appeals is because local authorities are so hard pushed that they give in more readily at planning application stage. Is there any evidence for or against that?

**Ms Sporle:** Not in my time.

**Mr Shepley:** I do not have any evidence. There are also those who say that local authorities, despairing, as it were, of their ability to sort things out, will refuse more applications. I am not aware of any evidence either way.

**Q77 Baroness Whitaker:** Can I ask you both what are the main reasons for the rejection of Local Plans? I am very happy to accept Ms Sporle’s characterisation of incompetence but, for our purposes, that is a little undifferentiated. Could you amplify these reasons and also say what the role of the Planning Inspectorate is in ensuring that the plan-making process is adequate to the task.

**Ms Sporle:** Again, I know it has changed over the years. I think I am right in saying in Chris’s day, it was an inquiry, and in my day it was an examination. We certainly, during the time I was there, did a lot of work to speed up the Local Plan process. We made a huge effort to make it more understandable and more inclusive, and I think all those things worked extremely well.

**Baroness Whitaker:** More inclusive of all the stakeholders?

**Ms Sporle:** Of the stakeholders. I apologise to all local planning authorities whom I have labelled as incompetent. I really did not mean that, because I am a great fan of local planning authorities, but the point is that nobody ever suggested that a Local Plan was easy and would be anodyne. A Local Plan is always going to be hard and it is always going to involve difficult choices, but what I am really saying is that local planning authorities and local politicians should be up for that task. Clearly, Local Plans are not accepted if the local planning authority has not followed things like the duty to co-operate, or has not put in the right level of housing supply or the right levels of sustainability.
Baroness Whitaker: Would they be the main reasons?

Ms Sporle: I think they are the main reasons. I go back to my time as Chief Executive of Basingstoke and Deane, when we were horrified to find that our Local Plan was turned down—I am going back a few years—on the basis that it was not sustainable because of water supply. We had not done our homework properly. We had to go back to the drawing board. The problem there, as I recall, was that in the time we went back to the drawing board, the political constitution of the council changed, and therefore everything went back to the drawing board. Here, there are not just the professional issues but the democratic issues, which do cause these kinds of difficulties.

Baroness Whitaker: Do they cause delay or change of tack?

Ms Sporle: They often cause a changed approach. In that case, it was a wholesale change from an urban extension in the west to an urban extension in the east.

Baroness Whitaker: How does this affect lack of homework over the water supply? I do not quite follow.

Ms Sporle: The lack of water supply was in the west, so it was changed to the east, and that fitted the political view of the day. I think what this means is that professional planners have to be able to really work hard and well, and have the skills they need to advise their councils about what they need in the Local Plan, and not leave councils exposed to being put back to the drawing board.

Baroness Whitaker: What is the role of the National Inspectorate in that?

Ms Sporle: The Inspector, I believe, does this extremely well. I think there might have been a time when the Inspector was seen as someone rigid and frightening. Currently inspectors do explain what is required at examination.

Baroness Whitaker: Can he or she come in early enough in the process?

Ms Sporle: I think so.

Mr Shepley: Shall I add a few things to that? On your last point, yes, it has been the practice for a long time for the inspectorate—not necessarily the Inspector dealing with the case—to advise local authorities right from the beginning on the process and how best they can go about what they should do and what the obstacles and problems might be. That is a long-
established practice, which was happening in my time and probably before, and obviously continues, and it is a very important thing that the inspectorate can do.

Just going back, I agree with what Katrine said but I think housing numbers, the objectively assessed need, the SHMA and all of that, and the allocation of sites, together with the duty to co-operate, are overwhelmingly the main problems that occur in most Local Plans. Sometimes there is another issue, but overwhelmingly this is the big issue that holds things up and causes problems, delay and difficulty. We see this particularly in the south of England; however, there are parts of England where it is not a problem. Then there is the duty to co-operate, which, frankly, is a suboptimal way of trying to assess these things. The abolition of Regional Spatial Strategies might have been justified, and there were reasons for it, but it took away one of the key decisions that had already been made, and it undoubtedly caused its own substantial delay. I know of cases that were delayed by two or three years because a plan which was close to completion and adoption was suddenly withdrawn when the RSS was abolished, and work started again. I really do not envy local authorities. It works quite well in some places but in most areas it really does not work at all, and I am sure other witnesses will have said to you that the absence of effective strategic planning is perhaps the biggest problem in the planning system.

Baroness Whitaker: I understand that very well, but it seems as if lack of capacity in a planning authority might also conduce to an inadequate plan.

Mr Shepley: I think now that is true. I agree with what Katrine said. There are local authorities that have been superb at producing Local Plans. Plymouth—I declare an interest as I once worked there, but some time ago—is held up as the best example in this regard, but there are quite a few others, and it is hard to understand why somewhere like Plymouth can do a really good job and others not, except that perhaps the pressures in Plymouth are rather less than in some parts of south-eastern England.

Baroness Andrews: We could have a long conversation about that, but I think the capacity issues are crucial because, as I recall, Katrine, when you were trying to speed up the plan-making process in the late 1980s, we were trying to simplify the process and strip out some of the extraneous suites of documents which everybody had to provide alongside their plan,
and if they did not get on with that, they could not get on with the plan, so a lot of it was about simplification—streamlining.

Mr Shepley: I absolutely agree. I am all in favour of that. Because the system has gradually become more complicated over a long period, things like sustainability appraisal have been introduced, understandably, and I have no problem with that, but that adds an extra dimension. The effort is considerable and the resources are reducing, and I think that will be a continuing problem.

Ms Sporle: All I would say, though, is that you only have to do it once. You have to update it, but the fact is, I have to say, the conservation plan for Salisbury Cathedral, for example, was the same 10 years after it had been done as when it started, because actually very little had changed. It is very easy to say there are problems—there are always problems. It is very easy to say that there is a lack of capacity. I agree; there is always a lack of capacity but you can still get on and make progress. If you really set your mind to doing your sustainability appraisal, and you do it well, it will stand you in good stead for years to come.

Baroness Young of Old Scone: I should declare a past interest, in that I am afraid I was the one that gave the Basingstoke plan a bit of a kicking as Chief Executive of the Environment Agency.

Ms Sporle: Indeed you were.

Baroness Young of Old Scone: Sorry about that!

The Chairman: We will pass over that. Is that all you wanted to say?

Baroness Young of Old Scone: That is all I wanted to say.

Q78 Earl of Lytton: I apologise if I have to slip away to another appointment before we finish discussing this module, but I will be quick. This is about consistency and the comments that have come out in our papers about apparent lack of consistency in planning appeals decisions. I assume it is a given that the Planning Inspectorate seeks consistency in general terms, but how does it actually bring that into being, and what are the challenges and pitfalls in trying to achieve that?

Mr Shepley: First of all, yes, the Planning Inspectorate has a whole range of processes to try to ensure consistency amongst inspectors. One of the problems it has, I suppose, is that planning inspectors all work from home, as you probably know. It is a big homeworking
organisation and has been since the 1970s, and that has some massive advantages, particularly in cost terms, but it does mean that quite a bit of time and money has to be spent on making sure they are brought up to date. The recruitment process is fierce. There is usually a big demand to become a planning inspector, a lot of applicants. I think all this is probably still true. There is a two-week residential induction process during which policy and procedures are explained. There is an annual training event which all inspectors attend, and a whole range of other training events in between on specialist topics—conservation or countryside, or whatever.

Inspectors have specialisms and they deal with particular topics as well as general appeal work. When policy changes, notes are sent out or information is provided to inspectors about the policy change. If necessary, training events are held on major changes of policy, and so on. Inspectors are also monitored and observed in planning inquiries, and their reports are read to check for consistency and for the approach they are taking and so on. A massive amount of effort is put into that, and it is the objective.

The only other thing I would say is that this is a problem I faced in local government too: that you can look at two seemingly identical cases and in fact, they can be very different. Certainly, the circumstances surrounding particular cases are always different, and until you get involved in the detail and go to the site and understand it thoroughly, that does not become clear. To give you an example, when I was in local government I can remember very well a committee that dealt with two applications for hot food takeaways, which looked identical, and we recommended approval for one and refusal for the other. The councillor for the ward where we were recommending approval was incandescent but there were significant differences in terms of car parking arrangements. The one where we were recommending refusal was on a main road with no car parking; the other one had some off-street parking, so there were differences like that, although superficially they appeared to be the same. You really have to go into the detail of it.

Finally, there is the question of the evidence which is actually presented. When I give talks about the inspectorate, I always talk about the importance of written evidence being comprehensive and all of the points being put to the inspector, because the inspector is not in a position to go out and search for evidence. The inspector relies on the objectors or the
local authority or the applicant putting evidence, and sometimes that is not done very well, so the quality of the evidence can lead to inconsistency on cases that are superficially similar. **Ms Sporle**: I would just add to what Chris has said that the proof of the pudding is in the eating, really. Twice when I was at the Planning Inspectorate, we won the TPI award for the quality of our training and the extent to which we made absolutely certain that planning inspectors were up to speed and at the top of their game. The second thing is that, with a change of Government, the inconsistency issue came up and hit me straight in the face, so I randomly picked on a monthly basis 10 appeals and sent them to the Minister so he could see for himself whether there was consistency in decision-making, and I have to say I satisfied him.

**The Chairman**: The final question is from Lord Inglewood.

**Q79 Lord Inglewood**: Ms Sporle has slightly covered some of this. There clearly has to be a relationship between the Planning Inspectorate and the Government of the day. How would you define that, and how do you think in the real world they can work together most effectively for the common good?

**Mr Shepley**: This is quite a complex question actually. Katrine described it earlier as a subtle relationship. The starting point is that governments are elected and planning inspectors are not.

**Lord Inglewood**: It is rather like the House of Lords and the House of Commons, is it not?

**Mr Shepley**: I was not going to make that comparison! That is a matter for others to think about. Therefore, there is a phrase in the inspectorate that when an inspector takes a decision, he or she is standing in the shoes of the Secretary of State. You will have heard that phrase, and one is always conscious of that and everyone needs to understand that, because the Secretary of State is elected and makes policy and, as long as the policy is clear, the inspectorate will implement that policy through plans or planning appeal decisions or whatever else.

Having said that, there is an arm’s-length relationship. There was reference earlier to the independence of the Planning Inspectorate, and it operates in this independent quasi-judicial role within the context of the policy which the Secretary of State or the Government of the day set out. That slightly awkward arm’s-length relationship, whilst standing in the shoes of
the Secretary of State, has worked extremely well. I never had any difficulty with it. The Secretaries of State that I dealt with when I was there, who mainly were Lord Deben, as he now is—John Gummer—and Lord Prescott, as he now is, and the junior Ministers who worked with them, understood that completely and there was never any problem; no one tried to bring any influence to bear that they should not have, and we had a cordial relationship. That was how it was. Of course, Secretaries of State can recover appeals, and have been recovering rather a lot recently. They can change that relationship in particular cases.

As to how they can work together, Katrine talked about this earlier. She talked about how the inspectorate has knowledge not about what the policies should be, because that is not for the inspectorate, but about how policies are working, whether they are effective or not, whether they having the intended effect, whether they are clear and what confusions are arising. I am sure when Katrine was there—when I was there, we would regularly feed that information back. There used to be quite extensive consultation with the Planning Inspectorate about policy changes when I was there, so that we could say, “We think that will work”, “We don’t think that will work”, or whatever. I am not sure that happens to quite the same extent as it used to.

Baroness Parminter: In recent years we have seen the Government taking our energy infrastructure out of the planning process, and obviously fracking is the latest example which is going to be pulled out. You are saying in the past, the Planning Inspectorate would have given a view on whether or not that was appropriate, given your understanding of the working of the system. Are you saying that is not happening quite so much now?

Mr Shepley: The Planning Inspectorate would have been consulted not on whether it was right to take fracking out, but on the practicability of it. Let me give you an example of what I have in mind. Somebody mentioned wind farms. There is a policy on wind farms which talks about the wishes of the local community, or words to that effect, but the local community is not defined, so the planning inspector would say, “Hang on, we need to know what you mean by the local community. Do you mean the people in the immediate vicinity or do you mean a much wider community?” The planning inspector would not be saying, “You should not do this”. They would be saying, “You can do that but it’s not clear what you mean and therefore we will have problems in inquiries.” That happened a lot when I was there, and although I do
not have direct experience of it, given the speed at which things happen these days, my sense is that rather less of that consultation takes place.

**Baroness Andrews:** From my experience, I completely concur with that. When we were in government, we spent a great deal of time listening to the Planning Inspectorate about the impact of policy, and it was extremely valuable advice we received—and it was completely independent. I do not know whether it was Katrine or one of my fellow Ministers who said to me, “Never refer to the Planning Inspectorate, as one Minister once did, as ‘my Planning Inspectorate’”. It is “the” Planning Inspectorate, and when cases are recovered, that principle of independence really makes an impact on Ministers, who know they have to follow those principles. We are in a quasi-judicial position as well, because you inherit that from the Planning Inspectorate, and judgments you make on recovered cases have to be seen to be independent.

**The Chairman:** Thank you. Is that a happy note on which to end? An equally happy note is that we are sorry you are going because it has been terrific—a wonderful session. You have engaged with us terrifically and given us a lot more information than we knew we needed or expected. I am particularly grateful to you for giving us this time. You will of course have the transcript. Thank you.

*03 December 2015*
Planning Officers Society — Written Evidence (BEN0162)

Introduction

This submission is made in my capacity as a Director of the Planning Officers Society, which represents senior professionals and managers of planning functions in the public sector serving English Local Authorities. The Society is the credible voice for public sector planning practitioners. Its aim is to make planning more effective in delivering sustainable development to support the well-being of our communities;

As Founder of NOVUS, a thinktank affiliated to the Planning Officers Society for young built environment practitioners working in the public sector. NOVUS currently has over 130 members from local authorities throughout England;

As Proactive Planning Champion of the Farrell Review, and author of Public Service, a proposal for a social enterprise to put exceptional placemaking practitioners (architects, urbanists, planners) at the service of everyday places, through placements in local authorities. The initiative will be to the built environment what Teach First is to education;

And on the basis of eight years’ experience of public practice in the built environment within the Croydon Council Placemaking Team, recognised in the Farrell Review as an exemplary authority for proactive planning, and in the Greater London Authority Regeneration Team.

This submission focuses on the issues of Skills and Design identified in the Call for Evidence.

Skills and Design

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

Two initial qualifications to answering these questions:

- Firstly, built environment practice varies significantly from authority to authority, in relation to different financial, structural, political and geographic conditions. There are examples of excellent practice, as well as areas of practice that need to be addressed. It is therefore difficult to make generalisations about local authority skills and capacity, and unlikely that there is any single solution that will work for all authorities.
- Secondly, whether local authorities have adequate skills and resources depends on the role we expect local authorities to have in planning, shaping and managing the built environment. The pressure on local authority budgets means that planning departments are increasingly retrenching to focus resources on statutory or fee-paying services. As a result our approach to the built environment is becoming more reactive. Reactive planning creates longer-term costs from missed opportunities.

This paper proposes that “to consider the built environment in a holistic manner” we need to build the public sector’s capacity for proactive planning.

1. The Value of Proactive Planning

1.1. Proactive planning is fundamental to creating the conditions and opportunities for good growth. It is the crucial work of establishing a long-term vision, securing and coordinating investment, shaping development, galvanising communities, and strengthening the character of a place.

1.2. The Farrell Review states that “the industry is united in the belief that the current housing crisis will only be solved by thinking long term and through proactive planning”. My experience of working at Croydon Council, which is identified as an exemplar of this approach in the Farrell Review, demonstrated that proactive planning can:

- **Increase certainty** by providing a robust and comprehensive planning framework to guide development through the local plan and delivery-focused masterplans. For example the East Croydon Masterplan, which received the NLA Award for Best Masterplan in 2012, resulted in a 100% approval rate for five planning consents for over 1,250 homes and 1 million sqft of commercial development.

- **Accelerate delivery** by frontloading placemaking input at the pre-application stage, resulting in a more efficient planning process and minimising the risk of abortive work. For example the developers of the 100,000 sqft Renaissance development bought the site on 6 January 2012, submitted a planning application on 16 February, received consent on 30 March, and started construction on 11 June 2012.

- **Raise the quality projects and places** through the integrated involvement of in-house placemaking expertise in plan making, development management, and Council-led capital projects. For example Croydon schools have been named as building of the year in London by the NLA, and the ‘best school in the world’ by the Architectural Review.

- **Strengthen local support** by proactive and ongoing engagement with communities in shaping plans for their area, rather than reactively consulting on individual schemes. For example in New Addington, where designers were commissioned to work ‘in residence’ with the local community group so that plans were both fully informed by local knowledge, and had full local support.
• **Secure external funding and inward investment** by putting forward a compelling and co-ordinated case for investment, backed up by a track record of delivery. For example the Connected Croydon programme, where over £50m funding was secured from sources including Network Rail, Greater London Authority, Transport for London, Heritage Lottery Fund, Sustrans, S106, and Council capital funding.

• **Stimulate local enterprise** by proactively engaging with and supporting emerging initiatives including community groups, social enterprises and start-ups. For example a programme of smaller grants including Portas Pilots and Meanwhile Use funding in Croydon has supported social and economic activity including Matthews Yard, Turf Projects, Croydon Tech City, and Croydon Old Town Business Association.

1.3. Proactive planning relies on successful cross-disciplinary collaboration between placemaking professions, including planning, surveying, architecture, landscape architecture, urban design, conservation, engineering, and regeneration. It relies on practitioners’ skills, as well as their local knowledge, experience, capacity and the scope of their involvement. It also depends on successful cross-sector collaboration; bringing together individuals and organisations across the development industry, from the public to private sectors, and housebuilders to housing associations.

2. **The Skills Gap**

2.1. Proactive planning is not solely dependent on the capacity of the public sector. But the biggest barrier to proactive planning is currently a real and widening skills gap between the public and private sectors across the placemaking professions. As a country we arguably already have the overall expertise and capacity we need to deliver proactive planning, but there is potential for it to be more effectively directed and distributed.

2.2. Significant reforms of the planning system have been introduced over the last few years to support sustainable development. But their success depends on having the right expertise to implement policies at a local level. The Farrell Review found that “attracting and retaining the best individuals for local authority planning departments was seen as key to enabling a culture change from reactive to proactive planning.”

If anything, it is the people rather than the policies that make the biggest difference at a local level. “Good people can work round bad polices but good policies cannot work round bad people.”

2.3. The 2008 ‘Planning Matters’ report forecast a labour shortage and skills gap in local government. “There is a drastic shortage of planning officers, estimated to affect 46% of local authority posts by 2012. There is also a significant and growing skills gap among those planners who remain within the system.”

---

409 The Farrell Review, 2014, p. 149
410 Communities and Local Government Committee, Planning Matters: Labour shortages and skills gaps, 2008
411 Institute for Fiscal Studies, Central Cuts, Local Decision-Making, 2015
constraints have exacerbated an existing shortfall. Net local authority spending on planning and development services reduced by more than half between 2009-10 and 2014-15 – the largest scale of reductions to any service area.\textsuperscript{412} With similar levels of savings projected for the future, there are few options available for planning departments to bridge the gap.

2.4. This gap is not just about staff numbers and budgets. It is also about talent. There are many examples of excellent practice within planning departments, but in the context of economic constraints public authorities are finding it harder to attract the most talented placemaking professionals, and harder to keep those with the ambition and capabilities to find jobs elsewhere. “Across the country, even where resources are available, it has proved difficult to attract good professional staff, especially with design skills, to work in the public sector. The present pressures on local authority budgets are only likely to exacerbate this problem.”\textsuperscript{413} As a result, authorities are increasingly turning to external consultants and private agencies to fill the gap – eroding local knowledge and capacity over the longer-term, and resulting in unnecessary costs.

2.5. At the same time, the skills that public authorities do still have in-house are not necessarily the right type to deliver proactive planning. In the House of Lords debate of the Farrell Review, Lord Tyler raised concerns over the design literacy of local authorities, and identified a lack of three-dimensional design skills such as a result of a reduction of in house architectural expertise. In the 1970s 50% of architects were employed by the public sector, now less than 9% are.\textsuperscript{414} It is therefore unsurprising that 67% of London boroughs require or strongly require more visual communication, drawing and presentation skills.\textsuperscript{415}

2.6. None of this is news. The skills gap is longstanding and systemic, and cannot be attributed to austerity measures alone. The 2011 Bishop Review warns that “The erosion of capacity and design capability within local authorities is a major issue. Although this is a process that has been going on for years (if not decades), it has now reached a critical stage and needs to be urgently addressed if costly delays and poor quality schemes are to be avoided.”\textsuperscript{416} Even in 2008, the Communities and Local Government Committee concluded that “perhaps the most surprising, and frustrating, point to arise repeatedly from this inquiry is the fact that labour and skills shortages in planning are so unsurprising. They have been evident for well over a decade but review after review, report after report, recommendation after recommendation have not resulted in their reduction. This must change.”\textsuperscript{417}

3. **The Impact of a Lack of Capacity**

3.1. Holding back the public sector’s capacity for proactive planning will hold back the delivery of homes and growth. The twin pressures of an increasing need for housing at a time of decreasing resources means that local authority planning departments are under-resourced at the time when they are most needed. 60% of Local Planning Authorities disagree or strongly disagree that future levels of human and financial resource and capacity in planning departments are adequate to meet future workload.418

3.2. These concerns are shared by private sector developers who, in a separate study, “expressed the view that in the current climate of fiscal austerity, there was a risk that planning departments would become under-resourced and that this could delay and undermine the planning process.”419 There is strong evidence that developers or investor are willing to subsidise additional local authority capacity if it helps to de-risk the planning process and timescales. A recent survey of housebuilders identified providing additional resources to local authority planning departments as the single most important policy measure to boost housing supply.420

3.3. Housing need is particularly pronounced in London, where the GLA has identified public sector speed and delivery as one of the main ‘Barriers to Housing Delivery’. Capacity does not always correlate with areas of planned growth - a survey of London’s placeshaping capacity carried out in 2014 shows that 67% of boroughs said they require or strongly require more skills to carry out architectural design, urban design and masterplanning in house.421

3.4. Inadequate resourcing also brings an opportunity cost - a lack of proactive planning is failing to prepare strategically for the future and realise the public sector’s potential to deliver growth. Conversely, increased housing delivery demands a proportionate strengthening of local government’s proactive planning capacity to ensure we are making the most of opportunities to deliver great places.

4. **Recommendation 1: Set Planning Fees at a Sustainable Level**

4.1. Planning fees currently cover only 59% of the costs of providing an effective and efficient planning system – leading to an annual shortfall of £156.2 million.422 The most immediate and essential first step in putting planning department resourcing on a more sustainable footing would be to realign fees at a national level to allow for full cost recovery, with an automatic rise for inflation.

421 Research highlights funding gap faced by planning departments  
422 _The Farrell Review, 2014, Recommendation #20_
4.2. The principle of setting fees at a sustainable level is supported by the Planning Advisory Service, British Property Federation, Home Builders Federation, Federation of Master Builders, Planning Officers Society and the Royal Town Planning Institute. Realigning fees would represent a cost saving to Government, and result in an improvement in the speed and quality of service for the development industry.

5. **Recommendation 2: Introduce a New Generation of Proactive Planners**

5.1. Setting fees at a sustainable level is essential to addressing the statutory role of planning and delivery of the development management process. However, it will not help bring about a shift towards more proactive planning alone. Many aspects of proactive planning happen at a ‘pre-pre-application’ stage – whether setting the vision for a place, securing funding and investment, or engaging proactively with local communities and businesses. Genuinely proactive planning needs not only better resourcing, but a new culture of practice.

5.2. Public Service is the working title for a social enterprise to put exceptional placemaking practitioners (architects, urbanists, planners) at the service of everyday places, through placements in local authorities. The initiative would be to the built environment what Teach First is to education, and Frontline is to social services.

5.3. Public Service would deliver on the Farrell Review by “attracting and retaining the best individuals for planning departments”\(^{423}\) “to bring about a revolution in support of proactive planning in this country.”\(^{424}\) It would do this by offering local authorities hand-picked, highly motivated and specially trained placemaking professionals for flexible placements at affordable rates, subsidised through private sector support.

5.4. Public Service would build a national pool of skills and expertise to grow the public sector’s capacity to deliver homes; support collaborative planning and sharing of resources across authorities; and develop a new generation of proactive planners committed to working with communities to shape better places.

5.5. The initiative already has the support of organisations including London Councils, the Place Alliance, Future Cities Catapult, Planning Officers Society, Future of London, Urban Design London, New London Architecture, University College London, Barratt London, Cathedral Group, Pocket, Allies & Morrison, and Arup. 15 London Boroughs have already expressed an interest in offering placements, and there is a strong pipeline of placemaking practitioners who have expressed an interest in applying.

5.6. A paper introducing the proposal was launched on the back of the Farrell Review in March 2015. A business plan is now being developed with the support of the Greater London Authority, with a view to launching a London pilot in 2016.

\(^{423}\) The Farrell Review, 2014, Recommendation #19

6. **Recommendation 3: Make the Most of Existing Expertise and Knowledge**

6.1. Local authority planning departments already hold significant expertise and knowledge, which could be shared more effectively across the public sector through innovative use of technology.

6.2. Planning services are increasingly being provided through dispersed models, whether through combined authorities and the sharing of staff, commissioning and outsourcing to the private sector, or planning departments charging out their services to other authorities.

6.3. This emerging structure offers the potential for sharing best-practice, better benchmarking, and allocating resources more efficiently across planning departments. However it is also a shorter-term and less place-based model, which makes it more difficult to maintain local knowledge, relationships and accountability over the longer-term.

6.4. The Planning Advisory Service already performs a vital function in this area, as did CABE before its transition to the Design Council. The sector needs more, not less, of this kind of support. There is also an opportunity to use technology to enable less resource-intensive peer-to-peer learning and development.

6.5. It could be extremely useful to establish a single, consolidated web-based platform to build collective technical and place-specific intelligence over time. For example, rather than rely on centrally issued guidance, this could provide a forum for sharing evidence and reports, a map for sharing place-based annotations, or a wiki for writing policies and conditions.

Finn Williams, Director of the Planning Officers Society, Founder of NOVUS

Examination of Witnesses

Mr Richard Blyth, Head of Policy, Royal Town Planning Institute, and Mr Finn Williams, Director, Planning Officers Society.

Q132 The Chairman: Welcome to this evidence session of the Select Committee on National Policy for the Built Environment. You have in front of you a list of the interests that have been declared by the members of this Committee. A transcript of the meeting will be taken and published on the Committee website. You will have the opportunity to make corrections to that transcript, where necessary. Can I begin by asking each of you for the purpose of the record to briefly introduce yourselves to the Committee, please, starting with Mr Blyth?

Richard Blyth: My name is Richard Blyth. I am head of policy at the Royal Town Planning Institute and a chartered planner of 25 years’ standing.

Finn Williams: I am Finn Williams. I am a director of the Planning Officers Society and the founder of NOVUS, a think tank for public planning, and a proactive planning champion of the Farrell review.
The Chairman: Thank you very much indeed. You have had the questions, and the Committee members will now ask them in turn.

Q133 Lord Freeman: Good morning. What are the principal reasons for skills and capacity shortages in planning and built environment professions? How can national policy, specifically government, ensure that the right skills are available to local planning authorities and others involved in the planning process?

Richard Blyth: We have done a deep study of the situation in the planning authorities in north-west England, and we certainly found a one-third fall in the number of planning staff in the five years between 2010 and 2015. That has not helped. As a consequence of that process, we found that there have been forced redundancies of more senior members of staff, and their replacement by temporary staff, which means that you tend to rely on people who are possibly at the beginning of their careers rather than more senior.

The Chairman: That is not very helpful, is it?

Baroness Andrews: What are the impacts of that?

Richard Blyth: We received feedback from people who want to make applications for planning permission that there are delays in the process. You sometimes find that the person who is dealing with the application changes and, as I say, you are dealing with people who are probably earlier in their careers and less confident at doing the work.

Baroness Andrews: Can you see the impact on the quality of decisions about, say, the degradation of conservation areas?

Richard Blyth: No, the quality of the decisions is fine. It is the time it takes, the difficulty of communications between the applicant and the local authority, and the difficulties of people not being available—the shortage of staff kind of question.

Lord Freeman: What do you believe central government can do to alleviate the problem?

Richard Blyth: There is a debate about whether the fees for planning applications should be increased. There is a whole series of reasons, which I probably do not have time to go into, about the pros and cons of that and the impact on different parts of the country to do with the strength of the economy in different areas. There is a difficult question to do with local government being a free agent. It is not for government to say to councils that they should spend particular parts of their overall funding on specific functions. That would be to intrude.
In the past, government has specifically grant-aided planning as a function, as a top-up. That is one possibility, but we are in a tight spending environment, so that may not be at all conceivable at the moment. We noted in the north-west study that £16 million of new homes bonus has gone into the north-west authorities. This is the money that is attached to the completion of homes. So our report recommends, if you like, an education process for councils that says in effect, “Planners are bringing all this money into your council coffers just for the new homes bonus, not to mention the impact on the local economy of building homes and creating jobs. So if you were to see the planning function within your organisation in those terms, rather than simply as a small department with a few staff, that might enable you to bring resources in to fill vacancies, and possibly to restore a little the status of the chief planning officer in the top management team of authorities, which over the last 30 years has pretty much been cleared out”.

**The Chairman:** Was this a report that you published?

**Richard Blyth:** Yes.

**The Chairman:** Could we have a copy of it?

**Richard Blyth:** Yes. It is linked in our evidence, but I can also provide the clerk with a complete copy.

Q134 **The Chairman:** Thank you. May I ask a simple question, and then Lady Young wants to ask a question. Do you think that respect for people in planning by other members of the councils is fairly low; it comes as an add-on at the end of schools and all the rest of it? Are there any really shining lights among councils who believe and support their planners, and who make sure that the function is fully staffed?

**Richard Blyth:** Yes. You have hit on two things. There is a mixed picture. As I say, one of the difficulties about local authority staff grading has been the introduction of the single status, which makes all posts the same and possibly does not give a particular status to professional staff. There is the question of attributing status within the organisation to the number of people you manage and the size of your actual budget within the council, rather than thinking of the role in terms of its wider economic and social significance, which has been a difficulty. I can point to Plymouth City Council, where the role of planning is held in very high regard. The Plymouth plan is an all-encompassing cross-sector plan of the council as a whole. It is not
simply a plan full of development control policies produced, if you like, in a corner of the council; it is the council’s full expression of what they wish to achieve.

**The Chairman**: That sounds ideal.

**Finn Williams**: Going back to the question of the skills and capacity in the sector as a whole, arguably they are there across the country as a whole, but they are not evenly distributed, and they are not necessarily in the right places all the time. London, in particular, is one of the world centres of skills in place-making and has an extraordinary concentration of talented architects. Only 16 architects work in local authorities in London. They are not necessarily distributed between the public and the private sector either. The action has tended to be for graduates looking for jobs in the private sector, or at least that is the perception, and as a result many of them are going into the private sector rather than the public sector.

There is also a debate about what we see planning being for within the public sector. In that context, professions such as architecture and urban design can be more attractive. On the whole, we have an extraordinary wealth of talent; we need mechanisms to get them in the right place.

On the question of what government can do about it, getting the funding in place to resource the system adequately is obviously critical, and certainly raising planning fees to a sustainable level. Currently, taxpayers are subsidising a third of planning fees across the country to the tune of £150 million a year. Setting those planning fees sustainably is a no-brainer. The industry is calling for it. Seventy per cent of developers and housebuilders would like to see fees raised to a sustainable level. Eighty-two per cent of housebuilders identify resourcing as the single most important issue for boosting housing supply.

You also need to define the job as something that is really exciting for people to do and to present it as really worthwhile and a privilege, not necessarily a last resort. You need a mechanism to get those people into the public sector and to give them the tools to do the job. I hope that we can go into each of those in more detail through subsequent questions.

**The Chairman**: That is a very good tour d’horizon. Lady Young, you want to ask something.

**Baroness Young of Old Scone**: I have one very brief question on the skills squeeze from a particular point of view, and that is the leadership role. There is a difficulty with the gross numbers of planners, but is there also any shift from having people who have been around
the block for a time, who have the ability to influence other departments and other players, and who have a sense of vision of the place over a longer period? Is that still there or is that beginning to disappear? Are some of our more experienced planners being written out of the script as well?

Richard Blyth: In all construction-related sectors there is this difficulty that, whenever you have a recession, everyone gets thrown out. It is not just planning; it can apply to the whole construction industry. There may be something to be said for the kinds of approaches taken in some other countries where you do not necessarily throw everybody out when there is a recession; you keep people going, because you know there is going to be an upturn. In certain parts of the country, we are now facing a shortage. I think that has been contributed to by fairly strongly recommended early retirements of people during the trough, which has then caused them not to return, and for us to now focus particularly on what we can do about getting entrants.

We have had a lot of success with our postgraduate one-year master’s degree. I frequently meet people who have done other careers for, say, five or six years and then, in their late 20s, they do a one-year master’s degree and get jobs amazingly quickly, particularly because they have picked up quite a wide range of business and life skills earlier in that process, so they come to the academic part of the planning training with communication skills that they have honed in other jobs.

We are very pleased to report that since the spring of this year we have set up 40 bursaries to do the one-year planning course. That is with support from the Scottish Government and a number of planning consultancies in the UK, and the universities pay a quarter. It is £1,000 all together: £750 from the sponsor, £250 from the university. We have 40 students in place doing that starting this term.

Baroness Rawlings: Which part of the country are we talking about for those bursaries? Are they in London or elsewhere?

Richard Blyth: We have around 40 planning schools accredited in the British Isles. It is available at any particular one; it is not attached to a particular locality.

Finn Williams: The issue of temporary staff has certainly become a real problem on a number of fronts, because of the pressures from a lack of budgets. In a survey we carried out of
London boroughs, we found that 83% of London boroughs are recruiting agency staff regularly to cover shortfalls. That is always going to be part of the solution, but when those staff are costing upwards of £500 to £1,000 a day and costing three to five times more than employing someone in-house, the costs are financial but also relate to long-term knowledge and relationships with the people of the place, communities and stakeholders. It can also result in inconsistent decisions when you get a high level of churn through the system.

Q135 Lord Inglewood: I would like to ask Finn Williams a question. This is not intended to be a critical question at all. I have looked at your CV, and I am pretty impressed. It strikes me that you have had an interesting career, but I do not think you have really worked in the public sector as such, have you?

Finn Williams: Yes, I have.

Lord Inglewood: It seems to me that you could not have had as good a career if you had been in the public sector.

Finn Williams: Funnily enough, I have. I have worked in the public sector for the last eight years: five years at Croydon Council and approaching three years at the Greater London Authority. So I have been employed as a completely straightforward planning officer in a place-making team at a local authority level, and now in the regeneration team in the Greater London Authority. It is true that I came to that from working for a so-called starchitect in Holland, and certainly among my peers that was a very unusual move to make, but part of what I do is to try to encourage other people who I teach in schools and universities to do the same thing.

Lord Inglewood: Do you think one of the problems is that, taken in the round, working in the private sector gives you more exposure and more interesting work?

Finn Williams: I have thought about this a lot, because I made that choice. For me, the choice was between, frankly speaking, designing extensions for friends of my parents as a private architect and doing really meaningful things for a place that really needed it: Croydon Council. In a way, the team that we had there was similar to running your own practice: we had a guaranteed flow of work, we had an extraordinarily talented group of people to work with, we had the luxury of being able to think long term and make decisions genuinely for the public good, and we had a great array of tools to work with. Our solution was not only proposing
another building; we could work with our parking or housing colleagues to propose very different ways of managing a place. It is an extraordinarily privileged job to have, but you need to be able to create the conditions for people to approach it creatively.

**Lord Inglewood**: Are there many of them like the ones you have described? Were you an exception?

**Finn Williams**: One of the reasons why I joined the Greater London Authority was to try to find ways of encouraging and building that culture elsewhere. It is possible. It is happening elsewhere. There are extraordinary teams in Haringey, Brent, and other councils. Admittedly, my experience is focused in London, but there are great teams out there. We need to build more.

**The Chairman**: Suddenly the grey sky has gone and the sun is shining. It is very nice to have that enthusiasm, I say. Lady Andrews wants to ask a quick question.

**Q136 Baroness Andrews**: I want to go back to the issue of fees, because at the moment this seems to be the only way of raising the capacity of local authorities if there is no fee income coming in. Because fees are complex, you may need to write to us about this. Of the various fees that can be charged, which ones could be increased, on whom would the burden fall, and would there be any perverse consequences? Do you think there is scope for a new fee regime on things that are now not charged but which could generate income?

**Richard Blyth**: There is a body that the Government sponsor within the LGA called the Planning Advisory Service. The Committee may have come across it in its work. It has done some fascinating analysis of how to run a local planning department like a business, by which I mean understanding where most of your money is coming from and where most of your activity is. I have to say that it is an 80:20 situation. I do not have the statistics with me, but a large part of the money comes from very few applications. An awful lot of applications are free, such as the ones related to trees. Then there are the householder applications to extend your home that, viewed in a narrow business sense, are loss-making applications. On the other hand, a large housing development where the fees are per unit of housing up to a maximum effectively subsidises the others. The very large housebuilding applications that are contributing to the homes that we need probably pay more than they cost to process and deal with. It is not only a question of the level of fees, as you say, but the distribution between
the classes of application. I think that is a matter for Parliament to consider. Do we wish to see a continued arrangement whereby the smallest applications are subsidised? If that is the will of Parliament and the Government, that should be identified almost as a specific subsidy, because if you are trying to run your department as a business and to get efficiencies and invest in people and in equipment, it is very difficult to do so if you have a compulsory subsidy which you have to pay for within your resources.

**Finn Williams:** There is also a question of what you do with the fees once you get them. If applicants are paying more for a service, they will want to see an improvement in that service. How government defines that improvement is critical, because development management is only part of the planning process. It is right at the end of the planning process in many ways. A lot of the really valuable work on place-making and the quality of the place is the proactive planning that happens at a pre-application stage. Unfortunately, that has been the place to suffer first, because it is not the area that is bringing in fees.

To answer the second part of your question, I think there is a role for alternative mechanisms that could help to reinforce and build that earlier part of the planning process that sits alongside a proper sustainable fee level. As an example of that, there is currently a regime of planning performance agreements whereby particularly large or complex developments can pay additional amounts of money to cross-subsidise the cost of processing their fees. That happens on a case-by-case basis in a not particularly strategic or long-term way. There is potentially a model that could see longer-term and wider pooling of the kind of subsidy you get through planning performance agreements in order to really build capacity over time.

**Baroness Andrews:** Are you aware of anything happening in CLG about this?

**Finn Williams:** I am afraid I would not know. The conversation about setting fees on a sustainable level is constant and regular, so I would not be surprised if something happens about that—I would certainly hope so—but I do not know about planning performance agreements.

**The Chairman:** That is really very useful. Lady Whitaker?

**Q137 Baroness Whitaker:** You have touched on the answer to my question, but I would like to pursue it. How might the most talented individuals be attracted to public sector planning? I recall that when I first became interested in the subject a long time ago, we had the legacy...
of the visionary planners, many of whom came over as immigrants, and of course we had the
garden cities. We were pioneers in visionary planning. How do we get that vision back again?
Particularly, how can local planning authorities attract talent without extra money? For
instance, it might be interesting to see what more could be done in schools to encourage the
right A-levels for planning and that kind of thing. What are your views about that?

Richard Blyth: Last year, in our centenary year, we had an ambassador programme into
schools with a superb video about why planning is a good thing. We sent our chartered
members into schools to share what they do day to day and to encourage people, because it
is often not a profession that people have heard of while they are in school. That has been a
useful thing.

Your Lordships have referred to what the Government can do. What it could perhaps stop
doing is repeated attacks not on planners, to be fair, but on the planning system, and
regarding the planning system as a drag on development. In the productivity plan only of 10
July, there was a long preamble, using evidence that is now quite old, saying that planning is
a drag on the economy, and lots of numbers were produced. In our organisation, we have a
research workstream called “the value of planning”, which says, in effect, “By all m
means let us
improve planning processes and not have applicants frustrated by delays, but at the same
time let us have a planning system that gives society as a whole a huge series of benefits
around creating places that people want to invest in”, as well as, as Finn was saying, the steps
that need to be taken before you even get to having a planning application. None of that is
quoted in things like the productivity plan. If I was 21, I might think, “This doesn’t sound
particularly encouraging or a place to
work in. I might want to do accountancy instead”. A
little less of that mood music is something that we are very concerned about.

Finn Williams: The skills shortages that we are talking about are not only post-2008, they go
much further back; they are long-standing and systemic. For me, they are not purely about
resources; they are about what we think planning is for. In 1976, half of all architects worked
for the public sector; it was what public sector planning was for. Now it is less than 2%. In
1976, the public sector was building half of all our housing, and now it is around 1%. There is
a proportionality to how far we give the public sector the ability to get their hands dirty,
deliver and get stuck in. That is what makes the job exciting. That is what attracts you from the private sector.

This is certainly something that I care very passionately about, and I have put together a proposal, which I am working on at the minute and which I have presented as part of the evidence, which is a sort of Teach First for planning. Teach First is a great example of something that has been cost-neutral to the education sector, but they have the most talented young graduates working in the most deprived schools in Britain. I see no reason why you cannot generate the same amount of zeal and social mission around planning in places that really need it. You need to create the right conditions for that. On the costs aspects, with all the money that we are currently spending on agency staff we could quite easily create a not-for-profit agency as a social enterprise that is cross-subsidised by the private sector. They are very willing to do it, as we heard previously. They see the value in a strong, innovative public sector. They are willing to put that resource in to cross-subsidise a not-for-profit programme that would give local authorities access to the most talented staff, and, indeed, would give the young place-makers I teach an opportunity to work for the public good, on their own terms. There is a whole new generation that is desperate to do that.

**Baroness Whitaker:** Should government prime that pump particularly, and how?

**Finn Williams:** I very much hope so. We are talking about a London pilot at the minute. Eighty six per cent of London boroughs have expressed an interest and said that it would be useful, and 15 boroughs have agreed in principle to take part in a pilot. The opportunity is clearly on a national scale. Once it is established it will be self-funding, but there is a certain amount of work to do to get it established.

**Baroness Whitaker:** So national government could have a role there.

**Finn Williams:** I would certainly hope so.

**Lord Clement-Jones:** We looked at the Birmingham City Council scheme and were quite impressed by the number of trainees—I do not think the word “apprentices” was used—who they took on board in rather an exciting context.

**Richard Blyth:** Waheed Nazir is the chief planner there and is very impressive. He is one of our members. He was faced with a situation where they said, “We want to privatise you”, and
he said, “No, give me some time. I want this to be in-house”. Then they said, “Will you do it for a certain sum of money?”, and he said, “I’ll do it for half that, but give me the time”.

It is also interesting, because that is done through the local enterprise partnership in Greater Birmingham and Solihull. One of our particular concerns is that the whole area of devolution and local enterprise partnerships needs to be brought closely in line with the housing planning that is done in those kinds of areas, otherwise there is a risk that you have economic planning in one corner and more of the traditional planning in another. I sometimes feel that there is huge talent in our local authorities that is not really employed on the strategic economic plans of local enterprise partnerships, because they are seen as a different organisation and in a different sort of silo, which I think your call for evidence was addressing. Certainly, if local enterprise partnerships are concerned about being tiny, lean and mean without huge numbers of staff, if they call on the local planners in the same area to contribute, a lot of them are eager and panting to do so, but there are structures that mean it does not happen or, as we heard earlier, that dealing with the planning applications—the day job—is so difficult when you are short-staffed that you do not have time to think where Birmingham and Solihull will go in the next 20 years.

The Chairman: The type of vision is not right.

Q138 Earl of Lytton: I am interested in the timetable for bringing in these young people or, for that matter, retraining people from allied or other professions sufficiently quickly to start making a real difference, given where we are with housing and other issues and the great importance of making sure that what we are now building, as opposed to what we might build in 15 years’ time, is fit for purpose and, indeed, creates built environments that will be durable. How long will it take for the bright young things, or people from other professions, to become sufficiently numerous and carry the authority and status to drive these sorts of policies forward? How many years do we have to wait?

Finn Williams: You can make an impact immediately, and not just through work on the ground. Realistically, the difference is made in the details of the conditions you write on the application, the Section 106 agreement you secure, and the way you procure a contract. Those are fine details that you work on the front line and at the coal face. That is why we need those skills there right away. Certainly I would hope that these new people coming in will
become the new generation of leaders in time. Simply by presenting the public sector as an exciting place to be planning, you hope it will have a wider effect of generating a movement to see planning in a different light.

The programme that I proposed should certainly not be limited to young people. I do not see why people towards the end of their careers, who have worked in the private sector their whole lives and want to give something back, could not be part of it.

Earl of Lytton: There is hope for me yet then.

Richard Blyth: Regarding the routes to chartership, suppose you are a 29 year-old and want to do a planning degree on one of our bursaries. That will take you a year. Proceeding to full chartership takes two years, although that may depend partly on what you did before the degree, because some of that might count. By that method, we ensure that people abide by a code of conduct, undertake regular, continuing professional development and have a set of very carefully analysed competencies, which we review regularly. You would be fully operational within three years. The competency framework is very much not box ticking; it is looking for things such as how you demonstrate leadership and other skills in your workplace and whether you can describe to a third party how you did that. We have a logbook, and that is how those things are checked out, so that we press for the highest standards.

One thing that sometimes concerns me is that quite a lot of people are employed in the sector who are not chartered, which seems a wasted opportunity. If more people pursue the professional qualification working in planning, that might address the concerns about skills and capacity.

The Chairman: May I pursue that point about the people who do not pursue the chartered route. Surely if it is as beneficial, as I am sure it is, you should be able to sell it to these people.

Richard Blyth: We work very hard on that, yes.

The Chairman: What is their reason not to pursue it? I ask this because I was president of the Chartered Institute of Marketing. We had a similar situation, and had to have both carrot and stick. Why do you think they are reluctant to do it? Is it just not sold with enough emphasis?

Richard Blyth:Scrolling back, there was a time in local authorities when progression to principal planning officer was related to membership of the institute. That has almost certainly been ruled out nowadays. Sometimes people do not consider it as important in an
environment where you are in quite a large public sector organisation, because what you do is evident to everybody. You are promoted because people see what you have done, whereas in the private sector there is more of an attachment to letters after your name, because you are selling your services to clients whom you have not necessarily met. Certainly I think that having more chartered planners in local authorities would be a great improvement.

Q139 Baroness Finlay of Llandaff: My question follows on from what you were saying about how to recruit people. Going beyond staff resources, what other tools are needed to support better place-making in the built environment? In answering that, could you address place-making from the point of view also of the mental and physical health of people who are in that environment, and how you get some cross-cutting awareness and ensure that the built environment is suitable for people who are there in whatever role as they become older and who may face degrees of disability. They might be impaired by learning difficulties or acquired mental difficulties, not only by mental illness and so on. We know that there is a link between really poor place-making and mental health; the question is where you improve it. I wondered, listening to your previous answers, whether you feel that when you have granted planning approval and the final product does not match up to your expectations, you have adequate levers, or would you like the capacity to go back with some financial penalty?

Richard Blyth: Questions about mental health and an ageing population are interesting examples of how important it is that the planning is integrated fully across government departments and within localities across the various functions. When health and well-being boards were established, we pressed very hard for the planning function within local government to be strongly represented. It was quite difficult, because we had the difficulty of two tiers, and health and well-being is at the upper-tier level.

At the moment, we are looking in a study at the location of planning permissions, because there is a question both of the immediate environment and whether that is conducive to people as their lifestyles and the public health aspects of their life change, and of where things are. We are concerned that in the drive to get a five-year land supply at all costs, there may be a risk that planning permissions are being granted in quite isolated places as extensions to small villages. That might be attractive if you are my age and you think, “I would quite like to live in a nice house with a big garden in a small village”. In 25 years’ time I might not be as
happy about being in such a remote place. There are wider considerations, in the drive for more homes, which we definitely need, to make sure they are not only designed in a way that is suitable for all the health aspects that may apply but are in the right places. Remote locations may not be very suitable in the long term for people who cannot drive themselves or who end up in huge traffic jams.

Finn Williams: I will answer the question on tools and address one particular tool that has come up previously in this Committee, which is design review. I have been a member of a design review panel for the last six or so years and the vice-chairman of the one in Tower Hamlets. Clearly, it holds an important place in the National Planning Policy Framework as one of the specific checks on quality. For me, it is very important to recognise that design review is no substitute for in-house capacity. In fact, it does not work without enhanced capacity to see through those recommendations.

Some recent work that we did in London demonstrated that only 28% of major applications undergo design review. In fact, that represents 1.5% of all planning applications, whereas Croydon’s place-making team, which I used to work in, provided design advice on 94% of all major applications. On its own, design review simply cannot be comprehensive. If we forced every major application in England to undergo design review at CABE’s current prices, it would cost £120 million, which could of course be spent on 2,500 design offices, or seven for every local authority. So there is an argument about where that resource sits. It is very useful if you have the resource in-house; that is great, but the priority needs to be about getting the offices there in the first place and embedding that resource long term.

To a certain extent, the same thing is true of engagement with communities and the more vulnerable. That close, one-to-one level of conversation is harder and harder to have when you are increasingly processing a case load of 90 applications at one time from Google Earth, as opposed to getting out on the street and speaking to people. I do think that there is an element of the profession itself and its diversity needing to change to reflect the diversity of the population, and therefore to really understand who we are planning for. That is something that new recruitment programmes need to address to achieve proper representation.

Q140 Lord Inglewood: In your previous response you indicated what the best system would do. Are we living in a world where it can be done that way? If we are not, what is the second
best, which is going to be the best that we can achieve? What worries me about the whole planning issue is that, in an ideal world, it would work in a particular way and produce wonderful outcomes—England beautiful and all the rest of it—but I cannot see that we are ever going to be in a position to achieve that.

**Finn Williams:** Ultimately, we are planning across 340 or 350 authorities just in England. There is a hugely divergent picture already. There are already some examples of brilliant practice, but you will never get all those hundreds performing in exactly the same way. There is not one solution to this. There is a baseline that needs to be brought up across the country, and that includes things like planning fees. It is the professional basis of the RTPI and making sure that we are setting bare minimums of performance but also resourcing to enable that performance. There is a huge uncaptured additional capacity that we could bring in. Even if that works on only 20% of local authorities, that will have knock-on effects on the person joining their local authority that might not be part of the programme.

**Richard Blyth:** I also wonder whether we might not benefit from some kind of blue-sky thinking about what the resources are. Finn has mentioned that you could re-think design reviews. The move of the NHS into Greater Manchester, for example, is a very exciting opportunity to start thinking about a place—in that case a city region—in its entirety.

I produced a paper for the Government Office for Science for Foresight Future of Cities programme, in which I talked about the concept of diagonal funding. The difficulty, particularly in relation to the health aspects, is that the things you do now, such as locating housing close to public transport or to cycle ways, are all costs that fall now, but the benefits are in the future, because you hope that the NHS bill will be lower in the 2030s as a consequence of investment made now. There are difficulties over time in relation to that and because outside Greater Manchester the NHS budget is a different budget from, say, the budget for the Department for Transport. Might there be ways of creating a municipal bond or something in which the finance is made available to increase the ability to invest now and to have benefits from the reduced costs later? I do not know, but we certainly ought to explore ways in which we think of resources not strictly within, say, the Department for Communities and Local Government’s ambit of spending, but look at wider things, such as dealing with diabetes and obesity. I saw some figures for Swindon when I was there on
Monday, and it was extraordinary to see what would happen if the current trends on diabetes and obesity were to continue just in one small city into the 2030s.

What could be done about active travel? Again, you have a health budget and a transport budget, and they are seen as different chapters in the comprehensive spending review. One thing that we proposed when we talked about a map for England, a database and website, was whether the implications of the spending review on individual places could be regarded as a requirement for publication by the Treasury. What will happen to, say, Teesside as a consequence of what the spending review announces later this month? That would be very useful and would mean that Teesside could say, “Can we move some of this stuff around, because by pooling some budgets we think we could achieve some wider benefits?” That is place-making at a high level and in quite a radical way, which we have not done very much of in the UK so far.

Lord Inglewood: But the bean counters will run a mile from this idea, however good it may be. I am not saying you are not absolutely right, but the people down the road in the Treasury building in Whitehall will take one look at this and say that this is financial controls gone out of the window.

Finn Williams: What do you mean by “this”?

Lord Inglewood: This approach to accounting forward and evaluating the way in which your public expenditure programmes may go.

The Chairman: If our report gets reasonable coverage, we might be able to change that and have a complete knitted plan. We started this. At our very first meeting, we brought in the health idea, the gearing idea, the demographics, and now on top of that we have another one, which is a much higher increase in the birth rate than anywhere else in the European Union. It is joined-up government. I know that we have heard it for about 30 years, and there are not many examples of it, but this might well be the thing that will crack it, because it is such an important issue, particularly, as Lady Finlay says, from the point of view of health, transport, greenness and waste of fossil fuels. All these issues are down to the built environment.

Richard Blyth: If someone had said to me even 12 months ago that there was a remote possibility that Manchester would have its own health service, I would have laughed.
The Chairman: All things are possible.

Richard Blyth: The agenda can change quite suddenly.

Baroness Finlay of Llandaff: If you were in our shoes and could have your wish list, given your answers just now, what do you think we should recommend for planning, for example for health and well-being boards, and for other areas? You spoke earlier about a low status, unappreciated, undervalued group, and within the change it seems that we have the opportunity to make recommendations.

Richard Blyth: Certainly for me, and you too may wish to take this up, the devolution agenda is on a slightly different track from the housing and planning agenda within central government. I suggest that they are the same topic. In my institute we have a to-do list about making sure that we communicate our ideas on strategic planning to the emerging leaders.

The Chairman: The institutions.

Richard Blyth: Particularly the northern cities where it is starting, and to communicate to them that it is one thing to have, say, the Manchester Metrolink, which is very nice—it goes all over the place—but what are you doing about housing? Similarly, in other areas that are starting to work together, this is not just about getting handouts from the Government; this is about you working together for example to provide enough land to meet your housing challenge, and making sure that the housing and planning agenda is completely overlain with all the exciting things that are happening in the devolution agenda.

The Chairman: Mr Williams, would you like to comment, briefly, on Lady Finlay’s wish list?

Finn Williams: Building proactive planning into large-scale public spending is critical, whether it is through devolution and also potentially through the National Infrastructure Commission and looking at a new generation of public sector housebuilding in a different way. There is also a role for taking that leadership at a central government level with resourcing and expertise, whether that is through an individual—a built environment officer or a chief architect—or perhaps through something that is more like the Cabinet Office Policy Lab or Government Digital Service, a lab with pioneering and innovative thinking that crosses boundaries. Often with a discrete unit, you are able to move horizontally in a way that is more fleet of foot and can start to connect up different initiatives across government.
Q141 Baroness Andrews: A lot of my question has been answered. It is essentially about cross-disciplinary working. We have said a lot about that. I think that the idea of a place-making budget that integrates funding, if it could be articulated in Manchester, which is probably further down the road, is really interesting, and not a million miles away from the sort of work that was done for things like City Challenge some time ago. We have some models for that.

In national policy we have very few levers. We have virtually no joined-up work or policy direction between housing and ageing and health and ageing. We have less connection than we had between planning and heritage because of the separation of the departments. What tools do we have other than the NPPF? You spoke about the Cabinet Office maybe having a lab for this. Is there anything that you could put into the NPPF that could be implemented and make any difference at all?

Finn Williams: The NPPF, in a way, is only as good as the people who can implement it. Good planners can work around inadequate policy but good policy cannot work around inadequate planning.

Baroness Andrews: Very good.

Finn Williams: When I worked on planning applications in Croydon, we found that we could get things done that were worthwhile for the developer and the place that were not necessarily written in a policy. There is an element of needing to make sure that you have enough people on the ground interpreting these things in the first place, and to a certain extent there is probably resistance to further change within the NPPF from the sector. In a recent survey, 98% of the public and private sectors said that they did not want to see the NPPF disappear. The majority of people wanted it to stay exactly the same or with a few small tweaks. The constant changes in policy, whether right or wrong, are a barrier to embedding good place-making planning over the long term.

Richard Blyth: With regard to the NPPF, it was a great idea to have a single document. I very much welcome the way it has made planning policy accessible to everybody. You can find it quickly. When public health got into the NPPF, there was a lot of applause, but what really makes a difference is how the Department of Health and Public Health England do things with their money and what their guidance is. It is fine to have your own sentence in the NPPF on a
subject that is important to you, but it is what is going on behind and underneath that is a key issue as well, whether that is heritage, public health or transport.

Heritage is interesting, because a simple assessment of the time taken to make planning applications happen, and the cost of this therefore to the economy—which we have seen a lot of evidence produced on—does not take account, for example, of how you would value Liverpool Waterfront, and therefore of how you would assist Liverpool to help itself to make that work. It is not simply by saying that a planning application costs so much and delays so much, so it is a drag on the economy.

**Baroness Andrews:** Especially when Liverpool Waterfront is a world heritage site and raises huge issues of how you value that sort of environment.

I have one very quick question. One of the dogs that is not barking so far is what to do about local councillors and their lack of appreciation of planning impacts, because in the ways you have suggested we can find ways of jacking up capacity among officers, but ultimately the decisions are taken by councillors, who may or may not be at all versed in the implications of their decisions.

**Richard Blyth:** This month in Birmingham we are running our annual Politicians in Planning Association conference, which is intended to network councillors on planning committees. We bring in experts, people who are working in planning all the time, to share with people who are councillors and therefore doing it as well as their other work. We have a particular stream this time on new councillors, because our understanding is that since the May elections many are on planning committees for the first time. So we are doing our bit to say that the RTPI is not just for people who are members of it, but we have a role in relation to people who are, as you say, the vital decision-makers on how to make better places.

I have a lot of sympathy for councillors, because a lot is put on their shoulders that is difficult to deal with. The responsibility for delivering all the Government’s aspirations on increasing housing supply is a big ask when you are accountable to ward members. One of the advantages of thinking across city regions, counties as a whole and strategic planning is that to a certain extent a bit of that is taken away. We, along with the Planning Officers Society and local government, have put in recommendations to Greg Clark on a two-tier concept on
planning whereby the whole strategic area has one plan and is then filled in at local level. In that way, the local members do not have to bear the whole burden of these wider discussions.

Baroness Whitaker: Can we see a copy of that? Is it in the public domain?

Richard Blyth: Yes.

Baroness Whitaker: That would be very helpful, thank you.

The Chairman: Mr Williams, do you have anything to add to that?

Finn Williams: Only to support what Richard said, and to add that the Planning Advisory Service, the Place Alliance and Urban Design London are running really great courses to engage with local members, and have strong programmes on that front. It is happening; it needs to happen more.

Baroness Andrews: Are they compulsory?

Finn Williams: No, they are not compulsory.

Q142 Lord Clement-Jones: I have an interconnected question. I want to come back to the whole question of proactive planning regimes. I mentioned Birmingham earlier. We have an inkling of what a proactive planning regime looks like. What do you think characterises a proactive planning regime? What changes are needed to help move the planning system towards that? You mentioned various mechanisms earlier; I think you mentioned planning performance agreements and the Government’s attitude towards the planning system. What sort of package would you put forward?

Richard Blyth: If I had a short amount of time I would focus on the use of public land, particularly all the public sector’s land ownership within a city or wider area. There have been some exciting moves to put all that in a single database. The evidence is one thing, but the policy is another. A key element in proactive planning is to think of the use of public sector assets in the long term, maybe encouraging local authorities to use them as a way of creating homes for rent that could then provide the local authority with its own income stream. Simply selling off public land to get the highest price in the first instance is definitely an attack on proactive planning. It would be easier if you could get control using all that land, some of which at the moment is not always used particularly efficiently in making the most use of the asset.
There was an amazing report written by Keith House and a colleague, Natalie Elphicke, under the last Government. I heard Keith House, who is the leader of Eastleigh Council, say, “I say to everybody I meet, ‘Go and employ planners and property professionals in your authorities, because they will make you money’”. Thinking in a wider sense about meeting all the challenges that an area has to meet—housing, health—the land that it has and quasi-public agencies such as fire and the police all have huge assets that, if integrated, could be put to fantastic use as an underpinning of a proactive planning approach.

**Lord Clement-Jones**: Thank you, particularly for the reference to Keith House, because he is a Lib Dem colleague and friend of ours. You mentioned LEPs earlier and taking a broader view. Is that specific to those conurbations, or do you think there is a broader lesson there?

**Richard Blyth**: The whole country is covered. In fact, it is overlapped by LEPs, so what I say about conurbations I would say equally about shire counties. There are some shire counties that have a unitary authority in the centre, and we need to think about strategic planning in such a way that that unitary authority co-operates with other parts of the traditional geographical county in a wider co-operative arrangement that addresses these wider questions.

**Finn Williams**: On the question of what proactive planning can do in many ways and how you get there, many of its benefits are longer term, as Richard has referred to. It increases certainty for developers making planning applications; there is a very real benefit there. It accelerates delivery, if you do it right. It raises the quality of projects, and in turn strengthens local support, because people see better development and are willing to see it come forward. Certainly, as has been demonstrated, it helps to secure more inward investment and funding and stimulate enterprise at a very local level.

On the question of how we get there and what it could look like at the national level, some things we have talked about already. Yes, we need to prioritise the resources for place-making at a local level and have a mechanism to get people into those posts, such as the proposal for a place agency. I certainly think there is a role for leadership within a central government department along the lines of an individual or a built environment lab.

There are ways in which we could use technology much more intelligently to free planners up to be more proactive. One of the no-brainers in the industry that would benefit the private
sector and the public sector is not so much having planning consultants but reducing the requirements on planning applications.

Lord Clement-Jones: With all due deference to Lord Inglewood, we can get there not simply just by putting in resources or whatever; it is an approach that we can adopt.

Finn Williams: I certainly think so, yes. Technology to reduce the work that our current planners do, and allowing them to spend that energy and intelligence further upstream in the process to really shape places as opposed to reading through boxes full of statements, would, I think, be welcomed by everyone.

Lord Clement-Jones: Fantastic. Thank you.

Q143 Baroness Young of Old Scone: Can I turn the question around the other way? What I am beginning to hear is that with good will, collaboration, skills and resource locally, not much change is needed nationally. You can get quite a long way past the blockages by proactive planning on a local basis. I never hold my breath waiting for national government to do anything, and calling for national change is often like whistling in the wind. If you had good planners, visionary members, collaboration across the sectors, pooling land for economic benefit, good proactive planning locally—all the things you talked about—are there still some real blockages that need to be addressed nationally, or could you get quite a long way locally?

Richard Blyth: One thing I would like to recommend is that the Home and Communities Agency’s disposal programme is not solely considered as something to reduce the size of the national debt as quickly as possible, but that land is thought of in wider place-making objectives. That is within Ministers’ control. I appreciate that there are huge pressures, but there needs to be some kind of compromise between getting the maximum return and some of these wider considerations. Some halfway house between one extreme and the other might have to be a useful compromise.

There is a lot of fear in local authorities about property ownership. There could be some warm words around the fact that it is not illegal to consider wider issues than the highest price you can get. I put in evidence to you that you could, for example, establish a situation in which you said that you were doing a disposal. Obviously there must be safeguards to make sure it is not to friends, but one way of doing that would be to say, in a design and build kind of concept, “On this piece of land we wish to see the following objectives”. Anybody is allowed
to compete, therefore, to achieve those objectives, and who has the best deal to achieve that wider set of objectives will get the contract and be able to purchase the site.

**Baroness Young of Old Scone:** But that could happen locally now?

**Richard Blyth:** Yes, but there is fear, so one thing has to be to make people feel that if they did that they would not get into deep water.

**Finn Williams:** I agree with that. There is also the option of delivering it yourself as a local authority. The will is there among local authorities, but there are nationally imposed constraints, particularly on borrowing caps in relation to HRA, that limit the ability of councils to be genuinely proactive in that sense.

I think the will is there across the sector. There are great people working in local authorities, but where they are making good things happen they are really struggling against a whole series of reforms, which seem to be moving in the opposite direction. So while it is possible on a case-by-case basis, a lot of the most recent reforms have tended to remove agency from the local planner, and even from the local authority, whether that is through the increasing role of the Planning Inspectorate, the increasing number of appeals, to a certain extent special measures, permitted development, the national infrastructure schemes, and even, dare I say it, neighbourhood planning. They are all ways of placing power in the hands of people who are not the local authority and not the local planners. Where the will is there, the tools to do the job are increasingly disappearing or going elsewhere.

**Baroness Rawlings:** You mentioned the National Health Service moving to Manchester. I declare an interest here. I used to work in the Department of the Environment in the early 1980s and was involved with Salford. There has been a big change with the BBC moving up to Salford. What is your view on big government organisations moving perhaps north to less developed areas? Is that a good thing, with everything that follows?

**Richard Blyth:** The BBC has been a good thing, but it was made possible by an enormous amount of preparation. We featured MediaCityUK in some of our best-practice literature. If you look at what happened—I appreciate that you probably know Salford better than me—a lot of work was done by the Central Manchester Development Corporation, with high levels of co-operation between two, or possibly three, metropolitan borough councils and the 10-council-wide Transport for Greater Manchester pushing through the Metrolink, and the work
of Peel holdings as the property owner. All that had to happen before the BBC was able to consider a move of that kind. That preparation lasted at least a decade, possibly longer. So it can happen, but on its own it probably would not work; it depends on a lot of groundwork being done. But the consequences were astounding. The BBC is a small part of the whole process now. Regarding the number of jobs, ITV, start-ups and supply-chain companies have all clustered around, so it is not just a BBC question now by any means.

**The Chairman:** It is a great practical use of clusters.

**Baroness Rawlings:** It could be looked at for further possibilities.

**Q144 Baroness Whitaker:** One thing proactive planning can do is anticipate the future with a bit more evidence of trends. Can I impose on you by asking you to write in, because we do not have much time, about how proactive planning can help in place-making in the much longer term? In his evidence Mr Blyth referred to a 20-year housing supply rather than five years. Even that may be too short. Could you map how you think proactive planning could help with place-making needs—transport, environment, housing, infrastructure—over a much longer term so that we know, as much as we can, what kind of people we are going to be?

**Richard Blyth:** We are happy to do that.

**The Chairman:** We started off thinking that it would be 30 years, but now we suspect that 30 years is probably a stepping stone. Is that, in a sense, your idea, Mr Williams?

**Finn Williams:** As far as I see it, the job of planner is often to redefine the here and now. It is a bigger “here” and a longer “now”, and that longer “now” could be 30, 50 or 100 years. We are currently doing a piece of work in London on the London infrastructure plan up to 2050. New York is planning up to 2100 with its infrastructure plan. These pieces of infrastructure and the stuff that we are delivering now had their origins 30 or 50 years ago. We need to do that thinking for the next generation.

**Baroness Parminter:** One of the key themes emerging from a lot the evidence that we have heard today is the lack of this national spatial planning framework. The RTPI has come up with its proposal for a map for England. Can that deliver all that is required, given the failure of there to be anything at the national level at the moment? If not, what else is needed alongside that?
**Richard Blyth:** The Map for England was proposed as a multi-layered geographical information system database in which government departments would be invited to put their plans for the future in one place so that if you are, say, in Teesside, you can identify all the things that are going to happen to you. It was not proposed as a national plan, which would be a very big step, but as a way in which people could tell, for example, whether the Department for Environment, Food and Rural Affairs was proposing something inconsistent with that proposed by the Treasury. You could see it all there and drill down.

The priority for us is to concentrate on getting sub-regional planning—that is, for cities, regions and counties—working as a first priority, and then getting them to talk to each other. At the moment, we have an initiative with the think tank IPPR North called, “Do we need a Great North Plan?”. We have a northern summit coming up in January, which is really about saying that it is fine to have Greater Manchester, West Yorkshire and Sheffield City regions, but are there some questions that we need to consider across all these areas together? Railways and motorways often seem to be talked about, but do we also need to consider, for example, where the new health-related new industries and advanced manufacturing might be concentrated, and how a series of city regions can work together, building on particular strengths that parts of them may have.

Given the Government’s devolution agenda, the interesting level at which the interactions are going to need to take place is not national. On the other hand, there are policies, for example the way in which the Department of Health approaches the issue of new buildings for healthcare in growing areas, that are currently at odds with the Department for Communities and Local Government’s drive to have more homes. There are policy frameworks where more co-ordination and discussion of impacts would help, but maps and that level of interaction I see as happening much more at the sub-national level and getting people to work together in the future.

**Finn Williams:** There is no doubt that the absence of larger than local planning has been one of the causes of delays in the production of local plans in many instances. More often than not, they boil down to negotiations over housing numbers one way or another. There needs to be an alternative mechanism, I would suggest, and I totally support things such as the map for England in creating a broader, longer-term, wider framework for those sorts of discussions
across authority boundaries. I agree with Richard that it does not have to be a government statutory national plan; it could be more of an alternative mechanism to plan spatially at regional level. There are examples from elsewhere. After a terrible earthquake, the city of Constitución in Chile managed to replan the entire city in 100 days just by setting a time limit on it and getting everyone in the room. It might just need a completely alternative approach—locking everyone in the room in a charrette type of scenario, for example—to unlock some of those areas where negotiations have come to a standstill over the production of local plans.

Q145 The Chairman: Is there a body of literature anywhere about how different major cities and countries in the world have adopted large plans? Only last week, I was down in the Caucasus, and I was told by the speaker of the parliament that there was a huge plan that completely changed Baku. One of the things they said was that there should be no further skyscrapers because they were blocking out the views. Also, it is very notable now how much friendlier New York and Manhattan are because there are much wider pavements and they have taken out the ground floors of shops and offices and made spaces that people can walk through and sit by a fountain, and all the shops and offices go up from there. It is very good. Is there anywhere an idiots’ guide, if you like, to this sort of thing?

Finn Williams: There are certainly publications.

The Chairman: Could you give us a list?

Finn Williams: I am sure your clerk will be able to point you in the right direction.

The Chairman: I am sure he would.

Richard Blyth: Looking in our strategic planning work at other countries, the challenge of getting different councils to work together is almost always a problem across the entire globe. There are very few areas of the world—London is unusual in this—where a single body controls a huge area. In most of the world there are different councils that have to work together. What is interesting are the recipes for success in doing that.

Lord Inglewood: Can I go back to what you said earlier about the way in which more of the initiatives should come at a more local level? Given that we still live in a very centralised country, do you think that the likely response of central government is favourable towards this form of further devolution?

Richard Blyth: Yes, in a word.
Lord Inglewood: So you think the wind is behind the idea?

Richard Blyth: Yes.

Finn Williams: I think certain reforms to the planning system have not been moving in that direction recently. A change of direction with an emphasis on, for example, simply promoting proactive planning at a local level as something that is positive, and indeed necessary, for growth would be a big step in the right direction.

Lord Inglewood: Where you have local initiatives that run counter to the sentiment of the centre, that is when you get trouble.

Finn Williams: Yes.

The Chairman: The last question I was going to ask was what problems are caused for planning professionals by a lack of co-ordination across government on built environment policy, but I think we have covered it all. It has been a fascinating and very stimulating session. I want to thank you both very much indeed. If you have any bright ideas—of course you have lots of them—that you think we need, could you please let us have them. We would be more than grateful. Thank you.
Dear Sirs,

The land Use and Transport Sub-group of Pontefract Civic Society has been active in planning matters concerning the town of Pontefract and its environs for a number of years and has responded regularly to public consultations conducted by Wakefield Metropolitan District Council and other bodies, which affect the town. Unfortunately, this particular consultation by the Select Committee has only just become known to us and is active for only a few more days. As a result of this we are only able to offer a brief submission in the time available but we hope that our comments will be of use to you in your deliberations.

About ten years ago we were involved in a consultation process with Wakefield Council under the Local Development Framework. This was at a time of recession, but the work was being done to identify suitable land for development at a later date. As a result of this work local housing developers were able to work up plans for more than 3,000 homes in our immediate area as part of the major housing growth for Wakefield Council's overall target of over 5,000 dwellings. The Council, under the terms of its LDF, agreed to a larger amount of development than might have otherwise been expected.

When the financial situation eased and housing was being promoted, the local construction industry went straight into building homes all-round the district.

As covered in the answer sheet, we, as a society, have had our reservations about the houses being erected, which appear to be at the high price end of the market. Locally, the jobs market is not good, so we believe that this type of house build will lead to a greater number of journeys to work. The work opportunities are at all points of the compass, so provision of public transport to cover all this would be impractical and possibly economically unsustainable. This means that private car use is the only way to commute to work.

What is needed first of all is a strategic road plan. Some roads of a very local nature have been built using S106 or C I L monies (Developer contributions), but we do need some major new roads to take commuter traffic away from town centre road junctions with the associated delays, pollution, and stress factors that arise from this. A case in point for us is a link road to join together areas of business growth, which would take some of the load off town centres. This is known as the South East Link Road and has been on and off the agenda since 1995. This is too big a project to be funded by developer contributions, but would be an ideal scheme for Central Government funding to eliminate local “Pinch Points”. We understand that this (pinch points) is a justification for Central Government funding provision.
We are seriously worried about the lack of extra school places to cope with the population growth inevitably resulting from the 3,000 plus new houses. Someone, somewhere must have figures relating to the average number of extra school places required per thousand households. Is C G funding available for education needs?

Our final concerns related to environment and health issues, though these are not directly requested in your search for evidence.

On the health of the population, at the moment waiting times for GP appointments, unless of an urgent nature can take up to two weeks, Outpatient appointments can be much longer. A & E waiting times are very long as staff levels and resources are stretched.

Finally, water, sewage and surface water drainage. We are fortunate here to have a good supply of drinking water under most circumstances and the local water board assures us that they can cope with the extra foul-water drainage demands. However the rivers rise and fall very rapidly after heavy rainfall, and the suspicion is that surface run off from all the hard surfaces of the built environment is a major factor in this, where formerly there was a land area acting as a sponge to take in water and release it slowly, as opposed to the current rushing torrents down surface water drains.

We hope that the evidence we submit here is of a useful nature. We think that the questions you are asking are relevant to our current situation.

Yours faithfully,

Derek Vaux. Secretary.

Per pro Peter Cookson. Chairman. Land and Transport sub group.
Written Evidence relating to Policy for the Built Environment.

**Pontefract Civic Society's** brief response to questions posed by the Select Committee.

Responses to

- National Policy makers should be looking to matching infrastructure with work distribution, education and health provision as their main priority leaving the local authorities to plan the required building strategy for homes.

- It is not possible for us to say how well internal structures linking different government departments actually work but our perception is not very well. Generally speaking, developers try to maximise profits by delivering as little infrastructure developments as they can get away with. Striking the right balance is difficult as developers must make profits and the built environment must have the right infrastructure to function properly. The value of local consultation should be strengthened and would help, but finding the right balance of competing interests will always be difficult.

- As regards the built environment NPPF should ensure that quality and suitability of design matches local needs whilst maintaining a suitable mix of affordable housing in the right locations. E.g. taking into account access to work and public transport. Agricultural land should be safeguarded from becoming an easy option for development.

- There seems to be an almost universal law that causes the rich to become richer and the large to become larger. The discrepancy between rich and poor, large and small becomes ever wider and this problem must be addressed at all levels. In the context of planning, the tendency to centralisation of services has caused our major cities to become large and prosperous at the expense of our smaller towns where most of the people actually live. The consequence of this (amongst others) is that this organizational model forces people into unnecessary and expensive travel to access services which were formerly available locally- with all the concomitant ill effects that this brings.

  There needs to be an intervention at national level to reinvigorate our smaller towns to ensure their viability, because natural processes will only exacerbate this problem. The Select Committee should consider setting up a group to look at this serious and urgent problem. This is not a question of equality but of proportionality- whether the balance of investment between our cities and smaller towns is right.
• Ten years would be a maximum time scale. Local circumstances are changing all the time and may overtake planning strategy.

• Government should be exerting more control on the housing mix. The impression we gain locally is that developers are aiming at the high value end of the market to maximise profit from land use. We also wonder whether the time is right to increase “Council Housing” stock levels to reduce the waiting lists for those families/persons financially unable to buy or preferring to rent.

• More direction should be given to re-instating existing housing and business properties within the urban boundaries. Relating housing to the places of work within easy travelling distance should be better for both the workforce and the environment.

• Historic environment properly advertised, managed and maintained attracts tourism with a spin-off to the benefit of the local business economy. The historic environment has suffered badly in recent years. Cuts in services provided by councils have resulted in far too few officers working in this area and extensive depredations have taken place to the detriment of our historic townscapes. The historic heritage of our towns (particularly our market towns) is a huge asset and should be developed and refurbished to improve their viability.

• The skills issue needs to be addressed at local authority level. The squeeze on councils has led to suitably qualified staff being made redundant putting excessive work load on those remaining in office. Funding from Central Government needs to be targeted to address these shortages after full consultation at local levels.

• National leadership would be enhanced by finding people with the highest skills at this level. They would be the very people to know what are the right skills etc to do the job.

• In a word, “No”. Housing build is usually done where land is easily available at an affordable price. This provides housing at a lower cost than in the more logical brownfield sites where development is needed. Developers almost always go for the easy option. The end result of this is often the unnecessary use of virgin land, longer journey times, more congestion, pollution and stress. The quality of family life can be seriously affected.

• Despite consultation processes being in place, the impression gained here is that it is
a perfunctory process to be gone through but rarely takes into account the opinions of the people with local experience. At times it appears that the easy option is to pass everything put before the planners to avoid having to justify objections. May be better addressed by a more transparent consultation process. This could be done by requiring developers to produce a post-consultation document explaining why certain proposals have been adopted and others rejected. This would go some way towards convincing consultees that their suggestions have been heeded.

- Does not apply much in our immediate area. We have one of the highest rates of housing growth in the district. This is explained in the covering letter.

Society Chairman. Paul Cartwright. Secretary Karl Gilbert

01 October 2015
Written evidence submitted by Portsmouth School of Architecture and Radian Group

21. We hereby respectfully answer the call for evidence invited by the House of Lords Select Committee on National Planning Policy for the Built Environment. This written evidence is part of the outcomes from a research and innovation collaboration between Radian Group Limited and the University of Portsmouth School of Architecture in the area of custom build and urban design, focusing on how the definition of frameworks for the design and delivery of custom build housing can be interrelated with urban design codes in order to achieve recognised qualities of place and organisational coherence. Named participants in the project are Ms Andrea Smith (Radian), Dr Fabiano Lemes de Oliveira, Mr Dan Blott, Dr Silvio Caputo and Ms Rebecca Cooper (UoP).

Custom build

Q6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

22. We welcome the fact that the government is promoting custom build as a means of increasing the supply of new homes. Custom build refers to hybrid models whereby individuals or groups work with a specialist developer to help deliver their homes,\textsuperscript{425} along the scale between self-build and traditional development.

23. There is strong evidence to suggest that there is the capacity and demand to increase the number of custom-built housing projects in the UK.\textsuperscript{426} Although a recent survey found that over half of respondents reported they would be interested in developing a custom build home in the UK,\textsuperscript{427} custom build accounts for less than 10% of overall new housing supply. This is in stark contrast with elsewhere in Europe, where custom build is relatively commonplace. Harnessing this untapped potential can make a significant contribution to the housing supply both in terms of quantity and quality of homes.

24. An obstacle preventing this leap is that the current custom build market is fragmented and lacks profile, making it difficult to navigate for many.\textsuperscript{428} Raising awareness of the

\textsuperscript{425} National Custom and Self Build Association - NaCSBA (2011). An action plan to promote the growth of self build housing, 2.

\textsuperscript{427} National Custom and Self Build Association - NaCSBA (2011). An action plan to promote the growth of self build housing, 5.

benefits of custom-build for the clients, developers and the public in general is needed; as well as guidance on the processes involved in such undertaking.

Q7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come?

25. Through the formation of a consumer-centric process, clients inherently feel valued and more invested in the end product. As a consequence, as was the case of Vauban, a shared overall vision developed through strong level of participation may push for higher quality of design, both of buildings and open spaces, and for enhanced environmental performance.

26. This tends to lead to more socially sustainable and resilient communities. Those living in custom build projects move on average only once every 25 years, compared to the national average of once every 6 years.\textsuperscript{129}

27. Living in the same house for over 25 years poses challenges of family growth and shrinkage, and the associated need for more or less space. Consideration for possible custom build expansion and retraction of homes catering for the specific needs of residents through their lives should be given at planning stage.

Q12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

28. Place quality is the central preoccupation of the Farrell Review of Architecture and the Built Environment. Whilst in traditional development, developers tend to focus on controlling costs and profitability often at the expense of design quality, custom build neighbourhoods offer a contrasting alternative. It has the potential to substantially contribute to better design quality and place making in the country.

29. Creating strong communities has been a key objective in UK housing policy for a long time.\textsuperscript{430} A crucial structural weakness of the speculative housing model points to the fact that the end users are not involved in the process, one of the consequences being that social relationships with neighbours do not start until the spatial structure of the community has been built. Custom build housing on the other hand starts creating communities by forming relationships during the actual process of making place.\textsuperscript{431}

30. Strong involvement of future residents from the onset and throughout all phases of the development in the co-design of their homes and communal spaces, as exemplified by

the case of Vauban in Freiburg, is a key factor in enhancing the levels of satisfaction, sense of belonging, community and identity.

31. The co-design process needs to be effectively led and managed. There is evidence to suggest that having too much choice may result in confusion rather than satisfaction, leading to a more time consuming and stressful process for the client. Clear goals, timelines, expectations and limitations need to be agreed early on.

32. Limiting the co-design process to customised modifications of dwellings may fail to attain neighbourhoods in which communities develop a long-lasting sense of ownership. Conversely, custom build projects in which the masterplan was co-designed tend to result not only in a good provision of dwellings but also in a successful public realm (and public spaces) for local communities and the city at large.

Response from Potterspury Parish Council to
Select Committee on National Policy for the Built Environment

Community involvement and community impact

Question 12 How effectively are communities able to engage with the process of decision
making that shapes the built environment in which they live and work? Are there any
barriers to effective public engagement and, if so, how might they be addressed?

1. In 2013–15 the village of Potterspury in south Northamptonshire, was subject to two
speculative planning applications by developers. The first (S/2014/0390/MAO) was
for a development of 65 houses on a green-field site outside the confines of the
village, and the second (S/2014/2356/MAO) for 195 houses on a large field, also
outside the village boundary. The first would have increased the size of the village by
10%; the second by 40%. This last scheme was presented by a large national
developer, was ill thought-out and demonstrated lamentable local knowledge.

2. To date, both these schemes have been dismissed, the first at appeal and the second
during the first stage of the planning process.

3. Our comments are based on our experiences over the past two or three years.

4. Potterspury Parish Council has produced a parish plan in consultation with residents
with a vision for the development of the village over the next decade. Between 2011
and 2014 the village expanded by more than 11% with the addition of some 70
houses. The Parish Council does not rule out further development, but would like it
to be achieved sensitively, with regard to the existing built environment and without
stretching local amenities such as schools, local transport and shops.

5. The Parish Council fully engaged with the planning process, and the local community
regarded it as the leader of the campaign against both developments. But both
proposals caused considerable alarm and upset, and it seemed to the Parish Council
that we were comparatively helpless in the face of the professionals.

6. Developers are bound to consult local communities, but in reality seem to pay little
regard to local opposition that is based on hard facts, such as rights of access,
accessibility and flood plains. And if a community opposes development, for whatever reason, surely by the principals of localism, those views should be given serious credence?

7. In our experience, planners’ public engagement at the most basic level was cynical. Consultation leaflets promised parks, amenities and a school extension – conveniently omitting the fact that none of these could be delivered without additional money from local government. The sustainable transport statement was simply not grounded in reality.

8. Local people have to fight to be heard; they must familiarise themselves with the rules and deadlines of the planning system; they must acquire a rudimentary knowledge of the language of planning law simply to understand the application and why the developers believe it is feasible.

9. Parish councillors must do this too, only more so, and if they want to represent the community effectively at the district council, volunteer a significant amount of their time. Two of our parish councillors spent four days at the district council attending an appeal hearing. Both are self-employed.

10. Furthermore, the success or otherwise of both applications in Potterspury depended on whether or not South Northamptonshire was deemed to have a secure five-year land supply for housing. This matter was entirely out of the hands of the local community.

11. At the appeal for the first application, there was much legal discussion about the overall plan for housing supply in the local area and it was clear that the local council had a clear holistic plan for the area. The developers spent a great deal of time and money trying to find flaws and legal loopholes.

12. The application process seems weighted towards developers.

a) There is nothing to stop developers presenting speculative proposals that quote chapter and verse of the NPPF and obscure facets of planning legislation in order to reinforce their proposals.

b) Parish and neighbourhood plans are cursorily acknowledged, often ignored, and occasionally face a legal challenge.

c) Local councils must shoulder the considerable burden of legal costs in having to oppose speculative and opportunistic plans that cause misery to local communities.
d) Money. Developers simply have more money at their disposal than local councils, which enables them to engage large teams of staff. Many councils have cut staff, leaving planning departments under-resourced.

e) Parish councils can be represented at planning appeals, but in our experience, there was little guidance about what was expected of us and how we should contribute to the discussion. Local councillors may face cross-examination by an urbane but ultimately hostile lawyer, which is not an experience for the faint-hearted.

f) Timescales – the planning process is governed by deadlines, but the outcome of appeals seems to be more flexible.

g) Despite the recent ‘slimmed down’ NPPF, planning policy and legislation is not an easy area of study for lay-people, and constitutes a serious barrier to public engagement.

15 September 2015
Response by John Preston MA(Cantab) DipTP IHBC

I have over 40 years’ professional experience, largely in local government planning (latterly as Historic Environment Manager for Cambridge, dealing with historic buildings and trees, taking redundancy when my post was abolished in 2012), and over 30 years’ experience in building conservation at local and national level. I currently lead on sustainability and green issues for the Institute of Historic Building Conservation (IHBC), having previously served as the Institute’s Education Secretary for 10 years; I am a Trustee of the Council on Training in Architectural Conservation, and on the Steering Group of the Sustainable Traditional Buildings Alliance (STBA).

Place-making, integration and coordination

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

National policy guidance is a vital framework for local decisions. Leaving individual local authorities to reinvent the wheel with their own guidance is wasteful, uneconomic, and thoroughly bad resource management.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

Too often, very poorly coordinated, both between and within departments.

To take just one example:

I have been part of efforts over the past 3 years to resolve a very damaging lack of coordination both within DECC, and between DECC and CLG in relation to retrofit works to counter climate change. DECC has promoted a “one size fits all” approach through ECO, the Green Deal, and CERT and CESP previously, in the face of a strong and growing body of evidence that this approach is totally inappropriate for solid wall buildings of traditional construction; these form well over 25% of the building stock (while 1919 seems to have become accepted as the division between “traditional” and “modern” cavity wall construction, I am writing this in a 1938 semi-detached with solid brick walls) and 34% in Wales. Although DECC has commissioned research highlighting the problems (notably the STBA’s “Responsible Retrofit” report 2012, the Solid Wall Insulation Literature Review 2014, and the current Solid Wall study being carried out by Building Research

433 Solid Wall Heat Losses and the Potential for Energy Saving

434 Awaiting publication; very worrying preliminary conclusions presented at Ecobuild 2014
http://www.slideshare.net/BREGroup/colin-king-ecobuild-6-march-2014

---
Establishment Wales\textsuperscript{435}), there is no sign of a change in approach, or even of a systematic audit of projects already carried out. This appears due to both lack of coordination within DECC, and political sensitivity regarding potential massive waste of public money.

What is already clear is that very large amounts of money (both public money and the premium customers have had to pay towards the Energy Company Obligation) have been spent on works to traditional solid wall buildings using inappropriate methods and materials whose rectification is bound to incur further major financial and carbon costs. The issues are highlighted by the BRE Wales Research for DECC\textsuperscript{3}.

These issues were exacerbated by lack of coordination between DECC and CLG. In promoting retrofit schemes, DECC totally ignored safeguards for traditional buildings in the Building Regulations (Part L1B para 3.8 onwards) which were introduced in 2002 specifically to avoid such problems. I twice raised this issue at the All-Party Parliamentary Green Deal Group with the former Minister Greg Barker MP, each time being promised follow-up from civil servants that never came.

**National policy for planning and the built environment**

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

The NPPF is narrowly focused on planning. Where previously PPG15 Planning and the Historic Environment (1994) at least included paragraphs cross-referencing transport, sustainability, and access, the NPPF has nothing. There is a woeful lack of requirement for transport proposals to take proper account of the historic environment: as I write, here in Cambridge there are 2 separate and totally uncoordinated City Deal transport proposals (cycle and orbital bus) for new routes (including river crossings) through unspoilt and very historic water meadows (along the Lents and Mays rowing course), with no coherent environmental assessment.

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

Long time horizons are vital, not least to ensure a fully strategic and coherent approach to meeting (e.g.) statutory Climate Change obligations.

**Buildings and places: New and old**

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

\textsuperscript{3} ibid – the examples shown in the presentation relate to failed retrofits of 1920s and 1930s solid wall buildings
Older, more flexible buildings are often best suited to adaptation and re-use, by comparison with precisely designed modern buildings with short design lives.

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?
   Far too little, in my experience (notably in relation to Cambridge, see 4 above).

Skills and design
9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?
   No. There is a major problem within the construction industry in that for the last 40 years professionals and trades have been trained almost exclusively on new buildings, not on traditional construction. This is exacerbating the problems noted in 2 above. Immediate, serious and strategic consideration needs to be given to how a suitably skilled workforce can be trained to meet climate change retrofit targets.

   Across the country, there has been a drastic reduction in the number of conservation staff dealing with the historic environment. This has severely reduced not only the skills but also the accumulated knowledge available to planning authorities.

Financial measures
13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

   Current short-term financial measures (e.g. ECO and Green Deal in relation to climate change) and precisely NOT what is needed to secure long-term successful solutions, or the sustained industry (and training) investments needed to deliver them.

   I urge the Committee to review the relationship between Treasury policy and its counter-productive environmental impacts.

   Apologies for this brief submission. I would be happy to provide further information if requested.

   06 October 2015
1. This submission is based on evidence of how the built environment and planning policy has a direct affect on the health and welfare of the human body. By recognizing these factors policy has the potential to provide preventative solutions that address human health passively rather than reactively.

There is an emerging and growing condition affecting western modern society called Electromagnetic hypersensitivity (EHS) it is characterized by a group of symptoms caused by exposure to electromagnetic fields. A more specific term used in medical literature is idiopathic environmental intolerance attributed to electromagnetic fields (IEI-EMF). Other terms for IEI-EMF include electro hypersensitivity, electro-sensitivity, and electrical sensitivity (ES). Idiopathic refers to the fact that the cause is unknown. However there is considerable and growing science that these symptoms are biological not physiological.

2. There is considerable science showing a very real and significant risk to the general health of the public, wildlife and the environment from exposure to Electromagnetic Fields, especially those of very low frequency used in Wireless transmitters, mobile phones and mobile phone infrastructure. The International Agency for Research on Cancer (IARC) an agency forming part of the World Health Organisation have already categorised RF as a Group 2b carcinogen for the entire spectrum, however some members are publicly vocal that the classification must be increased to Group 1 carcinogen.

These scientists have collectively published over 2,000 peer-reviewed papers on the biological or health effects of non-ionizing radiation, part of the EMF spectrum that includes Extremely Low Frequency fields (ELF) used for electricity, or Radio Frequency radiation (RFR) used for wireless communications. 70% of non -industry funded studies are showing negative biological affects from exposure to these frequencies. Lennart Hardell MD PHD professor of Oncology, Sweden (whose work was used as evidence for the 2B classification) has concluded from three out of four recent studies that there is a definite link between brain tumours and EMF. See Letter to World Health Organisation (appendix 1)

3. In May 2015 the International Scientists Appeal to the UN was submitted to the United Nations requesting they adopt more protective exposure guidelines for electromagnetic fields (EMF) and wireless technology in the face of increasing evidence of risk. These exposures are a rapidly growing form of environmental pollution worldwide (appendix 2) https://www.emfscientist.org

4. Following the Fifth Paris Appeal Congress, which took place on the 18th of May, 2015, the attending European, American and Canadian scientists unanimously decided to create a working group and to write a Common International Declaration.
to request an official recognition of these new diseases and of their sanitary consequences worldwide.

The declaration calls upon national and international bodies and institutions and particularly the WHO, to take urgent responsibility for recognizing electro hypersensitivity and multiple chemical sensitivity as real diseases, including them in the International Classification of Diseases.

This International Declaration also asks national and international institutions to adopt simple precautionary measures of prevention, to inform populations and requires the appointment of real independent expert groups to evaluate these sanitary risks in total scientific objectivity, which is not the case today.

8 Susan Foster, advisor for the Radiation Research Trust UK (http://www.radiationresearch.org) estimated that in Europe alone there are approximately 37 Million sufferers (data February 2015). However, with the roll out of more wireless networks, smart meters and 4G, this number is increasing at an accelerated rate. Due to the varying nature of symptoms, many people are not yet aware that the underlying cause of their lack of wellbeing could be from EMF.

9 Dr Gerd Oberfield (Salzburg, Austria) and Orjen Hallberg predict that due to the proliferation of EMF in the environment, 50% of urban population could well be affected by 2017. Dr Oberfield’s informative report on the Evaluation of Electromagnetic Fields can be read here: http://www.salzburg.gv.at/Oberfeld-EMF-enviro-med-evaluation-2007.pdf

10 In 2014, Professor Dominique Bel Pomme of the French ARTAC (Association for Research on Treatment Against Cancer) stated, based on statistics from Europe, that 10% of the population currently suffers from this syndrome of intolerance to EMF.

11 37 million Europeans are estimated to be suffering from this condition. It is not an illness it is an allergy because when they are removed from the irritant (EMF) their bodies recover. These people are totally handicapped from exposure to these frequencies. Many give up jobs and move to the countryside to try and obtain relief. They then have to try and avoid Hospitals, Schools, Doctors offices, public facilities, restaurants, cafes etc. due to Wi-Fi. This is not a finite conclusion, there is now Wi-Fi blanketing even rural communities. As Ofcom and

Government work towards 100% mobile phone coverage, there is always the risk of a planning application for a mobile phone mast nearby, (easy money for cash strapped farmers, rugby clubs and churches). Even camp sites are not free from these signals as the Caravan Club and many independent campsite owners are now promoting and installing Wi-Fi (after a visit from a Wireless salesman). If moving is not a financial option, sufferers can shield their property (not a cheap option) but then become prisoners in their own homes as venturing out into the urban
environment it too painful for them. Many become socially isolated and mocked as this condition is portrayed as a ‘mental condition’ and denied to exist by the British Medical Association. There is no medical drug that can treat the root of the problem. Anti-depressants, anti-anxiety and a multitude of other medicines can be prescribed, but the root cause is the EMF exposure. This is no doubt costing the NHS millions. It is not only affecting adults but a growing amount of children are being exposed and are starting to show symptoms as Wi-Fi and iPads are now part of daily school life.

12 Many people I have met suffering from this condition are incredibly intelligent balanced individuals, many with PHDs, from the IT industry, the mobile communications industry, ex-city traders (where exposure was historically at its highest). I have also met teachers, marketing executives and local authority office workers, everyday people succumbing to the condition.

13 In January 2015, the EHS community held their breath in hope, as the TEN committee of the European Economic and Social Committee (EESC) met to discuss a draft opinion to recognize the causal link between EMF and EHS. (draft opinion available at http://www.iemfa.org/wp-content/pdf/EESC-TEN559.pdf). In his statement which closed the meeting, Richard Adams gave a counter opinion, see (http://electromagnetichealth.org/electromagnetic-health-blog/eileen-oconnor-eesc/) that people with this condition did indeed suffer real physical symptoms, but it was not caused by Electromagnetic exposure. He concluded that the main course of treatment for this condition is Cognitive Behaviour Therapy. (37 million Europeans requiring mental health treatment). For further ‘comment’ see http://www.powerwatch.org.uk/news/2015-01-20-eesc-final-opinion.asp.

14 The Final vote - 138 votes for the counter opinion, 110 votes against and 19 absentions. EHS would not be recognized. The following report on the meeting was produced for ES –UK http://www.es-uk.info/attachments/article/65/EESC%20Adams%20counter-opinion.25.1.2015.pdf

15 Public Health England states that ‘there is no consistent evidence to date that exposure to radiofrequency (RF) signals from Wi-Fi and WLANS adversely affect the health of the general population’. However this has challenged by ‘The Safe Information Technology Alliance’ (SSITA). As PHE has failed to respond a formal complaint has now been forwarded to the ‘Parliamentary Health Service Ombudsman ‘(2015) supported by individual complaints from UK residents who’s lives have been adversely affected as a result of this guidance. For details of the full complaint go to http://ssita.org.uk/complaint-to-the-health-protection-agencypublic-health-england/

16 The voices of concern are gaining ground and getting louder. Government and policy makers need to take note and address this issue not only on health grounds but economic. Technology spend is leading GDP growth, however the ‘internet of things’
bubble could very well burst.
The Built environment - other biological affects

For thousands of years the human body has had an intimate relationship with our natural surroundings. Modern society is now a creature of the indoors, spending on average 90% of our time inside built structures.

We are not only being exposed to pollution from EMF in the built environment. There is growing research showing the correlation between other environmental factors and how they affect our health and wellbeing:

- Indoor **AIR** is often contaminated with various different compounds from building materials, paints, carpeting, furniture, uncirculated air.

- Tap **WATER** samples can show traces of contaminants such as phosphates, plastics, some heavy metals, hormones and even trace cocaine.

- Even **LIGHT** affects the human body. The circadian optic nerve regulates our 24-hour sleep/wake rhythm by exposure to light. In bright light (natural daylight, blue spectrum lighting) cortisol is released which keeps us awake and alert. At dusk, cortisol is suppressed and melatonin produced to aid sleep. The wrong spectrum of light at the wrong time can play havoc with sleep patterns.

- **INTERNAL DESIGN** and layout also have an affect on the body. For example, by placing stairwells next to windows, lined with uplifting and colourful art, stair use has been shown to increase. Compare this to less enthusiasm showed to use internal artificially lit stairwells.

- **ARCHITECTURE** itself can affect the human body. Compare the design of historic and ancient architecture, churches, public buildings with their intricate design and geometric patterns against sharp angled square block buildings. Modern architecture versus traditional design, which is the more visually satisfying and promotes a feeling of wellbeing?

In conclusion, based on the above evidence, the Committee for the Built Environment needs to consider the following:

a. The potential economic, social and financial impact of EMF pollution within the built environment. What affect will this have on future urban and rural housing demand and social habits?

b. Human Rights and the disabled with regard to access to public services (transport and healthcare), the right to live in a safe and healthy environment, earn a living and access community resources.
c. We do not need to lose modern technology - we need to refine how it is accessed. Wired solutions to replace wireless where possible to be made standard in new builds with a focus on those frequented by vulnerable group, schools, Hospitals, Surgeries, disabled and care homes.

d. Establishment of protected rural areas and designated urban areas guaranteed free of Electromagnetic pollution from mobile and WiMax infrastructure (White Zones).

e. Planning legislation with regard to the siting of mobile phone/Wimax/Airwave masts must take into consideration the science on health affects if challenged.

f. Household wireless systems currently feed ‘open zone’ hot spots. [Link](https://www.btwifi.co.uk/find/) The signal from a household WiFi will travel over 25 meters outside the boundary of the property into the airspace of neighbouring property and public rights of way. These ‘Hot spots’ encroach into the air space and homes of neighbours. Current planning rules do not allow building onto the boundary or overhanging a neighbours land. Bushes and hedges that overhang a neighbours land may be removed to the boundary, Environmental health law protects neighbours from noise pollution, smoke pollution etc. Yet, there is NO LAW with regard to EMF pollution and the affect on a neighbours land or public right of way.

g. Legislation for operators to ‘share’ mobile phone infrastructure. Therefore reducing the need for multiple masts and hardware (as in Europe).

h. Encourage and promote biological sustainability via awareness, education and certification within the UK Green Building council, building and architectural industries.

i. Embrace concepts such as that of ‘building biology (Bau-Biology of Switzerland and Germany) which consider EMF overload and remedies in building design

j. Consider the Wellness models presented by DELOS [http://delos.com](http://delos.com)

k. Investigate studies of quantum science that claim to mitigate or neutralize the damaging carrier wave of EMF frequencies. eg: Biogeometry.

l. Environmental sustainability has been the leading driving factor behind building policy in the last few years, however we are ignoring human and
biological sustainability. It is time for Wellness to be given equal focus in both building design and policy. In return a happier healthier population will be more economically productive and there will be less demand on public and social health sectors. Advances in modern technology have given us ever increasing comfort, convenience and global connection. However some elements of this technology as discussed in this submission are showing obvious conflicts with all living biological systems. We cannot go back as society is now so reliant on this sector. We can however move forward by finding multiple holistic solutions, rather than ‘fire fight’ the growing problems that this will cause to future health and welfare.

Surviving is not the same as thriving.

20 November 2015
Introduction

Some of the UK’s most pressing health challenges – such as obesity, mental health issues, physical inactivity and the needs of an ageing population – can all be influenced by the quality of our built and natural environment. In other words, the considerate design of spaces and places can help to promote good health; access to goods and services; and alleviate, and in some cases even prevent, poor health and thereby have a positive impact on reducing health inequalities (1, 2).

1.2 The move, in 2013, of public health responsibilities from the NHS into local government is seen as an opportunity to reunite public health practitioners with the wider levers of change under the umbrella of local government. Planning is one of those key levers. This new context provides a strong base for developing good practice in the integration of health, spatial planning and design. Call for action on this area has been advocated across the board, both from within planning as well as from health organisations and local government based on an emerging evidence base. (3-11).

1.3 This document, prepared by Public Health England (PHE), describes the evidence of the impacts of the built environment on health and wellbeing. It also describes PHE’s priorities and its role in translating evidence into national action for health improvement.

Public Health England

2.1 Public Health England exists to protect and improve the nation’s health and wellbeing, and reduce health inequalities. It does this through world-class science, knowledge and intelligence, advocacy, partnerships and the delivery of specialist public health services. PHE is an operationally autonomous executive agency of the Department of Health.

2.2 Our vision is that everyone, wherever they live, should be able to live, work and play in a place that promotes health and wellbeing; sustains the development of supportive and active communities; and helps reduce health inequalities.

2.3 The importance of this agenda is highlighted in the PHE priorities document ‘From evidence into action’ (12) which recognises the importance of place and place-based approaches in promoting long term health and wellbeing, rather than just treating illness.

Impacts of the Built and Natural Environment on Health

3.1 Our health as individuals, and as communities, is influenced by many factors – our family background, gender and age, our lifestyles, the health and other services we receive and the wider physical, social and economic environment in which we are raised, live and work (13).

3.2 There is a growing body of evidence that links public health outcomes to the natural and built environment. The Marmot Review: Fair Society, Healthy Lives (2), dedicates one of its
six policy domains to the theme of ‘Healthy and Sustainable Places and Communities’ – in recognition of the role the built environment plays on health, and health inequalities. If you live in the most deprived areas of the country, compared to the least deprived, you are:

twice as likely to be obese;

ten times less likely to live in the greenest areas;

more likely to live near fast-food outlets which can contribute towards the disparity on levels of obesity; and,

more likely to feel unsafe in your neighbourhood, with consequent negative effects on health (14).

3.3 It is difficult to quantify with precision the impact of the built and natural environment on health, but McGinnis et al (2002)(15) reported that social circumstances and environmental exposure contribute to as much as 45% to health outcomes. Alternatively, for instance, New Local Government Networks (16) quoting The Canadian Institute for Advanced Research estimates that the impact on health of the social and economic environment is 50% and environmental factors 10%. What seems to be consistent amongst recent research is that the majority of our health outcomes are explained by factors other than healthcare (9). The built environment is one of the wider determinants that has a role in shaping our behaviors and determines our exposure to health hazards.

3.4 Rao et al. (2007)(17) examined how the design, maintenance and availability of services could affect a range of environmental and social features which, in turn, could impact on both physical and mental health and wellbeing. A wide-ranging array of diseases was identified as being affected by the built environment including, amongst others: asthma, depression, accidents, reduced cognitive performance in children, obesity, cardiovascular disease, infectious diseases, musculo-skeletal problems and some forms of cancer (see Annex 1). The paper also identified how other aspects of the built environment could prevent or prolong recovery from disease. The strength of the evidence of the impacts of the built environment on health is not consistent across all these linkages. However, although complex, for many issues, there is a fairly direct interaction between the environment and its impact on the health of individuals and populations (6, 7, 18-21).

3.5 There is also a strong economic case for action. Poor diet-related ill health is estimated to cost the NHS £5.8 billion per year (22). The estimated cost of physical inactivity is £7.4 billion a year (£0.9 billion to the NHS) (22, 23). Alcohol costs the NHS £3.3 billion (22, 24), overweight and obesity costs the NHS £5.1 billion (22).

**Healthy Communities and Neighbourhoods**

4.1 Neighbourhood design can have a profound impact on the physical and mental health of communities. The key to successful places lies in the communication between services and proximity of amenities, from healthcare facilities to green infrastructure to local transport
networks (1). Compact neighbourhoods that feel safe, well connected and provide access to several amenities and destinations, seem to have a positive impact on health and wellbeing (25-30).

4.2 There is evidence to show that well serviced, compact, walkable and connected neighbourhoods, promote physical activity, cycling and walking (18, 27, 29). Cycling and walking are in turn shown to increase the overall number of opportunities for social interaction and networking, which foster a sense of community and a general feeling of safety within a neighbourhood (29). These factors are all linked to positive mental and physical health (28).

4.3 The delivery of healthy neighbourhoods does not only deliver health benefits. DCLG’s report Economic Case for Cohesion (31) stated that a total of £530M per annum could be saved through an increase in community cohesion, based on the expected reduction in a number of types of crime (violent crime, burglary, theft of and from a vehicle).

4.4 Research also suggests that reducing social isolation is associated with reduced levels of mortality from cardiovascular disease, accidents and suicide (26). Better social support is beneficial to mental health; associated with lower levels of anxiety and depression. Good neighbourhood design can promote community networks and reduce severance caused by transport networks (32) thereby promoting community cohesion and reduced social isolation.

4.5 There is a graded relationship between environmental conditions and levels of area deprivation:- residents of more deprived neighbourhoods tend to experience less favourable living and environmental conditions than people who live in more affluent areas (2-5). The design, location and layout of neighbourhoods can have an impact on these, particularly exposure to noise (33, 34) and air pollution (35).

4.6 PHE, in a 2014 report, estimated that 5.6 per cent of all deaths in over-25s in England were linked to air pollution, although the figures vary considerably by region (36). There is evidence linking increased levels of air pollution, with an increase in respiratory illnesses and higher levels of deprivation (19), with some of the most deprived areas in the country having the worst air quality and a disproportionate number of the most vulnerable (35).

4.7 Noise causes a number of short- and long-term health problems, such as sleep disturbance, cardiovascular effects, poorer work and school performance, hearing impairment (34). In the UK about 10% of the population is thought to live in areas where daytime sound levels exceed 65 dB LAeq (37), which WHO considers detrimental to health (38), and 34% in areas where night-time sound levels exceed 50 dB (37). It is known that continuous internal noise of over 30dB disturbs sleep (37).

Healthy Natural Environment and Sustainability
5.1 The relationship between health and exposure to nature is well documented and evidenced. Contact and access to green spaces is associated with a range of positive health outcomes including: better self-rated health (39), reductions in levels of stress and depression (28), lower levels of obesity, improved mental health and increased longevity in older people (3, 40).

5.2 Access to green space is not equal across the population of England. People living in the most deprived areas are less likely to live in the greenest areas, and will therefore have less opportunity to gain the health benefits of green space compared with people living in the least deprived areas (39). Research also shows that access to green space is associated with better health outcomes and income-related inequality in health is less pronounced (7, 21, 39).

5.3 Open green spaces also have a strong impact on the sustainability of the built environment (21, 41). Some of the environmental benefits of green spaces include: improved air quality (42), water quality and noise absorption (39), decreased risk of flooding, mitigation against the impacts of climate change (41, 43, 44) and mitigation against overheating caused by buildings and roads - the “urban heat island” effect (39, 44, 45).

5.4 Extreme weather events, including flooding, are likely to become more frequent due to climate change (46). These are likely to have significant impacts on health as extreme temperatures contribute directly to deaths from cardiovascular and respiratory disease (41, 43, 44, 47-49), particularly among elderly people (43), flooding can increase risk of injury and infection, as well as anxiety, depression and post-traumatic stress disorder (46).

5.5 In England and Wales, in the heat wave of summer 2003, more than 2,000 excess deaths were registered, an 16 per cent increase (50) in deaths compared to the baseline for that calendar period. Extreme cold temperatures also impact on health. There were an estimated 18,200 excess winter deaths in England and Wales in 2013/14 (51). It is important to note that the number of excess winter deaths does vary significantly from year to year however health impacts of heat and cold are affected by the quality of buildings such as homes and workplaces (see later section on 8. Healthier Housing).

Transport and Active Travel

6.1 A key priority for improving health is to encourage active travel as a means of reducing car use and increasing physical activity, with its consequential benefits for physical and mental health as well as sustainability and climate change (29, 52). Half of women and a third of men in England today are not active enough to stay healthy (52).

6.2 Physical inactivity directly contributes to one in six deaths in the UK, and if current trends continue we will be 35% less active by 2030 (52). Yet, as the former Chief Medical Officer has noted: “The potential benefits of physical activity to health are huge (Annex 2). If
a medication existed which had a similar effect, it would be regarded as a ‘wonder drug’ or ‘miracle cure.” (53)

6.3 There is evidence to show that walking is one of the least expensive and most broadly accessible forms of physical activity, it is rarely associated with physical injury and can easily be adopted by people of all ages, including those who have never participated in physical activity (25). However, distances walked have declined dramatically since the 1970s and travel by car has increased, as people travel longer distances and more frequently. The increasing affordability and convenience of car travel have led to the decentralisation of urban activities (eg. out-of-town shopping centres) with the consequence of a rise in the need to travel by car in a reinforcing cycle (54).

6.4 There is also a health inequalities dimension to transport. Children in the ten per cent most deprived wards were more than three times as likely to be pedestrian casualties as their counterparts in the ten per cent least deprived wards. This is compounded by the fact that more children live in deprived areas, so that more than one quarter of child pedestrian injuries happened in the most deprived tenth of wards (55). There is evidence to show that traffic calming measures are effective in, not only reducing the occurrence of accidents, but also having a significant effect on their severity (2, 56).

Healthy Food Systems

7.1 More than half of the adult population in the UK, with 67% of men and 57% of women, are either overweight or obese (57). This means that the UK has higher levels of obesity and overweight people than anywhere in Western Europe, except for Iceland and Malta. The latest figures also show that a third of 10-11 year olds and over a fifth of 4-5 year olds are overweight or obese (58).

7.2 Being obese can increase the risk of developing a range of serious disease, including hypertension, type 2 diabetes, cardiovascular diseases, several cancers, asthma, obstructive sleep apnoea and musculoskeletal problems (22, 59). Evidence also shows that overweight and obese children are also more likely to become obese adults, and have a higher risk of morbidity, disability and premature mortality in adulthood (58).

7.3 Estimates of the direct costs to the NHS in 2006/07 of overweight and obesity was £5.1 billion. These costs are projected to reach £9.7 billion by 2050 with the wider costs to society estimated to reach £49.9 billion per year by 2050 (59).

7.4 The built environment has a role to play, as part of a whole systems approach, not only in terms of encouraging physical activity, but also in terms of promoting access to healthy food (60). Recently published evidence looked at the associations between exposure to takeaway food outlets, takeaway food consumption and body weight in Cambridgeshire. The study concluded that, overall, access to takeaway food outlets in all domains combined
(home, work and along commuting routes) was positively associated with takeaway food consumption, body weight and obesity (61). Strong links between obesity and deprivation have also been established (62) as well as links between higher levels of deprivation and higher concentration of hot-food takeaways (62).

**Healthy Housing**

8.1 Evidence suggests that poor housing is associated with increased risk of cardiovascular diseases, respiratory diseases, depression and anxiety (10, 46, 48, 63). The greatest risks to health are related to cold and damp homes (including mold and fungus), which affect and exacerbate respiratory conditions, indoor air quality, dust mites and other allergens. House type and overcrowding represent further examples of risk factors (64).

8.2 The elderly, and children, are particularly vulnerable to poor housing conditions and are also more likely to suffer ill health in a cold home (48, 65). Evidence also shows that exposure to multiple housing problems increases children’s risk of ill-health and disability. One study suggested an increase of up to 25 per cent (48). The urban heat island effect (see Healthy Natural Environment and Sustainability), and the increase in the number of extreme weather events, is also likely to put increasing demands on housing, both in terms of heating and energy efficiency, as well as cooling mechanisms (66, 67).

8.3 According to the latest English Housing Survey (68), 4.8m homes in England do not meet decent homes standards, which is equivalent to 21% of England’s housing stock. “The private rented sector had the highest proportion of non-decent homes (30%) in 2013 while the social rented sector had the lowest (15%). A fifth (19%) of owner occupied homes failed to meet the decent homes standard in 2013”.

8.4 While housing conditions improved in all tenures between 2006 and 2013, the greatest improvement occurred in the social rented sector where the number of non-decent homes almost halved from 1.1 million (29%) in 2006 to 593,000 (15%) in 2013. The Building Research Establishment (BRE) recently estimated that the total health cost of poor housing to the NHS is £1.4 – 2.0 billion per year for England (69).

8.5 Housing impacts on health, not just through the quality and suitability of the housing supply, but also its availability, or absence of housing. Latest research suggests that some 240,000-245,000 additional homes will be required each year to meet newly arising demand with nearly one-third of required at below-market prices and rents (70). All forms of homelessness, including precarious housing, were estimated to cost the public purse (including health services) £1bn per annum (71) and the latest data indicates that a homeless person is 4 times more likely to be admitted to hospital and visit A&E than the general population (72).

Translating evidence into action – delivering healthy built and natural environments
9.1 Although the links between the built and natural environments are well established and evidenced, the planning process does not always consistently deliver communities which can enable these benefits (73). CABE’s study, which used the Building for Life methodology, found that only 18 per cent – fewer than one in five – of the private housing developments audited could be classed as ‘good’ or ‘very good’. They also found that the better private housing schemes tended to be in more affluent areas and the poorer private housing schemes in less affluent.

9.2 The National Policy Planning Framework (NPPF) recognises that the planning system can play an important role in creating healthy, inclusive communities. This recognition has been welcomed and supported by PHE which has collaborated with DH and DCLG in the production of the Planning Practice Guidance on Health and Wellbeing. The purpose of the Health and Wellbeing PPG is to further explain the health and wellbeing issues raised within the NPPF and provide further policy context and indication of the role of the built environment in promoting health communities.

9.3 In order to support action on health through the built environment, PHE has published or co-produced a series of guides, evidence briefs and reviews that recognise the role of the built environment on health:

- **Planning Healthier Places** (Town and Country Planning Association)
- **Planning Healthy Weight Environments** (Town and Country Planning Association)
- **Memorandum of Understanding (MoU)** to support joint action on improving health through the home with 19 other housing and health related organisations
- **Fuel poverty and cold home-related health problems** (Institute of Health Equity)
- **Improving access to green spaces** (Institute of Health Equity)
- **Everybody Active, Every Day**: a framework for increasing physical activity

9.4 PHE also supported the production of 2 guides published by the Department of Health:

- **A guide to the healthcare system in England for local planning authorities** (Dept of Health)
- **A guide to town planning for health organisations** (Dept of Health)
Annex 1 - The Impacts of the Built Environment on Health

Source: Rao et al. (2007)
Annex 2 – Physical activity contribution to reduction in risk of mortality and long term conditions

Physical activity: Our greatest defence against ill health and disease

| Physical Activity contribution to reduction in risk of mortality and long term conditions |
|---------------------------------|-----------------|-----------------|
| Disease            | Risk reduction | Strength of evidence |
| Death              | 20-35%          | Strong           |
| CHD and Stroke     | 20-35%          | Strong           |
| Type 2 Diabetes    | 35-40%          | Strong           |
| Colon Cancer       | 30-50%          | Strong           |
| Breast Cancer      | 20%             | Strong           |
| Hip Fracture       | 36-68%          | Moderate         |
| Depression         | 20-30%          | Strong           |
| Hypertension       | 33%             | Strong           |
| Alzheimer’s Disease| 20-30%          | Moderate         |
| Functional limitation, elderly | 30% | Strong |
| Prevention of falls | 30%             | Strong           |
| Osteoarthritis disability | 22-80% | Moderate |

Introduction

1. Pupils 2 Parliament is a project to enable school pupils to think about, and feed in their views to, consultations and inquiries being carried out by Parliament, the government and national public organisations. The project has been approved by the Clerks of both Houses of Parliament to use the word ‘Parliament’ officially in its name.

2. Pupils 2 Parliament brings the special viewpoint of children and young people to people carrying out inquiries and consultations - plus the uniquely fresh and often challenging analysis that children and young people bring to making decisions and policies.

3. The project gives school pupils the chance to learn and think about important decisions being made by parliament, government and public bodies, and to take part for real in democracy by feeding their views into real national decisionmaking.

4. We gather pupils’ views independently, through discussions with groups of pupils led by someone from Pupils 2 Parliament. We use material from the relevant consultation or inquiry document to explain things. We specialise in putting the issues and questions even-handedly, without leading pupils in any way or suggesting any responses. All views therefore come straight from pupils, with no adult prompting.

5. This report gives you all the views pupils gave us, without us leaving anything out, adding anything in, or making comments on what pupils said. The views in this report are pupils’ own views, and nothing but pupils’ views.

6. The views in this report came from 41 pupils, aged from 9 to 14, who we consulted in three groups, at Newtown High School, Powys, John Beddoes Campus, Powys, and Quarry Bank Primary School, Brierley Hill, West Midlands.

7. The report gives the pupils’ views about buildings and how decisions should be made about buildings, to feed in to the Lords Select Committee which is looking at the future policy and decisionmaking about buildings. We explained that the Committee wants to know pupils’ views about the built environment – meaning places where we have buildings around us. We asked about what pupils did and did not like about particular sorts of buildings, their favourite buildings and the places where there are buildings, keeping old buildings, building new buildings, and who should make decisions about giving permission to build or change buildings.

8. The questions we asked were agreed with the Select Committee, and the Chair of the Select Committee asked us to put some particular questions to the pupils.
Why do we need new buildings?

9. This was a question the Lords Select Committee asked us to put to the pupils. Here is the complete list of pupils’ answers (not in any special order):

- If they are needed for a definite purpose – for someone to live in or work in (but buildings should not be built if we aren’t completely sure they will be needed – buildings put up without enough reason add to ugliness and pollution)

- For business expansion and to provide jobs and buildings to work in

- To provide more places to educate people and to provide different schools for people in education to move on to

- To provide hospitals to treat injured people

- To replace houses with new ones so “you’re not stuck with what you’ve got”

- To provide larger houses for people who need them

- To replace old buildings

- For new housing for the growing population; “people are being born every day and need somewhere to live”, “we all need a place to live”

- For people who cannot afford other housing, or are having to “squish in” living with others

- If they are needed to provide services to support new housing – such as schools and hospitals to go with new houses

- To feed in to the economy

- To replace old buildings that are no longer adequate or up to standard

- To replace old buildings because technology in buildings is always improving

- Because humans are evolving technologically so buildings need to as well, to meet our new needs and demands on buildings and the new ways we go about our lives
• To expand our towns – but need to do this without cutting down on wildlife
• To help employment by expanding workplaces that need bigger space
• To replace houses and buildings that have become dangerous
• To give the country more modern and more attractive buildings
• To house and employ people coming into the country through immigration
• Because people need more room
• To house and provide facilities for more vulnerable people
• So builders can get work and be paid.

10. All three groups said a main reason for putting up new buildings was to provide more houses for our growing population, which then needed buildings for the services those people need. All said new buildings were needed for more employment. All spoke of people coming into the country from elsewhere needing houses. And all said we need new buildings to replace old ones that now need replacing. One group was very clear about the need to make sure that no new building is put up unless people know it is definitely going to be used and to meet a need.

What are pupils’ favourite buildings – and why?

11. We wanted to find out more about what pupils thought made a building an excellent one, and asked pupils to name either their favourite building – anywhere in the world – or their favourite type of building. We asked them to say why they had picked it as their favourite. We did ask them to pick a building other than their own house.

12. Two actual buildings were picked as favourites by more then one pupil each – and each of those buildings was picked by pupils in different groups from different schools. Both were tall landmarks – one was the Eiffel Tower, the other was the Shard.

13. The Eiffel Tower was was picked because it is an interesting tourist building, its design is interesting and famous, it is historic, and because of the way it was made. The Shard was picked because of its interesting and unusual shape, because it is taller than the buildings round it, and because its height means it doesn’t take up much space on the ground. The shape of a building can make it attractive.

14. What made many buildings favourites was not to do with the building itself, but because of what went on in it. Buildings are liked for what happens in them. The list of these (in no special order) is:
A pupil’s church – because of friends and activities there
Swimming pools – to enjoy swimming
An Air Force Cadet building – because the pupil wants to become an air cadet
Tennis courts – to enjoy playing tennis
A local leisure centre – because of weekend swimming activities there
Any library – because of the enjoyment of reading
Local games buildings – because they contain favourite games
A pet shop – because of love of pets
A local indoor skate park – where you can enjoy skating and scootering
Unusual and interesting shops
Supermarkets – because of what they have in them
Macdonalds – because people like what they provide
Animal care centres – because of what they do for animals.

15. Other buildings were picked as favourites because of what they were like as buildings. The list of these (again, in no special order) is:

- A very high glass sided restaurant – because you can see for miles from it
- Modern buildings – because they have new facilities
- Modern buildings that are big
- Tall skyscrapers – because they have good views from inside
- Attractive looking buildings; simple designs with bold coloured details like brightly coloured doors
- A holiday building in Turkey, because it was cool with a cold floor and air conditioning and walk-in wardrobes
- Merry Hill shopping centre, Dudley – because it is big enough to get lost in!
- The Statue of Liberty – because of the detail on it
- Seaside piers – because of the feeling of being above the sea, both inside buildings on the pier and when walking outside on the pier
- Buckingham Palace – because it looks so posh
- A cousin’s house – because it is big and warm
- Cinemas – because you always feel relaxed and calm in one
- Buildings which are tall and have dark shading – because this makes them look imposing
- Buildings in towns with windows that let you see in easily from outside
- The derelict house next door – because it can be fixed up, so we can use something old and make it look better
- Powys Castle – because it has been saved from ruin, and is now used for lots of different exhibitions
• Country cottages, if they are listed or old, historic and safe to live in – because they show “the beauty of simple design”
• The Taj Mahal – because it is symmetrical and pretty, and has a real story behind it
• Warwick Castle – because it was hand built without machines and is historic
• One storey houses – because they are humble, small and quiet.

16. There are some themes in what made particular buildings or types of building a pupils’ favourite. Favourites included big buildings, tall buildings with good views, imposing buildings, unusual buildings, historical buildings, famous monuments, older buildings, and buildings of a simple design. But they also included buildings where things pupils liked happened, regardless of their design.

**What buildings do pupils really not like, and why?**

17. This question was the other side of the last one. Having heard what pupils chose as their favourite buildings or types of building, and what made a favourite building, we wanted to find out what pupils really didn’t like, and so what made a building disliked by children or young people.

18. Again, some buildings were not liked because pupils didn’t like what went on in them. Some said they didn’t like school buildings because they found school boring. Some said they didn’t like shops, because they were boring places to be.

19. Some pupils told us they really didn’t like some of the types of building that others had chosen as favourites. Supermarkets had been chosen as a favourite, but someone else disliked them because they took a lot of time just walking around them for things. Fast food restaurants were somebody’s favourite because they liked fast food, but disliked by someone else because they didn’t like unhealthy food and worried about obesity. The Merry Hill shopping centre in Dudley, though it had been someone’s favourite, was disliked by someone else because it is always so busy, and that pupil did not like shopping.

20. One pupil had chosen Powys Castle as their favourite building because it had been restored. Another pupil said they really didn’t like it because it had been restored – really old historic buildings should be allowed to fall into ruins. They were then attractive because they were in their natural state for that stage in their life as a building and had not been made unnatural by being restored or rebuilt.

21. Some pupils disliked particular shop buildings, not because they found shopping boring, but because they thought those shops were too expensive for people to afford. Others disliked particular shop buildings because they didn’t like what they sold – one disliked the local ‘chippy’ because they did not like that food, and another disliked a specialist
chocolate shop because its chocolate was not normal chocolate and they didn’t like it. One pupil disliked the building of a particular takeaway, because they had found some metal in a meal they had bought from there.

22. One pupil had liked libraries because they enjoyed reading, but another said they really disliked libraries because they are too quiet.

23. Good or bad things happening in a building can make you like or dislike the building whenever you see it.

24. Here is the list of buildings or types of buildings the others chose as ones they really didn’t like (as always, in no special order):

- Old buildings that are derelict and boarded up and untidy
- Old abandoned buildings – “the sort people would throw stones through windows”
- Buildings that are old and not good looking – like some of the pupils’ own old school buildings
- Old castles that are ruined standing alone in fields
- Hospitals – because they smell nasty
- Old buildings that are boring and have no interesting features
- Old buildings that are simply old-fashioned and not updated
- A derelict house being sold – which may have growth in it that triggers someone’s allergies
- A petrol factory – because it smells bad, smokes, is grey and ugly and kills birds
- Derelict historic buildings
- Buildings that don’t fit in where they are – “like a jigsaw puzzle with a wrong piece stuck in it”
- The “concrete and asbestos buildings” round Chester
- The new buildings in Telford – because they look horrible and are badly designed with “random sticky out bits”
- Gigantic buildings built to be “impressive buildings that are meant to make an impression on you” – with the statement “hi – we are gigantic buildings”. Good buildings get the balance right between being impressive and being plain and boring
- Too many takeaway shops near each other – because this can even make you feel sick
- Rows and rows of the same type of house with nothing special about them.
- “Boring square brick buildings”.

Page 1535 of 1964
25. Some of the themes in what pupils said were that buildings that are either boring or designed to be too impressive can be disliked for that – there needs to be a good balance of interest and plainness – and buildings are disliked if they are run down or derelict. Out of date buildings can be disliked if they are run down rather than historic. It matters that buildings fit in with other buildings where they are. The smell in or around buildings can be important. And as with the choice of favourite buildings, what goes on in a building can be the most important thing about what you think about the building.

**What makes a good looking building?**

26. Architects and planners pay a lot of attention to what buildings look like, and pupils had talked about how important it can be that a building looks good. So we asked pupils to say what, for them, made a building a good looking one – to give us their guide to architects and planners on making the built environment look good.

27. Some said the size of a building is important. It needs to look the right size for its purpose. A building that looks and feels too small for what it is doesn’t look good. It also needs to look as if it has the right amount of land around it – the right size of garden for it if it is a house. Having greenery outside helps make a building look attractive.

28. As well as this, pupils told us that a building needs to be in the right position on its site. It looks wrong if it is put too far to one side, or too far forward or back on its plot.

29. Some talked of buildings needing to look interesting, and to be attractive by standing out from the other buildings. A good looking building is eye-catching, “appeals to the crowds”, and has something of a “wow” about it. A row of buildings needs to have different styles and shapes of building in it to look good and “more than just a row of houses”. But in trying to make a building stand out from other buildings, it is important not to put too many unique buildings next to each other, or it doesn’t look right. In a town area, catchy signs and posters can make buildings stand out and look good.

30. Having “jazzy” colours can make a building look interesting and attractive – one pupil said there were good examples of use of a variety of colours in the buildings in Amsterdam. Colours can stop a building looking too grey and boring, and are useful to break up big areas of glass on large or tall buildings. A building can be made to look good by using different styles and colours of bricks. Another thing that can make any building look good is to put a lot of interesting detail on it.

31. Some pupils gave us examples of very good looking buildings – Big Ben’s tower looks good because of its size and how it stands out, and Buckingham Palace looks good because of its different shading and different bricks. Generally, mansions looked good if they were big and posh.
32. Pupils in different groups again used the word “balanced” about the design of buildings to look good. The design needs to make a building stand out and be interesting, but not go ‘over the top’ and make it look odd or as if it is just trying to look impressive. As one pupil put it, it needs to be “not too odd, not too bland”.

33. And again, pupils talked about the ‘purpose’ of a building. To look good, a building needs to look right for its purpose.

34. Another factor that makes a building look good is looking sturdy and well built, and therefore safe and likely to last. “It is going to stay upright – going to last”. This factor came quite separately from pupils in different groups. In one group, a pupil said that a good building should look as if the builder has taken their time to build it well; “built right, not rushed, not just put up on a Friday”. A good looking building also looks well looked after.

35. Different pupils had different favourite styles that they thought looked good. Some thought modern looking buildings look good; “modern and big, not too small”. Other choices were black and white tudor style designs, rustic styles with thatched roofs, the stone cottage look, and the style of buildings from the industrial revolution like the Albert Dock in Liverpool. Another choice was modern glass fronted buildings, provided they were well designed and mainly white around the glass. One pupil liked Victorian houses because of the colours used in them.

36. One point made about new houses was that they should look “more than a box”, by having a room or part of the building outside any basic box shape.

37. There was one view though that there aren’t many good looking buildings around; one pupil said “I ain’t seen a good building, to be honest”.

**What are pupils’ favourite built environments?**

38. The Select Committee is interested in the built environment, not just buildings alone, and so we asked pupils what their favourite places were because of the buildings there (rather than because of the natural scenery of the place like hills, fields, rivers or coast). Here is the list of their favourites:

- Madrid – because its buildings look good together
- The fun buildings at Alton Towers
- A row of shops
- Torquay – because the buildings stand out at night
- My own street – because there are nice houses all around it
- Country buildings in Devon
- Disneyland glowing in the dark
• Weston-super-Mare – because there is a screen on a building you can watch
• Centre Parcs – because of the tree houses and different sized houses
• Buildings in lovely countryside locations
• Ireland – because the buildings are not too close together but still near enough for a sense of community, and are a good design
• London – because it is really busy and the buildings include stations
• The old industrial canal areas of Birmingham – because they fit the era and are small scale
• Seaside villages – because they feel serene
• Streets in India – because there is colour and everything happening, nothing organised, all going on and because of the atmosphere
• Venice – because of the buildings on the canals and the atmosphere
• Spain – with buildings on a slope and pretty golden houses, with skyscrapers throwing shadows on the hills
• Newtown, Powys – because the community is special, it “has everything” and doesn’t need new facilities, has a pretty clock tower, and “the people make it special”
• New York – because it is attractive and modern
• Paris – for its landmarks and the Eiffel Tower
• London – because of its tall buildings
• Cardiff Bay – because it is modern and up to date
• London’s rows of uniform houses
• Stourbridge’s rows of uniform houses
• London – because it has tall and impressive buildings in the centre, and nice and new houses around the edges, but it does have a dirty and untidy area between the centre and the edge, like most cities
• Knighton – because of its nice buildings, facilities and a particular department store there
• Dubai – because it is really interesting.

39. Some common themes here are pupils saying how the setting of buildings is important to the built environment (eg being set in countryside or well spaced out in a country area), how there is a difference between ‘nice’ and ‘impressive’ parts of a city and the unattractive band around the city centre, how London and some other cities abroad feature as attractive places, how lighting up can affect how somewhere looks, and how tall buildings and rows of uniform but attractive houses can be good. It is also clear that pupils regard the facilities of a place, and its atmosphere, as being important to the built environment – not just what it looks like.

What do pupils think of new buildings?
40. Thinking about the design of buildings in the future, we asked pupils what they either most liked, or most disliked, about new buildings being put up nowadays.

41. Some pupils told us they didn’t like seeing building construction going on around them – a building looks weird when half finished. It also takes ages for new buildings to be built.

42. Some liked new buildings that looked posh and expensive, and thought “the dear ones are the good ones”.

43. Lots of pupils liked new buildings that had a unique design and different shapes and some contrasting colours, as long as they weren’t too bold or odd-looking, had loads of windows that looked right and let in plenty of natural light, were good for environmental factors, and looked strong and safe. Permission to build any building should only be given if it was going to be safe. New buildings should have a good layout and be built out of good quality materials. As one put it, the “science of structure” had to look right.

44. New buildings should not be built “in the middle of a field” if they don’t belong there – “don’t build on nature”. There should be plenty of space to build the building and it should not look out of proportion to the buildings around it.

45. How the building looked was not always the architect’s idea of how it would look to people – pupils saw buildings in their own way, “not what ways the building wants you to see”.

46. Windows were vital to how a new building looked. Many pupils didn’t like new buildings with no windows, oddly shaped windows, windows in odd places, or windows that were too small or too big for the walls they were in. A building with no ordinary windows “looks weird and tacky”. Circular windows don’t look right. Massive rectangular windows mean you can see the people inside. Window sizes matter, and windows should not look like a puzzle. Windows also have reflections in them when you look at them from the outside, and what they reflect needs to look pretty. The reflections can help make interesting contrasting colours.

47. Size and space were important to pupils. They liked new buildings that had good size, and used their whole space properly without being cramped. A new building should not be built so close to its neighbours’ land that it inconveniences them.

48. Other things pupils didn’t like about new buildings were plain brick buildings, buildings that looked too plain, buildings that didn’t look right in their environment, buildings that were too bold, buildings that didn’t look safe, and big or tall buildings that shade or hide other buildings around them. One also didn’t like new buildings that had small rooms in them that soon looked neglected.
49. Again, pupils told us that it was important that any new building is only built if it will definitely be used and is needed. “Don’t build things that won’t be used”. It is important to “predict the future” in deciding whether a building will carry on being needed and so whether to give permission for it to be built. Some thought strongly that everyone affected by a new building should be asked about it, and it was important that “everyone should agree with the plan”.

**How important is it to keep old buildings?**

50. We asked pupils to vote on what policy there should be about keeping, or replacing, old buildings. We gave three options to choose from: to keep as many old buildings as possible, only to keep very special old buildings, or that it is not at all important to keep old buildings if the space is needed for something else.

51. Here are the pupils’ votes, putting all three school votes together:

- Keep as many old buildings as possible: 11
- Only keep very special old buildings: 23
- Not at all important if the space is needed for something else: 7

52. The pupils clearly voted for a policy of only keeping very special old buildings. Over half the pupils voted for this policy. Of those who voted for other policies about keeping or not keeping old buildings, most wanted as many old buildings to be kept as possible. Only 7 out of the 41 pupils voted that it is not important to keep old buildings if their space is needed for something else.

53. One worry was that if some old buildings are not kept, everywhere would be “just loads of new ones”, which would not be good.

54. Because the majority of pupils wanted very special old buildings to be kept, we asked what would make an old building very special. Most saw an old building as very special, and therefore one to keep, if it had history to it. This might be because something important in history had happened there, or because someone important had lived there, if the building had played a part in a big change for people in the past, if it was an important part of our culture, if it had links to royalty, or if it was an important part of our past. It was important to keep old buildings if they are “ones that people want to see”. Popular, famous, beautiful, unusual, rare or landmark buildings should be kept. Old buildings like castles should be kept and turned into tourist attractions.

55. Buildings that have been there a long time should always be considered for keeping, and buildings should not be knocked down just because they are old, as long as they are still
safe and people like them. Old buildings should only be knocked down if nobody really cares about them any more. “Only get rid of non-historical buildings”.

56. Buildings special enough to be kept could be many different sorts – they could include monuments as well as buildings as such.

57. One pupil group pointed out that it was easy to make decisions about keeping old buildings if lots of people thought they were special, but that planning people need to consider that a building may be special to a particular person, and knocking it down could upset someone who really likes it, even if nobody else does.

58. Pupils said it was important to keep buildings that have already been ‘listed’ as special, and many told us they thought the system of listing special buildings should carry on.

What rules should people putting up buildings have to follow to make a TOWN CENTRE a really good place to be?

59. We asked pupils to consider what rules should be followed before giving planning permission for new, or changed, buildings in town centres.

60. Here is the full list of rules they suggested:

- Respect the buildings already there
- Only build after asking local people and if there is public consent for the new or changed building
- Ask local people what they think about the design of the proposed new building
- If houses are being built, ask whether local people would want to live in that sort of house
- Only build if there is a definite need or if local people want the building or change
- Avoid having too many of the same sort of facility
- Avoid having too many of the same sort of building together
- Only build if it will benefit or give enjoyment to the local community
- Keep disruption to local people to a minimum while the building work is being done
- Don’t build too many new buildings in an area
- Keep a variety of buildings and facilities in the area
- Make sure landlords and solicitors are properly involved
- Make sure the new or changed buildings are safe
- Have two separate sorts of permission that people have to get – firstly, permission to knock any existing building down, and secondly permission for the new building they want to put up.
61. One pupil was very clear that how disruptive the building work will be to local people should be considered in deciding whether to give planning permission, as well as the buildings that might be knocked down and the building it is proposed to put up. Building work can cost lots of people lots of time, for example when a diversion around a large building site makes a journey to school or work far longer than it usually is, for a very long time.

**What rules should people putting up buildings have to follow to make the COUNTRYSIDE a really good place to be?**

62. We also asked pupils about the rules they thought should be followed in making decisions on whether to allow new buildings in the countryside. Here is the full list of the suggested rules:

- Ask people around if it’s ok with them to build there
- Only build in the countryside if there is a real need for the building to be there
- Ask local people if it’s a good spot to build, or whether the building should go somewhere else
- Only build in a field if it is safe and if nobody needs the field for other uses
- Don’t disturb or build on animals’ habitats
- Don’t build too much in the countryside
- Respect country activities
- Don’t make the countryside look like a town or city
- Don’t affect views
- Make any buildings suited to the landscape – including how they are positioned in the landscape and whether they are going to be on land that floods
- Don’t spend too much money developing building in the countryside
- Don’t allow “random buildings” in the countryside
- Allow some expansion of country towns if that is really needed
- Ask for the views of local farmers.

63. One common theme from all our three groups was not to build too much in the countryside, and keeping buildings there to what is really needed there rather than somewhere else. Many were concerned about keeping the countryside and not letting it become like a town area – as one pupil put it, summarising for many others, “sometimes I feel like we are losing the countryside”.

**How pupils would change the buildings in their local area to make it a better place to be**
64. We asked pupils to think about a built environment they all knew – the area around their own school. We asked them what changes, if any, they would want made to the buildings there to make the area as a whole a better place to be.

65. Many pupils at each school said they liked the buildings as they were, and would not make any big changes. As well as this though, many would like the buildings generally to be a bit better looked after, painted and repaired. “Fine as it is”, but needs a “good lick of paint”, “paint it and make it look nicer”, “everywhere needs a touch up”.

66. Some wanted particular buildings kept, but “revamped”. It was important to maintain buildings so that they don’t “just look old”. It was also important to keep buildings and the area around them clean. Buildings generally needed to be kept looking good and well-painted not plain. One proposal for improving the town while keeping it’s character was to “modernise buildings but don’t change the outside”.

67. Pupils thought it was important to keep the old character of old towns. “Old towns should stay old towns”, “keep the history of the town”, “do things up but don’t change them”.

68. It was important that the insides of buildings – like schools – were kept in a clean and good state. Chewing gum under tables, and graffiti, need to be removed. There were also some particular problems that needed sorting out in some areas – like the ‘leaky lampposts’ in one area.

69. Those who wanted changes wanted different sorts of improvements. These included making housing estates look nicer, making houses stand out from each other, knocking down buildings that were in a bad condition or now in the wrong place, making the place more modern, clean cut and neater. They also included having more and better maintained parks, getting rid of graffiti, and improving local roads to make places more accessible.

70. Some felt their town was too cramped, and proposed helping the place to look and feel “less squished”. It was important too that if new houses were to be added, they shouldn’t be ugly new houses, and shouldn’t be built cramped together.

71. There were proposals to improve security and ban smoking at a local large shopping centre, and to provide more to do locally with new facilities ranging from more climbing equipment and slides in the local park to giving the locality a multi-screen cinema and swimming baths.

72. Some discussed shops, and thought it was important that there should be proper research on what sorts of shops people actually want in their area. New shops could be
added, but without getting rid of old shops. There was concern that adding new shops and businesses could damage the existing ones; “don’t add new shops because old businesses will fail”.

73. In one group, there was a discussion about whether the old town clock should be demolished or kept. When someone proposed that it should be demolished, there was a general objection to this around the group, as it was an old local landmark. So we put that issue to a vote of the group. One person voted for the clock to be demolished, 8 that it should be kept as it is, but two, having heard the views discussed, were now undecided and abstained from voting either way. Proposals affecting something many see as historic or a landmark can raise strong views.

**If new houses need to be built, what kinds of places should they be built in?**

74. We asked pupils to consider the question of finding places to build new houses when the growing population needed them.

75. Pupils were keen that new housing should be built on existing unused land, without going into the countryside too much, and without taking away farmland. Sites like abandoned factories or other industrial sites should be used first, and housing should be built so that it fits in with nearby buildings. Existing buildings that don’t have a purpose any more could give way to new housing. Derelict or unoccupied housing should be reused or replaced.

76. They also thought new housing should be built on the outskirts of existing towns or villages, with a focus on cities rather than open countryside. Housing estates should be built on the edges of towns. Old places should be expanded, rather than new ones started.

77. Big plots of land that are not fully used should be found - where there is a massive house on a big plot of land, it could be knocked down to build more houses on the site. Building houses should happen in nice neighbourhoods which have spare land if possible, to make nice streets for the new people to live on. It is also important for new houses to be built next to areas that are already busy, so that people moving in can make friends easily. New houses should have schools nearby, so children don’t have to catch buses to school. It is important that new housing shouldn’t be overcrowded.

78. Some proposed that a lot more flats rather than houses should be built where there wasn’t much land available. The ‘bedroom tax’ also means that more smaller size houses should be built. New building should also include cheaper houses.
79. There was one thought about making existing towns and cities bigger. This was that building some small areas of new housing in the countryside away from towns might be safer should there ever be another war involving bombing.

**Who should make decisions about what sorts of buildings can be built where?**

80. One of the Select Committee’s questions was about who should have the final say on where new buildings can be built. We asked the pupils to vote between four possible options; that decisions should be made by the national government, or by the local council, or by the people who live or work nearby.

81. Here are the pupils’ votes:

- The government of the whole country: 2
- The local council: 15
- The people who live or work nearby: 23

82. There was a clear pupil vote in favour of the final decision on giving planning permission for new or changed buildings being made by the people who live or work nearby. The majority voted for this. Planning decisions being made by the local council came a strong second choice.

83. A final say on this came from one pupil on giving different people a say. They wanted local people to have the main say about whether a new building should be allowed, but thought that there were others who should have a say too, like the local council or government which had to find places to build new houses, which might not always be popular locally. Their idea was that planning permission decisions should be made by a voting system which gave most weight to local people, followed by the local council, and followed finally by the government. Different weights should be given to the views of different groups of people.

I am grateful to the Head and staff of Quarry Bank Primary School, of Newtown High School and of John Bedddoes campus for the chance to hold these discussion with their pupils. I am especially grateful to the school staff at each school who worked very hard taking detailed notes of each of the views given by each of the children. And above all I am very grateful to each of the pupils for their thinking, votes and views.

Transcript to be found under Penoyre & Prasad Architects
Introduction

1. Reclaim London was formed in 2015 to campaign for a fair, open, accountable and genuinely democratic planning process. We are an alliance of campaigners representing all parts of the capital, with direct experience of the planning system. We strongly believe that the planning system should include residents in the conversation about how their cities should develop.

2. Although the NPPF was supposed encourage public participation in the planning system by simplifying the planning rules, it has been our experience that this simply has not happened.

3. In our view the overriding problem is that the ‘flexible’ approach to planning policy means that almost any policy, no matter how important, can simply be set aside by a planning authority often with little justification. In London in particular, almost every development is seen as ‘exceptional’ and granted special dispensation to be allowed to depart from the local plan.

4. This approach of giving authorities almost limitless latitude with the development plan has been endorsed by the Planning Inspectorate and upheld by the courts, who have consistently refused to intervene to quash decisions, even in very clear circumstances where the NPPF has been ignored and where the failure to implement the NPPF has been challenged by the public.

5. What is particularly disturbing is that in an environment where the planning authorities are free to negotiate away planning policies the public are quickly shut out. Without any clear rules about how planning decisions should be taken the public are unable to hold planners to account for their decisions. The result is that almost no new buildings in London conform to the development plan. And as the development plan must reflect social need, this is creating a city that is unable to provide for its own population or protect its history and culture. The
NPPF aspires to create ‘change for the better’ but this is not happening in London.

6. It is clear that Londoners, generally speaking, wish to live in a city that has a diversity of people, buildings, neighbourhoods and economic activities. Yet as a result of current planning decisions London is becoming closed to all but the wealthiest, dominated by large businesses and by an increasing number of anti-social buildings and spaces. The common feeling among people from all income groups, backgrounds and areas of London is that the present planning rules need to be strengthened, not weakened.

**Question 1**

7. A well-resourced local authority should be at the heart of the decision-making process and the national policymakers’ role should be to apply checks and balances where appropriate.

8. There needs to be a stronger policy on when the Secretary of State should call in a decision, with call-in being mandatory in certain circumstances.

9. A shocking example of the failure of the current call-in policy came with the decision on Elizabeth House in Waterloo. Elizabeth House is in the setting of the World Heritage Site in Westminster. UNESCO, due to the increasing concern over the tall buildings being granted permission in the setting of Westminster issued a public statement saying that the Government’s treatment of the Elizabeth House decision would be the ‘litmus test’ on whether the UK wanted to retain Westminster’s World Heritage Site.

10. The Secretary of State refused to call-in the application and the planning minister, Nick Boles, wrote to Westminster Council saying that the application only raised local issues. The Secretary of State was content to leave the future of Westminster’s World Heritage Status to Lambeth Council. A decision which many found surprising, but was nonetheless found acceptable to the High Court in a subsequent judicial review of the decision launched by
Westminster City Council.

**Question 3**

11. The stated intention of the NPPF was to provide the public with a much clearer and consistent set of planning policies in order to allow them to better engage with the planning process. But in the context where all planning policies are seen as flexible and decision makers can arbitrarily set them aside, then the public finds the tools they need have been blunted.

12. The Shell Centre decision provides a clear example of this. The application to redevelop the Shell Centre on London’s South Bank resulted in a loss of more than 4,000 sq m of open space. The NPPF is clear\(^1\) that open space should not be built on and any loss of open space must be replaced with open space of equivalent size. The inclusion of this paragraph in the NPPF was the result of a hard fought campaign by the National Trust and others to protect England’s open spaces.

13. A subsequent judicial review of the decision found that the loss should be regarded as acceptable. The explanation given was that the provision in the NPPF should be interpreted flexibly.\(^4\)\(^3\)\(^6\) If the loss of 4,000sqm of open space in the centre of a dense urban environment is acceptable under a flexible interpretation of the NPPF, then it is difficult to see what meaning can be given to the NPPF at all.

14. Regarding prioritisation, the way in which the NPPF is interpreted is dominated by the weight given to the need to promote economic growth though building and construction. We see this being applied, often crudely, with other policies ignored. In many cases in London the size of a project seems to steer the decision, the implication being that any development will have a beneficial economic impact.

\(^1\) NPPF paragraph 74
\(^2\) Turner v Secretary of State CLG paragraphs 31-37
15. This approach risks minimising the negative impacts of development proposals on local economies. This can include a loss of space for small businesses and affordable office and workspace, as well as loss of amenity, which damages the value of surrounding areas. However these losses are seldom quantified.

16. As part of economic considerations in the NPPF, the viability of schemes is also being seen to trump all other policies on a grand scale. It is an obvious and necessary reform for developer’s viability claims to be made public.

17. It is common in London for a developer to declare their scheme to be financially unviable and therefore there is a need (they say) to depart from the development plan to allow the scheme to become viable.

18. This approach is problematic for two reasons. Firstly developers have no obligation to disclose their financial information and the public must trust that they are right. Frequently evidence has emerged that the viability claims of developers are fictitious, resulting in an unnecessary departure from the development plan.

19. Secondly the use of viability as a get-out from the development plan turns the entire planning system on its head. Planning should be about encouraging the development of appropriate buildings. Yet if a developer proposes an inappropriate building and claims it is viable, the planning authority often feels compelled to accept the proposal, even if it is a significant departure from the development plan. Whether or not a building that conformed to the local plan would also be viable is a question that is left unanswered.

20. It is interesting to note that the court of appeal in the Barnwell case found that the protection of heritage assets took precedent over all other planning policies, as it was the only planning
consideration that the Secretary of State had a statutory obligation to take into account.\textsuperscript{437}

**Question 4**

21. We feel that London needs to be defined separately within the NPPF because much of it was written to apply to the non-metropolitan centres, such as the need to encourage building. What matters in London is a greater emphasis on quality and amenity for communities within the high-density areas designed to boost the UK’s housing quota. Again, this has got to mean stricter planning rules.

**Question 5**

22. A more forward-looking approach is vital. New developments of unaffordable apartments may provide an immediate gain, but they are at risk from global capital movements. Looked at more closely, new development areas such as Vauxhall are not being provided with basic amenities and infrastructure and may be rendered unusable in years to come.

**Question 6**

23. We feel strongly that the important and often-overlooked issue here is the lack of supply of appropriate housing.

24. In Central London 75\% of new homes are sold to overseas buyers. This international demand has fuelled a boom in house prices. On the South Bank prices have hit £2,000 per square foot. The result is that very little housing supply is available to the domestic market, which is driving the current housing crisis. The knock-on effect is felt across the whole of the city, with London

\textsuperscript{437} Barnwell Manor Wind Energy Ltd V E.Northants DC, English Heritage, National Trust & SSCLG [2014] EWCA Civ 137
prices now at over ten times the average wage. Some way to prevent the dominance of overseas buyers in the market must be found.

25. In this context the new planning reforms announced by the Prime Minister at the Conservative Party conference are of little effect to deal with the housing problem. The proposal to give first time buyers a 20% discount on new homes will not help the majority of people for whom a stable home remains out of reach.

26. In addition, because the majority of buyers in Central London of new homes will not be permanent residents, there is a temptation on the part of developers to dispense with many crucial elements that settled populations require: adequate daylight, open spaces, children’s play spaces and communal spaces.

27. Further relaxation of the planning rules are likely to lead to more poor quality homes for people who do not need them and fewer good quality homes for people who do.

28. Instead Government should consider giving allowing councils to use CPO powers to take control of development land where landowners refuse to bring forward appropriate development. CPO powers have been used in a number of cases to remove residents from estates that are then demolished to make way for unaffordable market homes. However, if a developer sits on land for years and attempts to bring forward proposals that are not in line with the development plan he is allowed to continue this game endlessly.

**Question 7**

29. There must be a greater obligation to keep and improve already existing buildings including those that give areas a sense of place and local identity.
30. Increasingly, the demolition of council estates and their rebuilding at higher density is seen as the way to boost housing supply. However, local authority housing estates are often much denser than other types of housing stock. Planners would do much better to look elsewhere for development potential, such as in the outer London boroughs. A proper consideration of the social and environmental effects of what is being lost when you erase whole communities from estates is missing from these over-simplistic equations. We refer the committee to UCL Engineering report *Demolition or Refurbishment of Social Housing: a review of the evidence* 2014.

**Question 8**

31. The record of the protection of historic assets in our cities has been poor. Liverpool’s world heritage site has been assessed as ‘in danger’ by UNESCO and there are threats to place Westminster on the World Heritage In Danger list too. The ‘Walkie Talkie’ skyscraper has destroyed views of Tower Bridge and the Tower of London. This damage is purely the result of the failure of the Government to apply planning policies.

32. In the cities we can only dream of the level of protection afforded to rural historic assets and the threat they have seen from wind farms. The Secretary of State has frequently called-in wind farm applications and treated the impact of these with far greater care than the impact of development on our cities’ heritage. The impression given is that the Government’s action on the protection of heritage is driven more by political considerations than by policy.

**Question 9**

33. The biggest problem we see is in the lack of skills around the analysis of development viability. Developers will frequently claim that financial considerations prevent them from delivering

---

the development plan, however Councils have no in-house ability to scrutinize the claims made in Financial Viability Appraisals.

34. Often they will buy in that expertise, however, frequently the consultants hired by the local authority will be working for the developer the next day. The public perception is that these consultants always have one eye on their next job and are unable to properly scrutinize the developer’s proposals to ensure that Local Authorities are getting the benefits they are due from the scheme.

35. If Viability Appraisals were made public, the public has the skills to understand and scrutinise the figures.

Questions 11 and 12: Community involvement and community impact

36. Many of these questions have been answered previously. We strongly believe that more account should be taken of the way in which the built environment affects those who live and work within it. As we have suggested, the way to improve this is to refuse schemes that go against public amenity such light, green space, spaces for children, community space, heritage assets, as well as those which do not provide sufficient levels of affordable housing.

37. Of particular concern to Reclaim London is how the engagement with the public by planning authorities is often seen as tokenistic. For example, in a number of London boroughs the public is given only two or three minutes to put forward their objections to a planning committee. By contrast, developers will have had many hours and days of meetings with planners and decision-takers in the run up to a decision being made.

38. This is an example of how the positive aims of Localism agenda currently play no part in the daily business of the planning system.

Question 13
39. In London developers are making huge profits from building luxury housing. In this context it is inappropriate for the Government consider further fiscal measures to support developers.

13 October 2015
1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

I. As we set out in our recent report, Devo Home, the only way to plug the shortage of affordable housing is through the creation of new local institutions – Local Place Partnerships (LPPS) – that devolve housing to people and places. The LPP model can dramatically increase the numbers of homes built through bringing together all the interested parties: private developers, housing associations, residents, civil society and local business, and addressing their concerns and wishes through one decision point. Housing Zones, introduced by the Greater London Authority and the 20 Zones announced for England outside London, is recognition of the benefits of this approach. We believe more must be done to move from a command and control model to one in which not just local authorities but also other local stakeholders are empowered to address local housing need. More also needs to be done to address the fragmented terrain that is the current housebuilding process, which prevents ambitious action from becoming a reality.

II. We also believe that there is a significant role for communities in shaping their local built environment. Research shows that people highly value beautiful places, spaces and developments – and that experiencing such places can bring significant physical and mental health benefits – but that access to these, particularly for the least wealthy in society, is limited. Original polling conducted for our July 2015 report A Community Right to Beauty found that those most able to access beautiful places, spaces and buildings in their local area were households earning more than £45,000 per year. To address this question of social justice, and promote publically beneficial outcomes, we believe that communities must be given a greater say in promoting the creation of a local built environment they consider ‘beautiful’.

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

III. The NPPF retains the commitment to good design in buildings and spaces, and makes reference to the importance of visual appeal, attractiveness and beauty,
but submerges them beneath considerations such as viability and sustainability. Yet the appreciation of beauty is something that is much valued by the public – in one poll, 81% of those surveyed responded that everyone should be able to experience beauty regularly, with only 3% disagreeing.

IV. We therefore believe that the idea of beauty should be given more explicit weight in the NPPF, in order to drive a large-scale re-evaluation of the importance of beauty in the planning system. To give beauty a stronger emphasis in relation to other considerations, our July 2015 report A Community Right to Beauty detailed four alterations we believe should be made to the text of the NPPF. These were as follows:

i. Under Core Planning Principles, amend the fourth bullet of paragraph 17, so that it reads: “Planning should ...
   - always seek to secure high quality, create beautiful places, and provide a good standard of amenity for all existing and future occupants of land and buildings”.

ii. Under Requiring Good Design, amend the sixth bullet point under paragraph 58, so that it reads: “Ensure that developments ...
   - are visually attractive as a result of good architecture and appropriate landscaping and protect or enhance the beauty of an area”.

iii. Under Conserving and Enhancing the Natural Environment, amend the first bullet point under paragraph 109, so that it reads: “The planning system should contribute to an enhance the natural and local environment by:
   - protecting and enhancing valued landscapes, natural beauty, geological conservation interests and soils”.

iv. Under Plan Making, Local Plans, insert a new bullet at paragraph 156 which reads: “Local planning authorities should set out the strategic priorities for the area in the Local Plan. This should include strategic policies to deliver:
   - Places of urban and natural beauty that enhance the character and visual appeal of an area”.

V. This is not to say that beauty should take precedence over all other considerations in making decision about buildings, places and spaces. However, the fact that beauty is not always the most important consideration does not mean it should be considered a luxury only to be addressed when the finances allow.

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed
VI. As we argue above, we believe the Government should enable and empower local authorities to work with their communities and collaborate with neighbouring authorities to address local housing need at the appropriate scale. Local authorities built housing at the needed scale in the post-war period, but too often homes were ugly, cheap and utilitarian. Housebuilding under the command and control model of recent times has been stifled by the fact that, as a nation, we stop development. This is not simply ‘nimbyism’: it is very often a legitimate reaction to the commonly negative impact of new developments on communities, infrastructure and places. A new institutional model is needed to enable communities and local authorities to work together to steer local development and build communities in which people not only live but thrive.

VII. The Department for Communities and Local Government (DCLG) should devolve powers to LPPs to introduce Local Development Orders as a mechanism of land value capture to finance infrastructure and affordable homes; develop beyond brownfield land; offer whole sector investment opportunity; and enable the development of cross-boundary development plans. The DCLG has a crucial role to play in quality assuring Local Place Partnerships and the cross-boundary development plans they produce.

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

VIII. Attractive public spaces are important factors in individuals’ physical and mental health. ResPublica’s July 2015 report A Community Right to Beauty included original polling which found significant discrepancies in respondents’ satisfaction with their mental and physical health according to their perception of the beauty of their area. Those who rated their local area as ‘good’ or ‘very good’ in terms of being a beautiful place to live were significantly more satisfied with their physical and mental health than those who rated the beauty of their local area as ‘fairly poor’ or ‘very poor’.

IX. We therefore believe that more attention should be paid to the impact of individuals’ perception of the beauty or otherwise of their local built environment on those individuals’ health outcomes. Improving consideration of this impact will require giving communities a greater say in shaping their local built environment in order to create spaces which they consider beautiful and which can promote positive health outcomes of this kind.
12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

X. The absence of pre-existing exceptional buildings, places and spaces – most especially in deprived areas – ratchets down the expectations of communities as to the potential for new development to promote the beautiful and of the role they can play in improving the look of their built environment. Only through exposure to high quality environments can we develop the language and the confidence to demand more from new buildings and spaces. This can perhaps be seen in the geographically unbalanced uptake of Neighbourhood Planning; ten of the sixty completed Neighbourhood Plans are located within Arun District Council in West Sussex. We therefore believe that proactive efforts to involve communities in improving the appearance of their local built environment will prove self-reinforcing. *A Community Right to Beauty* made a number of recommendations as to how to encourage efforts of this kind; a selection of these is outlined here.

XI. Architects and developers should be given the space to physically display their plans, models and proposals for any new local developments, which should then be subject to a design competition and local vote. Communities should have the power to choose their preferred design and developer in line with what they believe will contribute most to the beauty and ethos of their locality and deliver the greatest community value.

XII. Decisions surrounding local development and place-shaping are often cumbersome and long-winded, which puts many people off engaging with the process. To respond to these concerns, and to reinforce the principle of democracy in the planning system, we recommend the introduction of local Citizens’ Juries, a model deployed in Australia and elsewhere to draw together a representative group of people from a given neighbourhood via a stratified sample of those on the electoral roll. A Citizens’ Jury would provide communities with the support and the access to experts and skilled professionals to enable them to come to a decision and conclude with their recommendations. The Jury could be triggered where there is widespread concern or disagreement over a particular area or development, or simply to facilitate the construction of a Neighbourhood Plan. This must be a community-led but expert-supported process, working within a defined public budget, and the local authority should be bound to adopt the Jury’s conclusions and recommendations.

XIII. Government should allow certain buildings, areas and spaces of local importance to be designated for preservation or improvement by introducing a new class on the Community Asset register: ‘local beauty assets’. This designation should seek to create a coalition of interest in favour of that
preservation or improvement between property owners and the community.

XIV. The Community Right to Reclaim Land should be extended to include buildings and spaces, to enable communities to challenge local councils and other public bodies to improve derelict, void or unsightly developments and areas, or to release such assets to enable the community to improve them. This process would be greatly assisted if local authorities were required to register unused or underused buildings and spaces to make clear for communities the assets that could be improved in this way. Where public land or development remains unused, the community should have the right to buy or use the asset in a way which will most benefit the neighbourhood, for example converting an unused piece of land into a community garden.

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

XV. The tax which would be levied on private sector developers via Section 106 of the Town and Country Planning Act 1990 should be reduced or waived to incentivise beautiful design in cases where the development has been progressed as a result of a local referendum to choose a preferred design and developer.

XVI. To incentivise improvement in the visual appeal of specific individual buildings, spaces and places, where such work is called for by the community, point relief on Capital Gains Tax could alternatively be used.

XVII. Although currently limited by EU legislation, we recommend that in the long-term a partial VAT relief on refurbishment costs (for example, from 20% to 10%) should apply where developers and owners can justify, through community engagement, the claim that the work would enhance or maintain the visual appeal of buildings and spaces.

XVIII. In our Devo Home report, we set out how a land value capture (LVC) mechanism can be instituted to fund infrastructure and affordable housing. A LVC mechanism can be led by local authorities through the use of Local Development Orders (LDOs). Through LDOs, local authorities can unlock sites and support developers in securing planning consent by establishing parameters for housing on brownfield sites. LDOs can enable local planning authorities to work with local communities to develop workable solutions to determine the development in their areas, providing a means for the planning system to incentivise development to meet a whole range of locally specific policy objectives. Through LDOs they would be able to capture the value of that site and set a bespoke levy, paid by the landowner, which would contribute to the cost. A major issue with Section 106 and CIL is that they can create an atmosphere of uncertainty the
terms of the agreement are not set out from the outset. By empowering local authorities through LDOs, which can form part of their cross-boundary development plans, the costs and requirements will be clear for all to see upfront.

02 October 2015
Policymaking, integration and coordination

Q1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

A1.1 Currently, decision-making processes are spread across a wide number of bodies: Historic England (HE) and the Secretary of State take decisions regarding Scheduled Monuments and Grade I and II* buildings, although the current financial situation means that HE has insufficient resources to carry out these functions adequately. Local authorities determine applications for Grade II buildings and conservation areas without advice from HE. Undesignated archaeological sites are catered for in some authorities through the provision of specialist advisors - although not all LPAs have, or have access to, such advice, thus these sites are often not considered in sufficient depth. HE does not provide support or advice relating to Grade II Registered Parks, meaning that these sites often lack any specialist input if and when decisions need to be taken. Decisions about maritime heritage are nominally settled on HE - but the MoD has recently taken apparently unilateral and financially-driven decisions about treasure recovery from the wrecks of the SS Gairsoppa and the SS City of Cairo, with scant regard to the heritage value of these sites or the artefacts therein. A coordinated approach to heritage decision-making would clearly be advantageous. Decisions about important heritage sites should be taken out of the hands of unqualified and poorly-advised local authorities: HE must be provided with sufficient resources to do its job effectively. National policymakers should also ensure that where they put measures in place, they follow through with appropriate guidance, instruction and monitoring of their effectiveness. It is clear (for example) that many of the heritage principles set out in the NPPF are regularly ignored or discarded at all levels of decision-making.

Q2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

A2.1 Coordination is poor. Each area of concern constantly attempts to trump the others. Where planning is concerned, "sustainable development" is given greater weight than heritage. Underwater, treasure recovery is a higher priority than adherence to international maritime guidelines. Good design concerns carry no weight whatsoever - as illustrated by the large number of inappropriate buildings constructed in London over the last decade - and is only supported by random meaningless statements. What is "good" design? - it is not defined anywhere.

A2.2 Even where individual concerns are under discussion, competing interests intrude:
the recent introduction of the HE Good Practice Advice Notes that replaced the PPS5 Planning Practice Guide are an example of this: a number of heritage bodies responded to the consultation on the draft version of the documents - but GPA 2 was delayed by the sudden introduction of a hitherto unseen and totally unsuitable proposed new archaeological planning condition by DCLG. The profession was given no opportunity to comment on this, and the version now included within the GPA is entirely unsatisfactory, and some bodies (the IHBC being one) have we understand refused to engage with the published document to the point that they are planning to release their own.

A2.3 Improvements should involve properly-stated policy aims, and a commitment to developing practice on the back of them that seeks to reconcile competing interests rather than allow blanket superiority of certain issues. If policy is sound, then decisions can be made equitably: in some cases, it might be appropriate to develop in the green belt, or to demolish a listed building - but in other cases it will be wholly unacceptable. This should be decided on a case-by-case basis on the back of robust policy positions. The current system affords advantages across the spectrum to development at the expense of the environment and this is unacceptable.

**National policy for planning and the built environment**

Q3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

A3.1 See discussion about equitable decision-making above. The NPPF sets out certain policies, but singularly fails to attempt reconciliation of possibly conflicting interests, instead promoting the primacy of "sustainable development". This phrase is then misleading in this context of default development, as much NPPF-driven development is anything but "sustainable" - resulting as it does in the wholesale loss of heritage sites, environmental landscapes, and green belt land. Recent discussions regarding housing site allocations at Shropshire are a case in point: the proposals to develop a site adjacent to the Scheduled Old Oswestry Hillfort are clearly inappropriate - yet convoluted discussions involving various decision-making groups have created a ludicrous "solution" that is obviously unsustainable and vehemently opposed locally, yet allegedly within the parameters of current planning policy.

Q4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy

A4.1 It is clear that certain parts of the country require regeneration more than others. Spatial policy should give weight and financial incentive to works in deprived areas - similarly, cramming more and more dense and inappropriate development into the south-east should be the subject of developer surcharges to form a national "regeneration fund". If every new house built in the south east were subject to a £5000 developer surcharge, the
resulting fund could be used for heritage and environmental benefits to offset and mitigate the damage. Alternatively, the fund could be used to provide a £5000 developer grant per unit, for new properties built in deprived areas in the north or midlands.

A4.2 Spatial policy should also coordinate transport planning. It is clear (for example) that yet another runway at Heathrow will be exceptionally damaging to the local natural and historic environment - yet an efficient rail link to the midlands and new airport capacity in the north could provide the impetus to encourage proper regeneration of deprived communities outside of London and the south.

Q5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

No comment to make.

Buildings and places: New and old

Q6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

A6.1 See above. The government should be the driving force for national regeneration. Incentives should be provided for sensible development in deprived areas, with further incentives for businesses - both small and large companies - to move to those areas. There must also be penalties for excessive development in the poor locations. Blanket housing allocations for every local authority damage confidence and trust in the development process locally, and result in poor development overall. Current planning measures - especially the recent extension of permitted development rights - are already starting to result in poor-quality, overly dense inappropriate development that will be unsustainable in the long term. This simply repeats the mistakes of the past.

Q7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

A7.1 There appears at present to be generally no need for "existing buildings" to adapt to future needs, as the current development ethos is either simply to demolish wholesale and begin again on a swept-clean site or, in many instances, alteration in such a way as to destroy intrinsic character and the local scene. This clearly doesn't create a built environment that is "sustainable and resilient" - but obviously such a regime is not what recent Governments have intended. The best use of existing housing stock is not to sell off housing association or LPA rented accommodation. There is no reason why poor design and materials should accompany economic measures in building; nor why potentially attractive
existing housing stock should not be renovated in order to provide good housing on a human scale where communities can retain their sense of place and their social needs can be met.

Q8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

A8.1  Optimum use is not made of heritage assets. The NPPF promotes retention and sensitive design - but allows "sustainable development" to take precedence. Combined with a VAT system that penalises building repairs with a 20% surcharge, but zero-rates new works, this has created a development framework that actively works against incorporating heritage assets in regeneration and place-making. This framework must change if we are not cause significant and irreversible harm to our national heritage assets. VAT rules must be relaxed to promote building conservation.

Skills and design

Q9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

A9.1  There is a chronic lack of conservation officer and archaeological officer provision at local authority levels. Planners should not be expected to possess all skills involved in the process of decision-making, as many of the areas of concern are highly specialised in nature. However, it is a reasonable expectation of the public that planning authorities should be able to call upon appropriately-qualified, independent expertise at the necessary times, to influence and support decision-making adequately. This is not the case where a local authority lacks the provision of a conservation or archaeological officer, or where the local authority does not have access to a properly resourced and up-to-date Historic Environment Record. Addressing these skills issues is a simple undertaking - HERs and advisory services should be made a statutory requirement as the heritage profession has been requesting for some years to no avail.

Q10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

A10.1  What are the tools and techniques in use? There is no coherent approach to these concerns as far as Rescue is aware. Recent development in London - the prime example being the infamous "Walkie Talkie" building - illustrate this admirably, where inappropriate and wholly unsuitable buildings are thrown up without any thought to their surrounding impact. In the aforementioned example, the structure reflected focussed light rays into the surrounding streets to the point where it melted cars, and its unusual shape has created a hostile and windy micro-climate at street level. The structure itself is ugly and overbearing, detracts from numerous heritage assets in the area including the World Heritage Site of the
Tower of London, and spoils views of the city for miles. The development has been a disaster for the environment and has created no positives whatsoever.

A10.2 Hypothetically, "good quality" designed buildings could potentially fulfil the criteria for Listing in the future. This therefore ought to mean that the Listing criteria should be applied during the planning process, as a test of whether a structure could be considered to be of "good quality" or not. Where a proposed structure obviously is of a nature or design or construction that would not qualify for Listing, it might reasonably be concluded that - despite what the architect's description might state - it is not of sufficient "quality" of design to warrant approval. Such a selection principle would not prevent development taking place - but it would certainly contribute significantly to ensuring that (for example) "landmark" buildings were of sufficiently considered and careful design to ensure they were satisfactory and sympathetic contributors to the surrounding environment.

Community involvement and community impact

Q11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

A11.1 No - and the fact they do not is blatantly demonstrated clearly by the burgeoning number of local campaign groups that have been formed to protest inappropriate and insensitive development proposals. Across the country, local groups are committing to oppose their own councils and local developers in inflicting irreversible damage on local environments.

A11.2 Improving the consideration of the impacts will involve legislative changes in the first instance, to remove the inherent default development bias within the NPPF and other planning documentation, and restore equitability of decision-making. However, it is obvious that simply being elected to a local authority is not a satisfactory qualification to enable someone to take planning decisions. The Government should require mandatory training programmes to be undertaken by elected officials, to ensure that they are competent, and aware of both relevant legislation, and their own responsibilities, before allowing these individuals to sit on planning committees. Local authorities should also be required to have local referenda on their strategic development frameworks and site allocations before putting them in place - and should be subject to a robust and easily accessible process for local challenge if and when they deviate from the agreed principles. No local community should find itself subjected to development proposals as inappropriate as or as contentious as recent examples as have been proposed at The Strand, or Smithfield Market in London, or was approved at Jessop's Hospital in Sheffield, without access to a simple process to challenge these in an independent and accessible way if (as in all these cases) the proposals deviate from previously-agreed development frameworks. Current rules for "calling in"
approved applications, and the appeals process, clearly favour the developer excessively, and to the detriment of local residents - particularly when such processes can incur significant fees.

Q12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

See response to Q.11.

Financial measures

Q13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

A13.1 Possible financial and other measures to put in place to address this question have been articulated throughout this response. Please refer to the answers to questions 1-12 for these.

04 October 2015
Riverhead Parish Council – Written Evidence (BEN0156)

Question 2

1. Coordination at local level is inefficient. New developments are signed off with no means for the NHS to provide doctors for surgeries and little means for Highways Agency to implement measures to deal with the new traffic. [see Re-Development of Cold Store in Dunton Green, Kent]

Question 8

2. Protection should be extended to old buildings with character that are not necessary listed. New developments should incorporate old façade instead of destroying the memory of places. Continuity should be preferred to total renewal. [Around Sevenoaks station, Kent, the old market place and two old pubs were destroyed and replaced by entirely new buildings with no character or interest. Station and surroundings should be landmarks welcoming people home]

Question 11

3. Developers should be legally forced to sell the entire square footage that they acquired initially. If they don’t, they might have disappeared 20 years later and unusable strips of unsold land will be derelict with no owner responsible for their upkeep. [Riverhead Parish Council, Kent is facing with many of those abandoned pieces of land that cost too much for a Parish Council to maintain; old staircase with dangerous bannister, old collapsing stone walls, piece of land with unstable trees].

4. Developers should also give guarantee [in term of money] that the development proposed will effectively take place in a reasonable time especially when they will first destroy existing building. [For the last 5 years Sevenoaks station faces a big hole where a pub was previously standing and no enforcement rule exist to force the developer to fill the gap]

Question 12

5. When a District Council is in charge of the planning decision in an area, the planning committee is usually chaired and composed by people who do not live in that area, who have not been elected in the area. Local people voice is largely ignored and District Councillors work hard to influence decisions toward the wishes of their electorate but in reality they carry very little weight in major decision and only manage a few amendments. Because planning and environment have such an effect
on people, their elected representative should have a much bigger say. [No one living in Sevenoaks would have ever accepted the complete destruction of the pubs surrounding Sevenoaks station. Similarly, the building of a new Liddle on an already very congested road would not have been permitted considering three large supermarkets being already present in the small town]

06 October 2015
This evidence is submitted by the Royal Academy of Engineering. As the UK’s national academy for engineering, we bring together the most successful and talented engineers from across the engineering sectors for a shared purpose: to advance and promote excellence in engineering.

The views described in this response were assembled through consultation with our Fellows. These include civil, structural and building services engineers, as well as experts in construction, resilience, sustainability and systems engineering.

Executive summary
An overarching strategy for the built environment is needed to address major challenges. This will improve the connectedness of built environment policy across departments. Decision-makers need to take a systems approach to the planning, design and management of the built environment, and to recognise where interdependencies add value.

Smarter targets for sustainability and resilience are essential. For example, it is important to understand what levels of resilience and sustainability are needed and how these translate into design objectives and expectations. Alongside this, decision-making and measures of success must move from cost-based to value-based, necessitating smarter procurement and better educated clients. The planning, design and management of the built environment must be considered alongside infrastructure as the two become increasingly interdependent.

Existing knowledge on energy efficiency of the existing building stock needs consolidation. This will help to improve understanding of the performance/delivery gap and provide a basis for new policies that take into account both social and technical drivers for energy consumption in buildings, and the impacts that any future intervention might have. Any measures to improve the energy efficiency of the built environment must be considered in the context of the future delivery of the UK’s whole energy system. Furthermore, sustainable markets are essential, and for this reason policies need to be consistent over time to provide certainty for the market.

The ability for built environment professionals to work collaboratively with other disciplines is central to achieving a holistic approach. This must be at the core of teaching in universities. It is essential that professionals understand and engage with the outcomes of their building projects to a much greater degree. There also needs to be a repeatable, verifiable way of integrating the question of how to reduce carbon emissions into the design, procurement and construction process so that the average is raised. National and local government require better in-house expertise to understand high level issues and to have the ability to act as an educated client.
Understanding the impact of the built environment on people is key to achieving objectives around important challenges for the built environment, including the use of resources, health and well-being, and performance and productivity.

**Question 2: How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?**

1. An overarching strategy is vital to address major challenges, such as climate change, improving health and well-being, wealth creation, economic growth, productivity, inward investment, export growth and job creation. The strategy will provide a high level vision and ‘asectoral’ aims to which all other policies can respond.

2. Currently there is a lack of connectedness in policy in relation to how the built environment is conceived, designed, operated and managed. As a result, progress is piecemeal, with policies often running in contrary and conflicting directions. The focus also needs to be on what we should build, rather than just how to build it.

3. Decision-makers must take a systems approach to the planning, design and management of the built environment. This approach considers the interdependencies between the various components, including the fabric of the built environment, the transport and energy networks, water supply and digital infrastructure, in the context of broader challenges such as an ageing society, changes in the economic environment and climate change. A more integrated policy approach is needed across the relevant government departments.

4. Synergistic interdependencies should also be recognised. An umbrella body is required to ensure that the value resulting from positive interdependencies between co-located infrastructure systems is maximised. An evidence base is needed that informs policy development and supports cross-sectoral systems approaches that deliver whole life cost benefits.

---

439 An example of this approach is the ‘five cities model’, that sets five areas of achievement for all sectors, and places people at the centre. See: Tyler N (2013) A Vision for Cities: the 5-cities model, ARGNote (1)5, www.cege.ucl.ac.uk/arg/Pages/ARGnote.aspx

440 The built environment comprises the planning, design, construction and operation of buildings, built areas and the public realm, and includes the economic infrastructure required to enable built areas to function (energy, water, waste, transport and ICT). So defined, the built environment has a market size of conservatively 10% - 15% GDP in a developed country such as the United Kingdom.

441 For example, the costs to the NHS of ill health caused by poor quality housing are substantial. Improving the housing stock and preventing health issues would be paid for by reductions in NHS operating costs. Nicol, S., Roys, M. and Garrett, H., (2011) BRE Briefing Paper - The cost of poor housing to the NHS http://www.bre.co.uk/filelibrary/pdf/87741-Cost-of-Poor-Housing-Briefing-Paper-v3.pdf
5 A stronger voice is crucial within government to champion a high quality built environment, and to lead on a systems approach to policymaking. Government departments should each have a single point of leadership and coordination to further connect and integrate built environment thinking and action.

**Question 5: Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?**

6 Current timeframes for thinking and action in the built environment sector are too long. Realistic but far more aggressive timeframes for strategy, planning and action should be set and then adhered to in order to drive meaningful focus and urgency from all involved.

7 We support the work that Infrastructure UK is doing in co-ordinating and simplifying the planning and prioritisation of investment in UK infrastructure, and await with interest the formation of the new National Infrastructure Commission chaired by Lord Adonis.

**Question 7: How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?**

**A sustainable and resilient built environment**

8 The built environment needs to be resilient to a large range of factors that include:
   - the impacts of climate change, requiring adaptation of the built environment
   - knock-on effects of a failure in one part of a system, for example, a failure of the electricity grid leading to a loss of the ability to pump water
   - failures of individual components. Redundancy in systems has been significantly sacrificed over the last few decades in the narrow interests of cost cutting
   - failures due to ageing, worn out components. Much of our infrastructure is still dependent on components and facilities that were built more than 100 years ago using the best methods at hand then
   - demographic change, for example, the needs of an ageing society and increasing population size, both in the UK and in individual cities.
9 It should be noted that climate change has two very different types of impact, both of which must be considered in adaptation:

- **Acute impacts** – resulting from increasingly severe and intense wind storms, rainfall, tidal surges and heatwaves. These will cause damage to buildings (particularly tall buildings), flooding and spikes in mortality caused by heatwaves, for example;

- **Chronic impacts** - resulting from gradual increases in sea level and temperature, and changing rainfall patterns. These will require modifications to coastal defences, and will lead to changes in the properties of ground conditions and an increased need for air conditioning, for example.

10 In order to achieve resilience, the planning, design and management of the built environment must be considered alongside infrastructure, as the two become increasingly interdependent.\(^{442}\) This will minimise the risk of failure in one part of the system affecting other systems. Government intervention in cross-infrastructure ‘hardening’ will be important, as individual operators have little business motivation to work together to reduce vulnerabilities. Guidance exists that can help lead project sponsors within government departments to a simple systems view of how their project fits within a wider, interdependent, infrastructure system of systems\(^ {443}\).

11 Mitigation measures, that aim to limit the scale of climate change, can often contribute to resilience too. For example, retrofitting buildings with insulation and renewable energy technologies reduce energy use and are also adaptations that increase resilience. Interdependencies between mitigation and adaptation should be identified so that interventions can contribute to both.

12 We must agree what ‘good’ looks like in order to then set smarter targets that we can collectively aim for, using consistent language and definitions. What do we actually mean by resilience and sustainability? What levels of resilience do we actually need, and how do these differ between sectors? How does this translate into design objectives and expectations? These issues need to be addressed in the context of the overarching strategy for the built environment.

13 The assessment of future scenarios and resilience must be an integral part of the design process in order to embed sufficient flexibility to provide future adaptability to climate change and to other future societal needs.

14 Decision-making and measures of success must move from cost-based to value-based in order to significantly lift the quality of delivered solutions. At the moment, cost drives too many decisions and important social and environmental issues are too often lost. Smarter procurement is needed, and better educated clients who focus on high-quality design and delivery. This approach need not automatically lead to increased costs, but will result in better and more appropriate long term solutions.

15 A strategy around climate change must consider how to make decisions about demolishing existing buildings, and whether it is appropriate to build very tall buildings that use more energy to construct and operate.

16 The focus of revisions to the building regulations in recent years has been on reducing carbon dioxide emissions from the built environment, but this has not been balanced with proper consideration of the impacts on resilience and on health. A good design team with the proper engineering expertise can take a systems engineering approach to balancing various demands and constraints and avoid these issues. The problems occur when developers lacking this expertise rely instead on the building regulations as a design standard. As long as the standards are developed piecemeal without a full systems engineering approach across the board, then the risk of creating such problems remains.

17 Engineers must develop further their ability to embrace probabilistic methods and flexible solutions, and to deal with complex risk scenarios. There has been a lot of work on risk analysis but for the most part it has been simplistic, for example, addressing just one risk element whereas future challenges involve a range of factors. Promoting the skills needed to address the full range of risks is essential, as is using modelling techniques and the methods of scenario planning. The professional engineering bodies should lead on promoting and developing skills in systems thinking within the workforce.

Energy efficiency of the existing building stock

18 New policies are needed urgently in the area of home energy efficiency given the recent withdrawal of funding to the Green Deal and uncertainty over the domestic Renewable Heat Incentive. We welcome the independent review of UK housing energy efficiency by Dr Peter Bonfield OBE FREng. A policy encompassing small business premises is also required.

19 Any measures to increase the sustainability of the built environment should be viewed within the context of the future delivery of the UK’s whole energy system, and the need to decarbonise energy supply, including heat and transport. Understanding the uncertainties around the future energy system is key; for example, if the gas grid becomes unsustainable, this will have a large impact on how people heat their homes. The transition from fossil fuel to renewable electricity for heating would place substantial additional burden on the grid – the increasing use of embedded, non-dispatchable domestic renewable generation are already having an impact on some local networks.

20 We must learn from less successful policy initiatives and also from initiatives that are succeeding. In particular, an understanding is required of the performance/delivery gap\(^{445}\) that exists in relation to energy efficiency measures in housing, and the financial, social, behavioural and technical factors that contribute to this. Existing knowledge is extensive but patchy, and it will be important to identify where gaps in knowledge are and to consolidate existing knowledge.

21 A more detailed understanding of the social and technical drivers for energy consumption in domestic and commercial buildings is crucial for addressing the performance/delivery gap. For example, a more nuanced understanding of occupant attitudes and behaviours is needed, as well as an understanding of how users control their environment using smart technologies.

22 Better dialogue with the public is vital around smart meters, particularly in relation to privacy and trust issues. The benefits to the public of smart meters must be communicated to help ensure that they are accepted.

23 The technologies required to retrofit exist, such as electric heat pumps, CHP units, and district heating, but it is important to appreciate in which contexts and for which types of consumers these will work best. Quality evidence is essential to guide the selection of technologies, which in the past have been blighted by ‘hype’. Fitting different technologies means disruption to people’s living space and requires people to

\(^{445}\) The performance/delivery gap means that the measures delivered failed to achieve the expected improvement in performance.
understand the operation of these technologies which may be very different to conventional technologies.

24 The possible unintended consequences of policy interventions, either beneficial or negative, should be understood and considered as a socio-technical systems matter when planning interventions, for example in relation to retrofitting.

25 Sustainable markets are essential, and for this reason, it is vital that policies are implemented promptly and then not regularly changed, to provide certainty for the market. Standards and procurement policies are effective alternatives to regulation in achieving some of these outcomes. A greater understanding of the motivations and behaviours of all stakeholders is needed, and where these work together or conflict. New approaches should be examined; for example, new business models are in development for retrofitting energy efficiency measures446.

26 A joined up approach to achieving the right balance between planning and energy-efficiency requirements is essential. We need to ensure that there is openness to new ideas that can help address major challenges.

**Question 9: Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?**

**Professional skills for a holistic approach**

27 A report published by the Academy in 2012447 highlighted the importance of specialist engineering education in providing the knowledge and skills required by the construction industry to contribute to energy efficiency in buildings. This type of education extends beyond traditional boundaries, combining building engineering physics448 with engineering, architectural and systems design.

---

446 Energiesprong: Transition Zero http://energiesprong.nl/transitionzero/

447 Royal Academy of Engineering (2012), *The case for Centres of Excellence in sustainable building design*

448 The discipline of building engineering physics is described in: Royal Academy of Engineering (2012), *Engineering a local carbon built environment: The discipline of Building Engineering Physics*
28 Built environment professions need to be able to and willing to work in collaboration with other disciplines and built environment stakeholders to develop solutions by means of a holistic approach. For example, architects, behavioural scientists, civil, environmental and building services engineers, planners and urban designers, scientists and technology developers, and clients will need to be able to work in an integrated way. Very few are able to cross disciplines, although individuals that have done so, such as Jan Gehl, Jaime Lerner and, Alejandro Echeverri, have through differing perspectives brought about massive change in cities in different parts of the world.

29 Built environment researchers need to have the ability to understand their contribution to the whole, while focusing on their own specific areas. They also need to understand how to collaborate across research disciplines, such as engineering and social sciences, and this will require the development of shared languages. Built environment research covers (at least) the areas funded by AHRC, EPSRC and ESRC. A greater willingness to fund collaborative funding programmes is needed.

30 A holistic approach has to start with education at undergraduate and postgraduate level so that any architect, planner, engineer, urban designer, has this core principle. Particular skills in these fields can then be developed on that holistic core. For example, Academy Centres of Excellence in integrated sustainable building design have been set up to provide engineers with experience of interdisciplinary, collaborative problem solving. However, universities will follow the market, and are not likely to develop courses unless there is a clear ‘pull’ from industry. This pull is not currently apparent.

31 While architects remain the authors of building designs in the minds of the public, many of the design issues that must be dealt with in creating sustainable buildings are actually engineering design issues. The engineering professions associated with construction need greater public visibility and clarity of their professional role. Thus clients commissioning building projects will be able to ensure that they receive appropriate professional advice and avoid the problems often cited in relation to the building performance gap. Further, increased visibility for the building engineering professions will aid recruitment into this key sector.

32 There is a need to raise the average, not just support excellent practice. However, there are barriers: the construction supply chain is highly fragmented with design and delivery of projects divided across may different professions, none with overall responsibility for ensuring the sustainable performance of the finished product. This makes the

dissemination of innovation and best practice difficult. The construction industry therefore urgently needs a repeatable, verifiable approach to integrating the question of how to reduce carbon emissions in the design, procurement and construction process. Approaches to procurement and project team organisation need to align risk and reward for all parties to encourage collaboration and team working and to establish smarter ways of driving innovation, especially from the supply chain.

33 National and local government are struggling to justify retaining in-house expertise. It is important that government itself understands the high level issues and is capable of acting as an educated client as a pre-requisite to delivering effective policy. For example, government must be able to understand a quality, high value solution when it is presented, and conversely, when a poor quality (cheap) solution is presented and should be blocked. As the conversation moves from cost towards value, this knowledge and understanding will be essential.

34 Building Information Modelling (BIM) supports integrated teamworking by developing a common language and a standardised process for sharing information. Future developments will extend its applicability to all stages of the lifecycle including operation, and to a scale beyond the individual building, supporting the development of smart cities. The seeds are in place, and we welcome the government’s requirement that government contracts use BIM. However, it is essential that the use of BIM is embedded further. Skills development and an ‘open systems’ approach will be vital in achieving this.

Question 11: Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

35 The effectiveness of built environment policies and of design is improved by understanding behaviour and by having the appropriate tools to apply this knowledge in practice. Greater understanding is needed of how the built environment functions as a socio-technical system with people as a central component. This will help to achieve

---

450 Royal Academy of Engineering (2012), *The case for Centres of Excellence in sustainable building design*

objectives around important challenges for the built environment, including the use of resources; health and wellbeing; and performance and productivity.

36 There is scope to improve the consideration of health and wellbeing in spatial planning and in the design of all types of building, including offices and housing for example, as well as hospitals and healthcare centres. It is important to consider the design of buildings alongside the public realm. Collaboration between researchers and practitioners is key to developing evidence-based design principles and guidance.

37 Professionals need to be exposed to, and engage with, the outcomes of the building projects. Ongoing post-occupancy evaluation to measure the actual performance of buildings in operation, assisted by the Internet of Things and data analytics technologies, will improve understanding of the way in which the built environment impacts on people, including how it influences health and wellbeing.

38 Government must promote collaboration between local government, clinical commissioning groups, planners, architects and the local community in planning and design. Lessons should be taken from other initiatives, such as the Center for Active Design in New York453.

39 Some sectors within the built environment are better at designing in quality at the outset; hospitals that are designed to promote recovery, schools that are designed to promote learning. Key Performance Indicators are identified and measured, with best practice swapped. This approach is not consistent however and many commercial developers do not consider the long term use of their products and their interests too often wane rapidly after completion. Best practice should be shared and smarter targets set for everyone to deliver against, in alignment with an overall strategy. Where deficiencies occur, there should be an obligation to correct these.

06 October 2015

453 Center for Active Design: promoting health through design http://centerforactivedesign.org/ A non-profit-making organisation that provides training, technical assistance, as well as research and policy support on the implementation of Active Design to promote healthy living and chronic disease prevention.
1. About us

We are the largest organisation of blind and partially sighted people in the UK and welcome this opportunity to respond to the consultation.

We are a membership organisation with over 14,000 members who are blind, partially sighted or the friends and family of people with sight loss. More than 80 per cent of our Board of Trustees are blind or partially sighted. We encourage members to be involved in our work, and regularly consult with them on government policy and their ideas for change.

We campaign for the rights of blind and partially sighted people in each of the UK’s countries. Our priorities are to:

- Be there for people losing their sight.
- Support independent living for blind and partially sighted people.
- Create a society that is inclusive of blind and partially sighted people’s interests and needs.
- Stop people losing their sight unnecessarily.

We provide expert knowledge to business and the public sector through consultancy on improving the accessibility of information, the built environment, technology, products and services.

RNIB regularly supports blind and partially sighted people to make the built environment more accessible. We also advise decision makers, such as local authorities, on how to make the built environment more accessible for blind and partially sighted people.

RNIB welcomes the opportunity to respond to the House of Lords Select Committee on the Built Environment Call for evidence.

2. Response
Policymaking, integration and coordination

Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

RNIB think decisions are taken at the right level (a mixture of national and local); however we are concerned about the postcode lottery approach taken when councils implement local and national regulation or guidance.

There are two sets of regulation/guidance which need to be considered – specific built environment legislation such as The Highways Act (1980) and specific equality provisions which are important to our service users such as the Public Sector Equality Duty.

A good example of national policy which is not followed correctly at a local level is the regulation of tactile paving and guidance around shared space. Whilst the political tide is heading toward devolution, it is important to recognise that some policies/regulations need to be the same whatever part of the country a person lives or works in. A blind person living in Surrey but commuting to work in London should expect tactile paving to be of the same standard, fitting and installation in both locations. If not the independence of someone with a visual impairment is likely to be seriously impacted. One of the biggest problems with some of the existing legislation can be the different interpretations that local authorities make about how to implement it. For example, The Highways Act (1980) states that it is illegal to obstruct the highway, but this is interpreted in different ways by different local authorities. On top of this, if other legislation exists around the same topic (such as the use of Traffic Regulation Orders in relation to parking on pavements) some local authorities will give that a higher status than The Highways Act.

The other issue which quite often impacts upon our service users is how specific equality legislation is implemented. Though essential to protect the needs of disabled people, some local authorities do not always follow the regulations as they should, resulting in planning and development which can considerably impact on the mobility of those with a visual impairment. We know from a freedom of information request we carried, we know engagement with blind and partially sighted people was limited.

Many local authorities use ‘Inclusive Mobility’ as a best practice guide to ensuring the built environment is accessible. However, this guidance is out of date and desperately needs reviewing. In its current form, Inclusive Mobility fails to offer adequate information on things like parking, cycling, pavement obstructions and shared space. Much of the guidance it offers is vague, leaving local authorities to interpret messages in different ways. Consequently, this results in different approaches being taken across the country when introducing street furniture and managing pavement obstructions.
Finally, the context in which the political landscape is changing is important – devolution and greater regionalisation/integration could be a significant opportunity to improve the policies and practices around the built environment. A number of local authorities, in their recent submissions to the Cabinet Office, have asked that Transport/Highways be included in their devolution bids. However, to avoid adding to the postcode lottery in certain cases, for example shared space, guidance needs to be reviewed and strengthened.

**How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?**

RNIB thinks there could be better integration across Government departments where often there is enormous cross over where one department has the lead in terms of ministerial approval or policy making, but their decisions have considerable impact on another department. A good example is the Department of Transport and its interaction with the Department of Communities and Local Government.

Disability issues can also affect a number of teams within one department. A recent policy example which had considerable impact was the political and financial weight given to cycling improvement. Considerable money has been spent on improving cycling infrastructure, but this was done without looking at some of the impacts on blind and partially sighted people who want to navigate streets, crossings and public transport.

National policy for planning and the built environment

**Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?**

We do not believe the NPPF provides sufficient policy guidance for those in planning, development and protecting the build environment. It does not deal with disability or inclusion in any great detail. It only talks about inclusive design and communities in a very limited way (four times). The only time in the document disability is mentioned is in Annex 2 in the glossary of terms.

Buildings and places: New and old

**How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?**
Sight loss affects nearly 2 million people but with an ageing population this is set to rise to 4 million by 2050. We also have an ageing population that is living longer and is encouraged to live independently as long as possible. To do this housing must be fit for purpose and should be as accessible for physical and sensory impairments as possible. Improvements and adaptations to homes can help people continue living independently; but this requires an assessment from the local social services team. We know more and more of the services, grants, and relief that were once offered by local authorities are being restricted or cut. Government needs to make sure national regulations are fit for purpose for the ageing population, while also providing resources at a local level so that the existing housing stock can be adapted, and new housing stock is built to a high standard.

All too often we review plans for new developments that do not have enough parking provision for the type and level of houses being built. This results in environments which do not support the needs of pedestrians or motorists, and creates the need for pavement parking. Parking on pavements is one of the biggest barriers which prevent blind and partially sighted people getting to where they want to go.

Campaigner Charlotte shared with us, “the main route I have to take to get to the bus stop and the shops has a lot of cars parked on the pavement. It’s normally deliveries for the local businesses and things like that. Walking into wing mirrors, or the back of the car itself can really hurt. I often can’t get round the car by staying on the pavement, so have to walk out onto a main road which has fast traffic and buses.”

Any new regulations need to include clear guidance around planning for parking so that new housing areas have pavements free for pedestrians.

In addition to this, we have seen an increase in housing developments that includes the provision of shared space as part of its overall design. By removing kerbs, blind and partially sighted people can often find it difficult to navigate the area. It also increases the chance of colliding with a parked car.

New regulation is needed to guide developers away from using shared space ideology as a means of achieving aesthetic goals while discounting the practical implications.

Skills and design

Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?
We do not believe the professionals have an adequate understanding of inclusive design or accessibility. Quite often aesthetic values supersede the concerns around inclusivity or disability. A good example is the current Government review of tactile paving regulations – changes are being proposed by a highways professional who does not seem to understand the mobility needs of blind and partially sighted people. As a result we are spending a considerable amount of time mobilising blind and partially sighted people to respond to a very technical consultation. If elements of this consultation proceed, it could seriously impact the independence and safety of blind people.

There are also very dangerous trends taking place across the country, such as the growth of shared space developments. Architects and planners think these developments create a positive impact on the built environment, but for someone who is blind or partially sighted their independence can be severely limited.

Campaigner Anne told us, “I was born blind. I can see light and dark but I don’t see any other useful clues such as steps or obstacles. I have a guide dog who works with me to navigate the streets. We don’t have shared space in my area yet, but it seems to work on the drivers and pedestrians making eye contact and signalling who will make the first move. But I can’t make eye contact or see what a driver is intending to do. Even if drivers are really attentive, it makes me very vulnerable. My guide dog had no idea what to do. He normally gives me some direction, but he needs markings like kerbs so he knows which bit is the road and which bit is the pavement. When we cross a road he needs the kerb to govern where the crossing point is. You can’t direct your dog, there are no landmarks, it’s just a massive square. You can’t judge where you are. My dog was so confused he just stopped moving. I know many of my friends who are blind or partially sighted say these spaces are no-go areas for them.”

As well as Anne’s experience, others have told us that shared space has resulted in serious injury.

Local authority Access Officers’ have responsibilities to engage with, and support, disabled people to shape the built environment. These officers are often the point of contact when disabled people experience difficulties accessing environments. These officers are often tasked with supporting Access Forums and groups who are well placed to inform local planners and developers about barriers to inclusive design. However, these vital posts are particularly vulnerable to local authority cuts and without officer support, access groups have closed, or don’t have the weight needed to impact decisions made by councillors or council officers.

To help address these issues, more blind and partially sighted people need to be involved in the training of professionals. Local authorities need to have an access group which includes blind and partially sighted people, and they need to make sure they talk to other teams within the local authority who also have knowledge and expertise, for example
rehabilitation officers who train people to use a white cane. All staff and elected councillors should have relevant diversity and equalities training – the training should specifically refer to the work they are involved with – for example someone in the planning department should have an understanding how someone with a disability could effectively engage with a consultation and what some of the barriers are.

Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

Aesthetic values should not supersede inclusivity – an area has to be inclusive for all, not just people with no mobility issues. Although RNIB recognises that local issues sometimes require local solutions, there is scope for national guidance to play a role in protecting these groups who are quite often ignored at a local level.

Community involvement and community impact

Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

We do not think that those involved in delivering and managing our built environment take sufficient account of the way these changes and development affect blind and partially sighted people. I refer to the points made under the answer to question nine. However, in short this could be improved by having a local access group that decision makers and developers could engage with throughout the process. Also, good staff training for officers and elected councillors around disability equality would better help them to represent the needs of those who face barriers relating to the built environment.

How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

Blind and partially sighted people are usually excluded from planning process due to lack of accessible information – the process relies on people being able to use their eye sight to access documents. We recently carried out a Freedom of Information request of all upper tier local authorities and we discovered that no local authority had sent out accessible formats of planning materials in the last 5 years. The way planning proposals are advertised is incredibly inaccessible. This results in blind and partially sighted people often not knowing about decisions being taken locally which could affect them.

One suggested improvement is that local authorities could use their registration lists to contact those people who are registered blind or partially sighted in their area. But this very
rarely happens. Blind and partially sighted people have told RNIB in the past that they think local authorities should do this particularly in relation to planning proposals that may affect them.

An example of where this worked well is a local council who consulted everyone on their VI list when moving the position of dog waste bins. They realised that a proportion of blind and partially sighted people have guide dogs, and therefore may have a view on where the dog bind were positioned.

06 October 2015
The Royal Institute of British Architects champions better buildings, communities and the environment through architecture and our 40,000 members. We provide the standards, training, support and recognition that put our members – in the UK and overseas – at the peak of their profession. With government and our partners, we work to improve the design quality of public buildings, new homes and new communities.

The RIBA welcomes the decision to create a House of Lords Committee on National Policy for the Built Environment and would like to thank the committee for this opportunity to submit evidence.

Issues relating to the UK’s built environment have achieved significant political attention in recent years. From the growing housing crisis, to the need for new infrastructure investment that both boosts the economy and protects the environment, decisions about what we build, where we build it and how we engage with the public need to be urgently addressed.

However, the UK’s approach to tackling built environment challenges has too often lacked an integrated approach, failing to consider the roles of the various professions involved or the associated impact on the built environment and society of developing (or not developing) an area. The RIBA’s response contains a number of recommendations about how policies and structures could be changed to address these issues.

Our primary recommendation is the appointment of a Chief Built Environment Advisor tasked with overseeing the integration of built environment policy into the wider policy making agenda through the establishment of a national strategy for the built environment.

To accompany the national strategy, we believe that subsidiarity needs to be applied more widely in the balancing of national goals and local implementation. Local government organisations of all sizes and structures need to be in the position to make positive decisions about the development of their areas. This will require the resource, expertise and the political will to make tough decisions.
Finally, we believe that the Government has a vital role to play in driving new approaches to harnessing technology that improve the ability of the public, professionals and the public sector to communicate their thoughts about proposed developments. We believe that this can help change the attitude of the public and professionals about how developments are planned, designed and delivered.

1. **Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?**

One of the major challenges faced by people interacting with the UK’s built environment today is the lack of coordination across the various decision making bodies. Decisions about the regulations governing housing, planning, transport and other factors which influence the quality of the built environment are often made in isolation. As a result, the process of planning and building or rebuilding is too often slanted towards one discipline or another depending on local or national political developments, instead of taking a coordinated approach to delivering the best possible outcome.

To maintain an effective planning system, decision-making at different administrative levels needs to be balanced to allow national and local priorities to be addressed. To help reach this situation, RIBA believe that policy makers at a national level should have the remit to develop an overarching national strategy for the built environment that addresses national priorities. This overarching strategy must be flexible enough to allow local policy makers to deliver local ambitions. It is vital that there is sufficient local resource raising elements to these plans.

2. **How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?**

The current approach to developing built environment policy is fragmented with polices and guidelines developed across different departments to meet different agendas. We believe that one of the most significant challenges to tackling this lack of clarity and direction is the absence of a single body with responsibility for developing a long-term approach to national level policy making.
A single cross cutting policy for the built environment should be developed. To help facilitate this, the RIBA has previously argued that a ‘Chief Architect’ sitting within the Cabinet Office or the Department for Communities and Local Government should be appointed. However, given the range of issues that this role could cover on a day-to-day basis, we would urge the Committee to consider the benefits of a Chief Officer for the Built Environment who could promote policies across a range of government departments. Based on our discussions, we believe that a policy along these lines would attract broad support from a range of built environment professions.

3. **Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?**

   In our view, the NPPF promotes financial viability more prominently than social or environmental factors. To encourage the development of resilient places the NPPF should be reviewed to balance the tenants of sustainability - economic, social and environmental.

The NPPF was developed as a response to unlocking stalled development in the recession. As such, it represents a response to an economic situation which no longer exists in many parts of the country. The imbalance between London and other areas of the UK highlights the need for a more devolved planning system. In particular, clearer guidance is needed from the Government on the ability of local authorities to mandate standards on key issues like Section 106 and CIL.

Some of the associated elements introduced at a similar time to the NPPF- in particular the decision to allow buildings to be changed from commercial to residential use without planning permission- have been hugely damaging, leading to a large number of small new apartments that fail to meet a wide range of standards that apply to newly built homes.

4. **Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?**

   There is a lack of clarity and vision over the future strategy for planning in England. The RIBA believes that a national strategy for the built environment should be developed to integrate major decisions around the economy, planning, housing and infrastructure.
A clear and coordinated strategy would shape national, regional and local priorities in a way that brings together built environmental and economic policies for England and helps inform the work of the National Infrastructure Commission. In addition to this macro-level change, we believe that there should be a consideration of the spatial impacts of individual schemes.

5. **Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?**

It is essential that upcoming changes in society are managed proactively through a coordinated strategy that ensures new and existing communities are designed in preparation for change. A built environment policy would set out a high level coordinated vision for the future of the built environment in the UK up to 2025. The document would demonstrate leadership and stimulate a partnership between government, the professions and industry. We note that the requirement for local authorities to identify a five-year land supply for new housing is proving to be very challenging in many areas, so further work will be needed to identify how longer term processes can be established.

6. **What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?**

Government needs to support the development of new housing at a local level and encourage a more diverse and competitive housing market. In particular, we are supportive of the Government’s ambitions to increase the role of small and medium sized house builders. In rural areas, the decline of these developers has been particularly damaging as the smaller sites favoured by them are often too small to be of interest to the larger house builders. Other initiatives like the release of public sector land can help speed up housing development. However, they are not of the requisite scale to tackle the housing crisis.

We welcomed the recent introduction of a national minimum space standard for new homes, however, unless this is widely adopted by local authorities, we do not believe it will end the disappointing fact that new homes in the UK are amongst the smallest in Europe.

7. **How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and**
places be able to adapt to changing needs and circumstances in the years to come?
How can the best use of existing housing stock and built environment assets be made?

The Government’s decision to abandon the Zero-Carbon Homes standard was deeply
disappointing. The RIBA believes that the UK requires a zero carbon building policy and
higher energy efficiency standards in Part L of Building Regulations to ensure built
environment assets are able to adapt to changing needs and circumstances.

Planning policy and buildings regulations should have more flood preventive guidance and
stipulations. There is a significant base of knowledge on how new developments can be
made more able to deal with heavy rain and flooding, in future we hope that the
Government will look at the regulations covering these issues in more detail.

8. To what extent do we make optimum use of the historic environment in terms of
future planning, regeneration and place-making? How can more be made of these
national assets?

The value of heritage buildings needs to be better recognized in planning, regeneration and
place-making. We believe that greater proportionality is needed in local planning decisions
to strike a better balance between the needs of historic buildings in use and other
protection schemes such as archaeology. We are concerned that heritage assets are
currently not treated as buildings whose usage and condition will change over time. This can
create significant issues for the owners of these buildings and those who work on them.

In addition to planning issues, we are concerned at the lack of an integrated strategy to
address the growing skills shortages in the sector both in local authorities, and in the
profession. A greater role for accredited conservation architects can help address the
shortage of conservation officers in local councils, and RIBA is keen to work with DCMS and
other stakeholders to address this. However, central government must do more to stimulate
a strong pipeline of heritage skills to design and deliver conservation projects.

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers
etc.) have the skills adequately to consider the built environment in a holistic manner?
How could we begin to address any skills issues? Do local authorities have access to
the skills and resources required to plan, shape and manage the built environment in
their areas?
There is undoubtedly a need for a more holistic approach to decision making both on behalf of professionals in the sector and the government. Multi-disciplinary teams can address built environment issues holistically but clients including government often make poor procurement decisions which put the focus of a project on one area over another.

The ongoing reduction in funding for local government has in many cases undermined the ability for local authorities to adequately appraise the quality of proposed schemes. The loss of skilled and experienced professionals is particularly challenging at a time when demands on local planning departments are rising in many parts of the country.

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

Design support services such as design review and enabling can promote better and more sustainable places however further funding needs to be made available to ensure a high level of service is available nationally. We believe that planning authorities should be able to mandate the use of design review on schemes in their area.

Government leadership has proved highly effective in promoting the take-up of new approaches to delivering high quality design – particularly the promotion of the use of Building Information Modelling (BIM) tools through requirements for the use of BIM on public sector projects. With reference to our response to Question 9, BIM has also proved a valuable tool for architects to work with engineers and contractors to improve the quality of project outputs.

Looking to the future, we believe that a focus on digitising the planning system could be a valuable tool in helping professionals and the public engage with the developments at an early stage in a way which helps ensure that decisions about design are informed by as wide a range of stakeholders as possible. Government leadership and support for this process would be very welcome.

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?
The current decision making structures do not encourage sufficient consideration of the impact of the built environment on those who live and work within it. Many developments are subject to significant opposition because of legitimate concerns about the impacts on schools, healthcare and transport infrastructure. There are currently few options open to local authorities to address these concerns before the developments start. A more integrated approach that gathers early input from communities and public service providers can help address this opposition – as well as highlighting the infrastructure consequences of failing to address demand for housing, a significant and growing issue in many rural communities.

Better and more systematic approaches to measuring the impact of the built environment are also urgently needed. User feedback and Post-Occupancy evaluation can enhance our knowledge of the outcomes of the Built Environment if they are collected effectively and regularly.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

The current system creates some opportunities for communities to engage positively with the design process for individual schemes. However these are often at a late stage where the design is advanced and inflexible. This can lead to significant opposition to development, even when all efforts to engage with residents through statutory and voluntary consultation have been made.

There needs to be further opportunities for the public to engage at a strategic planning level to proactively input into the design and decision making process. In areas where major developments have taken place and won public support, one common theme has often been the proactive role of the local public sector in helping make the case for high-quality developments. This combination of leadership and partnership requires both political will, and the ability

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?
As we have previously stated, we believe that a stipulation requiring design review would be one way to increase the quality of design and place making and address public concerns about development.

The Government has a range of decisions to make about the use of fiscal and financial measures to increase housing and land supply which go outside the RIBA’s core areas of expertise. Therefore, we will not be responding in detail to this question. However, we would like to take this opportunity to highlight two issues that we believe the Government should consider as it debates its central role in developing new communities.

Firstly, the Government’s focus on the disposal of public sector land for new homes should consider the core aims of the Social Value Act. If the Government decides that the goal of land sales should be maximum initial return, then it is likely that the cost of land will be increased to a point whereby developing the well-designed communities that the Government seeks will be challenging. We believe that a longer-term return should be sought so that developers are incentivised to deliver schemes which bring net benefits to the infrastructure of an area. The creation of the London Land Commission offers a promising model for establishing a register of available land that can be used to build new homes. We hope that this model can be extended nationally if it proves successful.

Secondly, the current approach to the release of land for housing is clearly failing to match demand. We therefore believe that the Government should commission a review of the green belt to assess the environmental and amenity value of the green belt and compile an evidence base to support Local Authorities in local decision making.

Examination of Witnesses

Ruth Reed, former Past President, Royal Institute of British Architects (RIBA), and David Henry, Planning Director, Savills, appearing on behalf of Royal Institution of Chartered Surveyors

Q146 The Chairman: Mr Henry and Ms Reed, welcome to this evidence session of the Select Committee on National Policy for the Built Environment. You have in front of you a list of the interests that have been declared by members of the Committee. A transcript of the meeting will be taken and published on the Committee website. You will have the opportunity to make corrections to that transcript, where necessary. Could I begin by asking each of you to briefly introduce yourselves to the Committee for the benefit of the record that we will be producing?

Ruth Reed: Good morning. I am Ruth Reed. I am past president of the Royal Institute of British Architects. I am an architect. I am also director of a planning and architecture consultancy. I have been a professor of professional practice. I no longer teach.
David Henry: Good morning. My name is David Henry. I am a town planner and chartered surveyor in private practice. I also chair the RICS planning policy panel. I am here representing the RICS.

The Chairman: Thank you. I saw you sitting in on the last session. I hope you found it interesting. We want to whip through this, but the problem is I am not a very good timekeeper.

The first question is mine. How would a chief built environment adviser—or other advisers with specific remits on built environment matters—help to deliver better outcomes at a national level?

Ruth Reed: The RIBA would welcome such a person, because we believe that they would not only co-ordinate policy across the policy-making departments—BIS, DCLG, DCMS—but co-ordinate a joined-up approach to procurement in the spending departments, leading the country by example in good practice in design and procurement and ensuring that policy was joined-up, that it did not repeat itself or contradict itself and, to take the good example of the National Planning Policy Framework, to ensure that you have a pared down, succinct approach to built environment matters across government. The built environment is so much more than buildings. I know it is odd for an architect to say this. It is about a co-ordinated response to the needs of the population, which I am sure you are very well aware of. It would be extremely helpful to have a single responsibility at the heart of government driving that approach and co-ordinating excellence across all matters to do with the built environment.

The Chairman: There was a suggestion for a chief architect, but that is slightly different from a planner. If that ever came to fruition, would you think there was a need for an equivalent chief planner as well?

Ruth Reed: We have had discussions with the fellow institutes on this matter. We recognise that each of us brings a different aspect of skills to the built environment. We are quite open to the idea that each of us could bring something to the role, should it fall to a member of one institute or another, and some of us—not me—hold skills across different disciplines. I do not think that the RIBA is continuing to say that only architecture should be pushing this; that could be too building-specific rather than to do with the broader environment. It would
not be helpful to be that prescriptive about which discipline should take it on. It is a role that is much needed and we would not want to stand in the way.

The Chairman: Yes, but you do not want it to slip between two stools either, do you?

Ruth Reed: No. The chief planning officer has particular responsibilities for communication between DCLG and the planners. That may be in statute; forgive me if I am wrong. That might be somewhat different to subsume into this role.

David Henry: Picking up on that last point, first of all it is about acting as a focal point for experience. After all, very few issues to do with the built environment are singular. They are not just architecture, just property or just anything else. There is a distinction. It is one of the reasons why there is recognition in the various professions of that overlapping-ness and the need to work together. They are part of a continuum, after all. That is the first point to grasp. The second thing is that we look far beyond the immediacy of any particular issue. A chief adviser is there, to some extent, as the critical friend, as the prod for sometimes saying, “If you do this, it might also have a knock-on consequence to that, so you should take that into account beyond the immediate realms of the professional interest”. The holistic consequences are very important as well.

The third reasoning is to act as a signpost. I listened to the session just now, and the point was made that we can look back 50 years but we should be looking forward another 50 or 100 years. Quite often there is a need to have that vision for a place, and to challenge, to identify opportunity, and look at how one might steer and guide decision-making within that context. The job description is the more important initial issue, beyond the who, what and where that applies to it.

Q147 The Chairman: Is there a usual channel of communication between architects and planners at the Royal Institute of British Architects level, or are they rather like the engineering field used to be, with 50 different institutions never speaking to each other? That is a slight exaggeration, but it was true, and that was why they put the Engineering Council together.

Ruth Reed: In recent consultation responses to the other House, we put forward a joint response with the other institutes calling on different areas of knowledge. I think you are
already aware that the Landscape Institute has taken a particular lead on the flooding issue, where it might be more appropriate.

Baroness Andrews: I apologise if this sounds rather cynical. As you have been speaking about the prospect of a chief officer for the built environment, I have become more persuaded. The problem is that I am looking for an analogy across government, and it could be the Chief Scientific Adviser to the Government. The problem with having somebody for the built environment is that there are huge vested interests at play across the built environment, and there are now huge stakes in policy-making on housing and infrastructure. It is slightly different in science. With respect, you would have no power to speak of if you were the chief built environment officer, so how could you exert influence, given that your main opponent would be the Treasury and you would cover practically every department in government?

Ruth Reed: It is fair to say that the complexity of it and the lack of a joined-up approach to the built environment is the very reason why you might want somebody to attempt this gargantuan task of pulling it all together. I would not want to think that nobody ever tried to make it work. There are great examples across government, including a forward consultation on procurement that could easily be brought, with Treasury backing, to the spending departments, as the requirement on the way in which government procurement and delivery in the built environment are delivered. I would not want to say that it was not possible. Any role has to be given a mandate and support, and the Treasury is a very powerful place to begin.

Q148 Lord Inglewood: We have had a lot of evidence, and people have told us different things, but I think there has been agreement from all our witnesses that we do need some kind of joined-up or holistic national strategy for the built environment—not that I terribly like the word “joined-up”—and certainly nobody has told us that we do not need it. That being the case, how would you set about doing that in order to deliver high-quality new homes, meet housing and other development requirements and conserve what is good? To declare an interest, I am a member of the RICS myself.

David Henry: I am glad to hear it. It is a big question. A simple place to start is vision as to what we are seeking to achieve out of this. I was interested to hear in the session before about spatial planning, regional plans, local plans and the like. Certainly I think those have a
strong role to play in there somewhere; at what level is for discussion. To have vision of place is a good starting point, because otherwise the inputs become rather dislocated and self-interest starts to kick in. The second thing is sharing understanding and knowledge of what is going on out there in the built environment as a whole. In our submissions, for example, we talk about sharing a database to look at what knowledge is already there and making sure that people are aware of that so that it informs the decisions in a more objective and better way. These are all important ingredients to that mix.

Staying on the spatial planning point, I was struck in the previous session by some of the comments. As far as I am aware, England is the only part of the UK that does not have some form of spatial planning in its planning system. That tells me something—you can tell by my accent, perhaps, that I have an interest in this. It tells me that they cannot all be wrong. Therefore, that requires a little bit of exploration about whether the frameworks are correct to allow the drive and the vision to be expressed and delivered through, however those mechanisms fit in.

**Ruth Reed:** I am slightly conscious that we follow on from the planners, who will have facts that are not at my disposal. There is a danger that we are underplaying the strategic level of decision-making that is needed to deliver the things that will support the new housing and economic development arising from a growing population. At the moment, we have no mechanism for forward planning for the health, education and transportation provision to support the housing that is so needed. We are already behind with the housing. We have not even begun with the other support mechanisms that build a holistic society. There is a danger that in devolving to a very local level, we have lost that ability to see the whole picture across the country, which essentially is what spatial planning is. There is a considerable reluctance to centralise planning. There is a feeling that the local population should have a say in what happens, but there are some big decisions to be made about where everybody is going to live and how communities will be built.

**The Chairman:** It would work, would it not, if there was an umbrella of national planning and people really bought into it bottom-up, whereas the other would be top-down?

**Ruth Reed:** Yes.
The Chairman: I can envisage that happening. When we were in Birmingham we could physically see what they did in that area around the station. It is possible, I am sure.

Q149 Baroness Finlay of Llandaff: You spoke about the demographic change in the health and infrastructure needs of the population, and one could perhaps use the word well-being for the people who use it. What powers do you feel would be needed for such a role to function, and function well? I could see the danger in it having a liaison role and a forward-looking role but not having any levers to make changes either happen or not.

Ruth Reed: I assume that the role would come with sufficient power to oblige central government to identify how it was going to support growing communities and for strategic development—whether it be a town extension, a new town, whatever form it took—to oblige health and education to explain how they would support this rather than for everything to be reactive to the imposition of new housing and new development.

David Henry: If I can build on that a little, it is about making sure that the different factors are recognised, taken into account and given due weight in the decision-making. There is a great tendency to have fragmentation of the different inputs without joining them together in a balanced decision. If the role is to have that duty, it would be to ensure that all the relevant factors are properly taken into account. It is almost like a wicket-keeper type of role, so that the health inputs, the utilities, the infrastructure investments are properly factored into the decision-making and planning making at whatever level that is, whether very localised or national. Many of the complaints that one sees and hears come from, “Oh, you didn’t listen to me and now we’ve got a consequence”.

Baroness Andrews: I seem to remember that when the big housing numbers were put forward in 2005-06, when Kate Barker gave evidence to us, there was more or less a national debate that was more reactive than proactive. It was about how we build infrastructure. Water became a big issue, because we were in periods of drought in the mid-2000s. That sort of dialogue seems to have disappeared. Do you think the National Infrastructure Commission should take responsibility for that? Do you think there is a danger that, having created it, we may have more of a division in the debate on where and how much housing and infrastructure, or that it can be more easily integrated now?
David Henry: It follows from what I have been saying, I hope, that the challenge is certainly there for it to become that animal. I have had quite a lot of experience within the water industry and of the dislocation that has occurred there between spatial planning and the asset management plans—the AMPs, as they are called—and trying to anticipate exactly where growth is going to be. It is the same in other sectors. The National Infrastructure Commission has the opportunity, perhaps, to step into that realm. My point about growth and where it goes is that it is not just about the direction of travel but how you support it, and making sure that those factors are properly encompassed within that.

Q150 Lord Woolmer of Leeds: I will, if I may, address this question first to Mr Henry, but it would be very helpful to have another view on it. What are the issues raised for the built environment by the existing system of viability assessments? What problems do you see emerging in practice? Do you think that policy changes are needed at national level?

David Henry: The first thing is to look at what the question asks. Many people become rather scared of this issue of viability. What is it? Essentially, it is a simple financial equation. There are many ways of approaching that equation. There is a disposal price, a sale price, a cost of construction, a total development cost, and a residual sum—a land value or whatever it is. Viability comes into this discussion when changes in the total development cost impact on one or other of those outriggers, whether it is the sale price or the residual land value; something gives somewhere in the equation. The art, of course, is to look at striking the right balance and for mechanisms to ensure that one does not unduly adversely prejudice the other, because otherwise the whole thing becomes fraught with challenge and difficulty. So the first thing is that it has to be looked at in terms of that overarching equation and it has to be understood.

The response is to make sure that people are not frightened by the concept of viability, that they understand where to look for advice on viability, which comes into the policy realm, that there are good practice guidelines, including through our own institution, on looking at what the rules of the road are before one engages in the debate. Having done that, where might policy change take place or be improved? First of all, it is about the signposting that I touched on. Where does one look for advice on the issue? Where does one go if one cannot resolve any debates on viability? Independent mediation, arbitration, whichever one feels ought to
be pursued. Also, are the changes in built-environment cost and complexity properly acknowledged as material considerations in that decision? Quite often, it is almost the Cinderella in planning decisions: the cost of something is somewhere in there, but we are never quite sure what it is and how it impacts. Does it have a knock-on consequence to other equally worthy aspects of making a decision, whether it is schools, hospitals, affordable housing? Understanding that mechanism is key to it. The response in policy terms is to direct people on how to find out about it, what the rules of the road are, and how to arbitrate or mediate on the issue should there still be a dispute.

Lord Woolmer of Leeds: I would like to hear from Ms Reed and then I will come back.

Ruth Reed: The Growth and Infrastructure Act brought in the concept of challenging the viability of providing full Section 106 provisions on affordable housing as holding back development during a period of economic downturn, if not recession. It enabled developers to renegotiate. At the moment, that situation has not changed. Where we are now experiencing growth, we are still seeing developers able to renegotiate their Section 106 terms. It is not always perceived—I do not have any knowledge either way—as the most open and transparent process.

The consequence for society as a whole is that less affordable provision is coming through from the private developers, which in the long term is a disaster for those who are not in a position to purchase their own home. I imagine that the situation with regard to renegotiating Section 106s will change with time, because, particularly in the south-east, economic conditions are looking up. From a personal perspective—this is not an RIBA view—it all goes back to the value of land at the base of it. There is a fundamental problem about relying on the private sector operating in an open market to deliver affordable social housing through the provision of an obligation on any development. There will always be a pressure from those who quite rightly want to make money out of their day job to resist the need to provide social provision. In the long term the whole provision needs looking at. That is a personal opinion, and I happily accept there are others who have greater knowledge of that than I do. At the moment, viability in planning is not as transparent as it should be, and that is an observation from my daily practice.
The Chairman: I sense that there are changing attitudes in social housing versus rented housing, even in local authorities that are building houses for purchase. A lot of people—not just us—are looking at this in the round at the moment. It is probably quite a good time to sow seeds to bring this out into the open. Certainly it was very interesting in Birmingham; the housing development that we went to had social housing of one or two bedrooms—five bedrooms in one case—cheek by jowl with housing owned by the council that they were going to sell. A lot of the barriers seem to be coming down and reality is coming up, we hope. Lord Woolmer wants to come in on this one again.

Q151 Lord Woolmer of Leeds: One view expressed to us by, I think, Islington Borough was that in practice the viability test leads to the developers who make the most bullish assumptions about growth minimising their costs, what they are going to do in social housing, and what they need to contribute to wider development and social development over 30 or 40 years. Those who make the weakest assumptions about what they need to contribute will always be able to outbid others. Is not one of the problems that in practice those bidders secure the land and then minimise what they contribute to the rest of society? In reality, is that not a consequence of the marketplace, whether it is good or bad?

David Henry: The reality depends on how you perceive it. It is an open market. Some people have deeper pockets than others, so of course there will be people who will bid more than others. It depends on their perception of risk, when they will get their reward from it, and so forth. It is not necessarily a simple linear discussion of the sort, “They will always win”. People have different appetites for investment in different parts of the market or, indeed, the geography of a place. First of all, there is a need to understand how markets function. However, your point does rather chime with what I was saying: that this is about understanding how those debates, negotiations and rules of the road are applied. In my practical experience, the ability to understand the equation, as I put it, is not very strong in some places, so the negotiating position is weaker for some people and some authorities to understand exactly the scope of a negotiation and approaching things in more innovative ways. We had the example of Birmingham just now. Are there different elements of the equation that can be brought in to deliver goods to the benefit of the broader community? If you have somebody who is vastly experienced and somebody who has little experience having
that conversation, it is one-way traffic, and that may be the sort of discussion that you are referring to. This goes back to my point about signposting: where do you go for best advice, how do you apply that best advice, how do you feel that you have a rational, balanced decision out of these issues?

**Lord Woolmer of Leeds:** Many local authorities, through no fault of their own, have inadequate numbers of planners and architects. They have inexperience, and some of them have a rapid turnover of agency planners. Is it not inevitable that in many local authorities the experience and ability to compete on equal terms in the marketplace with perfectly reasonably hard-headed developers is a bit of a one-sided market? Is that not the reality?

**David Henry:** I sympathise with that point. I just said that. You have taken it a step further. There is a degree of truth in what you say. The resourcing, the skill sets, the understanding of mechanisms can be one-sided, so where does one look for support and experience to find more confidence to have a dialogue around these issues?

**Lord Woolmer of Leeds:** So what is your advice to local authorities?

**David Henry:** First of all, I would say prioritisation and whether the built environment is seen as a key service. With all due respect, we have put a lot of investment as a nation into our health and education. We have just talked about the longevity of our built environment. Is it not as much a key service at some level as anything else? Therefore, the resourcing to address the under provision would be an important element to that. In the short run, as I said, there is a need for signposting: where to go to find the right advice, whether independently from district valuers, the Planning Inspectorate, RICS, RIBA, whoever it is, to look at that. Thirdly, there is also a need to look at deploying those resources as effectively as possible through the sharing and pooling of resources, particularly cross-boundary—which goes back to the devolution discussion—and whether one needs more national-level resourcing brought to the fore again so that in effect one has flying squads of expertise to bring into particular areas to call on.

**Ruth Reed:** It is symptomatic of a loss of skills within local authorities. It does not just apply to viability. We have addressed this in our written responses to your questions.
Q152 Earl of Lytton: I have a particular interest to declare, because I am also a chartered surveyor. I chair one of the other panels that deals with party walls, right to light and other esoteric matters.

I am very interested in this business of what I used to know as a development appraisal, but it gets retrofitted and turned around in different ways. Often we deal with valuation of non-market principles, on which I know the RICS has done a lot of work in the past. We used to laugh about the old business of whether you are buying or selling, because people come to the issue with completely different sets of objectives. Then you have the question of issues that cost money today versus value tomorrow; I am thinking in particular of long-term management, use and enjoyment—the downstream things that build communities, societies, a sense of place. You have touched, first, on making the process more transparent: in other words, the Excel spreadsheet of your development appraisal.

David Henry: Yes.

Earl of Lytton: Do you think that there is value in making more explicit some of the consequences of asking for a certain level of affordable housing, for instance, on the entire scheme and future management project, and in connection with that the costs that might be imposed on a particular developer of doing something that applies to the wider community? In other words, the tariff should not be attached to the particular developer but in some way equalised out. Is there a more explicit process that we can create? Sorry, that is rather a long question.

David Henry: There is quite a lot in there. The last point is the hardest one to respond to. Let me pick up on a few of those points. First of all, it is a day-to-day occurrence in my realm to have exactly those conversations about the short term versus the long term. In fact, you can have whatever this good is, but there is a cost in doing so that is offset somewhere else. For example, if a local priority is the provision of a high level of affordable housing, it may in the overall equation of things—I accept there is a negotiation here—have the knock-on consequence that there is not so much of something else in there. That is for exploration, but that is how it works. As I said at the beginning, this is the basic equation. Priorities and how you set those come into that.
Royal Institute of British Architects and Royal Institution of Chartered Surveyors – Oral Evidence (QQ146-158)

The second thing is to look for where the added value comes in. There is some very interesting research—I know you are interested in looking at these things. For example, the Prince’s Foundation did some great work a few years back on the added value of green space in development. How does property price increase if you have a view over the park, putting it at its simplest? That is very interesting, because that is another aspect of built-environment quality reflecting on the property value, hence the valuation—discounted cash flow, or whatever approach one is taking—and how one calculates the effect of that. Again, one of the aspects here is looking at how far ahead you go, what assumptions you build into this in relation to the increase in value of the land, property, whatever it is. A lot of investors of course are looking for those horizons: not just the immediacy of planning today but the investment value—the YP, if you want to put it in the jargon—of what is happening over 25 years, et cetera. I wonder if that helps.

The Chairman: I do not think it does.

David Henry: Sorry.

The Chairman: The reality is that you have a nice view over the bay or of the mountains, and then you have the house, and each of them is going to have a different value. They are not going to stay in the same relationship.

David Henry: No, they are not.

The Chairman: Unfortunately, the houses—the bricks and mortar—seem to be accelerating at a much greater rate. Interestingly, people I know who have bought over the river say that it will always be that amount, but it will not necessarily be; it depends what happens to the river.

David Henry: Objectively exploring those issues is quite helpful in trying to look at the overall value.

Q153 Lord Inglewood: Ms Reed, in your private capacity you gave us some thoughts about housing. Listening to you, I sensed that you had thought about it a bit further than that. I wonder whether in your private capacity you are prepared to share those thoughts with us. Do not feel that you have to.

Ruth Reed: My answer follows on from the response to the previous question, in that the provision of social housing and other social infrastructure through viability and the Section
106 and CIL process is forced to be reactive. This is essential social infrastructure, yet it depends entirely on the ability of a local authority, equipped or ill equipped, to negotiate to achieve sufficient money to support the housing that is being built now, with no real ability to plan forward from that. There is a very real prospect that we will marginalise areas that do not have the skills or where the developments are not producing sufficient income through contributions, because their level of social infrastructure, particularly social housing, will be diminished as a consequence of the inability to raise money through the private sector, which is effectively what it is. I am not proposing an alternative—it is way beyond my ability to be able to suggest how else this money may arise—but at the moment it is leading towards a very iniquitous situation, geographically and socially.

Lord Inglewood: In the background papers there was mention of your having a practice and experience based in Wales. I am a Cumbrian. Is it the same problem that we are facing in Cumbria that you are talking about in Wales?

Ruth Reed: To be fair, I ceased practice in Wales in 2006, so I do not have current knowledge. I cannot comment on how it works there any more, I am afraid. Sorry.

David Henry: Can I pick up on that, because it is quite an interesting perception? With the reduction of public sector expenditure, as a generality the public do not realise how many of the public goods, whether it is the primary school, the road, the park, are now provided out of private sector development, so the equation, as we put it, the dialogue, is a matter for that prioritisation. As I said in response just now, what comes first—the primary school, et cetera? It is those issues that are the immediate ones, balanced against the longer-term issues of added value and so forth that we have touched on.

Lord Inglewood: Let us talk about housing, for example. Where I live, housing is substantially less expensive than it is in, say, the south-east. The ability of the developer to deliver the school, which costs the same, more or less, wherever you are, is curiously severely diminished.

David Henry: Absolutely.

The Chairman: It skews it completely.

Baroness Whitaker: I just want to pick up on what Mr Henry said. Do you think the rules of the road should be changed in the public interest?
David Henry: May I ask for clarification?
Baroness Whitaker: You keep referring to the rules of the road, which is the system that produces the viability problems that we heard about. Do you think the rules should be changed?
David Henry: As I said in response—we have put this in our evidence—it is about pointing people to where they find those rules, if I can term it like that, and the processes by which valuation and negotiation take place. The National Planning Policy Framework and the planning policy guidelines take you to a certain point, but they do not take you further and tell you how you calculate where the good practice examples are, and where one looks for them.
Baroness Whitaker: Are you recommending a change in the guidance?
David Henry: Not a change in the guidance, but taking the guidance perhaps a step further.
Baroness Whitaker: Maybe we could ask for something in writing. It would be very helpful, if you do not mind setting that out.
David Henry: I suspect it is there, but as a user of the system you get to the point where you think, “It’s all smoke and mirrors because I don’t know where to look to find out how those rules are applied”. It is there, but you need to be able to hunt it out. I suggest that the rules need to be clarified to that degree.
Q154 Baroness Young of Old Scone: If everybody else is declaring interests, I ought to declare that I am an honorary fellow of the Royal Institution of Chartered Surveyors. It means that I get my subscription free, which is even better. I want to talk about sustainability and resilience. We have seen zero-carbon homes gone, the sustainable building code gone, and quite a few other things are going. What would you do to try and redress that? Do you think that in the current red in tooth and claw drive to get development to happen this is an unfortunate and necessary casualty of the process?
Ruth Reed: The RIBA’s position is very clear on this: we cannot rush for quantity and lose quality. That applies to performance as it does to any other aspect of the built environment. We cannot reach a point at which we are so keen to build houses that we accept that they put a greater load on this planet. As far as the institute is concerned, it is not an ethical position that can be sustained. Without making any political point, you have been talking
about 30 to 50 years hence. This has to be part of the consideration: that buildings can continue to perform to the best of our current knowledge and technological ability. It would be very wrong to lose sight of what we know about the impact of how much carbon is wasted through the built environment.

**Baroness Young of Old Scone:** Can I take that one stage further? Are you saying that at the moment we are building buildings that in the future are not sufficiently sustainable, not just in a carbon sense but in other ways as well?

**Ruth Reed:** We know that we can build better. What we have lost at the moment is the regulatory and political drive to do that. It is regrettable. We need to go back to a point where we are constantly pushing the average to get better and the very best to innovate. I am very sorry that we appear to have lost that drive, particularly on carbon sustainability.

**The Chairman:** There is also the consideration of developments in building materials. We were quite struck by Quinlan Terry, who said that nobody has yet developed an effective seal between glass and steel; they all go eventually. He made me think. We have all these huge buildings using these seals and they are all coming unstuck in the building I live in now. It is a risky job.

**Ruth Reed:** We know that when mankind is pushed to innovate there is extraordinary capacity.

**The Chairman:** That is true.

**Ruth Reed:** We have removed the push at the moment.

**Baroness Andrews:** Could you give us a list of the deregulatory arrangements introduced over the past five years in order that we can evidence exactly what you have said about the loss of quality, and test that against what the developers have told us about what they would like to build and the viability test?

**Ruth Reed:** We can certainly provide that.

**The Chairman:** That would be very helpful. Thank you.

**Q155 Baroness Whitaker:** Ruth Reed referred to a lack of public sector skills shortages in the built environment professions. I would like to ask both of you how this might be remedied. What other changes are necessary to ensure that existing built environment skills and expertise are better co-ordinated, because you have also commented on the lack of that?
Ruth Reed: We suggested, particularly with reference to the historic environment but generally across the board, that there are skills out in the private sector that would be available to local authorities if they want them.

Baroness Whitaker: If they had the money to pay for them?

Ruth Reed: There is also the requirement for developers to pay for design review, so you could very rapidly get to a point at which you could invite the professional bodies and representatives of the various built environment professions to have a proactive input into the design of places and buildings.

Baroness Whitaker: By “proactive” you mean earlier on in the process?

Ruth Reed: Everything that we know about design review is that it is most effective very early on in the process. If you attempt to influence a building or development that has gone a long way down, it is counterproductive for all involved. There is help out there. Local authorities have been inconsistent in their take-up. There is not necessarily an understanding of the importance of good design.

Baroness Whitaker: How can their understanding be improved? Are we talking about courses for councillors?

Ruth Reed: You heard that in the previous session that I sat in on. I gather there is plenty going on.

The Chairman: Mr Henry, do you want to come in on this?

David Henry: Just to endorse what has been said from practical experience. I am based in Cambridge. I have taken a scheme three times back to the local design panel before it is even submitted as a planning application. Those initiatives are there and they work very successfully at building in the quality before the scheme gets to the decision-making point.

The Chairman: Can you give us a little background to that particular issue if it has gone back three times? Were the parameters not right?

David Henry: In the particular instance that I evidence, there are a number of subjective choices to be made in design. Therefore, it becomes a dialogue to get to a balance and think, “Okay, this is about right between various different factors”.

The Chairman: Are the public involved in this at all?

David Henry: Yes.
The Chairman: You poll them?

David Henry: Not within the immediate design conservation panel made up of the various professionals, but certainly as a factor into the design process through the consultations taking place as an input to that.

The Chairman: Do you think three times is the average?

David Henry: No. This is a very special case. It was to support the view that it is not a whim; these things do happen very effectively.

Q156 Baroness Rawlings: I had better declare an interest as a member of the Georgian Group in relation to the question I am about to ask. In your RIBA submission you take the view of the importance of heritage and how it is understood, which is dear to my heart. How do you feel the public sector gives better recognition to the importance of heritage assets, history, quality of life, and difficulties perhaps with listing? What challenges do your members face in handling conflicting demands of new and existing buildings?

Ruth Reed: There is a question of capacity in local authorities in heritage, as there is in all other aspects of both planning and managing development. The danger is there is a very safe route to saying no to intervention in the historic environment rather than a considered route that says, “How best can this environment be sustained into the future? How can buildings be readapted? How can places be made part of our living lives again rather than preserved?” There is capacity outside of the local authorities to assist with this. The RIBA has a conservation architecture accreditation, which is held in high regard by Historic England and is a prerequisite of their grants system. These are people who understand not only the sensitivities of the environment and the significance of the buildings they are dealing with but how they can be sensitively reused or enhanced and brought back. There is a danger that the heritage environment becomes a “them and us” between the local authorities and the agents outside. Architects and surveyors are extremely sensitive to the needs of those environments. They are the line between clients who may be pushing things a little too far and the local authorities. It is important that there is a mutual respect for what we all know, and perhaps there can be some degree of consultation about heritage matters with those of us working in the private sector. We are not pushing for major change. We know a great deal about how buildings can be managed well.
Baroness Andrews: You have talked about capacity and it is a real issue because of the loss of conservation officers. I declare an interest as an ex-chairman of English Heritage. Would you not agree that there is a perfect storm because of the loss of conservation officers and the potential loss of capacity from some of the agencies such as Historic England and English Heritage, which is making it much more difficult for local authorities to hold the line on the historic environment? I am not talking about monuments; I am talking about the everyday historic environment that we live within. Do you have views on that?

Ruth Reed: The RIBA is conscious of this and is currently doing some research into the responsible reuse of buildings and what a proportionate response is. We have a huge number of listed buildings and conservation areas in this country, which, if all ossified and prevented from change, would contribute to society’s ills and lack of addressing the needs of climate change. We need to take a responsible and forward-looking attitude to that. We will work with Historic England to have that recognised by local authority planners as a matter of authority so that they can rely on that advice, because there is a lack of capacity. The institutes are trying to assist. The problem is that without a conservation officer, even the question of knowing where to go and how to approach the information that is being thrown at an authority has been lost as well.

The Chairman: Mr Henry, what do you think?

David Henry: I am going to make a connection between the two parts here. First of all, the heritage aspects of the historic environment are always evolving and changing, so it is a misconception to look at them as being somehow fixed. It is absolutely essential that we understand that process and where beneficial change can take place, and the added value—sorry to use that hackneyed phrase—from that change can be achieved without denigrating the underlying integrity of the asset. Between the institutions, there is quite a lot of research looking into those issues.

Picking up on the first point, again from practical experience, listed buildings tend to be described as the skeleton of the building, the bricks and mortar, but not the life of the building and its longevity. Understanding its cultural capital, as it were, its historic and economic interests, the well-being that it adds to place, are all aspects of added value that get lost in the smoke of discussion about simply the architecture, dare I say it. We should pick up on that.
and say, “No, there is a future, they can be dynamic and positive assets”. Unfortunately, that does lead back to viability and how one achieves that, but that may be a different aspect of the discussion.

**The Chairman**: Thank you very much. We come to our last question.

**Q157 Earl of Lytton**: I am looking at some of the criticisms encountered from the evidence that has come before us on the quality of new housing development and lack of good design in the built environment. We know some of the reasons for this: cost-cutting and not factoring in the long-term durability, because things can be sold at any price because of the demand. We know there is that element there. Could you share your views on how we can support good design that fosters a long-term sense of place and the value that people attach to it in use? How might this be promoted through the national policy? Are there ways in which built-environment professionals can work together to support that element of better quality design that makes all the difference in the long term?

**David Henry**: Perhaps I will start on this one. First of all, you used the word “sharing”. You heard from both of us there is an increasing and strong element of that, perhaps coming from different aspects, but understanding and addressing common issues. We live in the era of what is called “big data”. There is a lot of information out there that we need to pool. Where is the cost benefit of this? How does the equation work between design and cost of construction in return? That is one aspect of it: the bricks, as it were, of getting to quality design. Having a good understanding is very important.

Secondly, research is very important—looking forward at these very diverse and multi-faceted issues. We just touched on the role of heritage, which has more to it than simply the framework of the building. How do we make sure that quality of design is understood, dynamic and multi-faceted in that respect? So research would be the second key thing that I would put in there.

The third is making sure that construction and design skills are supported and understood. Earlier you heard about training for decision-makers. Dare I say that that also applies to professionals, making sure that they understand the width of skill they require to get to good design? Beyond that, we do not have a monopoly on good ideas. There is good experience
globally, never mind within the UK, that needs to be brought to bear on these issues to challenge poor design and to say, “Look, it can and should be done in a better way”.

Ruth Reed: I, too, have three points. The first is going back to earlier discussion, which is the promotion of excellence by example in the public sector. There is a real opportunity for the public sector to demonstrate what it requires of its built environment through its own work. The second is to put in place a requirement to review good practice to understand why that has benefited. You will be aware that a school won the Stirling prize again. That is a fantastic example of where good design has benefited a whole community. We do not always learn from what we do well. Frequently, we appear to learn from what we do not do well. It would be useful to have a review process to support that excellence agenda.

Baroness Whitaker: Are you talking post-occupancy?

Ruth Reed: Post-occupancy or some kind of holistic community review beyond building users. The implications of good design in public sector buildings go beyond the immediate users and benefit the community.

The third is regulatory change. You may or may not be aware that the RIBA began a campaign called HomeWise, which looked at the size of homes. That began in 2012. We found that new homes were some 7.5 square metres smaller than good homes standards would suggest, which is the size of a small bedroom. We have revisited those figures. The report is not ready yet. Unfortunately, from what we can see, it shows that these matters have not improved. The Government brought in discretionary home sizes through the planning system, but unfortunately with the construction of the planning system requiring evidence leading to policy change, leading to adoption only where a local authority is interested in bringing it in, that is going to be a very slow process. In a system that is underresourced, it will probably not happen, not for lack of will but for lack of time and money. How many more very small houses are going to be built before anything can be done about it?

The RIBA will be putting the idea of an amendment through to the Housing and Planning Bill suggesting that it should be moved to the building regulations. This would be a very simple, straightforward way of ensuring that an aspect of good design was brought about through regulation. It will change a lot of people’s lives to live in larger homes—somewhere for the
kids to do their homework and with proper storage—all the things that we have identified are missing from quite a lot of the developer housing on offer at the moment.

**Q158 The Chairman:** Thank you very much indeed. I am sorry if I truncated some of the answers, but we started at 10 o’clock this morning. New subjects keep arising. We need a long breather to go back over the evidence. This has been very useful and the transcript will be very useful to us. I will reread your submission, it has been very helpful. If you were sitting where I am, what glaring questions do you think we have missed?

**Ruth Reed:** This is a personal response. At the moment, people who are directly affected by development are not necessarily the people making the decisions about whether it should happen or not.

**The Chairman:** I think that is coming through. There needs to be much more consultation about the needs of every human being. It is the biggest investment and part of their lives, yet they are not really consulted.

**Baroness Whitaker:** Not so much consultation as involvement in the process of working out what their place ought to be.

**The Chairman:** It is the same sort of thing, is it not, consulting what they want for the rest of their lives?

**David Henry:** If I can endorse that, it is about the dislocation of place and how that place changes. I touched on that in my example of how funding takes place in many of the facilities the whole community uses. It is about how that is done through engagement, whether it is through localism, plan-making, design, charrettes, whatever it might be. There are a multitude of ways of doing that. It would be very interesting to explore how one re-establishes that connection with place.

**The Chairman:** Have any surveys been done about that mismatch of the final product with what the local people really wanted?

**Ruth Reed:** My point was rather that it may not be the local people who eventually use the buildings.

**The Chairman:** Yes, it is the ones in 30 years’ time.
Ruth Reed: It is also the people who move into the houses, who were not part of the democratic process that led to them being built. It is a wider problem, way beyond the scope of looking at the existing situation.

The Chairman: True. Do you think any country has mastered it?

Ruth Reed: I doubt it.

The Chairman: In one way, that is a relief.

Lord Inglewood: Can you suggest how you consult the people who are not yet born?

The Chairman: We are not going into eugenics. Thank you very much. I am sure I speak for the whole Committee when I say that we are delighted that you are here and you have stimulated us. It will make very interesting reading. If you think, “Gosh, why didn’t I say that?”, or “Do they really know the implications of X or Y?”, could you jot it down or give us a call?

Ruth Reed: Of course.

The Chairman: This will all come together in January when we come back after Christmas, because we have to have this report ready by 23 March. That is going to be a really long haul. At the moment we are garnering all this very interesting evidence. We have already had 147 written submissions. It seems like 400. That is not a complaint. Thank you very much.

05 November 2015
Royal Institution of Chartered Surveyors – Written Evidence (BEN0185)

RICS – Royal Institution of Chartered Surveyors is pleased to respond to the above consultation.

RICS is the leading organization of its kind in the world for professionals in property, construction, land and related environmental issues. As an independent and chartered organization, RICS regulates and maintains the professional standards of over 100,000 qualified members (FRICS, MRICS and AssocRICS) and over 50,000 trainee and student members.

It regulates and promotes the work of these property professionals throughout 146 countries and is governed by a Royal Charter approved by Parliament, and monitored by the Privy Council, which requires it to act in the wider public interest.

Since 1868, RICS has been committed to setting and upholding the highest standards of excellence and integrity – providing impartial, authoritative advice on key issues affecting businesses and society. RICS is a regulator of both its individual members and firms enabling it to maintain the highest standards and providing the basis for unparalleled client confidence in the sector.

There has been an attitudinal shift in public policy towards the built environment over the last decade; the establishment of this Select Committee itself attests to the increasing attention placed on the built environment is receiving and as such is warmly welcomed by the RICS. The political capital that is being invested in addressing the national housing crisis and meeting the UK’s infrastructure needs also reflects the increasing recognition of the importance of the built environment for the national interest.

Nevertheless, there remains an urgent requirement for an integrated and comprehensive approach to policy to meet the public need. This must encompass a holistic understanding of the interplay between the various built environment professions, and their role in delivering effective public policy. A multifaceted challenge requires a multifaceted solution, and we are keen to continue to work with this committee to develop an effective response to the challenges the UK faces.
Policymaking, integration and coordination

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

In principle, policy decisions relating to the built environment should be taken as closely as possible to the communities which they affect; broadly speaking this means they should be taken at the lowest level possible. This is in keeping with the localism agenda that has characterized Government over the last 5 years or so. However, this principle must also take account of the full scope of any particular policy, and the fact that many decisions are of national strategic importance with an impact that goes far beyond any particular locality.

In this context, the role of national policymakers is to provide a robust overall framework and strategic direction within which policy decisions can be made effectively. A good example of this is the recently announced Infrastructure Commission to be headed by Lord Adonis. RICS have long called for such a body and worked closely with Sir John Armitt on his proposals prior to the General Election in May. We welcome the adoption of the concept by the Government, and will watch closely to see how the Commission works in practice. Fundamentally, the Commission should transcend the electoral cycle and extend the time horizons over which infrastructure priorities are formulated and delivered. This should not be about removing politics from infrastructure policy-making, but about developing a long-term strategic framework within which decisions can be made. A similar approach should be applied to other areas of policy.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

All policy decisions pertaining to the built environment have consequences far beyond the primary area to which they apply. For example, housing and planning decisions have major implications for our infrastructure requirements and vice versa. The establishment of this committee is itself an acknowledgment of the interdependence of all areas of the built environment, and policymakers should reflect this. The National Planning Policy Framework
and the National Infrastructure Plan are in themselves welcome attempts to harmonise policy, but as yet they don’t always link together effectively.

As the leading body for property professionals, the RICS can play a crucial role in coordinating the full spectrum of professions across the built environment. The appointment of Government advisers across construction, surveying, engineering, architecture and planning would be an effective way of crystallizing decision making and ensuring coherence across the built environment professions.

**National policy for planning and the built environment**

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritized and why?

Our members broadly welcome the NPPF, and through our consultations we have found it to be much preferred to the ever-proliferating amount of guidance that preceded it. The greatest strength of the NPPF is its holistic nature, and as such no one element can realistically be identified as more important than the others – the framework must be considered in its entirety.

4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

A fully coordinated national policy for the built environment necessitates a spatial perspective. Our members identified the Scottish approach in particular as something which England could learn from. The National Policy Framework there includes spatial guidance which applies to a whole range of strategically important national projects and policies, and furthermore, this framework interacts effectively with the Scottish National Planning Policies (the Scottish equivalent of the NPPF). England would benefit from a similarly joined-up approach, and should take full account of the spatial implications of key Government policies, especially its plans for devolution and the Northern Powerhouse. We will also soon be launching our Place-making and Land Value paper which looks at the drivers of value in residential developments, which we are happy to discuss in greater depth in due course.
5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

There is no ‘one size fits all’ answer to this – the appropriate time horizon for policy-making depends on the particular policy and circumstances in questions. Broadly speaking, the UK would benefit from a more long-term approach which transcends short-term constraints such as the electoral cycle. This is of particular importance in areas such as infrastructure, where lead-times are long, the economic benefits widely dispersed and long-term, and the costs immediate and easily assigned to individual interest groups.

Whatever time-horizon is decided upon, policy should be agile, flexible and responsive to changes in market conditions.

**Buildings and places: New and old**

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

The RICS recently launched its Residential Policy Paper, which includes a raft of recommendations for improving housing supply and tackling the UK’s housing crisis. In particular, we have called for measures to increase the availability of land for building; changes to the planning system such as the enforcement of local plans and the extension of Housing Zones; developing improved delivery models through increasing the availability of finance for SME builders, the recognition of Community Land Trusts (CLTs), and the creation of Development Delivery Units (DDUs); and creating incentives for older homeowners to ‘right-size’ and unlock supply at the top end of the market.

Ultimately, the UK’s housing supply crisis will only be addressed through a coherent and coordinated strategy for building across the tenures. At times Ministers have been resistant
to the idea of a national strategy for housing supply, and whilst we agree that strategy alone will not meet our needs, we do stress that it is necessary for central Government to provide an overarching plan and strategic direction.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

Sustainability is crucial, and the Government must set clear minimum standards in the areas of design, promote innovative construction techniques, and ensure energy efficiency targets are met. Our Residential Policy Paper recommends that Government implements a series of measures to encourage the retrofit of existing properties. These include requiring local authorities to publish data on empty properties together with a measurable timetable for bringing empty stock back into use, using new City Deals to promote large-scale renovation projects (particularly in areas such as the Midlands and the North where demand is low), and tax incentives to encourage the repair and maintenance of existing properties.

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more use be made of these national assets?

A key feature of our built environment is the extent to which it represents our national heritage, and policymakers need to take full account of this. Policies should ensure that our historic assets are preserved, maintained and enhanced, making the best use of their economic and social potential. The historic environment not only provides financial benefits for the UK, it also has a positive impact on quality of life. It must be a key part of a holistic approach to policy in the built environment.

Skills and design

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environments in their areas?

The built environment professions as a whole do have an appreciation of the breadth of issues involved in this area and the range of skills and viewpoints required to deliver a coherent strategy, and this appreciation exists even where particular skill sets are focused on a particular niche area. The RICS especially has a unique perspective on the built environment, given the scope and breadth of surveying as a profession.
We have identified several measures the Government could take to address those areas where skills are in short supply, including the introduction of a Construction Skills Investment Charter to encourage more young people to enter the sector. In addition, there may be scope for the professions to collaborate more closely to align the various routes into the professions, including training programmes, university degrees and apprenticeship schemes.

There are significant gaps in the skills available to local authorities. In particular, we have identified a lack of resource in local planning departments as a serious barrier to effective planning policy. Our Planning Resource Thought Leadership Paper made a number of recommendations to address this problem, including ‘flying squad’ planning teams that can be deployed across local authority boundaries, and better deployment of personnel on strategically important projects.

10. Are we using the right tools and techniques to promote high-quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

Our members have raised the concern that the market tends towards the lowest common denominator on design and place-making in the absence of any incentive to do otherwise. Government should provide clear guidelines and where necessary, enforce standards to ensure the quality and effectiveness of design.

Community involvement and community impact

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

Partly as a result of the lack of a coordinated policy for the built environment, there is not at present sufficient data to assess the health and social impacts of the built environment on the general population. A more joined-up approach would help to address this – in particular the Department of Health should be involved more closely in decision making to improve the effects of policies for the built environment on other areas of public policy.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment within which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed? Communities could be better involved through the promotion of neighbourhood plans as a component of local plans. Alternative Dispute Resolution (ADR) is another area that can be utilized to greater effect – the RICS has a sophisticated dispute resolution service that is an effective way of resolving conflicts without recourse to the courts.
Financial measures

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

The question of how fiscal policy can be designed to increase housing and land supply and improve design is vital, and merits a fuller response than can be given here. However, the RICS has called for the issuance of Property Tax Forward Guidance for the market, to give clarity and certainty to investors and stakeholders. This would remove uncertainty and allow longer-term, strategic decisions to be made. We have also recommended financial incentives to improve the use of existing housing stock, such as a 5% VAT rate on repairs and improvements.

Conclusion

RICS welcomes this consultation, and we are keen to work with the committee on an ongoing basis to develop an effective national policy for the built environment. The key theme of all our recommendations is coherence. All aspects of the built environment must be considered as part of a whole, they cannot be looked at in isolation. Policymakers need to understand the interconnectedness of the built environment, and fully appreciate the broader economic, social, and environmental impacts of their decisions. Only then can we develop a truly holistic approach that meets all of the UK’s needs.

Transcript to be found under Royal Institute of British Architects
SUMMARY

1. The RSPB’s interest in national policy for the built environment primarily relates to the way in which national policy can help to:
   - Halt and reverse the ongoing decline in biodiversity;
   - Enhance people’s health and wellbeing through access to wildlife-rich greenspace.

2. Nature is in trouble. The recent State of Nature report has highlighted that 60% of the species monitored in the UK over the last 50 years are in decline, with 31% declining strongly. The built environment has been a contributing factor to this decline.

3. At the same time, we are experiencing a national health crisis, with increasing levels of physical inactivity, obesity and mental health problems, which are costing the UK economy billions of pounds every year.

4. Whilst the way in which we plan, build and manage the built environment can have adverse effects on people and nature, it also has a key role to play in overcoming these problems and in providing positive benefits. In responding to the Select Committee’s Call for Evidence (focussing on Questions 7 and 11), we make a number of recommendations on how these positive benefits can be achieved.

5. With regards to Question 7, the Government’s manifesto commitment to ‘develop a 25 year plan to restore the UK’s biodiversity’, provides a key opportunity to ensure that we plan, build and manage the built environment so that it is more sustainable and resilient. In particular, we recommend that the 25 year plan should put in place specific measures to: (a) protect existing nature conservation assets; and (b) restore and enhance biodiversity. These are outlined in paragraph 14, below. We also make recommendations on the forthcoming Housing Bill and the proposed streamlining of Local Plans.

6. With regards to Question 11, the Government’s manifesto commitment for an ambitious programme of Pocket Parks, provides a key opportunity to address mental and physical health issues by increasing the extent, accessibility and quality of wildlife-rich greenspace in the built environment. In particular, we recommend that the Government takes account of Natural England’s Accessible Natural Greenspace Standard (ANGSt) when considering the location, size and quality of these Pocket Parks. In addition, we recommend that the Government develops a more coordinated approach between funding streams and initiatives for health, the environment and the economy.
QUESTION 7: How do we build built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing building and places be able to adapt to the changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

7. From the RSPB's perspective, the key issue to be addressed under Question 7 is to ensure that the built environment is planned, built and managed in harmony with nature, for the benefit of both people and wildlife. [N.B. The response to question 7 focuses primarily on wildlife - the link between a wildlife-rich built environment and people’s health and well-being is covered in more detail in response to Question 11].

8. Nature is in trouble. The State of Nature report, produced by the RSPB and 24 other UK nature conservation and research organisations, has highlighted that 60% of the species monitored in the UK over the last 50 years are in decline, with 31% declining strongly. This decline is particularly severe for some of the species associated with the built environment, such as the:

- House sparrow – declined by two-thirds, from approximately 30 million in the 1960s to approximately 10 million.
- Hedgehog – declined from approximately 30 million in the 1960s to less than 1 million (in other words the hedgehog population has declined by more than 1 hedgehog every minute over the last 50 years, on average).

9. Much of this decline, especially for those species associated with the built environment, is due to the way in which we plan, build and manage the built environment, including: destruction and fragmentation of habitat; loss of green spaces; changes to buildings (e.g. loss of nest and roost sites for building-dependent birds); and water and air pollution.

10. Whilst the way in which we plan, build and manage the built environment can have adverse effects on people and nature, it also has a key role to play in overcoming these problems and in providing positive benefits for people and nature. The range of environmental, social and economic benefits that can be provided by addressing these issues in an integrated way are detailed in key publications such as the UK National Ecosystem Assessment (NEA) and the reports of the Natural Capital Committee.

11. Recognising these potential benefits, the RSPB has joined forces with one of the UK’s largest home-builders – Barratt Developments – to set a new benchmark for wildlife-friendly housing developments. This is the first national agreement of its kind in the UK and the flagship project will be a 2,450-home development in Kingsbrook, Aylesbury Vale that will also include new schools and community facilities. 50% of the Kingsbrook development will be green infrastructure, including 250 acres of wildlife-rich open space as well as orchards, hedgehog highways, newt ponds, tree-lined avenues, nesting boxes and nectar-rich planting for bees and other pollinators.

12. The RSPB’s aspiration is that the Kingsbrook development will set a high standard for wildlife-friendly housing that can be affordably reached for other housing
developments in the future, such that wildlife-friendly housing developments become standard practice.

13. The Government has a key role to play in helping to address these issues. Whilst it already has a variety of legislation, policies and strategies in place that seek to halt and reverse the decline in nature, in many cases these are either insufficient or not being delivered effectively or being weakened by current Government proposals. For example, the National Planning Policy Framework (NPPF) encourages local planning authorities to:

- Plan positively for the creation, protection, enhancement and management of coherent ecological networks.
- Plan for biodiversity at a landscape-scale across local authority boundaries.
- Identify and map components of local ecological networks.

However, the report, Nature Positive Local Plans, recently published by the RSPB and the Wildlife Trusts, found that:

- Less than one-third of Core Strategies (that have been adopted since the publication of the NPPF) present a clear strategic approach to planning for biodiversity.
- Only 20% of Core Strategies identify cross-boundary biodiversity matters that might need to be addressed in cooperation with other local planning authorities.
- Less than 20% of Core Strategies have spatially expressed habitat restoration priorities.

14. The Government’s manifesto commitment to ‘develop a 25 year plan to restore the UK’s biodiversity’, provides a key opportunity to ensure that we plan, build and manage the built environment in harmony with nature, so that it is more sustainable and resilient. To deliver this aspiration, we recommend that 25 year plan should put in place measures to address the following issues:

(a) Protect existing nature conservation assets, including the hierarchy of designated sites and priority habitats and species, in particular:

(i) Sites and species of international importance:

- Oppose any changes to the Nature Directives under the European Commission “Fitness Check”; making changes to the Directives would undermine decades of progress and cause unnecessary uncertainty for developers.
- Fully implement the Nature Directives and make this a key milestone in the Government’s forthcoming 25 year plan for biodiversity.
- Conduct a review of the extent to which the measures outlined in the 2012 Habitats and Wild Birds Directives Implementation Review have been adequately implemented.
o Continue to support the ongoing work of the Defra Great-crested newt Task Force which is working to deliver better solutions for both developers and this protected species.

(ii) Sites of national importance:

o Ensure that housing developments (and other built environment developments) do not have an adverse effect on Sites of Special Scientific Interest (SSSIs). In particular, we recommend that the Government should reject the proposed housing development at Lodge Hill, in Kent, which would destroy the majority of the Chattenden Woods and Lodge Hill SSSI, as it is inconsistent with the NPPF and the Government’s very strong presumption against developing SSSIs. Similarly, the Government should reject the Rampisham Down Solar Park, in Dorset, which would damage the Rampisham Down SSSI.

(b) Restore and enhance biodiversity, in particular:

(i) Identify and create a national ecological network, built at the local level, which incorporates ecological networks in the built environment. Robust implementation of the biodiversity policies of the NPPF by local planning authorities will play a key role in delivering this aspiration. In implementing these policies, every local planning authority should be required to set out a coherent strategic and spatial vision for the protection and restoration of biodiversity. Ensure that all local planning authorities have access to good ecological expertise and up-to-date ecological information to enable them to plan and manage nature-positive development and infrastructure.

(ii) Promote the production - and use - of relevant standards and guidance for biodiversity in the built environment, such as British Standard (BS) 42020 (Biodiversity: Code of Practice for planning and development).

15. The forthcoming Housing Bill will provide another key opportunity to ensure that we plan, build and manage the built environment in harmony with nature. In particular, we recommend that the Government should exclude brownfield land with nature conservation designations - and other nature conservation assets - from the proposed statutory brownfield land register. If any brownfield land with such designations or assets is included on the register, ‘permission in principle’ should not be granted for such sites.

16. Finally, we recommend that the Government’s proposals to streamline the Local Plan process, currently being addressed by the Local Plan Expert Group, should specifically acknowledge the benefits of early engagement with nature conservation NGOs, Natural England, etc. Such early engagement has been proven to help speed-up the Local Plan process by identifying and filtering, at an early stage, the key environmental / nature conservation issues on which the planning authority should focus its resources. It can also help to ensure that Local Plans are not withdrawn on the basis of
environmental issues, such as the Habitat Regulations Assessment, not being addressed in a satisfactory manner.

**QUESTION 11:** Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

17. From the RSPB’s perspective, the main issue to be addressed in Question 11 is to enhance people’s health and wellbeing by providing easy access to wildlife-rich greenspace, close to home. At present, sufficient account is not taken of this issue. Not only do existing approaches fail to exploit the opportunities that exist for enhancing people’s health and well-being through greater contact with nature, in some cases they undermine people’s long-run health and well-being by failing to account for the underpinning role played by critical ‘natural capital’ assets.

18. The UK is experiencing increasing levels of physical inactivity, obesity and mental health problems, with these health issues being skewed towards poorer sections of society. For example:

- Physical inactivity affects 60–70% of the adult population, costing the economy £20 billion per year, including direct treatment costs and work days lost through sickness.
- In the UK, 67% of adult men, 57% of adult women and 28% of children are overweight or obese.
- At least one in four people will experience a mental health problem at some point in their lives.

19. Yet there is considerable evidence to show that contact with nature can help to prevent and reverse poor health and wellbeing. For example:

- Proximity of green space to the home is associated with higher levels of physical activity and improving access to green space can encourage people to be more active.
- In general, individuals with easy access to nature are three times more likely to participate in physical activity and 40% less likely to become overweight or obese.

20. Crucially, greenspace quality, including its richness in wildlife, may be more important to mental health benefits than its quantity. People living near high-quality, wildlife-rich greenspace are twice as likely to report low psychological distress as those living near low quality open spaces.

21. Providing access to wildlife-rich greenspace, close to home, is therefore a crucial strand in addressing the UK’s health crisis. Initiatives such as the Kingsbrook housing development, where the RSPB is working in partnership with Barratt Developments (see
paragraphs 11 and 12 above), are showing how nature can be put at the heart of such developments, for the benefit of both people and wildlife.

22. However, relying on voluntary action by developers is highly unlikely to be enough on its own to deliver the scale of change required. In many areas, there isn’t sufficient provision of wildlife-rich greenspace. For example, in Hertfordshire, only 36% of households have access to an accessible natural green space of at least two hectares (ha) within 300 m of their home - the minimum level of provision recommended in Natural England’s Accessible Natural Greenspace Standard (ANGSt). If this situation is to be rectified, the housing sector will need regulatory, or financial, incentives to encourage the provision of wildlife-rich greenspace.

23. The Government’s manifesto commitment for ‘an ambitious programme of Pocket Parks’ provides a key opportunity to address mental and physical health issues by increasing the extent, accessibility and quality of wildlife-rich greenspace in the built environment. In particular, we recommend that the Government takes account of Natural England’s Accessible Natural Greenspace Standard (ANGSt) when considering the location, size and quality of these Pocket Parks.

24. In addition, we recommend that the Government develops a more co-ordinated approach between funding streams and initiatives for health, the environment and the economy, for example, by:

(a) Incorporating access to wildlife-rich greenspace as a key component of initiatives such as NHS England’s Healthy New Towns initiative.

(b) Developing closer links between Health and Wellbeing Boards, Local Nature Partnerships and Local Enterprise Partnerships.

(c) Targeting deprived areas with poorer-quality environments and increased levels of physical inactivity, obesity and mental health problems.

(d) Providing funding for further research into the connection between mental and physical health and the (wildlife-rich) built environment.

15 October 2015
House of Lords Select Committee on National Policy for the Built Environment, Response to Consultation.

1. The Royal Town Planning Institute (RTPI) is the largest professional institute for planners in Europe, representing some 23,000 spatial planners. The Institute seeks to advance the science and art of spatial planning for the benefit of the public. As well as promoting spatial planning, the RTPI develops and shapes policy affecting the built environment, works to raise professional standards and supports members through continuous education, training and development. In preparation for our response we have drawn on the experience of some of our most highly experienced and senior practitioners in planning and the built environment, representing the public and private sector and distributed around the country (England). Please see our response to the questions posed by the call for evidence:

Q1) Levels of Decision Making

2. Local Authorities should remain the main administrative level on which planning is done. However, there are many parts of the country where there is a severe lack of strategic coordination at city-region or county level. We have put forward proposals for how this might be done. There should be closer link between local authorities exhibiting cooperation and government’s spending plans.

3. The key to success of effective strategic and local plan making and day-to-day decision making rests with authorities’ ability to be properly staffed with professionally chartered planners, who are able to provide elected members with sound, well-rounded advice to balance the needs of the community with wider strategic needs such as housing and infrastructure delivery.

Q2) Coordination of Built Environment Policy

4. We are very concerned that different government departments pull in different directions. Given the high degree of centralisation in England, coupled with a corresponding high degree of delegation or even privatisation of functions to autonomous bodies, this is a matter of even greater concern that it might otherwise be. How does this play out in practice?

5. An example of the tensions created is the lack of coordination between the Department for Health and the Department for Communities when it comes to ensuring that health and housing are planned together, and that new homes do not cause an adverse impact on health provision.

---

454 Strategic Planning 2015, Effective Cooperation for Planning Across Boundaries, RTPI, January 2015
6. Councils are being urged by the Department for Communities to make provision for more homes. However from a strictly health perspective this may not necessarily be good news. The practical outworking of Department of Health guidelines is that any new health premises and the staff to run them (at first) should be financed by landowners accepting lower prices for land, and effectively deeding the balance to finance health care. However the development industry does not necessarily work in such a theoretically elegant fashion: prices for land cannot be retrospectively changed once deals have been made. And there are many calls apart from health services on the potential uplift in land values that occurs if planning permission is granted.

7. Another difficult area is the tension between economic development objectives and others. Under direction from the Business Department, Local Enterprise Partnerships have produced Strategic Economic Plans. In some cases the level of job growth proposed in SEPs is not compatible with the level of housing growth proposed by the constituent local planning authorities under the tutelage of the Department for Communities. Nevertheless SEPs have been accepted under these circumstances and even grants for investment in economic development have been made. Not only does this cause considerable dissension between interest groups within LEP areas, but can in the worst cases lead to poaching of labour from adjoining LEP areas, which means more unsustainable commuting and a threat to the economic development aims of adjoining areas.

Q3) Sufficiency of the NPPF

8. The NPPF does not generally make choices between the various priorities it recognises. There are advantages to this approach given the variety of circumstances within such a large country as England. More direction could be regarded as trespassing on local discretion. However lawyers can observe in appeal decisions that there are general trends in priorities which can vary even within a single year. Arguably if government is going to prioritise elements of the NPPF this should be easily readable and not require careful scrutiny of cases.

9. A critical exception to the neutrality of the NPPF is the priority placed on the preferences of landowners in paragraph 173. Arguably if a landowner holds a piece of land which is critical to the sustainable expansion of a town, it is a form of ransom behaviour to withhold land from development in the hope of a better deal in the future. Given the general neutrality of the NPPF in making choices between priorities, this is surprising.

Q4) Spatial Perspective

10. There are certain elements of national planning policy which are spatial, such as the small number of site specific Nationally-Significant Infrastructure Projects in National Policy Statements. But there are arguably fewer of these than was envisaged when the Planning Act 2008 was enacted to speed up decision making.

---

11. The RTPI commissioned a study\textsuperscript{456} in 2012 which on the other hand found 95 different policies in government departments which have a spatial dimension – either explicit or implicit. We are concerned that this complexity makes it difficult to gauge the impact of government’s collective policy on places. In an era of ever more open data, we believe the public should be able to see such impacts, and propose there should be a website called Map for England where all these interactions can be appreciated.

12. Therefore a spatial element for national policy would be useful if it extended to all relevant national policy. There would little point if only one government department was involved.

Q5) Timescale for planning for the Built Environment

13. Investment decisions are costly and long lasting. We consider there may be a downside to the current emphasis on the short term. For example we think consideration should be given to a 20 year housing supply rather than a 5 year one. We have commissioned a study of all the major planning permissions in a dozen city regions in England to assess both whether they are in sustainable locations and whether the scale of projects is sufficient to support infrastructure. We will be able to come to conclusions on the possible impact of the emphasis on 5 years only at the beginning of 2016.

Q6) Addressing Housing Supply

14. The problem of the price of housing (either to rent or buy) has a large number of causes of which planning is but one. Over the long term there is a need to increase housing supply and to increase the number of units permitted each year, but this will only make a difference if coordinated, as the inquiry suggests, across government. The Productivity Plan of July 2015 is not encouraging in indicating the necessary support from the key departments of Health and Education Environment and Energy to ensure infrastructure provision in proper lock step with housing growth. One key aspect of public objection to housing is the impact it places on public services (see question 2).

15. The RTPI has researched the issue\textsuperscript{457} of how to get large housing sites completed and has made a list of 15 recommendations, not all addressed to government, which would help. As regards the government ones, it is critical that when public sector land is sold, this is not done to the person prepared to pay the highest price. What matters is whether broader outcomes are achieved. It would be quite possible to undertake a competitive sale in which purchasers were judged on price once they had all committed to a common series of obligations around affordable housing and infrastructure provision.

16. The Productivity Plan’s aim to reduce planning risks to development does seem a worthwhile area to pursue. In the early days of the post 1947 planning system councils

\textsuperscript{456} RTPI Map For England 2012
\textsuperscript{457} Delivering Large Scale Housing, RTPI, September 2013
would grant permissions to themselves for redevelopment of land and this could assist with bringing difficult sites forward.

Q7) Creating Sustainable and Resilient Environments

17. Sustainable and resilient environments are the result of well-planned places.

18. The findings of the “Location of Development” work we have commissioned should help identify that places which are well located in terms of access to housing, jobs and transport bear all the hallmarks of sustainable and resilient places and we will be happy to our findings with the select committee once complete.

19. Buildings should be constructed to high standards, they need to be designed with people in mind and there should be a symbiotic relationship between the built and natural environment. Government needs to support planning departments’ abilities to engage in effective and visionary place-making in the public interest and positively incentivise them to do so.

20. Local plan policies can encourage improvements to sustainability and resilience of new developments. However, where requests to improve developments (e.g. better materials) are criticised for making them unviable, the challenge for planners has become even more significant as decisions must now ensure proposals provide competitive returns for landowners. The deregulation bill, which will prevent local plans from having technical standards for housing and withdraws the code for sustainable homes, is arguably a step away from achieving this aim. On the other hand, examples of government-backed changes in legislation, such as amendments to permitted development rights for renewables and micro-generation and legislation on Sustainable Urban Drainage Systems (SUDS) have been effective tools in achieving environmental resilience. Similarly, legislation on heritage (such as Conservation and Listed Buildings Act) have always been powerful tools to help facilitate imaginative ways of bringing old buildings back in to use.

21. We have welcomed proposals to improve CPO powers but believe more should be done to allow local authorities to be able to intervene on empty homes to secure re-use.

Q8) Historic Environment

22. Many settlements with a historic environment already make full use of that environment and it can be at the very heart of future planning, regeneration and place-making. In places such as York, Durham and Chester (and very many lesser sized settlements), the historic environment is seen as a key economic asset (often of international value) that creates considerable social benefit for local communities and provides a means of retaining the continuity of heritage. “Liverpool One” is another good example of how new major developments have been woven into the historic
fabric. There are many lessons and much good practice that can be drawn from existing examples and applied elsewhere, to prevent the further loss of historic environments and promote successful heritage-based regeneration. On a small scale, the heritage railways across England provide a good example, with the Worth Valley Railway in West Yorkshire and the North Yorkshire Moors Railway between Pickering and Whitby providing excellent case examples.

23. Since every place has ‘history’ of some kind or other (Whitehaven is a good example) there remains considerable scope for making more of such assets. They are part of what makes us who we are. Strong and resilient planning policies for the historic environment remain a key ingredient for success (especially blending historic and modern buildings; providing historic character assessments), as do a successful combination of public, private and voluntary sector resources to kick-start initiatives. English Heritage are important for monitoring and evaluating the historic environment and strong Government support for them must be retained, even in face of often short-sighted austerity measures by the Government.

Q9) Skills of built environment professionals

24. Chartered Town Planners, accredited by the RTPI are trained to consider the built environment in a holistic manner. They must complete post graduate training and demonstrate a wide range of skills and competencies over a two year period, measured through an assessment of professional competence. They are also required to undertake continued professional development in order to remain accredited. The RTPI are constantly reviewing professional competencies required of planners and have identified the following priorities for 2015-2016;

25. Understanding and practicing in a market economy; Health and inclusive planning; Delivering housing to meet national needs; Understanding land as a resource (demand for energy); Communication, mediation and negotiation skills; Effective decision making, Management and business skills and Ethics.

26. We are working to help address a shortage of planners in the profession, recently offering 50 bursaries for students to undertake postgraduate planning courses, funded by the RTPI and sponsored through partnership organisations. We have also introduced an apprenticeship scheme for school leavers in partnership with a number of planning consultancies and local authorities.

Q10) Tools to promote Place Making

27. We need to recognise the economic value of good design and place making. Techniques and tools such as Design Review provide valuable tools in promoting high quality design and so there should be continued support for the Design Council to carry on supporting these activities. Continued training facilitated by the RTPI and others on matters of design continue to provide professionals with necessary tools. Opportunities for
knowledge transfer also exist within the professions, such as the RTPI’s Urban Design Network. Inter-professional and non professional groups such as the “place alliance” do well to promote the message that people want to live in great places.

Q11) Consideration of all those who use the built environment.

28. Decision-makers are increasingly taking account the effects of the built environment has on the community at large. To a large extent this has been a result from the statutory duty to publicise plans and proposals and to engage in public consultation. Developers should always consult with local communities on the design content of major schemes, even before the submission of a planning application.

29. The value of neighbourhood plans is that they encourage and stimulate debate in the community about the quality of the built environment and highlight those features which are most valued.

30. The sharing of best practice in areas like inclusive planning is a good way to improve consideration of the impacts of the built environment on the mental and physical health of users. We have signed up to an Inclusive Environments Action Plan together with the Construction Industry Council, one of the outcomes should be Design Council led learning tools for practitioners.

Q12) Community Engagement

31. There are statutory requirements which ensure communities are consulted during the planning decision making process and the plan making process. However, our research papers have recognised that more can and should be done in order that planning is truly inclusive but also to enable development. Consultation by developers and authorities with a wider community bases as early as possible are an example\(^{458}\).

32. Neighbourhood plans can provide a more systematic way of achieving engagement in localities particularly where they conclude with a list of priority projects and a live delivery programme. This can hold the local authority to account and may support more community projects and action to deliver some of these requirements. However the challenge remains for those areas that do not have the time or energy to devote to more than surviving and here there may need to be encouragement and support for these processes. Guidance that the RTPI and Planning Aid England have produced is one way\(^{459}\). But this will take more resources and will than many local authorities have at present but nevertheless planners and planning can give a lead on these issues. There is also a need to reinvigorate and revive those planners in local authorities. We need to improve their confidence and allow them some space to use their skills in working with communities.

Q13 Financial measures to address housing and land supply

33. The price of housing is a function both of limited supply and inflated demand. Demand is driven by:

- Lending against high multiples of two incomes
- Property (council) tax falling lightly on expensive homes
- No taxation of sale of family home
- No taxation of imputed rent of family home
- Shortage of pension saving options people feel safe about
- Shortage of good long term rental options for housing

34. Action could be taken in parallel with land based measures to work more effectively long term to lower real prices.

06 October 2015
Key messages for policy and practice

The forthcoming (23/11/15) RTPI-University of Liverpool research report detailing three case studies from Hamburg, Lille and Nijmegen shows how public investment in planning can be used to stimulate development in the private sector. Planning tools that increase the quality of places, such as coordinated transport infrastructure investment, or land assembly tools have the effect of increasing demand for land in those locations. Where planning is used to coordinate the development of this land, development can be forthcoming at high levels of quantity and quality.

Planning can coordinate action in situations where cooperative working between multiple stakeholders is necessary to catalyse development or meet social and economic objectives. The ‘first mover problem’, when planning intervenes to reduce risk or ensure fair share of rewards, is a prime example of the role planning can play to encourage development into being and facilitate the subsequent entry of private sector investments. For example, if there is excessive demand for housing in a location but land is held by multiple owners, it is unlikely that an uncoordinated approach would be able to deliver the desired quantity or quality of development. Here, planning can provide the solution by using tools such as pooling of property rights that enable the development of plans that can allow supply to meet demand.

The assembly of coalitions is often an essential precondition to effectively marshal the development process. The durability of such coalitions is dependent upon the belief of coalition members that they have more to gain as part of the coalition than by acting alone, a notion known as ‘superadditivity’. This might occur through the translation of shared interests into a formal agreement and a strategic vision that balances ambition with systematic inclusion. Moreover, this concept can be extended to include forms of intra-metropolitan cooperation where development may otherwise be disrupted by the presence of formal administrative boundaries.

A behavioural shift towards a model that sees planning act as a ‘market maker’ for the private development industry does not imply a shift in the ethical goals of planning in favour of economic objectives. What we see from the case studies is that planning interventions that boost demand and value go hand in hand with those that make great quality places for people, such as good public and active transport provision, the supply of green space, and high quality design. That is, they are the kind of interventions which also facilitate the achievement of social and environmental goals.

However, only planning which is well resourced and culturally supported can deliver these kind of positive development outcomes. All too often in the UK we leave development outcomes in the built environment to chance, passing up the opportunity to plan proactively
and thus being left with lower quantity and quality in output than might otherwise be the case.

**The ‘Value of Planning’**

The UK Government has key economic priorities to boost national productivity and ensure that economic growth is sustainable and the RTPI believes that planning in the UK is an underused tool that can help achieve these goals.

For example, we know that many of the outcomes produced by good planning are essential for a strongly performing economy. We know that good transport connectivity between homes and jobs provides greater economic opportunity and supply in the labour market. We know that places which induce healthy lifestyles can produce more productive labour forces. We know that developing inclusive places, safe places, and cohesive places, can all reduce the need for Government expenditure on services like health and social care and crime prevention and security, whilst increasing consumption opportunities.

Greater investment in the kind of proactive planning, that is rarely seen in the UK but much more frequent in continental Western Europe, can play a leading role in delivering the kinds of places that can improve local economic outcomes.

**Empowered planning**

In the case study cities planning has been empowered and is provided with legislative, cultural and financial support and we see startling results in terms of development quality, laying the foundations for sustainable, positive economic outcomes. A culture within which planning is charged with engaging with the market provides responses to inconsistencies and market failures with which a more passive, regulatory model of planning would be ill-equipped to deal.

**Coordinated planning**

The Nijmegen case study illustrates how planning might be used to lead and coordinate development through the use of specific mechanisms that guide and stimulate the market. ‘Land-readjustment’, a term used in the Netherlands to refer to a specific form of planning whereby land rights are temporarily pooled to deliver infrastructure or collective area-benefits, delivers individual benefits to private land-owners that would significantly outweigh any garnered from acting in isolation. In this model, risk is reduced for the public sector without the need to engage in resource intensive compulsory-purchase procedures, and the very processes involved in bringing private land-owners into cooperation often creates healthy coalitions which are able to share knowledge and ensure that the development closely reflects the interests of the stakeholders.

**Leading with planning**
In Hamburg, a strong guiding role for a planning institution points to ways in which large scale developments can be used to channel private sector innovation and delivery capabilities to achieve higher overall development quality. As a result of the Lander (regional State) and the city developing a strong planning institution that was able to undertake upfront land assembly and infrastructure provision, planning was able to shape the form and structure of development in the area, encouraging a density and quality commensurate with the economic aspirations of the region.

Planning coalitions

The Lille case study shows how planning institutions can be empowered to employ strategic foresight and cooperative incentives to overcome institutional deficiencies which might otherwise prevent coordinated development across jurisdictions. Coalition building, whereby neighbouring authorities pool resources in order to share the products of investment that would be greater than they could achieve in isolation, is crucial for the successful results in the region. Strong planning institutions and tools, devolved funding, and local leadership that encourages strategic spatial planning is central to the delivery and maintenance of this model.

Achieving better outcomes

The report argues that the outcomes of such approaches to animating urban development can produce better quality, more sustainable built environments. Much recent research that explores the relationship between planning and the wider economy has used a neoclassical framework to investigate the costs of the activity. Using this approach an analysis of planning has emerged that points to the constraints that this form of statutory intervention places on ‘development’ (widely construed) and, correspondingly, economic growth. The currency of this academic argument has in turn had a significant bearing on political debate. In this respect planning is now routinely perceived as an overbearing, regulatory state function the principal effect of which is to supress our economic performance and contribute to the major social dilemma of the day – our collective inability to provide sufficient housing at accessible prices.

This is a false understanding of both what planning can achieve and how land and property markets actually function.

The report illustrates that in reality, only strong planning institutions, where planning professionals are well resourced, empowered, and culturally and societally supported, can routinely deliver positive outcomes for places. Taking a wider international perspective points to the possibility that the kind of outcomes that will enhance economic performance through the creation of great places will require more planning, and proactive planning in particular, not less.

Policy Implications
Supporting locally devised approaches and devolved decision making

Devolved decision making allows contextually specific planning problems and their solutions to be devised locally. Those currently involved in pursuing and delivering greater devolution settlements in the metropolitan regions of England should focus on how they can use planning most efficiently to deliver better built environment outcomes. Sharing best practice via digital forums could aid policy transfer within and between regions and nations of the UK, as well as those in Europe, would be essential to the stimulation of professional exchange and supporting locally-attuned responses to planning issues.

Since the General Election of 2015 and the Scottish Independence Referendum, the process of devolution of greater political powers to the various regions and nations of the UK has begun. One of the core functions that a new polity of British city-regions would have is greater control over its ability to be more creative and strategic with pooled resources for urban planning. Ensuring continuity across and between territories with differing jurisdictional authority will be essential if built environment development is not to be disrupted and piecemeal. Ongoing research on the effects of this potentially variegated approach to the scales at which planning power is vested is essential.

A re-consideration of the use of development agencies

Development agencies provide the chance to integrate public and private interests, especially in the case of large-scale or stalled developments. Research presented in the report identifies the common role development agencies may play in kick-starting and managing development. The Town and Country Planning Association’s urging of a reappraisal of the New Towns Act to create development corporations (TCPA, 2015), as well as the Labour Party’s Lyons Review (Lyons, 2015) arrive at similar conclusions to those of the current government as to the potential value of incorporated bodies to lead the development process. The findings of this report similarly point to the ways in which the UK’s nearest continental neighbours have used development corporations/agencies to guarantee consistency of focus in strategically important developments.

Moving from instrumentalism to strategic planning in area development

While strategic planning has appeared and reappeared on numerous occasions over the course of the post-war era, the form it has taken in the UK has tended to focus on the broad spatial pattern of development (for example across a region) rather than taking a strategic view of the form taken by specific developments. The strategic dimension in area development is constituted by such factors as the use value of the built environment, the resilience of development to shocks (economic or otherwise) and the role of architecture and urban design in raising living standards. Encouraging a behavioural shift, such as that which is currently occurring in aspects of the case study research presented in the report,
from goal-specific regulation to strategic intervention, could potentially contribute to addressing these aims.

**Further research on the implications of local government reform**

The aggregate of reforms affecting local government across the UK are likely to have profound behavioural effects, not least the creation of more autonomous and entrepreneurial local authorities in some cases covering city-regional territories much greater in size than the inherited boundary settlement. The research presented in this report points to the dilemmas these increased powers and spheres of influence create. The degree to which the changing landscape of local government in the UK prompts a corresponding change in focus in how development is animated should be a focus for further research.

*19 November 2015*
Royal Town Planning Institute and Planning Officers Society – Oral Evidence (QQ132-145)

Transcript to be found under Planning Officers Society
Rushden Town Council would like to make the following responses:

1. We feel that Neighbourhood Plans should be an important part of the decision making on built environment. Whilst this plans need to be consistent with overarching plans, they should carry considerable weight as they are derived views of the people who live and work in the said built environment. Localism embraces the opinions of the local residents and a good Neighbourhood Plan that has satisfied all the consultation processes will give a good indication of how residents wish to see their town or village develop.

   Obviously Town and Parish Councils need to work closely with their District and Borough Councils to ensure all parties understand the needs and requirements of residents. There needs to be a National Framework which gives a guide for any local plans that may be implemented.

2. Government departments need to adopt a holistic approach to matters such as housing, design, transport, heritage and sustainability. Consultation at a local level is very important and this should be carried out robustly to ensure local residents views are taken into consideration. National plans with no consideration for local views will only be harmful to the planning process.

3. With regard to supply of housing stock, this can only be considered in conjunction with adequate infrastructure to support it.

   Rushden has now been recognized as a growth town and we are happy to take further housing stock as long as we have the adequate infrastructure to support it. We wish to rebalance our employment opportunities and sports and leisure facilities as part of our growth. We consider a balanced housing mix, adequate infrastructure to include schools, medical facilities, leisure and sports facilities a sustainable transport network and increased employment opportunities is the only way to successfully increase housing supply.

   We would welcome a more positive approach to brown field site development for both industry and housing and in our immediate area a restriction on B8 warehouse
type development. This type of development does not create a good built environment to jobs ratio.

In conclusion we feel whilst there is a need for a national framework for planning greater consideration should now be given to local needs and consultation at a local level is vital to ensure residents needs and aspirations are met.

06 October 2015
Five radical ideas for a better planning system

1. Planning should be for well-being not just growth
2. Planning powers must be radically devolved
3. The benefits of planning regulation should be recognised
4. Land reform is essential, including local land ownership and land value capture
5. The democratic deficit in planning must be tackled.

Why radical change is needed
The planning system has changed significantly over the last five years. Regional planning has been abolished and emphasis thrown on the smallest ‘neighbourhood’ level. Policy guidance is produced via a single National Planning Policy Framework (NPPF), which falls short of a spatial plan for the country as a whole. The current system doesn’t connect regional and local planning, and planning tools favour market-led urban development.

There is growing criticism that the system lacks strategic direction and is not fit for purpose. Given the continued government drive for deregulation of the system, compounded by shrinking local authority budgets, now is the time to call for an improved approach to deliver a sustainable future.

The five radical ideas for change comprise a package that should be implemented as a whole. Together they can deliver better economic, social and environmental outcomes. This is illustrated by a topical policy issue in each case.

Five radical ideas for change

1. Planning should be for well-being and not just growth
Well-being should be the key principle of planning. Planning needs to rediscover its original purpose of delivering fairness and promoting collective well-being. It should delink from the narrow measure of GDP that gives no consideration to how rising income is shared out, where it came from, or consequent negative environmental impacts. It should not rely on a discredited ‘trickle-down’ theory or the assumption that all public goods can be funded from the profits of private-sector development.

What this means for Garden Cities:

- Location not determined solely by their contribution to economic activity or the ready availability of land through the market
- Location rather determined by a range of factors such as the potential for sustainable living
➤ providing a high quality local environment in areas of housing need as well as in areas of market demand
➤ not dominated by private sector housing developments but rather providing for all sections of the community in terms of housing and social needs
➤ through good design promoting low carbon lifestyles, sustainable water management and enhanced provision for biodiversity

2. Planning powers must be radically devolved
Ensuring a legitimate planning system is a pressing concern. Genuine decentralisation of planning powers as part of a wider reinvigoration of direct, participative and representative democracy is required. This will involve a move away from the ad-hoc deal-based system that characterises current central-local relationships in the direction of enduring and stable frameworks based upon the principle of subsidiarity.

The issues that affect the UK have a national, regional and local dimension and these all have to be reflected in the planning system. There is a pressing need to:

• set national frameworks for key issues such as a rebalanced economy, housing supply, national infrastructure and the response to climate change;
• recognise the democratic right of cities and regions to shape their future directions; and
• have regional and urban frameworks for strategic planning matters based on democratic decision-making.

What this means for Green belts:

➤ communities able to consider how land in their regions and localities should be used to accommodate urban growth and change
➤ the ability to allocate new land for protection from development if existing green belt is considered suitable for urban development.
➤ full and open debate on land development needs and aspirations and how open space provision could be met
➤ a shift in emphasis away from protecting green belt land from development at all costs towards allocating land to meet a range of important regional and urban needs

3. Planning should recognise the benefits of regulation
A good planning system should be proactive in delivering the right development and infrastructure in the right places, at the right time, and take a positive and engaging approach to producing a vision for the future. But planning also needs the power of regulation in order to be able to implement policies, prevent harm, control externalities, and maximise social and environmental benefit.

Regulation allows for the preservation of amenities and the protection of the environment. Through regulation, planning can help improve the quality of development. Deregulation is
currently preventing this. Specifically it is undermining the ability of local authorities to provide more affordable housing in high-pressure areas and to deliver proper strategic plans for town centres.

Planning regulation is not a barrier to economic growth as evidenced by the fact that in 2014, 88% of all planning applications were granted permission. Rather planning regulation as a system ensures that developers meet certain agreed standards and empowers planners to negotiate improvements to schemes for public benefit.

What this means for tackling the housing crisis:

- planners’ ability to influence the nature of new development seen as a positive intervention, rather than a ‘barrier to growth’
- local authorities able to ensure the provision of affordable housing in all new development
- regulation complementing a renewed programme of council house building, allowing local authorities to plan effectively to meet housing needs in their localities
- developers benefitting from increased transparency, simplicity and certainty in the planning system arising from clear regulatory policies

4. Land reform is essential, including local land ownership and land value capture

Since nationalisation of development rights in 1947, the financial benefits of development have become increasingly concentrated in the hands of private landowners, and there has been a gradual erosion of public planning, with many 'permitted development rights' returned to those same owners.

The ambitions of 1947 have been all but lost – a system of planning that was known and renowned around the world is now effectively broken. In order to change this situation, three things need to happen:

- there needs to be a reiteration of the collective ownership of development rights in the UK;
- more effective and consistent mechanisms should be introduced to capture and share the benefits of land value uplift; and
- land reform is needed to enable communities, where appropriate, to take direct
control of local land assets for the purpose of community development.

What this means for place making and associated transport infrastructure systems:

- mechanisms to create new opportunities for timely infrastructure investment and broader investment in place making
- greater control over land ownership at the local level and regional funds for public transport infrastructure generated through value capture
- greater potential for creating urban settlements that meet communities’ needs while respecting the environment
- greater possibility to plan new urban development locations and to encourage more sustainable patterns of travel as well as socially successful residential settlements
- local priorities, such as safe cycle routes or a broad range of community assets, being adequately resourced.

5. The planning system must be democratic

The planning system – through spatial planning at national, regional and local scales, regulation of development proposals and proactive proposals for new development – can only operate in the public interest if it is democratic.

Ensuring the full involvement of local communities, alongside inputs from key stakeholders, is essential. This must be complemented by transparent decision-making. This requires the following measures:

- planning department budgets, community grants and the education of planners should all reflect that engaging communities requires skills, time, commitment and resources;
- the tendency for neighbourhood planning only to benefit communities who already ‘have’ or ‘can’ results in inequality; engagement strategies which actively give a voice to marginalised communities and encourage a greater diversity of voices can help counter-balance this;
- conflicts between different local viewpoints are inevitable, but a democratic form of local planning will be equipped with ways of responding to these in the public interest;
- above all, the planning system has to convince local communities of their ability to deliver urban change for their collective benefit.

What this means for neighbourhood planning:

- local governments with access to a substantial and dedicated budget for supporting disadvantaged communities in preparing neighbourhood plans based on: strategic planning, infrastructure investment, land ownership powers and transparent
Summary: Key principles for making better planning decisions

- Planning should seek to deliver quality in our urban and rural environments in line with broad public goals; a system orientated to profit cannot deliver this.
- Planning should seek to develop strong city and regional economics, aim at a fairer society and facilitate the transition to an environmentally sustainable future through reductions in carbon emissions, adaptation to climate and waste-less use of natural resources.
- Planning should operate democratically through the participation of communities in full and open dialogue; the principle applies at all scales and to all stakeholders.
- The planning system should be fully equipped with the range of tools and resources needed to enable the effective implementation of agreed policies and plans.

The full document is available at [http://www.bartlett.ucl.ac.uk/planning/five-radical-ideas](http://www.bartlett.ucl.ac.uk/planning/five-radical-ideas)

The five radical ideas for a better planning system have been devised by members of the UCL Bartlett School of Planning in conversation with their colleagues and is the outcome of expertise and debate. It is our collective view that the future of the planning system is in need of urgent debate, conducted within and between political parties and across society as a whole.

SELECT COMMITTEE ON NATIONAL POLICY FOR THE BUILT ENVIRONMENT

I am a land use planner with over 40 years experience of working in public, private and voluntary sectors. I have also provided training to property lawyers in planning and taught planning at Oxford University Department of Continuing Education. I make regular contributions to the trade magazines and newspapers.

Introduction

Government will be aware that the planning system is extremely hierarchical; with powers delegated to LPAs but under supervision by the Communities Secretary/Inspectorate through the examination of development plans and conducting appeals against refusals of permission. Although those working with the planning system are generally hoping for a period during which there will be no significant (or even minor changes) for them to learn, understand, communicate and implement, the Communities Secretary does have extraordinary power to bring about positive change through what he says and how Inspectors are briefed. Many if not most changes are based on a misunderstanding of how the system could or should work and are often responsible for making things worse rather than better. Government then blames the 'system' for these failings and introduces further misjudged changes. Ministers seem incapable of taking or acting on a holistic or systemic view of the environment.

The recent successful challenge of West Berks and Reading BC to a written ministerial statement which was found to be incompatible with the existing statutory scheme should be taken as a lesson for Government (and its ministers) to be sparing with its interventions and ensure that changes are carried out through due process and are compatible with the system as formally established.

Questions

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

The most important consideration to be taken into account in our planning of town and country is the 2008 Climate Change Act and Carbon Budgets that are formulated by the National Climate Change Committee. It is essential that central government is seen to be adopting these budgets and providing advice to lower tiers of government that they must be adhered to and how. It is unacceptable that the Government appears to be retreating from the implementation of the well-established carbon reduction measures when even these were likely to prove inadequate without further innovation and development.
There does not appear to be any rationale behind the Government’s insistence that the appointment/election of mayors is a prerequisite of regional devolution. It is true that the structure of local government is a mess, primarily due to the motivation of saving money. If, however, a more logical system could be (re-) introduced, including regional planning authorities, as were dismantled in 2012, then devolution should not be much of a problem.

Given the obvious problems that are being caused by further development in what is already a very congested South East region, there is also a strong case for a National Spatial Plan. This should be drawn up primarily from the regions ‘up’ and not from central government ‘down’.

2. **How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?**

Since 2010 the coordination of ‘sustainable development’ has been an unmitigated disaster. Different offices of the Communities Department and different inspectors have been operating like a random number generator in terms of the Code for Sustainable Homes. This, and the Zero Carbon Homes 2016 target have been removed by written ministerial statements of dubious legal authority (post the West Berks/Reading Borough judgement). Local Planning Authorities must be working on development plans and making planning decisions so as to “contribute to the achievement of sustainable development”. It is unacceptable that they should be doing so without some coherent and consistent advice from the (new) Communities Secretary so that his offices, inspectors, LPAs, developers, neighbourhood planners, and the public know where they stand and can pull in the same direction.

The National Policy Statements are vague and obscure. The NPS on the national road infrastructure was/is incompatible with the 4th Carbon Budget, mainly in respect of the continued reliance on the growth of use of the private car. The interference by the Treasury in transport decisions (most obviously seen in the planning of new high-speed train services, and recently in regional improvements) results in a very incoherent strategy. Transport should be the primary job of the Communities Secretary as part of spatial planning.

In respect of housing, the most urgent need is to address the unsustainable levels of under occupancy which could be done through a written ministerial statement, entirely compatible with the existing statutory scheme. There is no place for central government in respect of design, except to encourage adaptability in terms of new dwellings and Lifetime Neighbourhoods, both intended to improve the social sustainability and resilience of residential areas.

Heritage is a matter that has been satisfactorily divided between local and central ‘government’ (eg English Heritage).
The latest unwarranted interference was that by the Treasury/Chancellor the Business Secretary (‘Fixing the Foundations’), with the Communities Secretary’s name not on the document.

3. **Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?**

The most important part of the NPPF is the “presumption in favour of sustainable development”. The previous administration demonstrated such a low-level of understanding of or interest in the principles of sustainable development that the presumption became meaningless and/or discredited. The Communities Select Committee has already investigated this matter and recommended that the definition be refined and made fit for purpose.

Whilst there or many advantages of the discretion available to decision-makers in the operation of the planning system founded under the 1947 Town & Country Planning Act, on matters as important as the presumption in the NPPF there should be some clear and effective guidance from the Communities Secretary. It should not be possible for one inspector to make the following findings:

60. If one considers locational sustainability i.e. being adjacent to an existing built up area and able to take advantage of any existing services and infrastructure, then developing this site would score heavily. On the other hand, if we seek a Bruntland scenario, whereby today's development would not impose environmental costs on future generations, we are a considerable way from achieving that. There was certainly no expectation that the development would 'consume its own smoke'. The application does not deal in many specifics and targets, other than the aim to reach Code for Sustainable Homes Level 4.

61. As for movement, there is little beyond broad principles and these are largely internally focused. A Travel Plan was submitted with the application, but this only covers a residential offer. There was nothing about the employment or leisure uses. Similarly, there were no proposals for energy
generation on the site or firm sustainable drainage projects. When additional draft conditions were suggested they were accepted, and the saving grace is that this is an outline scheme and one that could be up-rated as part of the submission of details, so long as appropriate conditions are attached at this stage. Such matters as design, layout and even the orientation of buildings are crucial in this context.

www.planningportal.gov.uk/planninginspectorate 12
Appeal Decision APP/N2345/A/12/2169598

And, for this to remain an honorable exception to the ducking and diving of other decision-makers, fearful that their considered and professional the view of what constitute sustainable development would not be supported by the Secretary of State.

Nothing could be more important than the reduction in carbon emissions. There is no model or precedent (outside wartime or deep recession) for the scale of carbon emissions required to meet the official carbon budgets (6% per year) or the Tyndall Institute estimate of 10%. Planning guidance and development plans are fundamentally dishonest in the lack of attention being paid to this existential challenge. The Environmental Audit Select Committee ‘Reducing Carbon Emissions from Transport 2005/6 based its recommendations on an honest appraisal of the problem – advising the Government that a lower speed limit (evidence had been given of the need for a 55mph limit) was necessary, not just to reduce carbon but to send the right message to the general public. 10 years later, denial of the scale of the challenge posed by the required level of carbon reduction far exceeds the insignificant level of denial that climate change is being influenced by carbon emissions. This H of L Committee should take the same rigorous position based on the available scientific evidence but, with ten years of missed opportunities, the challenge has become very much greater. Carbon reductions have largely been achieved by exporting emissions from manufacturing/mining and by picking some low hanging fruit. The reductions that are now required will have to come disproportionately from buildings, as transport (while the speed limit reduction continues to be rejected), agriculture, industry, and power generation (with the Government retreating on renewables) sectors will all have more difficulty. New buildings can be carbon negative (solar positive) using existing and affordable technologies (with the added benefit of reducing the incidence of fuel poverty). We have to talk about ‘one planet living’ starting from now, a time that we are living as if we have three.

4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?
Possibly. One element of a national spatial plan would be to put a stop to HS2. Improving the regional rail network should be a priority. Any capacity problems in the routes into London occur within a 50 mile radius that can be addressed by express coaches using the over-taking lanes on the radial m-ways and trunk routes. These coach services can access many more centres of employment than can rail terminuses. Cars would be limited to 50mph to meet the carbon reduction targets (see above reference to Environmental Audit Committee) and car drivers will soon become coach passengers. Commuting coaches will not add to the congestion in the area around Euston that will not be able to cope with the 30,000 additional in and out movements were HS2 to be built. The few minutes saved on the high speed train journey will be lost on the already congested road and underground system within the Euston area. The regeneration of the area around Old Oak Common is a perfectly good idea but this is not a remedy for the congestion likely to be caused by HS2 and could happen with a normal rail connection. Railways are essential to the country’s low carbon future but High Speed Trains need a far more objective assessment that the Government seems capable of delivering. The same seems to be the case of additional runway capacity.

5. **Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?**

There should be no problem with development plans being drafted for about twenty years with frequent if not continuous reviews. A serious problem has arisen from a misunderstanding of the ‘five year housing land supply’ requirement set out in the NPPF. If development in a particular area is booming then it could be argued that the lack of 5 years land supply would harm the forward planning of the house-building industry and employers in that area. If development is sluggish, then a shortage of allocated and permitted land is not harmful and should not form the basis for allowing even more land that is not required (and would deflate the value of permitted sites making their development less profitable and slower to deliver). This leads to arguments about viability; s106 contributions and the proportion of affordable housing. By definition, ‘necessary’ infrastructure - including housing affordable to key workers - cannot be sacrificed to artificially inflated assessments of land values. Hence, a 5 year housing land supply can only be a suggestion for what would be a sensible target averaging good years for building with bad, and not a justification for allowing more land that is actually needed. This should be reflected in planning decisions where, in law, weight should be given to the real harm being caused by a breach of policy and not simply to the breach itself.

The necessary trajectory of carbon emissions reductions does not allow the Government to delay showing that it is treating this matter with the required degree of seriousness and ensuring that their plans, and those of all LPAs, reflect the necessary annual reductions of between 6% and 10%.

6. **What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central**
Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

Almost every intervention by the Government has been to the “demand-side” (Funding for Lending, Help to Buy, discounts for 1st-time buyers) all of which have the effect of maintaining or raising prices and reducing affordability to all those not on that particular scheme. There has never been more housing space per capita and the Government which introduced the pernicious bedroom tax in the social rented sector (this could have been managed satisfactorily were there an adequate supply of smaller dwellings available) must be aware of the even more prevalent under-occupancy by owner occupiers. Under-occupation is, without exception, the most unsustainable aspect to our housing system. A very simple and easily implemented policy would be for the Communities Secretary to require LPAs (and inspectors) to ensure that all new housing is of 2 bedrooms, unless a special case has been made out for larger dwellings. Even in that case, such dwellings should be designed to be easily subdivided. Further, planning conditions should be imposed on new developments to prevent extensions in order to retain the balance of the size of households (average size approaching 2) and housing (there is already a surplus of larger dwellings), and the energy efficiency. The Government should also revisit the very sensible and important concept of ‘consequential improvements’. This is one of the few ways in which the existing housing stock (80% of existing houses are EPC ‘D’ and below) whereby dwellings cannot be enlarged without upgrading the energy performance of the whole. Why must properties be upgraded prior to rent and not prior to sale? This has become urgent in the context of the demise of the Green Deal.

The government should not continue to change the scope of ‘permitted development’. The ‘permitted’ change from offices to residential without any contributions to affordable housing, infrastructure or sustainability should be revoked. The permitted change from agricultural buildings to residential in remote rural areas also comprises unsustainable development.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

Reference has already been made to the unsustainable level of under occupation of the existing housing stock. This should be the first matter for the Communities Sec to address by signalling his support for predominantly smaller dwellings. Adaptability should also be a requirement of all larger dwellings to enable relatively cheap and simple subdivision (preferably exempted from further planning applications)

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?
There is a danger that the Government preoccupation with 'Brownfield' sites could endanger some sites of very high heritage value. For example the best examples of Cold War airbases have been substantially harmed by new development. Such sites are in unsustainable locations and their status as 'previously developed land' should not be a justification for inappropriate development.

9. **Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?**

The most topical and damaging shortage of skills has been the inability of LPAs to deal effectively with viability assessments. It is extremely encouraging that the Royal Institute of Chartered Surveyors has been instrumental in setting up an All-Party Parliamentary Group to address planning and housing. Viability assessments have been used to justify material reductions in the provision of infrastructure and affordable housing. The Communities Sec should ensure that such assessments are made available to both decision-makers and public and the RICS should use powers and influence under its Code of professional conduct to ensure that assessments genuinely reflect the profitability of developments and their ability to pay for necessary infrastructure.

11. **Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?**

The Government has been supportive of self-building. This has probably being seen as a way of diversifying the supply of new housing. In fact, self/group/custom-building/finishing could be made into a large and viable and vibrant 'industry' were it to be treated with the required level of seriousness. There needs to be proper definitions of different types of delivery, training, supervision and funding. One of the benefits of these forms of building would be community development and place-making.

12. **How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?**

There is increasing evidence that neighbourhood plans are not being produced to include policies with the necessary level of precision, prescription or proscription. Most policies are of a 'permissive' type that set out what might be allowed but say nothing about what should not be permitted. The fault lies with the supervision provided by LPAs that must now treat 'made' NDPs as the 'development plan' for decision-making purposes. This process should
receive far more attention and is likely to result in a set of properly worded policies from which parish councils and neighbourhood forums can ‘pick and mix’.

One of the ways in which local people could be enthused about future development within their area would be neighbourhood competitions. Individuals and groups could receive small incentives to submit their development proposals for the use of empty, underused or derelict sites/buildings. The most promising proposals could then receive further funding to demonstrate viability and sustainability.

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

Since 1947 successive Government have failed to capture the additional value of land attributable to the permissions allowing for its development (see 2015 Housing Review by Sir Michael Lyons. Most if not all of this value relates to the social and physical infrastructure which has been created as part of the public domain and the only uplift that should be permitted in the interest of fairness to the landowner would be that sufficient for them to agree to sell. A system that condones land values of $< 10,000 \times$ agricultural value cannot be in the public interest and is a serious impediment to the provision of housing of sufficient scale, at genuinely affordable prices and of the right quality (including zero carbon – see above). The fact that developers should be made to pay for the necessary infrastructure (which includes depreciation/renewal costs of roads, schools and public transport as well as housing for key workers and others unable to pay market rates based on inflated land costs), should mean that in most parts of the UK development would pay its way. In fact there would be an immediate impact on land costs that should make all the housing more affordable, so that this would need less cross subsidy from the development.

10 August 2015
Training needs of Built Environment Professionals

Briefing points in response to discussion

Key Points

1. We need to change public and political awareness of the positive work that planners and built environment professionals do. The left hand slide is a popular misrepresentation of planners as negative regulatory controllers when a lot of their work is about positive joined up working across professions and sectors.

2. Many built environment professionals operate in specialised work silos partly due to their early specialisation at school and university which stifles wider interdisciplinary thinking regarding how the built and natural environment jigsaw is joined up. The current fetish for housing numbers alone illustrates this thinking without wider recourse to the need to create sustainable communities with the services they need.

3. There is a need to consider the skills planners need now as well as in 20 years time to ensure that planners are future proofed. We are moving away from a need for
specialist planners in favour of more flexible and adaptable built environment professionals who understand how the different professions work together for societal interest and benefit. Of particular importance is the need to understand the business, commercial, environmental and legal aspects which are currently underplayed in many planning schools. As we look long term there is a need for better PR about the planning profession itself and how it contributes to better places. Here it was stressed that professional institutes need to work better together to present a united message about the value of successful places in joined up planning. E.g. RICS, RTPI, ICE, RIBA, LI, and IEEM. This also requires universities to join up their different built and natural environment courses.

4. Core themes in future of training in the built environment

From the discussion we had on 15th October I would identify the following core actions.

- Encourage work experience type modules in partnership with practice. BCU have modules in both architecture and planning which expose students to real world of work as seen through this lens.
- Improve the understanding of how to collect, analyse and interpret evidence in effective and accurate ways
- Manage change to best advantage using tools and techniques to establish trade-offs in decisions.
- Promote teaching away from specialist modules into responding to particular spatial planning challenges and then bring together the people and resources needed to tackle them.
- Do not get fixed on the built city environments at the expense of the peri urban and rural environments which are all too often disintegrated within planning policy and responses. Here improved dialogue between government departments eg Defra and DCLG is imperative.
• Improve learning situations across different built environment courses as far as timetables can allow. To reflect the real world of work.
• Training needs to embrace interdisciplinarity to help create a new more flexible and adaptable breed of planners. Crucially their role as place makers and shapers needs to be recognised. This thinking needs to be embedded in our secondary schools.

5. Finally planners need to use the words of Captain James T Kirk and boldly go with confidence into their profession. At present there is a lack of confidence and champions that promote what good planning is. All too often others outside planning do this.
Appendix: Supplementary Evidence to Built Environment call from Professor Alister Scott

Sources:

Evidence for the committee is drawn from the following research projects.

In addition your questions on governance formed a major part of our ESRC (2102) report. We have produced a video to highlight what we call the natural versus the built environment divide and to start to cross it through a shared dialogue. https://www.youtube.com/watch?feature=player_embedded&v=9GD0hZ84Ws0

A more conventional report to address your concerns is attached below.

Executive Summary  In my research on the operation of the English planning system I have highlighted the lack of integration in policy and decision-making leading to what I termed ‘disintegrated’ development. In particular, the coincidence of different governance frameworks within the built and the natural environment has shaped significant conflict over the kind of places that are wanted. Typically, this is pursued within largely urban centric land use models as towns and cities expand into their surrounding countrysides with little thought given to potential ruralisation of our city spaces.

At present England has no spatial plan or vision to shape development. This hinders the development of a national infrastructure and energy, transport policy which signals uncertainty to investors and communities alike. It also leads to ministerial announcements that can change the policy landscape overnight causing confusion and uncertainty; the real enemies of enterprise.

Whilst the NPPF represented a simplified level of guidance for planning it is currently too vague and continually being added to through extra legislation, NPPG and permitted development procedures that are cumulatively hindering more joined up planning responses.
1. The Disintegration of planning governance for the built and natural environment through a fetish on housing numbers

The issue of housing policy, delivery and affordability is becoming increasingly important in political debates and for many represents a crisis\textsuperscript{460} that has been building due to inadequate government interventions\textsuperscript{461}. It has dominated planning concerns of the present government.

Current estimates of future housing need reveal an annual need for some 265,000 additional dwellings but, due to significant past undersupply, this figure may well need to rise to 300,000 (RTPI, 2014). Invariably, building houses on this scale will invoke negative political and public responses at the local scale. So how and where is this to be achieved?

In my view, there are no ‘magic bullet’ solutions as the housing question is complex and demands much more cross-sector thinking as housing does not exist in its own policy silo; but this type of approach is something conspicuously absent in contemporary policy and decision-making processes for the built and natural environment.

Arguably, we have reached this impasse because the ‘wrong’ question is being asked. Leaving aside the intractable issue of how ‘need’ is measured, the question should not be how many houses do we need to build; rather it should be: what kind of future places do we want to create? But this fundamental societal question is overlooked as the housing debate becomes increasingly disintegrated. New development is viewed in isolated pieces without reference to its place in the overall built and natural environment jigsaw. The fetish for housing numbers alone pays little reference to the infrastructure, community, economic and environmental services needed to support functioning places. This is symptomatic of a wider agency and sectoral myopia.

Potential solutions of new garden cities such as Ebbsfleet and Bicester have been heavily promoted and lauded by government. Yet the government is also providing renewed policy support for protecting green belt from new housing incursions; such political posturing and potential contradictions generates significant scope for land-use conflict and uncertainty.

This is exacerbated by the vacuum in strategic planning and where some 85% of local authorities are yet to make their local plans fully NPPF compliant. Increasingly, questions are being asked about the competency of the duty to cooperate across neighbouring local authorities in resolving unmet housing demand, together with other fundamental components of the housing question such as speeding up the development pipeline.

\textsuperscript{460} \url{http://www.independent.co.uk/news/business/news/house-prices-hit-record-high-as-uk-housing-crisis-worsens-10189495.html}

\textsuperscript{461} \url{http://www.newstatesman.com/politics/2013/09/how-can-we-solve-britains-housing-crisis}
overcoming landbanking by developers, identifying viable delivery mechanisms, and delivering affordability and social and environmental justice through new schemes such as help to buy. Indeed recent pronouncements by the government for affordable houses in line with the ‘Ryan Air’ model will merely exacerbate social exclusion and alienation.\footnote{http://www.24dash.com/news/housing/2015-03-02-Tories-pledge-200-000-homes-for-first-time-buyers}

**Potential Solutions**

First, there needs to be a more holistic approach to the legal requirement for authority-derived objective assessments of housing need. At present, too many assessments are made by the local authority in isolation resulting in challenges at examination. Unfortunately, the guidance and metrics for housing need assessments are beset by statistical anomalies and dubious econometrics, making any derived figure disputable. A collaborative approach such as that pursued by the joint housing study of the Birmingham and Black Country LEPS provides a useful model forward under the auspices of the duty to cooperate requirement. However, there is a powerful case for making such models more transparent and understandable and also linking them to transport, employment, waste and climate projections.

Secondly, there needs to be strategic consideration and assessment of different growth models, set within the opportunities and constraints of housing market areas not just within single local authorities which do not represent functional geographies. Despite claims to the contrary, there is no way that a solution based on garden city ideas alone can address the housing requirement or, equally, no way that brownfield sites alone can meet the projected housing need. So we need to bundle several options together within housing market areas that deliver multiple economic, social and environmental benefits. Here a potential option mix might include new towns, urban extensions, urban densification, public transport extensions and dispersed development for example.

Thirdly, we need to move away from any one-size-fits-all approaches that restrict such options. Here the green belt has moved past its ‘use by’ date. I have argued elsewhere that we need to sensitively rethink the value of the green belt in order to maximise its environmental and social credentials, but only as part of a wider discussion of placemaking. Such green components form a vital link in development considerations: not as bolt-ons, but rather as core infrastructure to help liveability and growth and to deal with issues associated with flooding and health.

Fourthly, we urgently need to consider how housing and employment developments are to be financed and delivered. All too often, the debate revolves around the perceived problem of securing planning permission, but this is only one part of the overall development pipeline. Significantly, the development of 10,000 homes at Northstowe is being delivered by the Homes and Communities Agency as landowner on former RAF land – hence a
brownfield, previously-developed site. In many ways this might provide an instructive way of overcoming some of the stagnation observed in the development pipeline. Significantly, the TCPA has provided some much-needed leadership on this issue within its New Town Act manifesto with the idea of a revitalised development corporation delivery vehicle.

Finally, we need to think about the quality of life for residents and users of the new places we create. All too often the social and environmental components are seen as luxury bolt-ons to new developments. Recent legislation by government has for example removed affordable housing provision on viability grounds and recent national planning guidance downplayed the value of green infrastructure. Yet, in reality, they need to be integral components of the mix from the start. Issues of climate change and health demand that we rethink how our cities, towns and countryside are designed and planned to avoid costs and disruption in the years and generations ahead; flooding, drought and extreme weather conditions demand more proactive responses. These are all issues that will greatly add to the sustainability and liveability of our settlements.

At the heart of the planning debate lies the need for a culture change from agency and sectoral insularity to more cooperative and collaborative ventures across the built and natural environment professions and the wider public to understand, view and assess better the housing picture within the wider economic, social and environmental settings in which it sits.

2. The operation of The National Planning Policy Framework

Using the headlines from the recent CLG select Committee inquiry into the NPPF I offer my own assessment; I scored this 48% in a recent post for the Birmingham Post. http://www.birminghampost.co.uk/news/news-opinion/national-planning-policy-framework-school-8302693

We should ensure that the same weight is given to the environmental and social as to the economic dimension;

Economic considerations continue to trump environmental and social matters in decision making through our fetish for economic growth. In particular, the assessment of viability in the NPPF has been too heavily weighted in the developer interest. The lack of transparency in these assessments is a matter of concern as brownfield-first policies and affordability housing quotas can easily be bypassed. It is also equally important to consider environmental and social limits in such decisions where the concepts of natural and social capital provide useful tools for decision making.

Professor Alister Scott – Written Evidence (BEN0227)

All councils must move much more quickly to get an adopted plan in place

Only 41% of local authorities have a local plan in place. At present it is in the developer interest for plans to be delayed enabling development to be considered on an ad-hoc, case by case basis on sustainable development grounds as defined within all 209 paragraphs in the NPPF. This developer free for all does not make for good or consistent planning and certainly goes against any form of localism. From my observations at local plan inquiries this leads to developers queuing up to challenge housing need numbers within their own pseudo ‘duty to obfuscate’. This local plan delay is further hindered by the acute lack of planning inspectors after significant cuts to the Planning Inspectorate.

There also needs to be clearer guidance about how housing need should be assessed.

At present local authorities are required to undertake objective assessments of housing need. Unfortunately, this new requirement is a statistical minefield, with the key DCLG and ONS data on which such assessments are based, full of statistical anomalies and difficulties associated with the impacts of the recent recession and (im)migration. This leads to excessive dispute about any derived figure by local authorities causing further delays to the local plan process. In my view there needs to be an approved methodology subject to local modifications before housing need assessments are undertaken, thus eliminating disputed figures. Joint initiatives such as the Greater Birmingham and Solihull and Black Country Local Enterprise Partnership joint housing study provide a model here for the way forward.

The Duty to Cooperate is a flawed model.

The replacement of strategic regional planning with the duty to cooperate has been beset by problems. First, is the fetish for housing as the principal driver for the duty to cooperate tests. Other strategic matters such as climate change, energy and infrastructure seem to be bypassed here in favour of only one part of the built and natural environment jigsaw. In my view it is time for a more strategic model of planning to support the NPPF as for example provided by Futures Network West Midlands. At present we are sleepwalking into a half-baked regional model based on local enterprise partnerships and some combined authorities (as long as they follow the government requirement for an elected mayor). This piecemeal, ‘make it up as you go along’ approach is not the way to do proper planning and is an insult to the professional training that planners receive. At the heart of this lies the need for closer integration and collaboration across scales and sectors but without further complicating the many layers of governance we already have.

Local authorities should be encouraged to review their green belts as part of the local planning process.

There is clear evidence that the green belt is not fit for purpose. They seem to be all too readily bypassed in some planning decisions whilst they also help fossilise landscape. There needs to be wider recognition of the way a revitalised green space designation can help to maximise environmental and social benefits as opposed to the current fossilization of the
landscape with no positive incentive for land management. There needs to be improved leadership here by government to recognise the wider benefits of such a green designation that works with the development needs of an area. The concept of multiple benefits is key here.

**Permitted development is the enemy of good planning**

There have been a whole raft of recent permitted development changes which are eroding the fundamentals of good planning. This incremental change to planning policy is also unwelcome as it creates further uncertainty and indeed can operate against the main policy focus of an approved local plan such as town centre regeneration. Crucially such provisions have been imposed on local planning authorities challenging any notions of localism. Thus the ability of conversions from employment to residential uses in town centres is leading to the hollowing out of town centres further threatening their viability. The recent changes in rural areas allowing farmers to convert barns to residential uses goes against a firm tenet of countryside policy to avoid isolated development in the countryside unrelated to settlements. The policy on enabling 8m housing extensions also fails to take account of the cumulative impact of such developments on a neighbourhood.

In conclusion the NPPF can do much better and needs to improve the cooperation across local planning authorities on all matters; not just those dealing with housing and employment land. The lack of strategic planning is a serious problem at present and the consistent tinkering with the system in the name of economic growth is simply creating further uncertainty in the planning system. It is this which is the true enemy of enterprise.

3. **Using spatial planning and the Ecosystem approach to improve our planning system**

Ecosystem science offers, in theory, a powerful new lens to improve the understanding and management of the natural environment. The [UKNEA 2011](#) provided the first base line assessment of the state and value of the UK's natural environment, concluding that the services provided by nature were in significant decline, in part because nature is consistently undervalued in policy and decision-making. This poses fundamental questions about how we can mainstream nature into policy and decision-making in practice, particularly when economic growth seemingly trumps most considerations.

Currently, the built and natural environment professions exist largely in their own silos with separate theories, governance and interventions. Virtually all ecosystem science has been funded, for research and practice in the natural environment sector through Defra and NERC with the consequential effect that ecosystem science and its voluminous and complex lexicon is perceived as alien and largely irrelevant to the built environment sector. Yet arguably it is the built environment which has most impact on the ecosystem services through the planning system.
Although impact assessment tools help ensure environmental considerations are taken into account there remains a dominant narrative that the environment is a constraint to be overcome; a perceived cost to development. The twin concepts of natural capital and ecosystem services both lack sufficient currency and traction in the built environment, making them vulnerable to ‘cherry-picking’ to support particular policy position (policy-based evidence) where decision-makers value only what is measured rather than measuring what society actually values. The Ecosystem Approach principles collectively help overcome these potential abuses in policy- and decision-making, but only if they are used collectively within policy and/or decision-making processes.

Consequently, we have translated these ideas within a NEAT tree hosted by EKN which focuses attention on the universal stages by which ALL policy and decisions are made. Each stage has guidance that is adapted from the ecosystem approach signposting the bundle of tools to use.

So to mainstream ecosystem thinking into practice within a given sector you first must identify their key ‘hooks’ that drive their work practices. For the built environment these are illustrated in Table 1 with the National Planning Policy Framework and National Planning Policy Guidance as key. These have statutory clout and resonate in discussions. Within these documents we can identify other key concepts and terms. It is from these terms that we then can then apply our understanding of ecosystem science to start maximising synergies.

Table 1. Built Environment Hooks mapped against Ecosystem Approach
Table 1 shows how, by focusing on key policy hooks in the built environment, we can cover all 12 principles of the Ecosystem Approach within new opportunity spaces to offer improved and additional insights into the operationalisation of these concepts.

So for example the NPPF chapter 11 paragraphs 109-118 recognises the value of ecosystem services making connections with ecological networks and connectivity and the role that green infrastructure can play. Here there is an explicit link with the NEWP. This offers opportunities for mapping ecosystem services from which you might then make planning interventions based on siting new housing and industry development using water regulation services or develop new market based instruments such as PES schemes.

The Duty to Cooperate (Localism Act 2011) requires planning authorities to consider strategic planning issues that cross their boundaries. Most attention has been placed on housing markets but using ecosystem services we can start to factor in new geographies of flooding, climate change and biodiversity using existing/new partnership vehicles.

Within the NPPF viability has focussed on economic issues associated with securing developer profit margins but within ecosystem thinking concepts of environmental thresholds and limits through ideas of natural capital can challenge the economic orthodoxy.

Ecosystem thinking can also help to expose operational limitations with current tools such as CBA where there is a failure to take a long term view beyond 25 years with the application of a suitable discount rate for environmental factors.

Unfortunately there still remains the expectation that other professions will simply adopt ecosystem thinking and hence little effort is put into translating the language of ecosystem science into the hooks of other professions. Perhaps the most exciting opportunity here is the progress that can be made linking the NPPF explicitly with the Natural Environment White Paper through improved landscape-scale thinking; where LEPS meet LNPs.
debates over city regions and biodiversity offsetting can be considerably enhanced when bringing in an ecosystem perspective challenging the often simplistic media debates than ensue. The shared language of multiple benefits transforms the way the environment is viewed and valued and we urgently need to boldly go into new sectors understanding and using their languages to maximise ecosystem service mainstreaming.

02 February 2016
Comments and description of how the PC went about receiving 150 dwellings in to a small rural village.

Sellindge is a small parish consisting our around 700 properties in Kent. It is cut in half by the A20 with various sizes of housing developments each side of the A20

The School and the Doctors surgery are on opposite sides of the road. Sellindge is also bounded by the M20 and the HS1 railway.

It is in the district of Shepway and considered a ‘hub’ village due to the other facilities we have.

In January 2015 a 150 dwelling development was given the go ahead, in two phases, one of 50 and the other of 100 properties. This was all with the support of the majority of residents – only one letter of objection was ever sent to Shepway District Council – and the Parish Council

The reasoning behind such overwhelming support was the inclusion of villagers from the start.

Meetings, exhibitions and leaflet information drops took place over a period of around 2 years, meaning that even minor details, put forward, were accepted by the developer and incorporated into the designs.

Sellindge Parish Council (PC) feel that this is the way forward for all developments and should be part of any policy moving forward.

Below we have made comments to the questions raised and hope that in some way the voice of a small PC will be heard.

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

   National Policy does not appear to take in to account the effect on the local communities, after any new development has been completed.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?
'The South East is one of the driest areas in the country' (KCC document)
This places great strain on any proposed developments and often has a negative effect on those already living in the area. Water companies should be given the opportunity to consider whether or not there is the infrastructure to accommodate more dwellings in any given area.

Large developers do not always consider the type of property within the village/parish and build to what they consider is appropriate cost wise. Often placing urban type dwellings in rural areas, with little regard to the local heritage. Sustainability is a word often used but without meaning. Building in a small village with very little bus and other public transport encourages the use of private motor cars

The way to improve the co-ordination and integration would be to make the planning system more inclusive of parish and town councils rather than they just receive a planning application for comments. More input should be arranged prior to any application being submitted to the local Planning Authority.

National policy for planning and the built environment

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

The natural environment often gets side-lined using the statement that the development in question is sustainable (see reply above) especially in the rush to build more housing.

4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

It is considered that having a spatial element within the policy would be beneficial to planning across the board at all levels, whether a small infill or larger development.

4. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

It is our understanding that the current 20 or 30 years is sufficient, however there should be a policy in place to downgrade the number of dwellings should the need arise, rather than at the current time where once the numbers have been agreed there appears to be no recourse to reduce them.

Buildings and places: New and old

5. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level,
required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

Local Planning Authority (LPA) should be given the opportunity to state what they can achieve in any given situation before any statements from central government is made, at present it is very top down. This is contrary to the Localism Act, notwithstanding that local plans are making a difference at local levels.

6. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

All of the larger developments (the numbers to be agreed) should be considered for environmental issues, for example water capture, individual solar panels etc. to reduce the need/use of fossil fuels.
Also the Government should instruct LPA make more use Brownfield sites regardless of the development size, rather than issue guidelines saying it should be used first.

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

It is considered that in the main, the historic envelopment is protected sufficiently

Skills and design
9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

It is felt that each expert tends to concentrate on their own area or field of knowledge rather than looking holistically. (This was demonstrated by the events that took place in Sellindge when during public events questions to the experts attending, each could only answer in their own field. This proved that there was no holistically dialogue with others involved in the development)

It is considered that LPA do not always have the resources required and with the current cuts are finding it more difficult to buy in this expertise.

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?
Yes it is accepted that these are the correct tools and techniques however these do not always get filtered down to local levels.

Community involvement and community impact

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

LPA do not always have the opportunity to take account of local inputs, due to the top down pressures of development.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

On a positive note, the fairly recent development about to commence from Taylor Wimpey was a success in that collaboration and dialogue was introduced very early on in the proceedings which meant that the PC could gain insight into the resident’s wishes and hold public exhibitions to agree even minor details.

Sellindge PC believes that all major development should be carried out this way and this should be a policy not just a recommendation in the NPPF

Financial measures

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

Local groups do not always have the resources to consider large developments due to inexperience and there is not always the financial backing to aid them in carrying out this important role.

At local parish and town level it would be greatly appreciated if finances or other resources could be put in place to enable better or improved communication with the LPA and Developers.

This would ensure that any misunderstandings did not occur and residents would feel they have made an informed decision. This may also reduce the time taken going through the planning system and allow the developments commence earlier.

Policymaking, integration and coordination

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

We want to focus our answer on an important re-framing of the question. To develop a spatial long-term strategic plan, taking on board goals of the National Planning Policy Framework (NPPF), requires development planning and infrastructure investments that are blind to local administrative boundaries. Much academic work has been published on cross-boundary planning, its necessity and its implementation (For example Allmendinger and Haughton 2012; Pugalis and Townsend 2013).

The administrative boundaries of Bristol City Council and associated neighbouring authorities are not the correct starting point for functional housing growth and settlement planning that will address sustainability objectives, be they economic or environmental. Sectoral catchments are paramount – in terms of, say, commuting to work, hospital catchments, species corridors, watersheds, food growing and resilience, urban waste and resources. It is the functional catchment, resource flows or impact footprint that matters – these are independent of local administrative boundaries – which can get in the way of good planning. Development policy and the associated investments in a functional city region need to be planned across administrative boundaries in a co-ordinated and integrated manner for efficacy and financial reasons.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

A spatial planning approach is necessary (see later point 4), as other sectors/departments such as health, education, food/farming interests, that impact on ‘territory’ need to also be part of the policy co-ordination. There is a lack of clear cross-cutting joint objectives; with no transparent process for managing the inevitable tensions between different departmental objectives.
We suggest population, community and individual health - using a broad definition of health that includes wellbeing - could provide a valuable common framework for setting joint objectives and measuring success.

**National policy for planning and the built environment**

3. *Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?*

Economic wealth and prosperity has been a key goal in the NPPF. This needs pursuing in planning and development as a long-term goal harnessing the ways it can support resilience and underpin population health. Currently, the NPPF has allowed decisions that favour short-term economic objectives to override long-term goals. This creates a greater future economic burden on the public purse and constrains the ability to provide the necessary development processes that will deliver places that support strong and prosperous communities.

In terms of the natural environment, moving away from a ‘protecting’ narrative towards one that recognises the important role of natural capital and natural assets in delivering a range of ecosystem services for urban living should be prioritised. The development of the concept of ‘Nature Based Solutions’ both at EU level and nationally should be prioritised as a way of defining, communicating and operationalising this.

Land disposal mechanisms at local authority level often serve as a block to achieving the objectives set out in the NPPF. At a local level ‘Best Value’ policy is usually interpreted as being required, when disposing of land, to secure maximum financial receipt for the public purse. The current climate of austerity intensifies the need for capital receipts. However, the Best Value calculations all too often only address direct fiscal receipts and do not take into account the future increased burden on the state from poor design. Where a local authority owns land legal mechanisms, such as conditions controlling the urban form, can be used to reduce future burden to the public purse arising from lack of attention to health and well-being in the housing and neighbourhood layout and design.

4. *Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?*

Correctly introduced, a spatial planning approach is necessary to properly align all sectoral policies that have territorial impact to achieve the NPPF ambitions. This is currently lacking. If a long-term perspective is taken, commensurate with life-cycles of built infrastructure investment (see point 5), the effect would be savings across a
number of policy areas and better quality of environment for communities and people across their life-course.

5. *Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?*

This is a complicated field with different categories of infrastructure, and a need to address the ability for renewal and retrofit, plus inevitable technological advances (say transport IT systems for example). However investments in the ‘hard’ urban built environment generally have a broad life-span of some 120 years or more in many cases. Turn-over of built stock is less than 1% a year. Moreover, sustainable development would lead to an imperative to extend that time considerably by building in future flexibility of use at both unit, building and neighbourhood scales.

In terms of greatest benefit to society, private and public interests, long-term cross-generational timescales need to be used. For example in landscape planning, it may take in excess of 20 years for an energy enhancing tree shelter belt to achieve meaningful performance, with correct management this can be then maintained indefinitely - at no additional gross cost and with many health and well-being co-benefits. Stable and self-supporting communities can take time to emerge but can be destroyed very quickly. Ideally a 50-70 year timescale should be the minimum, with a view to longer-term flexibility too.

**Buildings and places: New and old**

6. *What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?*

No comment.

7. *How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?*

It is vital for the Government to step in to address evident market failure. The market is unable to deliver built environments that are sustainable and resilient. The financial model for the volume developers and house builders is of necessity, in their current mode of operation, risk adverse and unable to capture the external disbenefits of their product that put a cost on the public purse. There are well evidenced arguments that market-driven neighbourhood form can give rise to preventable non-communicable
disease (Barton 2009, Grant and Braubach 2010). Leading to unnecessary costs falling to health, social care, community safety and education budgets.

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

No comment.

Skills and design

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

Public Health specialists, who understand the impact of neighbourhood form on health and well-being, must be involved in these processes. Through the Directors of Public Health, local authorities have a responsibility to support the health of the population, and to reduce health inequalities. To use the NHS most effectively there needs to be more recognition of public health’s role in providing population health objectives, health focused design processes and an evidence base to the built environment professions.

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

Greater use needs to be made of participatory, and non-weighted (inclusive), prospective health appraisal methods to guide policy and design development iterations.

Community involvement and community impact

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

Those current involved in delivering and managing our built environment have a gap in their skills, mindsets and knowledge bases to be able to adequately use development to actively promote and support health and well-being, including reducing health inequalities. Public Health specialists, who sufficiently understand the
impact of neighbourhood form on health and well-being, must be involved in these processes. A good yardstick is the degree to which vulnerable sectors of the community (identified as those to whom the form and design of the built environments can become an impediment to their own independence and health status) are being included in the decision making too. For example the inclusion of older people population and those vulnerable to living in isolation by decision-makers in design development. Greater use needs to be made of participatory, stakeholder-based, and non-weighted (inclusive), prospective health appraisal methods to guide policy and design development iterations.

12. **How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?**

The formal planning system, even with its cycles of consultation, often serves as an impediment to engagement. Local capacity building, and then devolving real decision and investment influencing power, is the only way to effectively engage. Experience shows that if carried out in an authentic manner, this pays back through its positive influence on social capacity, inclusion and ownership of the final results (Bryson et al. 2013; Rydin and Pennington 2000).

**Financial measures**

13. **Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?**

Evidence is growing that certain attributes of urban form at the neighbourhood scale, and specific urban design detailing at street level present risks and challenge to health (Grant and Braubach 2010). Better attention to reducing these impact at the planning and design stage would lead to savings to the public purse through reducing the burden on health and social care services and providing co-benefits for education and community safety budgets. Early on in the design and planning, these attributes may have minimal extra cost, and/or long-term savings easily outweigh such cost. A financial mechanism is required to ‘recycle’ long-term and future savings to the public purse, across several budget heads, into the extra initial cost of development that promotes healthier lives and more inclusive communities. There are already a few groups in England working on the margins of the required research such as the BRE Housing Health Cost Calculator; UWE’s Wellcome trust ‘Our planet, our health award’; and here at SHINE we have a pilot financial model for proposed housing development. More of this research could be funded and tested through the NHS Healthy Towns initiative.

2. No comment

National Policy for planning and the built environment

3. The aspect of sustainability: economically, environmentally and socially is unhelpful in all of its aspects and is too much open to interpretation. What is economically sustainable in a business environment which changes very rapidly? From an environmental point of view building on greenfield sites is de facto not sustainable.

4. Yes it does lack spatial perspective. In order to distribute business opportunities and wealth but also the environmental burden which very often goes with it more evenly across the country, a national spatial policy should seek to further decentralize from London and the Home Counties.

5. This depends on the aspect. E.g. housing demand. One aspect population growth/decline as a result of the UK can be easily predicted. However immigration or emigration on national or local are less predictable and are sometimes a consequence of housing provision (self fulfilling prophecy): more house building will lead to more people moving into the area where houses are available.

Buildings and places: New and old

6. The fact that today fewer people live on a larger built footprint than e.g. 60 years ago, is connected to higher income (in relative terms) and overall higher standard of living.

If income and standard of living are declining (as seen since 2009) we will have to reflect on our demand for living space.

As there is also only a certain amount of land available we will have to learn to live in dwellings with higher density: multi-generations homes etc. More provision for couples and singles in one-2 bedrooms apartments.

The chancellor’s suggestion to extend ‘upwards’ in suitable parts of London is very inspired as is the Prince of Wales plea for ‘Midrise Solutions’. This could be the way forward for all urban environments instead of building on greenfield sites. And extended towns and cities horizontally.

7. As mentioned above: midrise building and midrise extensions in towns and cities will help with living space in times of population growth.

8. I believe on a national level the UK is very good at using the historic environment especially for ‘place-making’. This is in my opinion the most important reason for tourists to
come to the UK. There is in so many cities, towns and villages a ‘sense of place’ rooted in continues use of a place for hundred of years. The problem at the moment is that even very historic places are under threat from being spoilt by unsympathetic development near such a national asset (e.g. Leeds Castle). Guidelines for building in conservation areas are not strict enough with regard to design or the use ‘open spaces’ (public or private) which are also part of the distinctiveness of a conservation area. (e.g. Lenham) Too many ‘anywhere’ houses even in conservation areas.

Skills and design

9 From my experience in Maidstone District the planners have been completely incompetent in producing a new Local Plan. Important preparatory work such as Landscape Assessment, Blue and Green Infrastructure Plan, Transport Plan are being produced after the first draft of the Local Plan has been published. The correct process would have been that the various plans are informing each other as a process in their making.

How to address the issue? Funding is certainly an issue. If the head of a planning department earns so much less than any planning professional in the private industry it will be impossible to attract the most qualified people into the job.

Outsourcing can be a part solution, but it might lead to councillors being completely intimidated by the expert views (as seen in questioning the ‘objectively assessed housing need’) and there is a question mark over the independence of the expert towards from developers.

10. By asking councils to provide a detailed character assessment of a historic place and its setting before any changes are made. Then providing guidelines how to build in order to adhere to these historic character traits. (One example of how this can be done is ‘A Vision of Britain’ by the Prince of Wales)

Community involvement and community impact

11 By developing ‘statues’ based on established facts.

E.G. negative impact on respiratory system if people live too close to busy roads. In the past we built bypasses or bypassing ‘A roads ‘to give people relief from pollution (air and noise). Today houses are built directly adjoining the bypass as if it were a village street. Examples: Harrietsham, Lenham (in the planning), Langley. In Ashford (Kent) a beautiful private care home for elderly people with dementia was built directly on a very busy roundabout.

In Germany they build noise barriers next to very busy roads to protect inhabitants in adjoining towns and villages. Why is this not mandatory in the UK?

12 I like the idea of Neighbourhood Planning but I believe it will be too costly in the long term and is too much to cope with for elected councilors of small communities. In Neighbourhood Planning the affected community can not question the amount of development which is a fundamental flaw.
There should be instead a proper consultation process between planning authority and e.g. parish before any draft plan is published. The parish should be an official consultee. This would give communities a chance to become aware of certain issues which can be, if done well, also a learning process), discuss them and have an input before they are seen to be ‘objectors’. Any development which is allowed in non compliance with the Local Plan should have a ‘Community Right to object’.

Financial measures

13. Brownfield development should attract fiscal advantages to make it more attractive to developers.

There should also be tax advantages to add a storey or two (Midrise solution) to existing buildings in suitable locations in towns and cities.

A certain percentage of land for housing in any development plan should be required to be available for self-built. This will lower the cost, make houses more affordable, will create local jobs from architects to builders and plumbers.

05 October 2015
The quality of the built environment – why it’s like it is and how it might be made better

1. Everything in the built environment is the result of our decisions to make, remove or retain things, and use them in particular ways; or the consequence of interactions between the natural environment and human-made things and activities. These decisions involve conscious or unconscious design, because we form the built environment by shaping processes and materials. They cannot be shaped without some idea of what is intended and how it should be achieved.

2. So why doesn’t the built environment always look beautiful or work well? Reasons, include:

2.1. Complexity: Making and caring for the built environment is complex in both the common usage and scientific senses. Complexity means that decisions do not always have their intended consequences. Things interact in unexpected ways. Risks are not always easy to foresee or accommodate. Good intentions do not guarantee good results.

2.2. Governance: Many people are involved and they often have different priorities and objectives. Interests conflict. This makes governance of the built environment difficult. A good result may not always be popular, making life difficult for democratic decision-makers. In non-democratic processes (e.g. market-based decision-making), interest groups can prevail at the expense of the public good, or of other interest groups. To be fair, this can also be an unintended consequence of democratic governance.

2.3. Agency: Often, quite simply, those people who would prefer better outcomes do not have the ability or power (agency) to influence decision-makers or compel them to act in the interests of better quality.

2.4. Skills: The right skills are often absent, or lacking, amongst decision-makers and their constituencies. Our education system does not prioritize and reward spatially aware disciplines, such as art and design, as much it values STEM subjects. Geography (a key knowledge-base for many town planners) is part of the mainstream curriculum, but still valued less than maths or sciences. Maths, statistics, biology (especially ecology) and physics are important to the built environment, as are economics and accountancy; but they need to be combined with an understanding of other subjects, such as aesthetics, engineering and psychology, that are not in the core curriculum.

2.5. Society’s priorities: As society focuses increasingly on economic and financial value it becomes more difficult for intangibles to play an equal part in decision-making; yet they are usually critical elements in decisions about the built environment. Arguably, we are also moving towards being a society that values individual expression more than collective action (or, at least, where the State, as the guardian of the public good, is less welcome and trusted as an arbiter of what should be done); and where consumerism dominates the discourse – do we talk about
consumers of the built environment or citizens? These changes are not necessarily bad. It has been suggested, for example, that groups of non-expert individuals can come up with better results than experts - though there do need to be accountable mechanisms to gather and apply the ‘wisdom of crowds’ in the built environment, and there is no prima facie reason why democratic planning processes should not be able to do this. So, not necessarily bad, just different; but these changes need to be considered when framing how we tackle shared problems. The State has traditionally carried huge responsibility for much of the built environment. Rights and responsibilities are seen differently depending on whether you are a customer or a citizen. Ambiguity about whose job it is to build and fix the built environment is a guarantee that things will go wrong.

2.6. Change and inertia: As Yogi Berra allegedly said: ‘It’s tough to make predictions, especially about the future’. All the main decisions about the built environment involve anticipation of future needs. Future needs don’t always turn out as expected. Innovation and change in other sectors impact on the built environment. Those responsible for the built environment aren’t always well informed about such changes. Also, buildings and infrastructure are big investments and are intended to be long-lasting. In a rapidly changing world, they (and even whole neighbourhoods or towns) can be left behind because it is difficult quickly to adapt fixed assets. They may outlive their usefulness but be difficult and costly to replace – hence dereliction.

2.7. Development economics: The way that the market works for property and the way that funders, developers and consumers respond to it has an impact on quality. Suppliers such as house builders, with no long term direct interest in the properties they build, can more easily compromise on quality than developers who build to retain property, or build it for an investor client. This is not always true, of course. Some house builders care passionately about quality; some funds invest in industrial sheds with little to recommend them other than cheapness to construct. On the whole, though, the incentives for investors to build something that will last, and attract people for the long term, are stronger than they are for traders. Additionally, in housing, the fact that we have a massive supply shortage means that just about anything will sell, so the market is more focused on finance than on the quality of new homes.

2.8. Gulfs between who benefits and who bears the cost: Economists use the term ‘externalities’ to describe what happens when one person’s actions benefit or disbenefit another. A negative externality is one that costs somebody other than the person who took the action. The built environment is littered with problems arising from negative externalities. In fact, litter is a good example of a negative externality. When someone throws an empty cigarette packet from their car they hand the cost of disposing of it to the community. Others include derelict buildings where the owner walks away and leaves the State to pick up the tab for regeneration, housing estates where crime is facilitated by poor design, projects which create traffic congestion due to under-investment in infrastructure, and retail developments which suck the life out of town centres.

Page 1688 of 1964
3. This seems like a pretty depressing list, and quite intractable. In fact, of course, the built environment also produces positive externalities – it does good for individuals and communities. It does this for most of us most of the time. In some cases it does it brilliantly.

4. This submission is about problems, though, so what are some of the consequences of the above?
   4.1. The built environment contains many wicked issues.
   4.2. There are more dilemmas than problems (a problem can be solved; a dilemma has no single right solution).
   4.3. Different sectors have different perceptions. For example, the private sector might view planning gain as a tax on development, whereas the public sector might see it as a legitimate way to cover costs imposed on society by a development (negative externalities).
   4.4. Politicians are often reluctant to take difficult decisions that need to be taken, or to regulate where regulation is necessary.
   4.5. People often feel that they lack agency, or that it is not clear where agency lies.
   4.6. The best solutions may not be found because the skills to find them are not brought to bear.

5. Some other factors are also important:
   5.1. Councillors represent very small geographical patches. Often they are only elected by narrow margins by small numbers of electors. It is difficult to stand back and look at the bigger picture in these circumstances.
   5.2. Partly as a result of 5.1, there is nobody to represent the opinions and needs of people who are not yet constituents, such as those who might need a home in an area where NIMBYs oppose new housing.
   5.3. The built environment is increasingly seen as a local issue by the UK government. While Localism is an excellent idea, not all decisions can, or should, be taken locally and not all policies should be local policies. There is sometimes still ambiguity about where decisions will be taken.
   5.4. In fairness to politicians, the built environment does not carry the same weight with electors as, say, the NHS, immigration or the economy. It may have more importance in local elections but even that is not always clear-cut.
   5.5. Historically, as the Farrell Review showed in an excellent diagram, the UK government has divided responsibility for the built environment between departments. That makes it difficult to get the government to think across departmental boundaries; but the built environment is not bounded in the same way as government departments.
   5.6. We have, in the main, an adversarial planning system, which can make working together difficult.
   5.7. The built environment sector has many professions, which sometimes conflict and overlap.

6. How might we improve the way we value the built environment so that we know better how to get the positives and avoid the negatives?
7. We need to think differently, taking our cue from the environmental sciences. Thinking about the way we are entrained holistically with Nature, they have developed the concept of ‘eco-system services’. That is, the benefits people get from natural eco-systems. They include:

7.1. Supporting (e.g. waste recycling).
7.2. Provisioning (e.g. food, water).
7.3. Regulating (e.g. air and water purification).
7.4. Cultural (e.g. spiritual development, recreation, appreciation of beauty).

8. We should think in the same way about the built environment. Built environment system services (BESS) are provided by physically intertwining and functionally interdependent systems and networks. They include:

8.1. Shelter for living, working and relaxing.
8.2. Meeting points and places of exchange for labour, ideas, knowledge, goods and services, genes.
8.3. Connection, through transport and information networks.
8.4. Information - direct flows such as advertising, or indirect, such as knowing where we are by the shape of the place and the style of the buildings.
8.5. Cultural, national and local identities.
8.6. Recreation.
8.7. Aesthetic pleasure and artistic expression.
8.8. Resilience – defence, disaster management, begetting and accommodating economic and social change.
8.9. Economic benefits from developing, replacing and servicing the built environment.
8.10. Opportunities for eco-system services to work within our urban habitat – parks, gardens, sustainable urban drainage, street trees etc.
8.11. Infrastructure to support modern lives – drains, public utilities, waste management, end-of-life (cemeteries, crematoria).
8.12. Citizenship - the benefit of living in a town or city. It used to be highly prized (think what it meant to be a Roman citizen); by many, it still is. It brings rights, responsibilities and civic pride, all of which benefit us by developing our potential as individuals and communities.
8.13. A legacy for us and our descendants. Athenian youths swore the oft-quoted Ephebic Oath not to diminish their heritage but to leave Athens greater and better. Given the relative permanence of most towns and cities, and the heritage that we inherit through them, an important benefit of the built environment can be a sense of continuity and belonging to a long history. There are also tangible inheritances, such as bridges, railways, sewers, reservoirs - assets which go on giving, so long as we maintain them properly.

9. One irritating thing about lists is that they often separate things that are, in fact, interwoven. A quick glance at this list will show that many built environment system
services offer benefits because of how they are interleaved as well as in their own right. In this way they mimic eco-system services, which have the same characteristic.

10. This way of understanding the built environment helps us to see past some divides to which we have given so much significance that they can inhibit developing a better built environment. They include divides between things which appear to make a profit and those that seem to impose a cost, between public and private sector rights and responsibilities, and between those with an existing stake in a place and those who might want or need one in the future.

11. Instead, by recognizing that the whole built environment is delivering essential habitat services we might begin to chart ways in which we can maximize their benefits for us all. This doesn’t automatically solve wicked issues such as who should pay for what; but it does enable us to address issues of governance, choice and benefit from a new perspective. It also draws attention to the need to resolve built environment issues in cross-disciplinary, cross-governmental and inter- as well as intra-community ways.

12. It leads to the first key question to be asked about interventions in the built environment: how will this action (or inaction) improve the delivery of built environment system services, or will it harm them?

13. The second question is who will benefit, or suffer harm? This is important because the benefits of built environment system services are not always equitably distributed. To what extent they should be is a policy question – for example, a new road will benefit travellers but may harm the environment of its neighbours. That does not necessarily mean that the road should not be built; but it should be a factor in deciding whether the built environment system services it will provide are sufficient to justify its construction. Regardless of policy, it is always important to understand not only what will change but for whom.

14. The third question is what impact will the intervention have on eco-system services? The built environment exists within eco-systems that sustain it, and us. Impacts beyond the built environment cannot be ignored.

15. Thinking about the built environment in this holistic way is fine in theory, and I hope it might help the Committee to consider how all dimensions of the built environment contribute services that are essential to our livelihood and wellbeing. It is, though, a big step from thought to action. Is there any evidence that this approach might actually work in practice?

16. New Scandinavian housing is widely admired for the quality of its design and placemaking. In a recent article in *Built Environment*, I and Karin Krokfors, a Finnish

---

architect, have looked at case studies from Stockholm, Malmö, Copenhagen and Helsinki. Although they don’t use the term ‘built environment services’, what is evident is that an holistic approach to design and an openness to partnerships between public and private sectors has brought results that we can only envy. I have appended our ‘top ten’ learning points from the case studies. Similar ideas have been applied in other countries such as the Netherlands.

17. This was also a finding from the late Sir Peter Hall’s last book, *Good Cities, Better Lives: How Europe Discovered the Lost Art of Urbanism*, written with contributions from Nicholas Falk (Routledge, 2014), which I commend to the Committee.

18. Other propositions arise from the issues I have outlined. Some echo the findings of the Farrell Review. Others are distinct from it:

18.1. Decision-makers need to be given better skills, and better access to advisors with the skills necessary to understand the issues and come up with creative solutions. They also need good and consistent data to help them to navigate complexity.

18.2. Partners usually deliver better results than adversaries, so we should increase the amount of partnership working in the built environment and attempt to reduce the current combative nature of much of the town planning and design discourse. This entails culture change in the industry and professions and a better understanding that delivering built environment system services is a collaborative process. No one sector, profession, industry or political ideology has a monopoly, nor all the right answers.

18.3. We need an honest conversation about agency. Are local people really always the best decision-makers? When do strategic considerations outweigh local opinion?

18.4. We should not be embarrassed to regulate to reduce the impact of negative externalities and to encourage the market to innovate.

18.5. There should be stronger advocacy for the needs of those who do not yet have a place in the locality, but need one.

18.6. We should revitalize built environment education for young people. It assists with the STEM subjects but it also helps them to understand the importance of built environment services.

18.7. Faster progress is needed on the government’s side in implementing the Farrell Review. Although most of its recommendations are for the industry, the proposal that there should be a stronger cross-governmental relationship with the built environment sector would be a step towards developing an understanding of the value of built environment services. The Place Alliance is seeking to develop this relationship and the Government should respond positively, meaningfully – and emphatically cross-departmentally.
In Stockholm, Malmö and Copenhagen, strategy and policy demand that homes should be set in townscapes, landscapes and waterscapes that are both functional and beautiful. This is for reasons of wellbeing and aesthetics; but also because it enables systems that offer ease of walking and cycling, and deliver eco-system services to residents. […] We have drawn out the ‘top ten’ factors [...] which, we believe, help to explain how Scandinavia achieves the quality which makes it justly admired.

1. **Aspirational leadership from stakeholders with the leverage to insist on good design.** A senior city official, asked in 2015 for the key drivers behind Copenhagen’s housing achievements, answered clearly and simply: ‘commitment and will.’ A defining success factor in our case studies is consistent and persistent aspiration to achieve very high quality design. Those with this aspiration have not just been designers. They include civic authorities, developers, other clients, customers and the public. Ambition has been there in the early planning of projects [...]. It has carried on through delivery, enabled by tools from design competitions (particularly effective in Copenhagen) to design codes; and, as in Malmö in the recession, even when times were tough. There is often a tendency to emphasise Scandinavian municipal leadership, [...]. In fact, good design has not sprung solely from public bodies. The Malmö Dialogue, the emerging importance of co-operatives as demanding clients in Helsinki, and the interaction between city and developers in Hammarby show that leadership can come from any stakeholder with the authority to require high standards; often it is shared across sectors, sometimes by inter-organisation project teams.

2. **Building consensus, collaboration and partnerships for design quality.** Inter-organisation project teams are part of a wider process of building consensus that homes should be well designed, and forming partnerships to do so. Inevitably there were disagreements and tough negotiations between city authorities and developers in all our case studies; but Malmö’s belief that dialogue with developers would take quality to ‘the next level’ is typical of an attitude which bred agreement [...].

3. **An investment attitude.** In the majority of projects, care was taken to create long-term value and liveability [...] the long view is, demonstrably, in the minds of those behind much Scandinavian housing, as building infrastructure ahead of development [...] and arts investment show [...] In Malmö, design quality was not sacrificed when recession hit.

4. **Innovation, especially for environmental and social sustainability.** [...] innovation defines the best Scandinavian housing design (especially in Sweden and Denmark) because of its progressive integration of environmental sustainability into mainstream projects. Innovation is design-led, spanning and interlocking architecture, engineering and systems design. Where it has operated long enough to evaluate, it appears to be doing its job [...] As Copenhagen exemplifies, however, our
cities do not rest on their laurels. They design further innovation into new developments.

5. Use of contracts and compacts to secure quality, rather than relying on civic or national regulation. The way quality is guaranteed in all four cities does not rely purely on regulatory design controls like those found in the UK’s planning system. The use of contracts – usually linking the right to acquire land and build to the quality of the product; or compacts - as in Malmo’s Dialogue – ensure that what gets built is of the required standard. This is not a new practice. It goes back at least to landed estates which oversaw urban growth in parts of eighteenth century London [...] and was used by the UK’s Urban Development Corporations in the 1980s. Modern Scandinavian practice confirms the efficacy of this approach, when combined with the other factors in our ‘top ten’.

6. Application of learning to new projects. Reflection and evaluation are practiced in all four cities’ development programmes. Experience from projects has been consciously garnered to improve subsequent designs. In Hammarby and Ørestad, the two pioneering areas that we consider, shortcomings and successes have been analysed, understood and used to change later programmes. In Helsinki, the poor reception of monotonous housing design led the city to change land disposal methods to exert more leverage over innovation and quality. In Copenhagen, advances in sustainability were based, in part, on understanding the efficacy and limitations of what had gone before.

7. Integration of design elements – holistic thinking. In the best Scandinavian housing, design does not stop at the doorstep. Integrating design elements holistically improved design quality in our case studies, whether by networking area-wide environmental measures into homes; mixing land uses, public spaces and tenures to make new housing areas attractive and busy; or employing art to build new identities. [...] 

8. Use of guiding masterplans, design policies and briefs. Aspiring to quality is not the same as communicating what is needed to achieve it. The successful projects we describe were specified using governing documents which established principles, rules, standards and methods that made aspirations concrete. Standards can stifle innovation and creativity if they are not applied sensitively. [...] On the whole, though, the care taken in preparing governing documents, and their clarity, made them ideal vehicles to catalyse discussion and establish consensus about design [...] They made a valuable contribution to design outcomes.

9. Use of architects and their retention throughout projects’ lives. The projects we describe all benefited from the involvement of architects. Even in Helsinki, with its history of speculative housebuilding, developers value experienced designers. Many places (notably the UK) see much less use of architects to design housing, more application of standard products [...] and sometimes withdrawal of architects’ contracts once permission to build is obtained [...] It is no coincidence that Scandinavia gets high quality housing. Employing architects is prevalent and they see their buildings through to completion.

10. Responsiveness. Our case studies were all highly responsive to feedback and changing circumstances. Hammarby adapted to unexpected numbers of children in
the mix. Malmö used [...] processes to engage citizens and developers and respond to what they wanted. Helsinki listened to criticisms of the diversity of new housing and changed things. Copenhagen held dialogues with citizens and businesses about sustainability and design, concluding, for example, ‘that aesthetics is important [...] to securing public support for renewable energy infrastructure’ [...] This responsiveness, built-in to the majority of major projects, does not reduce design to lowest common denominators. It leads to attractive and popular solutions.

[...] Does something inherent in Nordic culture lead Scandinavians to design better housing than the rest of the world? [...] We conclude that Scandinavian norms enabled dialogues, partnerships and aspirations that produced results envied by other nations.

That does not mean that other cultures should be unable to emulate Scandinavia. Adopting some of our ‘top ten’ methods would be straightforward in any planning, design and construction environment. Others require translation and adaptation – examples being the operation of town planning systems and the powers of local government. We hope this commentary helps adaptation and encourages those who build housing to aim high.

05 September 2015
Dr Richard Simmons, Professor Mark Tewdwr-Jones and Professor Rachel Cooper – Oral evidence (QQ1-12)

Transcript to be found under Professor Rachel Cooper
Introduction.

Int.1. Consideration of The Built Environment must deal not only with structures, their design, purpose and spatial distribution but also with the green spaces within them and around them. The built environment will provide the dwellings, places of employment and the transport links plus other infrastructure including some sporting and leisure facilities but it is the green land that will provide the spaces for outdoor recreational activities ranging from active sports (formal and informal) to contemplation, so vital for the well-being of humankind, as well as improving the oxygen: carbon dioxide exchange so vital for life itself.

Int.2. Attention is drawn to a quote from Bill Bryson (a writer born in America now a UK citizen with a great love for rural England) in the Sunday Times Magazine of 27 09 2015 p.20 that “Taking the English countryside for granted --- its greatest threat. --- the things that make the landscape of Britain comely and distinctive, hedgerows, country churches, sheep roaming over windswept hills and much more, are almost entirely no longer needed and can only now rarely be justified on economic grounds and for most people in power these are the only grounds that matter;” my thinking entirely.

Int.3. As a member of CPRE (Campaign to Protect rural England) my concern is that new building should be in those areas that do least harm to the green countryside, starting with building on brownfield land. Consideration of the built environment must also consider the effects on the countryside and the need to protect that countryside that forms the setting for the built environment. CPRE has estimated that building homes on identified brownfield sites and bringing back into use empty dwellings would contribute about one and three quarter million additional dwellings, a five year supply for estimated requirements, even longer at current annual completions. Such action would give more time to plan the location of new housing and infrastructure in more appropriate locations to satisfy sustainability criteria and thereby protect the countryside.

ANSWERS to the SET QUESTIONS which are submitted separately.

Numbering 1-13 reflects the numbering of the questions)

Policymaking, integration and coordination

1.1 No, decisions that shape England’s built environment are not taken at the right level. It was a mistake to remove the strategic planning function from County Councils, so there are no overarching planning policies for wide areas of the country. Although the NPPF in para.
178 states that “Public bodies have a duty to cooperate on planning issues that cross administrative boundaries, particularly those that relate to the strategic priorities set out in para. 156” which deals with housing, employment, other commercial development, a range of infrastructure projects, health and the enhancement of the natural and historic environment including landscape, such cooperation, much less any “collaborative working” does not always take place. Local Authorities (District Councils) are vying with one another for development to meet perceived Central Government requirements or to encourage “prestige development” even when this is purely speculative.

1.2 A Government so concerned to create” urban power houses” should also consider returning strategic planning powers to County Councils via County Structure Plans, and thereby show appreciation of the interdependence of rural and urban communities. This would also provide the opportunity for planners to plan and not just react to developers’ proposals.

1.3 It is obviously inevitable that national policymakers will take and preserve a role in shaping the built environment, as this is so significant for voters. It is important that there is consistency in the approach. At present lip service is paid to the importance of local decision making, yet the Government’s demand for built development to provide housing, jobs and infrastructure, seems to encourage economic development regardless of the cost in terms of a reduction in the quality of life of the existing residents of an area. This encourages Local Authorities to “Go for Growth”, again regardless of the harm to the environment and the quality of life of their residents. It is the lack of appreciation of the spatial dimension of government policies that contributes to the feeling of being pressurised to have development at any cost. (Also para. 4.1).

2.1 In general, policy does not seem to be well coordinated across the relevant Government departments. Particularly there is no drive to develop brownfield land as a real aid to the regeneration of declining built areas, especially within many towns, nor to bring back into use unoccupied dwellings. Also new housing could be provided by investment in restoring historical sites with well-designed “enabling development”. It seems that the Treasury is involved with many Departments but does not exercise a positive coordination role, even if this would improve the” value for money” aspect of development.

2.2 Improved coordination might happen if Cabinet members and Junior Ministers discussed well researched papers that explored detailed breakdowns into housing needs and suggestions as to how these might be provided within ideas of sustainability including protecting the environment, rural and built. There must also involvement with the many Agencies onto which Government has offloaded much responsibility for development and environment protection.

National policy for planning and the built environment
3.1. Although the NPPF provides policy guidance for those involved in planning and developing the built environment, the emphasis on development expressed in para. 11 by the “presumption in favour of sustainable development” has in practice meant that despite the words of the NPPF, development proposals are paramount and so there is insufficient protection for the natural environment and in some cases not even for the built environment with a heritage aspect. The Ministerial Foreword has a rather wishful thinking content: “sustainable development is about change for the better, not only in our built environment” and he lists various areas in which there can be improvement but he does not consider that even such development can be detrimental. He writes “sustainable development is about positive growth - making economic, environmental and social progress for this and future generations. He does not consider that many developers and indeed councillors will pursue developments and make claims that the proposals are sustainable, leaving it to local groups and residents to prove that such development is not sustainable. The paragraph on neighbourhood planning misses the point that neighbourhood plans must pinpoint locations for development whether or not any development is appropriate wanted by local people for that locale.

3.2 Given CPRE ’s emphasis on brownfield development first, “Section 2 Ensuring the vitality of town centres”. Para.23 which states “local planning authorities should recognise town centres as the heart of their communities, and pursue policies to support their viability and vitality” should continue by stating “in promoting development, priority will be given to brownfield sites within the town centre and then to brownfield sites on the edge of the town centres.” The sequential test is mentioned in para.24 but as there is no appeal against a planning decision by the local authority, is easily by-passed. Thus regeneration opportunities risk being lost.

3.3 Similarly the Sections 9. “Protecting the Green Belt, 11 Conserving and enhancing the natural environment and 12 Conserving and enhancing the historic environment” contain much protection guidance e.g. para. 109 “by protecting and enhancing valued landscapes” yet it is difficult for local people to have an effective say in the designation of such landscapes, especially if they cover areas such as the foreground of the escarpment of the Kent Downs AONB and the Low Weald in Kent.

3.4 Essentially more emphasis needs to be put on protecting those elements of a place that make it attractive for living, especially now that attention is being paid to the happiness of people in England. Development pressures for large scale housing and employment buildings and the supporting infrastructure, on precious green land that not only supports food production but also serves as important leisure areas, creates anger and distress.

4.1 Yes national planning policy in England does lack a spatial perspective. There is insufficient recognition that for communities to flourish there must be an appreciation of the place occupied by those communities. Thus any development must take into consideration what and who is there already on the land in a specific place.
4.2 Having a spatial dimension would, hopefully make politicians and other decision makers more aware that planning policies apply to the real world of places where people live, work and participate in leisure activities within particular environments.

5.1 Very difficult to determine. However the 20 years for housing numbers,(now 16 years to 2031), is too long and is resulting in large areas, particularly of green land, being given planning permission for housing, when the future just cannot be determined by taking forward some past trends . Many of the housing figures are based on dubious evidence based on those past trends and assumptions about the future. Also, there is no coherent policy on phasing such development and an absence of a strategic overview. Even Communist Russia was unable to make its 5-year plans realisable because of circumstances not foreseen at the start. Even the 5 year housing bank demanded by Government is flawed since it is usually based on a proportion of the 20 year total. A return to the 10 year projections used in the Structure Plans would seem preferable to the present system and enable a more realistic appraisal of future requirements to be incorporated into Local Plans.

5.2 Those involved in the development of planning and built environment policy should be looking well into the future, but not expressing their thoughts as policy. Rather they should be concerned about the risks of assessing demand and supply for built development and the investment required.

Buildings and places: New and old

6.1 Before the Government intervenes further in addressing current issues of housing supply, in order to avoid the lack of proper coordination it is important that it has a good understanding of the complexities involved including that supply must take many forms to satisfy the variable needs of those seeking new-to-them housing. (See also 6.4 *sponsoring research). Generalizations may not cover sufficient aspects to be effective, including certain assumptions about the way people wish to live and where they wish to do that living. It is important to know that widespread owner occupation is a relatively new phenomenon and aspirations must be tempered by the reality of earnings lest sub-prime mortgage problems return. A new factor is that for some people owning a dwelling is an investment not a home. This has implications for the creation of communities with a sense of valuing a place and widens the assets gap between dwelling-owners and those renting.

6.2 Such understanding is necessary as it seems that the Government’s main role in seeking to address housing supply is to provide additional finance, especially to speed up the building of new dwellings in the affordable subsidised housing sector, most particularly on brownfield sites, often stated by developers to be more costly than greenfield sites. To increase the stock of affordable dwellings the Government must withdraw the almost blanket promise of right-to- buy for Housing Association tenants, unless they have lived in the same dwelling for, say, 15 years, or at least with the same HA, given the Government’s
“bedroom tax” encouraging tenants to downsize. It is especially important that the right to buy is not extended to affordable dwellings on rural exception sites specifically for people with a local affinity, lest this lead to creeping development in the green countryside.

6.3 So the Government should:

* clarify, and alter in necessary, its fiscal policy as regards housing:
  i. subsidies for affordable (social and first time buyer) homes and
  ii. inheritance tax levels and recipients lest the elderly “hang on” rather than downsize

* encourage, perhaps by grants, Local Authorities to take over empty properties and renovate them if necessary for rent or even sale in some circumstances

* encourage, perhaps by grants or loans, the reservation of some land within large private housing schemes for self-build dwellings

* impose penalties on the properties of “non doms”, who buy up large houses particularly in London but do not reside in them, especially when several houses are turned into one dwelling.

* allow Local Authorities to impose a full council tax on properties left empty for whom the owners are known and so not liable to be purchased for others to inhabit.

* sponsor independent research on housing demand, not only numbers but also size and location. There is now talk if not hard evidence, that older, retired people/ “empty nesters” may wish to move from the suburbs into urban areas in order to have easier access to entertainment facilities, but wish well-appointed apartments which are also well-maintained and managed. Also that many young people wish small studio or one bedroom flats close to their work in the urban areas. Thus flats may become more popular especially if the reforms encourage more building-up on existing buildings in urban areas. Greater density of occupation emphasizes the importance of well-maintained green spaces within the built environment.

6.4 The Government might also, CPRE suggests:

* give the Homes and Communities Agency, or its equivalent, greater power to redevelopment large and difficult sites

* develop a pro-active approach to identifying brownfield land with the emphasis on regenerating large sites with multiple owners.

7.1 There must be the requirement to consider of equal importance the three aspects of sustainability: economic, environmental and social, in relation to the needs for quality of life of the existing population as well as future generations. The provision of infrastructure facilities must happen alongside any built development for housing and economic development, and again the emphasis must be on retaining and indeed enhancing, where
necessary, green spaces within and outside the built environment. Hence the importance of considering the location of any additional built development in relation to its surroundings. Government must ensure that policies are upheld.

7.2 The question, will existing buildings and places be able to adapt to changing needs requires a crystal ball. Quality of the building materials would help, as would design that wins general approval. Fashions in living change, the values of quality of life may change, the demography of the population of an area is likely to change, personal and government finances will change, and all may affect the demand for the built environment and the way it is used.

7.3 The best use of existing housing stock is to seek to ensure that empty dwelling are brought into reuse as permanent ones, and that rundown housing if of sound structure, is modernised for the existing tenants or owners but is demolished and rebuild if the cost of conversion is considered unviable. There must be no further demolition simply because the housing stock was old. Also sound redundant buildings and spaces within existing buildings could be converted into dwellings. VAT on renovation and new build should be equalised, preferably for both at zero.

7.4 Similarly built environment assets may require some modernization to become more efficient, and in the case of some schools and hospitals may need to be demolished and rebuilt with improvements. There might also be the opportunity to use some of the land for additional building providing the green space provision was not compromised. Government funding may be required.

8.1 No, optimum use is not made of the historic environment, which can give character and value to a particular place. When plans are submitted for “enabling development” on historic sites, much of the promised restoration of the historic attraction is “mislaid”. In urban, suburban and village streets again some of the new build is out of keeping with the street scene in a desire to be “modern”. New build in Conservation Areas should be more strictly controlled. For many people, the recognition of the heritage aspects of their living space is important.

8.2 So even for “national assets” local views are very important, as they will show the value to the community of its historical buildings and other features. The Government can help by ensuring that Agencies dealing with historical sites have the funding to appraise properly development proposals. Within the built environment additional funding to restore and renovate historic assets would increase the character of that place and encourage a view that the past that has shaped individuals, communities and the country matters as well as the present and the future.

**Skills and Design.**

9.1. The skills may well be there, either directly employed by Councils, or through the use of consultants, but in so many instances the will may be lacking as there is no indication that
the built environment is considered in a holistic manner, merely piecemeal according to the wishes of senior officers and members. Few Council planners actually plan but are reactive to developers’ proposals. So skills may not be the issue, rather the pursuit of specific outcomes. This is compounded by the comments of qualified professionals on planning applications, as it sometimes seems that their professional appraisal of a situation is governed by the developer’s brief. There is an increasing assumption that no information is independently provided.

9.2 As it is members who are supposed to look after the interests of their residents, especially quality of life issues, more training for those members on the wide range of matters to take into account in determining planning applications, large and small might enable members to challenge officers reasoning and so produce better planning for the District. Also required is consultation with the residents whereby information is given to residents and groups and responses are listened to and digested by councillors and officers. (see para 12.2). Funding for training should be incorporated into Local Authority budgets from Government.

10.1 Not certain high quality design and “place making” can be created just at the national level. The significance of a place is its location in a particular area. Even if the building or feature is of national significance it still should fit into its surroundings, urban and rural. The perception of good design is personal, so function and cost must also be a consideration. Any additions to the built environment must be “fit for purpose” and meet all the sustainability criteria. National leadership should be involved if additional funding would improve the usage of the proposed building and protection for the surrounding environment.

Community involvement and community impact

11.1 No, and so there is a requirement for acceptable high standards of building materials and design coupled with protection for and enhanced maintenance of the green spaces within the built environment and protection of the green land around and beyond.

11.2 Behaviour within communities, a subject on which there is much pontification without always good evidence, seems to be related to the extent to which people feel they have a stake in what is happening within and around their community, varying from a street or small housing estate to a parish or even a town. That stake may take the form of active involvement in decision making or just taking pride in living in that place. One way of encouraging that pride is ensuring that community facilities are available and are well maintained, as that encourages local people to protect those facilities by acknowledging their value to the community. Such community involvement requires funding and even if some comes from the community itself or from donations, some government funding, often at a local level is necessary, to establish creditably.
12.1 Not very, since at present many local authorities pay little heed to local groups or individuals, not even to elected Parish and Town Councils. Yes, developers hold public meetings to show off their prospective development proposals but rarely indicate the degree of opposition.

12.2 A barrier to effective public engagement is not only time but the feeling that the “planning powers” ignore any representations from the public as individuals or groups. More proper consultation (see para.9.2) is required. It is assumed that Government devised Neighbourhood Plans as a means of providing effective community involvement in the planning of built development in an area. So far these have had limited interest from the relevant Local Authorities, and seem top down as the main decisions are on where development amount already proposed by the LA should be located. Resisting proposed built development is hard given the Government’s push for such development. Government should allow local communities more freedom to reject development proposals, especially where locals feel swamped by the proposed new built development.

12.3 One aspect of the planning procedure that would help to encourage effective public engagement would be to allow an appeal to the Planning Inspectorate/relevant Secretary of State against a decision by the Local Planning Authority.

Financial Measures.

13.1 By increasing the grant to Local Authorities/Housing Associations to enable more affordable housing to be built especially on brownfield land, with a higher subsidy if the land is contaminated; by providing some funding for bringing permanently empty housing into new permanent usage. Government must recognise that additional housing cannot be achieved without some Government investment in that provision. Also refer back to Paras. 6.2 p.4, 7.3 and 7.4 pp 4 and 5.

13.2 Probably by LPAs refusing development considered to have poor design of buildings and layout, after local as well as professional consultation. However some LPAs are reluctant to do so because of the cost of appeals. Local Government funding levels again an issue.

13.3 Place-making would require the provision of additional high quality community facilities commensurate with the expected increase in residents. Developers must make a financial contribution and that money should be spent on those community facilities. The ability of LPAs to spend developer contributions elsewhere needs to be curtailed, so the former 106 Agreements system should be reinstated. There must be a clear direction by Planning Authorities of the amount of any levy and the quality of the infrastructure to be funded, commensurate with financial viability, but the final say must be: no infrastructure provision no addition to the built housing environment.
This submission is from Social Life, a centre of expertise in placemaking and social sustainability, established by the Young Foundation in 2012.

About Social Life
All of Social Life’s projects are about the relationship between people and the places they live in. We specialise in work that explores the social outcomes of regeneration and development, understanding the social dynamics of places and how residents, local businesses and community-based organisations are affected by change. We work with local authorities, public agencies, community organisations, planners, developers and housing providers in the UK and internationally. More examples of Social Life’s recent work are included in an appendix.

Background: Social Life’s approach to social sustainability
Social Life has developed a framework for social sustainability - sitting alongside environmental and economic sustainability - which is applied in all our work. We believe that this can be a powerful way of helping built environment professionals and agencies think creatively and effectively about what they do. Our thinking on social sustainability frames our response to this call for evidence.

Our social sustainability framework originated in a commission from the Homes and Communities Agency (HAC) in 2010 to audit what was known about what makes places thrive. It was originally published on the Future Communities website (http://www.futurecommunities.net/), developed by the Social Life team and hosted by HCA.

A small, but growing, movement of architects, planners, developers, housing associations and local authorities are advocating a more ‘social’ approach to planning, constructing and managing cities. They are increasingly using the language of social sustainability to frame decisions about urban development, regeneration and housing, as part of a burgeoning policy debate about the sustainability and resilience of cities.

Social sustainability is one of the three pillars of sustainable development, first articulated by the Brundtland commission in 1887.

“Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs”.

Social, economic and environmental sustainability are familiar terms. Social sustainability has often been overlooked in comparison to the other two elements, being less easy to understand, quantify and action. However, social sustainability is now emerging as a new strand of discourse within sustainable development internationally. This is in response to the dominance of environmental concerns and technological solutions in urban development and the lack of progress in tackling inequality, displacement, liveability and growing needs for affordable housing in urban areas. In the UK, a combination of fiscal austerity, public sector budget cuts, rising housing need, and public and political concern about the social
outcomes of regeneration schemes are focusing attention on the relationship between urban development, quality of life and opportunities.

Much is known about the importance of the quality of the built environment and community facilities, and how these contribute to residents’ satisfaction and wellbeing. There is less understanding however, about the practical steps that can be taken to make these aspirations tangible; about what can be done in practice.

Social Life’s definition of social sustainability is:

"a process for creating sustainable, successful places that promote wellbeing, by understanding what people need from the places they live and work. Social sustainability combines design of the physical realm with design of the social world – infrastructure to support social and cultural life, social amenities, systems for citizen engagement and space for people and places to evolve."

Social Life’s framework has been developed to help understand how the idea of social sustainability can be applied to different places. It is intended to be used as a flexible tool, what sits within the different elements of the framework will vary between context, for example people living in rural and urban areas will have different needs in terms of transport and infrastructure.

The diagrams below show Social Life’s framework. When this is used on existing communities and area regeneration schemes we put a greater emphasis on adaptability and resilience under “space to grow”.

Social Life’s social sustainability framework: for new housing developments
Responses to the Select Committee’s questions
We have addressed the questions where our work has given us a particularly valuable perspective.

National policy for planning and the built environment
Q 3 Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

The NPPF has increased the focus on sustainability within planning and design for the built environment, and this is welcome. However “sustainability” in practice tends to be interpreted as environmental sustainability, or (less frequently but still commonly) economic sustainability. Social sustainability – how the physical environment supports resident wellbeing and community strengths – features less often within the language of planning officers or committees, or within planning applications.

Social Life’s work has demonstrated that social sustainability can be “built” into new housing developments, by carefully considering the relationship between the existing and planned developments – for example whether community facilities can be shared, whether social relationships between different groups of residents can be fostered; by careful provision of new facilities and shared spaces; and ensuring that design brings people from different groups and backgrounds together rather than encouraging them to live separate experiences.

We have worked with private sector developers and housing associations to explore how social sustainability can become part of their thinking about new development. For example, for The Berkeley Group we have developed a method for carrying out “early stage” social sustainability assessments of their planned developments, interrogating plans to explore their social aspects would and how these aspects can be strengthened. For Notting Hill Housing we have devised a monitoring framework for their regeneration of the Aylesbury estate in Southwark which measures key social sustainability indicators, including residents’ sense of belonging, wellbeing, their relationships with their neighbours, fear of crime and community cohesion.

The NPPF should be strengthened to put a greater emphasis on social sustainability and how this can be accelerated. We believe that government, the HCA, and local authorities could take a leading role in promoting the importance of social sustainability and the approaches that can work to boost it.

The diagram below, “the building blocks for social sustainability”, gives some examples of tangible, mainly low cost practical measures that can boost social sustainability.
Buildung blocks for social sustainability: from Design for Social Sustainability (Social Life, 2012)

Buildings and places: New and old

Q6 How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

Our social sustainability framework includes a focus on what we call “space to grow”, which encompasses the capacity of local neighbourhoods to flex in the face of change. This might be in response to changing demands from people who use the space - for example the
demand for cycle routes and community gardens is far greater now than a decade ago; or to improve the use of spaces and facilities – for example making new pathways or creating new community buildings; or in response to residents demands or wishes for change.

The places that are best loved are often those that have evolved over years, and places that are over designed and rigid may not thrive in the future. There can be a danger within masterplanning processes that places become over specified and inflexible. Our experience is that developers across sectors can be reluctant to leave flexibility developments fearing that this will be seen as “messy” by potential residents, both buyers and renters. However the wish to pin down all aspects of the built environment, including shared spaces and landscaping, can backfire when no flexibility is allowed. For example, we worked on one development where more children moved into the new apartments flats than anticipated, overwhelming the limited play provision and creating noise and nuisance problems for others. However there was very limited flexibility within the design to provide the play provision that was needed.

Skills and design

Q9 Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

We believe that planners, architects, developers and other built environment professionals have much more skill, expertise and experience in considering the “hard” or tangible aspects of the built environment than the social dimensions. There is a substantial literature and breadth of experience in the UK about creating places that work for residents, from the utopian developments of the 19th century, like Saltaire near Leeds, or Ebeneezer Howard’s garden cities, to the New Towns after 1945 and the thinking behind the mass housing of the 1960s and 1970s. Although not all these experiments worked, many did succeed socially (including some of the much maligned 1960s and 1970s council estates) and consequently a great deal has been learnt about how to design the social fabric. However built environment professionals are often unaware of the importance of this and of the knowledge and experience that exists. This is also true of local authority housing and planning departments.

Professional bodies – from the RPTI to RIBA, the Nat Fed and the HCA – should put a greater emphasis on the social dimensions of place in their training and accreditation.

Community involvement and community impact

Q11 Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

We believe that our social sustainability framework provides a good starting point for thinking about the impact of the built environment on the people who live and work in it. It
was developed as a framework for planning and reviewing places, rather than a prescriptive framework. It is impossible to prescribe what social sustainability will look like in different places - when we use our framework to train built environment professionals – for example in the professional practice sessions we deliver for the Barn wood Trust in Gloucester – we emphasise the need to consider what should be in place in each dimension of our framework (amenities & infrastructure, social & cultural life, voice & influence, space to grow) and what will work in each area.

Places that promote good neighbourly relationships, that feel comfortable to be in, that encourage people to use outside spaces for exercise and leisure and that feel safe and welcoming are more likely to improve mental and physical health than hostile unfriendly environment.

Q12 How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

It is often very difficult for communities to engage with decision making. Some issues – like the seemingly long timescales for developments to be planned and built – are difficult to overcome. But others can be tackled – for example making sure that plans are communicated accessibly in writing and through visualisations, and using best practice in engagement. The Social Life team, whilst at the Young Foundation, wrote the HCA’s community engagement guidelines, we believe that this and other good practice tools are readily available and should be the minimum expected practice (sadly this is not currently the case).

Social Life believes that communities should be able to, and encouraged to, shape their built environment and that places that work with the grain of existing communities are most likely to work in the long term. In thinking about new developments, the focus is often on the future, on new provision, rather than the people living in the area. However current residents are the link between the planned future and present and plans are weakened when their needs and experience are not fully taken into account.

One of the aspects that hampers community engagement is the declining amount of support for communities through dedicated community development workers, planning aid centres or other independent advice. When communities are not supported with good quality advice and information they may find it more difficult to engage constructively with plans, often debates between agencies advocating new development and communities become strained and mutually untrusting.

Communities will be most likely to engage with local discussions about development when they feel that their assets are recognised. It is important that decisions about the built environment, whether for regeneration schemes or new build, pay attention to conserving what is working now. Some low income communities, including big council estates, are home to complex social networks and support networks that help people facing difficult life circumstances to thrive. When estates are demolished, these networks are demolished as
well, and more care than is often now the case needs to be paid to preserving local social assets.

APPENDIX

Social Life’s recent work

- For **Notting Hill Housing** (in partnership with Southwark Council) we are monitoring the impact of the regeneration of the Aylesbury estate in Southwark, and over the summer of 2014 carried out an initial benchmarking exercise. For **Countryside Properties and L&Q**, we are also developing a social outcomes measurement framework to assess the impact of regeneration at South Acton.

- For the **Berkeley Group** we have developed a metrics framework to measure the social sustainability of their new developments, which has now been mainstreamed across the business. This includes assessments of developments that have been completed, those that are at the mid-point, and those that have yet to get planning consent. This work has been on-going since 2012.

- For **Grainger**, we are developing a comprehensive social and economic sustainability for their new Wellesley development in Aldershot.

- We are advising the **Realdania Foundation** in Denmark about their place based collective impact programmers.

- For **Hounslow Council** we are developing a data framework that will enable them to measure wellbeing and community resilience in Hounslow’s neighbourhoods, and for **Sutton Council**, we have developed a social sustainability toolkit that will enable their officers to assess how well Sutton’s neighbourhoods are thriving, piloting this in Beddington in the south of the borough.

- For **Lambeth Council** we have carried out community development and options development for two estate regeneration schemes.

- For **London & Quadrant** housing association, we have assessed the social value of shared courtyards and garden spaces on four housing developments.

- For **Wandsworth Arts Team** (part of LB Wandsworth) we carried out a viability study in 2014 for a community arts hub as part of the regeneration of the Alton Estate in Roehampton.

- For **Brixton Green**, a mutually owned organisation set up to regenerate a vacant parcel of land in Brixton, we convened a series of deliberative workshops to develop plans for Somerleyton Road, a poorly used site in central Brixton.

- For the **Royal Society of Arts (RSA)**, we wrote a report in their “Plugging the gap” series, published in 2013, exploring how local services can continue to meet needs in a time of austerity, focusing on low-cost ways to support people living in places most affected by the collapse of local economies.
With Cisco Systems, we set up the Social Life of Cities collaborative, which brings together cities interested in exploring how their strategic plans can better fit with the complexities of residents’ lived experience. Our early work in Chicago, supported by the University of Chicago, explored how digital technology could boost community resilience in the deprived areas of Chicago’s south side. We are now taking this forward with SIX – the Social Innovation Exchange – looking at how participatory mapping can be used as a tool for innovation and inclusive placemaking.

06 October 2015
Stelling Minnis Parish Council – Written Evidence (BEN0093)

Policymaking, integration and coordination

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

1 More notice needs to be taken of the views of Parish and Town Councils. They have the local knowledge and are more in touch with local people and their views.

2 District and City Councils (the planning authorities) need to be more accessible for discussion and should take more notice of issues raised by Parish and Town Councils on any given planning application. Little account seems to be taken of the wider transport and infrastructure needs when considering planning applications, especially at local level. The granting of permission for a large development in one authorities area can have serious impacts on adjacent authorities’ areas, which are not always taken into account.

National policy for planning and the built environment

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

3 The NPPF guidance should be just that. Local planning authorities should be required to apply common sense, in consultation with Town and Parish Councils, to apply variations to the NPPF or their own local policies, to meet local needs or requirements.

4 The effect of introducing a spatial element to national policy, whilst desirable to meet local needs, could lead to precedents being applied to places where they would not be acceptable; nevertheless some flexibility or latitude is desirable.
5. The time scale should be at least 30 years or whatever timescale is actually required to access the impact of the proposals and plan for infrastructure including water, railways, roads, telecommunications and other matters which themselves have long lead times to bring to fruition.

Buildings and places: New and old

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

6a. All developments, of more than just a few residential dwellings, should have land set aside for the provision of small, low cost and affordable, homes for single people and couples before permission is given to build. There are now more single people living on their own than any other time in history.

6b. Before any planning permission is granted, there should be an investigation into whether there is the necessary infrastructure to support the new buildings/homes.

7a. Attention should be given to empty/rundown accommodation and the owners made to either improve, if finances are available, or sell if they are not, if those buildings are in area(s) where homes are still being sought.

7b. Brownfield sites should be considered for development before spreading onto Greenfield sites or the Green Belt. Perhaps tax advantages could be used as an incentive?

Skills and design

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?
9  Not sure that local planners do have the skills to consider the built environment in a holistic manner. This could be addressed by training individuals or more effectively, efficiently and economically be utilising expertise on agency basis to advise on the wider impact that developments would have on the environment.

10  No views on this question.

Community involvement and community impact
11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

11  In short the answer is no. Consideration would be improved by consultation with the local communities through their Town and Parish Councils, whose views should carry more weight than they do currently. It is local people and their Town and Parish Councils who are best placed to understand how a particular development will affect them and their environment.

12  Not very effectively. Again this could be addresses by taking more notice of the Town and Parish Councils views. Better awareness of potential developments to local people by use of modern communications, top down, should be considered. For example the publication of planning application summaries should become part of the audit transparency requirements for Town and Parish Councils.

Financial measures

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

13a  Tax advantages, waiving of capital gains and/or government contributions should be considered as a way of overcoming any financial restrictions on housing and land supply.

13b  If planning permission conditions made developers responsible for financing the required infrastructure associated with any development, then Brown Field sites would be more attractive than sites out of town.

Stockport Metropolitan Borough Council and Arun District Council – Oral Evidence (QQ208-223)

Transcript to be found under Arun District Council
SELECT COMMITTEE ON NATIONAL POLICY FOR THE BUILT ENVIRONMENT

Call for Written Evidence — Submission by Stop Smart Meters! UK

[001] Q1: Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

[002] SSM! UK: Not in some cases. A clear example of where decision making is not taken at the right administrative level is in relation to the placing of mobile phone cell towers and antenna arrays. For example, it is our understand that under current legislation, local authorities and communities are blocked from preventing the installation or expansion of cell towers due to health risk concerns. As more than 5,000 scientific studies now show, these concerns are bona fide and growing — a fact supported by the WHO-IARC’s 2011 classification of RF emissions from mobile phones and other wireless devices, e.g. ‘Smart’ Meters, WiFi routers and other so-called ‘Smart’ technologies, as Class “2B Possible Carcinogens.

[003] As a result, not only are the hands of every community in the UK tied to the Government’s blanket decision to block prevention of cell tower installation, the Government has implicitly tied itself to liability for any harm that may be caused.

[004] Given the increasingly wide-spread deployment of such technologies, this arguably represents a significant threat in terms of public health impacts, financial compensation, remediation and redevelopment and so those shaping England’s Build Environments must now play a proactive, precautionary role. The stakes could not be higher. For example, it has been suggested — by eminent scientific researchers and medical doctors — that the consequences associated with chronic exposure to wireless radiation at certain levels could have inter-generation impacts on fertility, reproduction and genetic heredity. Critics of presently supported “safety limits” for RF exposure in the UK have included Noble Prize co-winner Dr Devra Davis of the National Institute for Environmental Health in the United States. The Parliamentary Assembly of the Council of Europe also voted against the UK’s RF standards in 2008, labelling them “obsolete” and out of date. These standards, however, remain active.

[005] Q2: How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

[006] SSM! UK: If policy associated with housing, design, transport, infrastructure, sustainability and heritage does not involve engagement with functional, informed and
responsible departments that are fully briefed and accountable for the apparent health and privacy risks of digital technologies, then not well enough.

[007] Policy creation for the application of digital technologies — whilst offering great potential in some respects — is failing to grapple with the health impacts of artificial, electromagnetic EL- and RF-fields, e.g. handheld wireless devices, routers and cell towers, as well as other important human rights imperatives such as individuals’ rights to privacy, data and cyber security. Built Environment policy must take all of these issues into account.

[008] Departmental consultation should also involve the public — the people who will actually have to live and contend with the consequences of centralised policy-making.

[009] Q3: Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

[010] SSM! UK: No comment.

[011] Q4: Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

[012] SSM! UK: No comment.

[013] Q5: Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

[014] SSM! UK: Time is absolutely of the essence for this Committee consultation. The optimum timescale for planning is now — and should have at its core the need to be precautionary in the face of new scientific understanding.

[015] Planning which includes consideration of the impacts of RF radiation on both individuals who are sensitive (EHS) and who are not immediately sensitive to artificial wireless frequencies (but who are nonetheless still affected by them at a biological level) must happen right away. It is already late in the day for this kind of activity to happen but the consequences of not doing so now are of potentially huge significance and severity.

[016] With respect to the consideration of EMF safety, planning should account for the generations yet unborn. They have no voice, yet it is today’s policy that they will inherit and face the consequences of— good and bad. There is little point in shooting for the stars with innovative Built Environments if we have no future generations to fully live in, work in and enjoy them. There will be no second chance to take a precautionary approach to unproven, artificial EMF technology proliferation.
[017] Q6: What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

[018] **SSM UK**: No comment.

[019] Q7: How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

[020] **SSM UK**: When one calculates the need for sustainability, the formula tends to begin with protection of the environment and its resources. But the inhabitants and neighbours of Built Environments must also be considered. Humans, animals, insects and plant life are dependent on suitable, harmonious and responsible Built Environment planning. They cannot be placed at risk until mainstream scientific dogma finally catches up with those who are making significant leaps in our understanding of electromagnetic in living organisms and their susceptibility to interference from artificial EMF pollution.

[021] More than 5,000 studies now show that artificial electromagnetic pollutions from wireless technologies such as cell towers/mobile phone masts can have a substantial impact on the health and well-being of people, animals and plant life. Many of those studies are peer-reviewed, replicated and include clear evidence of mechanistic pathways that explain not only what harm is caused by non-ionising EM fields, but how harm is caused, e.g. Prof Martin Pall, 2013.

[022] Existing housing stock and build environments must be factored into a purposeful and sustainable approach to EMFs and the Built Environment for the viability of this stock to be maintained.

[023] Q8: To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

[024] **SSM UK**: Historic environments should set examples for how innovation, sustainability and precautionary approaches to safeguard environmental and human well-being can combine successfully.

[025] Q9: Do the professions involved in this area (e.g. planners, surveyors, architects, engineers, etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?
SSM! UK: No. Professionals working in this area are not bio-physicists and have no understanding of this issue in a professional capacity. And they have little recourse to public health agencies in the UK which maintain out-of-date and obsolete EMF safety standards. Most notably, Public Health England — tasked with protecting the public from artificial EM fields — takes its lead on EMF safety from ICNIRP — a private industry group that has no official accountability to any governmental authorities. And ICNIRP’s guidelines on EMF are very much in question — as mentioned earlier, PACE voted these standards as “obsolete” in 2008, yet they are still in use in the UK. Even ICNIRP’s former chairman, Paulo Vecchio, warned that ICNIRP’s guidelines are not “defensive walls for Governments to hide behind” nor are they “the final word” on EMF safety.

On the contrary, in fact. These standards take little if any account for non-thermal effects of non-ionising radiation, something that is now a matter of scientific double-think as approaches to diseases like Alzheimer’s disease apply pulsed, non-thermal applications of ultrasound to effect biological changes on neurophysiological plaques. These approaches simply would not be possible, let alone shown to work, if non-ionising radiation only effected humans when heating occurs.

Consequently, we find ourselves in a situation where most of the professionals designing and constructing “Built Environments” have no knowledge of the risks and effects of artificial electromagnetic fields. And possibly without presently knowing it, they themselves have little recourse or reliable advice from authorities asleep at the wheel on the issue of EMF.

The issue of accountability in this discussion, then, is evidently a troubling one; but more troubling is the potential extent of the damage that might be done to those occupying, working, living in or near to the UK’s current and future Built Environments where this issue of artificial EMF remains unchecked. Artificial EMF pollution is missing from the conversation. It needs to be added.

Q10: Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

SSM! UK: Britain has an opportunity to move from a very poor performer in relation to EMF safety to being a global leader. The tools and techniques that it employs moving forward for designing environments that are not only high-quality but suitable for long-term human occupation and ‘place-being’ must include a recognition that there is an awakening to a wide-spread understanding of the role of electromagnetic fields in both positive health and disease.

Tools and techniques at present do not include this understanding. But they could do and they should do. If we are to move forwards with a responsibility to guarantee the safety of both adults and children alike — something that is required under the Children’s
Act 1989 — we will do. To not do so would be negligent and ignorant of a substantial and growing body of high-quality, credible, peer-reviewed scientific research.

[034] Q11: Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

[035] **SSM! UK**: Please firstly see answer to Q10.

[036] In relation to mental health, it has been shown that artificial electromagnetic fields can lead to adverse cognitive impacts as well as stimulating emotional changes in the state of mind of some subjects. Research in this area was lead by the military in the 1960s and 1970s and resulted in assertions that in excess of 100 different mental and physical symptoms can be caused by exposure to non-thermal, artificial electromagnetic fields that are increasingly abundant in Built Environments.

[037] Q12: How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

[038] The voices of individuals and communities are entirely absent from the table at which exposure to artificial EMFs are discussed and decided up. This represents a huge omission — and one that may come home to roost soon as the understand of how artificial electromagnetic fields impact upon living organisms. Thousands of peer-reviewed scientific papers now show that EMF exposures that are now in wide-spread use across our Built Environments cause harm. New papers are also now available which show that this harm is manifested in repeatable and predictable ways.

[039] Present legislation prevents communities from blocking cell tower proliferation. Energy policy currently supports the national roll-out of ‘Smart’ Meters despite emerging evidence of harm. People’s personal spaces at home are violated without permission by increasingly powerful cell towers, street-level wireless routers, ‘smart’ meters and WiFi hubs from neighbouring homes. The issue of accountability therefore lies with those making and enforcing the policy. This consultation is therefore timely and crucially important.

[041] Q13: Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

[042] **SSM! UK**: Yes. There is a significant financial incentive for design and place-making to take account of the existing and growing body of evidence showing harm from artificial electromagnetic fields. This applies to both government and private sector developers who,
when deploying potentially harmful wireless technologies, run the risk of needing to pay large financial compensation to victims.

[043] This issue was highlighted in 2012 when a court in Brescia, Italy, ruled that a company director’s brain tumour was caused by use of a company mobile phone. He was awarded compensation.

[044] The floodgates to more cases are open and in view.

6 October 2015
Teresa Strachan, Newcastle University, School of Architecture Planning and Landscape – Written Evidence (BEN0173)

Teresa Strachan, Newcastle University, School of Architecture Planning and Landscape – Written Evidence (BEN0173)

Evidence Presented by Teresa Strachan, Professional Practice Tutor, on behalf of the School of Architecture Planning and Landscape, Newcastle University

Question 12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

1.0 Research undertaken by students of town planning at Newcastle University since the autumn of 2012 has explored the extent to which young people feel that they can influence the planning decisions that affect their local environments. This group of students has worked with young people ranging from eight to twenty years of age, in a variety of settings and with different gatekeepers to supervise. The research began with a questionnaire that was completed by fifty 13 and 14 year olds from a school in a Northumberland market town and by fifty 13 and 14 year olds from a school in Newcastle Upon Tyne. Below is a summary of the group’s findings.

Figure 1: Is it important for young people to have a say in their local area?

![Figure 1](image)

Source: Stephenson, B., 2013

2.0 Thirty-six of the one hundred young people said that they should have a say in planning decisions because they live in the area that is being planned. Twenty young people stated that it was only fair in terms of equality of rights that they should be consulted. Only one
young person stated that they felt that young people wanted change so should be consulted for their ideas and input. This correlates with subsequent research by the team with other groups of young people who indicate that they are less inclined to be suggesting any change to their environment, but are only seeking inclusion in a decision making process.

Figure 2: Why young people should or shouldn’t have a say

Source: Stephenson, B., 2013

3.0 Those who said that they shouldn’t have a say gave the following reasons:

“kids could say things that’s never going to happen whereas adults have better and reasonable ideas” (Rural Male 1)

“because they might make stupid ideas but it would be like how they want it to be” (Urban Female 1)

“young people don’t generally know what they want” (Urban Male 1)

4.0 When the young people were asked if they wanted to know more about town planning in their area, 57% responded positively (rural young people 74.5% and urban young people 38.5%).

Figure 3. Do you want to know more about town planning in your area?
5.0 The young people were asked about which of the suggested ‘values’ were true of young people and their local areas. Seventy three percent of young people stated that it was very important for them to feel safe in their local area.
Whilst ‘feeling safe’ was indicated as being a common value for the young people, there was a lack of time in the project to explore their interpretation of this concept. Subsequent workshops with other groups of young people have clearly highlighted their concern for antisocial behaviour and the fear of crime that stems from this.

6.0 When asked about the barriers to getting involved in local decision making and planning, the young people made the following observations:

“**Adults don’t think we’re responsible enough**”

“**Adults won’t listen**”

“**ADULTS, their views get talked about but ours get ignored**”

“**Because they (adults) don’t ask us because they forget about our age people**”

This initial research has led to further work with young people to identify methods in which town planning students can begin a dialogue about town planning through the activities in an engagement toolkit (available on the Newcastle University website: http://toolkit.ncl.ac.uk/resource/planning-future-toolkit-engaging-young-people-town-planning). There is clearly a desire amongst young people for them to get involved and their attachment and value for the local area is unquestionable. Ensuring that young people’s views reach the decision makers and feeds into a planning process remains a considerable challenge.

09 October 2015
Dear Sirs

National Policy for the Built Environment Call for Written Evidence

Introduction

SPS is a non-political, independent, self-funding charity that was established in 1929. Its charitable objects are to “promote the conservation, protection and improvement of Suffolk’s physical and natural environment for the public benefit by ensuring any change is undertaken sympathetically and to the highest level of design and sustainability possible”. It also acts as the CPRE county branch in Suffolk.

Suffolk’s built heritage, its historic buildings, conservation areas, diverse landscapes and the sustainability of its communities are a major part of the SPS’s work in protecting what is fundamentally important in and to the County. The county has over 13,200 listed buildings and nearly 150 conservation areas as well as important historic parks, gardens, cemeteries and other historic landscapes.

Scrutiny of planning applications that affect heritage assets are a particular focus in helping to deliver a County with rich and varied townscapes and landscapes that communities have pride in and that respect its vernacular past. SPS campaigns on important development issues which affect its remit and we work constructively with the county and local planning authorities and other relevant statutory agencies and bodies to help achieve better outcomes in planning and the management of our historic natural and built environment. SPS works and promotes co-operation with other groups whose objects are consistent with its own including town and parish councils and local amenity societies on common issues.

Policymaking, Integration and Co-ordination

Evidence on the ground in Suffolk indicates that the Government’s commitment to stimulating housing supply is failing to deliver high quality places in appropriate locations. Current planning policy has sought to deliver quantity at the expense of quality and failed because too often the market has not delivered the right kind of housing in the right places at the right price. This has been exacerbated by de-skilling and a loss of capacity in the building industry leading to utilitarian construction and a failure to deliver distinctive places. Underfunding of local authority skilled staff and imposition of artificial and often unachievable housing targets are also contributory factors. The government needs to redress
i. the balance; less of the top-down approach and give lpa’s the tools, highly skilled staff and ability to invest in social housing, to address the acute shortage of homes combined with devolved powers to communities through improved delivery of Neighbourhood Plans. Highway Authorities frequently lack urban design skills and how these contribute to attractive place-making. This militates against good built environment outcomes. Furthermore, Highway Authorities frequently are located at county level (where services have not been outsourced) and are frequently divorced from district planning departments who need to ensure an appropriate local context for development is achieved. Transport proposals should be subject to planning permission and undergo extensive public scrutiny and appraisal. The detailed design work of highway departments should be much better integrated into the heart of the development management process and for development schemes – particularly large residential developments and urban extensions – should be located at district/borough level. This would ensure that transportation and development agendas are dovetailed to deliver genuinely sustainable transport schemes that are compatible with high quality built environments. Furthermore, Manual for Streets guidance should be elevated in status and adopted as policy not just advanced as good practice.

ii. National Policy for planning and the built environment

iii. The NPPF is predicated on the principle of achieving sustainable development but it is not always clear that the stated balance that needs to be achieved between economic, environmental and social factors (NPPF paragraph 7) is evident in practice, with far more emphasis on economic aspects at the expense of the other two. The SPS and CPRE campaigned effectively to ensure that the intrinsic beauty of small towns, villages and the countryside was acknowledged in the Framework. Nevertheless, the five year housing land supply policy has distorted the planning process and inevitably the pressure for development in inappropriate places has irrevocably undermined both the credibility of the planning profession to adequately protect these attributes and by extension the special rural qualities of Suffolk. In those districts where there has been a delay in adopting a Local Plan (Suffolk Coastal and Forest Heath), we have witnessed an “open season” of speculative developments that are uncoordinated, fail to meet the local housing need and fail to provide the necessary infrastructure. Since the introduction of the NPPF in March 2012 parts of the county have been the subject of unprecedented development pressure. Insufficient clarity around housing need has resulted in delays to plan preparation and has created opportunities for developers to cynically challenge adopted housing figures, which has left lpa’s vulnerable to inappropriate development in form, scale and location. In turn, the statutory duties to protect the historic natural and built environment have been undermined by this policy vacuum with more emphasis on the economics of development than on cultural and social values and sustainability criteria to the detriment of the county. Furthermore, the NPPF gives inadequate weight to requiring good design which is vague and very hard for lpa’s to defend. A clearer policy framework to support good design is required.
including greater weight to the work of Design Review Panels and the requirement to take expert design advice and clearly demonstrate that it has been taken into account in approved schemes.

iv. -

v. The current timescales which dominate planning making decisions are the 5 year housing land supply and the duration of the Local Plan. However, increasingly the five year housing land supply figures are distorted by the transient market conditions which affect viability. Councils need clearer guidance on methodology to assess housing requirements, not least in assessing viability and the extent to which affordable housing can be delivered. Increased transparency is required regarding housing need and how it is calculated, which must be detached from commercial interests of developers and not tied to the short term vagaries of the market. A clearer and transparent definition of housing need is essential to ensure that the brownfield sites are developed preferentially and developer contributions to infrastructure are made fairly and that transient economic up/downturns are not used to distort deliverability of much needed housing.

**Buildings and places: New and old**

vi. The Government should continue to support local authority commitment to the prioritisation of new homes developed on brownfield before greenfield. It is essential that a co-ordinated database of all brownfield sites should be put in place, and local authorities should be required to submit annual returns in order to ensure a reliable data set of brownland that is available for housing. It is regrettable that a requirement to prepare a regularly updated register of brownfield land was abolished by a previous government, and should be reintroduced. The current system of SHLAA’s is developer led and does not accurately capture all available brownfield sites and in short is not consistent, coherent or comprehensive.

The recent planning reforms to allow Starter Homes to be built on rural exception sites raises concern as it may result in a net loss of affordable housing when Starter Homes can be sold on the open market after 5 years, unlike affordable housing, which currently is held in perpetuity by housing associations. This reform represents a potential risk of further loss of affordable housing in rural areas, and this may be exacerbated if housing associations are required to sell off their properties under Right to Buy proposals.

The shortage of resources in LPA’s is likely to have implications for the delivery of Local Development Orders on brownfield sites. It will be necessary for developers to share the cost burden of drafting LDO’s in order to make this mechanism effective.

vii. Sustainable and resilient built environments flow from building high quality homes in locations where people want to be, close to work, family and amenities and not
characterised by high density living, generic anonymous design and over reliance upon the car. The government must commit to requiring local authorities to fund highly skilled design and conservation staff who in turn will promote the agenda for quality of place. This is a pre-requisite for translating the government’s commitment to delivering new homes into the creation of high quality places where people want to live. In the last decade the planning profession has been reduced to providing building stock at the expense of creating sustainable, beautiful places that are conducive to a high standard of wellbeing.

viii. The historic environment is a huge driver of economic regeneration and quality place making. The chronic decline of heritage professionals from planning departments since 2006 (30% according to IHBC research for English Heritage/Historic England) has meant that this resource of precious historic buildings and conservation areas cannot be properly protected or adequately managed and many opportunities to regenerate historic areas and buildings is lost. The Government needs to restore adequate funding to local authorities and funds should be earmarked for heritage posts to develop and bring forward schemes to maximise the benefits of this national resource.

Skills and design

ix. Local Planning Authorities have undergone a massive decline in resources which has ultimately impacted upon the quantity and quality of staff in recent years. Since 2008 many Lpa’s have seen their most experienced staff leave and their posts have been lost from the structure or downgraded to make savings. Accordingly, in Suffolk only one of the seven Lpa’s (Ipswich) employs a qualified urban design officer and the number of conservation officers across the county has been reduced by approximately 30%. This means that at a time of unprecedented development pressures both the capacity and expertise within planning departments is deficient. The RIBA Suffolk Design Review Panel has been set up in a bid to address the shortcoming of new development proposals (on both greenfield sites and in heritage contexts). However, the administrative costs of having a case review (currently £350) is payable by the body that refers the scheme to the panel. This often acts as a disincentive to the majority of developers of the small/medium sized schemes that are more typical of Suffolk. In summary, Lpa’s require more resources, both human and financial to build in capacity and expertise to raise the design standards that the mass volume housebuilders seem unwilling to address themselves. This is despite the guidance provided by publications such as ‘Building for Life’.

The SPS acknowledges the need for more homes, however, the current mechanism succeeds too often in providing low quality housing of ubiquitous design that is too expensive for local people to afford, is frequently located far away from where people work, dominated by car parking and lacking the distinctive architectural and design characteristics that define Suffolk’s special character. In order to deliver high quality environments Lpa’s
need the dedicated skilled design staff to deliver it. This requires greater direction from central government.

Recently the brief for architectural policy has been transferred from DCMS to DCLG with the intention that higher architectural standards would pervade the planning system. Nevertheless, recognition of the importance of the built environment generally and the creation of attractive memorable places needs to be raised within Government. A minister clearly and principally responsible for not just the mechanism of planning but with an emphasis on architecture and producing a high quality environment that understands the implications for wellbeing and behaviour is required urgently. Planning has become a political football and held responsible for the inadequacy of the free market. The Society notes that recent announcements about planning policy have been made by the Treasury not CLG suggesting a lack of architectural and planning policy input by those who understand it. Planning as a profession is effective in delivering planning consents; it is the imperfections of the market which has stopped the delivery of the much needed housing and jobs.

x. A minister responsible for housing and design in the cabinet is now required to raise the profile of this fundamentally important aspect of modern government. For too long the quality of Britain’s built environment has been a Cinderella subject, an afterthought that can be applied to the economic reforms that the country has been in search of. This is a fundamental misunderstanding of the importance of how and where we live. An integrated approach to planning, regeneration, conservation and urban design is essential to maintain the tradition of internationally important architectural history and town planning. The post war New Towns Programme was at the cutting edge of town planning, but for the last 30 or more years the UK has fallen behind in the arena of creating new settlements and inspiring places to live and work. There is for example a fundamental misunderstanding about what garden cities are and that they should not be large housing estates “with extra trees”. The status of the planning profession needs to be restored to give us an environmental legacy of which the country can be proud. The government for too long has held the profession responsible for the shortcomings of the market and the mass housebuilders who dominate it.

Community involvement and community impact

xi. The SPS is dedicated to standing up for the quality of the new development in Suffolk. Too often the policy presumption of sustainable development eclipses the commitment to the quality of place. The requirements of viability, affordable housing and parking standards too often give rise to a dismal design outcome that fails to acknowledge how the places that we build today will influence the way in which people live sustainably in the 21st Century. The profile of The SPS is committed to ensuring that the legacy of our decision makers is one worthy of our county. We make our best efforts to ensure that significant planning schemes in the county achieve high quality housing and public realm. This is increasingly difficult to
achieve in a climate driven by targets, both numerical and financial. To that end the government should seek increased community engagement, not just through Neighbourhood Plans, but through vehicles such as civic forums, shared ownership and self build schemes where places are influenced by those that will live in them rather than just the developer and the decision makers.

xii. The interest in and delivery of Neighbourhood Plans in Suffolk has been patchy and slow. While the recent confirmation of funds for NP groups is welcomed, the process is long, frequently technical and favours middle class areas. In Suffolk we see large areas of the county including Ipswich, St Edmundsbury and Forest Heath with no areas currently designated, while Babergh, Suffolk Coastal and Mid Suffolk each have approx. 8 plans in various stages of gestation but these cover tiny areas by comparison with the size of the county as a whole. It is clear that the Ip’a’s that have dedicated staff in place are generating greater levels of activity and ultimately adopted plans. It is essential that the government continues to stress the importance of communities producing their plans, providing adequate technical support and in particular to those areas which are more socially and economically deprived.

In Suffolk large scale housing schemes are often lacking effective master planning. Too often token public participation events are hosted by developers, but the views and opinions of the community are rarely translated into the masterplans which they produce. The master planning of large scale sites should be driven by Ip’a’s informed with visual analysis and design (which frequently do not have requisite resources to prepare development briefs) and subject to meaningful community engagement, and not just led by developers who undertake their own consultation. Public engagement in master planning will increase in direct proportion to the weight given to their views on the places that they want to live in.

Financial measures

xiii. The issue of landbanking by developers is seriously impacting upon the deliverability of housing. The government should impose a “use-it-or-lose-it” requirement for developers that will make them build out their consented schemes or risk forfeiting them. Too often in Suffolk we see cases of developers having bought at the peak of the market and where the scheme is not being built out until market conditions improve. Councils and developer partners should have the power to acquire those sites at current values and deliver them.

Yours faithfully

Fiona Cairns BA(Hons)

Director

Suffolk Preservation Society
Response of the Sustainable Traditional Buildings Alliance (STBA)

(0.1) The Sustainable Traditional Buildings Alliance (STBA) is a collaboration of not for profit organisations that acts as a forum for sustaining and improving traditional buildings in the UK. The STBA aims to promote and deliver a more sustainable traditional built environment in the UK through high quality research, education, training and policy.

(0.2) In the context of concerns over climate change, much policymaking in recent years has centered upon improving the energy efficiency of the built environment. Now that problems are starting to emerge as a result of poorly planned and executed retrofit, it is clear that a different approach is required. Traditional buildings (including solid walled buildings up to the late 1930s) constitute at least 25% of the building stock, and they need to be properly understood in their context before decisions can be taken as to their retrofit.

(0.3) The STBA has therefore worked closely with DECC and other leading stakeholders to identify the key knowledge gaps, skills gaps, and implicit errors in approach. The Responsible Retrofit Report (2012) sets out the key concerns. Since then we have developed tools, training and guidance to help designers, contractors and building owners to manage and address these issues.

With this in mind, we can offer the following comments in response to:

Question 2
Question 7
Question 8
Question 9.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

(2.1) The drive to make buildings more “energy efficient” can sometimes lead to situations in which Sustainability and Heritage can appear to come into conflict with each other. Looked at narrowly, a retrofit measure which damages or covers up heritage may be questioned on these grounds. However, such conflicts normally arise when one or other imperative has not been fully understood. The sustainability of buildings is too often assessed purely in terms of carbon emissions from buildings in use and this definition missed several key points.

- There is good evidence to show that traditional buildings do not perform as poorly as had been assumed (due to the use of limited and erroneous models).
• The embodied energy of buildings in some cases outweighs the energy used for their operation. Our traditional building stock has relatively low embodied energy and has lasted for over a century.
• Modern buildings often do not have such long design lives so their embodied energy is more significant. When these buildings are taken down, it is also necessary to account for their impact on waste streams and recycling.
• Retrofit, like all building work has an impact in terms of energy use and the use of scarce resources, and this impact needs to be measures and offset against actual savings achieved during the life of the measure and the building.
• The **unintended consequences** of measures to improve the energy efficiency of the built environment can have consequences not only for building fabric but also for human health.

(2.2) Heritage itself is also an asset, an asset which should be protected and enhanced for the benefit of future generations. Responsible retrofit delivers both enhancement of Heritage and an improvement in Sustainability of the built environment.

(2.3) Lastly, the retrofit of buildings may be used to achieve a wide spectrum of other social, economic and environmental goals. In addition to providing local employment and assisting with community regeneration, there may also be the opportunity to use the retrofit process to reduce waste, water use, drainage impact etc, depending on the context.

(2.4) Integration and co-ordination of policy can be improved through a *more fundamental cost-benefit analysis*, which reflects the importance of human health, the value of heritage assets and a wider set of sustainability goals alongside opportunities to deliver genuine regeneration.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

(7.1) As outlined above, there is an opportunity to make great improvements to the existing building stock in terms of its sustainability. However, there are also great risks and, if this process is handled badly, there will be serious negative consequences for the environment, for human health and for the longevity of the buildings themselves.

(7.2) To reduce these risks, the STBA has developed the **whole-building approach to retrofit**, an approach which has been endorsed by our key supporting organisations and welcomed by DECC. This approach acknowledges firstly the *importance of context* – so any measures selected for retrofit must recognise the value of a building and its appearance to the local community and be appropriate to its location, exposure and condition. The whole building
approach also takes account of the interactions between building fabric and its services, and the crucial importance of interactions with the occupants.

(7.3) The Government can play a positive role by endorsing and encouraging the whole-building approach to retrofit.

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

(8.1) Traditional buildings and places have much to teach us about genuine sustainability. How people constructed and lived in traditional buildings, and the economic/social circumstances within which they were built, of course differs from the perspective of the 21st century. However, in current thinking there is a lack of understanding of place-making and the value of the traditional built environment in people’s sense of identity, both locally and nationally.

(8.2) The STBA is developing a framework that may be used to address these issues and we would welcome UK Government support for this work.

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

(9.1) As identified in the Responsible Retrofit Report (2012), there are significant knowledge gaps in the understanding of how traditional buildings function, and also how they function when subjected to retrofit. The most significant of these is a lack of understanding of moisture movement in buildings, and of how to manage the risks of moisture build-up in both new construction and retrofit. With DECC’s support and with widespread agreement across the industry, we have developed a new Moisture Risk Assessment and Guidance; this is shortly to be reflected in a new British Standard on Moisture in Buildings.

(9.2) However, to specify appropriate retrofit measures requires an understanding of traditional buildings and of moisture risks; at present there are very few building professionals at present who are technically qualified to make the necessary assessment. Training in Moisture Risk Assessment is therefore required – materials and courses have yet to be developed so we recommend that this task is undertaken in parallel to the issuance of the new British Standard on Moisture.
(9.3) Planners, surveyors, architects and engineers usually lack the full set of skills to assess the built environment in a holistic manner. Most do not have sufficient technical understanding of traditional buildings and many lack a full appreciation of the value of heritage and its contribution to genuine sustainability. The STBA has contributed to training courses for Supervisors/Technical Officers and on Retrofit Co-ordinators, developed by CITB and CoRE respectively. There remains a need for more technical training of surveyors in particular – as they should have the primary responsibility of determining the most appropriate measures for retrofit. The existing workforce is almost entirely trained for new construction; retraining is required to work on retrofits and to learn the basic techniques of repair.

(9.4) We are actively working with Local Authorities (currently Bristol City Council) to test out the whole-building approach to the decision-making process for the selection of retrofit measures. We would welcome UK Government support to disseminate this approach to all Local Authorities and to embed it within their planning processes.

Nigel Griffiths, Director, STBA.

06 October 2015
Syresham Parish Council met to review the 13 questions and felt it should respond to Q12.

The Parish Council would like a more robust method to ensure the planning officers are more thorough in their community consultations to ensure everyone has the chance to comment on planning applications.

05 October 2015
1. **Introduction**

1.1. Tata Steel is grateful for the opportunity to respond to this inquiry. Tata Steel is a key member of the UK’s foundation industries, directly employing 17,000 in the UK with many more dependent jobs in our supply chains and local communities. We are a key partner of the construction industry, with our products being used in high volumes in landmark buildings and infrastructure projects in the UK and across the globe.

1.2. While we are unable to comment on issues such as administrative responsibility for the built environment, responding to the housing shortage and approach to ‘place-making’, we feel that the lessons we have learned in our mission to provide sustainable and energy efficient construction products may be of interest to the committee.

1.3. In 2012 the UK’s metals sectors comprised 24,000+ enterprises and employed over 330,000 people. They are worth over £45.5bn to the UK economy, generating £16.5bn GVA and sector exports 150% of UK demand. Tata Steel exports around 50% of its products to Europe. Steel is a driver of productivity which, along with other UK Foundation Industries, is characterised by sector productivity of 136%. Steel has a clear, strategic value to the country and is valuable in driving export and productivity growth.

1.4. Steel is a key foundation of significant, strategic supply chains (e.g. automotive, construction, energy) and an engine of regional growth and opportunity. Two to three jobs are dependent on every direct steel sector job, often in less prosperous parts of the country. The industry produces hundreds of high skilled, high value-added apprentices, vocational trainees and graduates. We are well linked into the UK’s innovation infrastructure through partnerships with leading universities, participation in Catapults and own R&D investment. In this regard, steel is a real asset to a high value, high skill economy.

2. **Steel and the built environment**

2.1. Construction is one of the heaviest consumers of natural resources and uses around 40% of global raw materials (around 3 billion tonnes annually). The construction industry produces more than three times as much waste as domestic properties and the operation of buildings accounts for almost half of all energy use and carbon dioxide emissions. If the construction industry is to truly embrace sustainability it must be embedded through the whole life-cycle of the building. This combined with the fact that some 41% of global energy use is in buildings, means that it is critical that companies like Tata Steel lead the way in the development of processes, products and services which reduce the use of materials and increase the efficient use of energy during the life cycle of a construction product.
2.2. Steel buildings are inherently efficient in design, construction, use and even demolition. Steel buildings are flexible in use and highly adaptable. Steel structures are lightweight and thermally responsive and steel building systems help to minimise energy use in buildings. Meanwhile, using steel in construction helps to save precious resources, since it is efficiently collected and truly recycled in demolition. Steel is used in many of the most sustainable buildings. Steel building systems are very well rated in schemes such as BREEAM and LEED and our products are frequently used in some of the highest-rated buildings.

2.3. At Tata Steel, we produce a range of products to make buildings more efficient. Our wide range of structural products enables design efficiency, while our building envelope products are the most durable available. Our latest products are designed to harness energy, turning buildings into energy generators and aim to bring the goal of zero carbon building ever closer.

3. **Examples of Tata Steel's contribution to the built environment**

*Sustainability*

3.1. Tata Steel was a key partner of the recent World Green Building Week, hosting a number of seminars to facilitate discussion about the role of the built environment in helping meet global sustainability targets. We were proud to demonstrate leadership in this area by showcasing our efforts to help reduce energy consumption by buildings by encasing them with Transpired Solar Collectors, effectively turning buildings into power stations.

3.2. Non-domestic buildings account for 17% of UK energy consumption, with over 60% of energy used in these buildings being spent on heating. Renewable energy uptake has been very low in non-domestic buildings which rely predominantly on gas boilers. Tata Steel is able to help reduce gas dependency in such properties by coating them in active building envelopes containing Transpired Solar Collectors. This is a simple but effective product which requires no specialist installation training, can be installed in a short period and has no additional operation costs. It has a 75% conversion rate of solar power into useable heat and can provide up to half of a building’s space heating requirements per year. The committee may wish to consider how built environment policy can ensure that buildings make use of such technologies to help reduce UK energy consumption.

*Building Information Modelling*

3.3. Data management is increasingly important to the UK economy and the same is true for the built environment. We recognise that not everyone needs the same data, and especially when supplying products across a number of territories, externalising the data is crucial. It provides users with the flexibility to select the data they need and for manufacturers, the potential to tailor their information to local requirement. To achieve
many national Governments are now developing strategies and standards to implement BIM (Building Information Modelling) over the next few years.

3.4. We recognise that the move to a digital environment is only the beginning, and the Tata Steel Digital Product Platform forms a key part of our long-term construction strategy. Over the coming months, we will be enabling BIM objects for our products in the Construction, Energy & Power and Rail sectors across all territories, with some 7000 products already included. Tata Steel’s BIM objects include software agnostic data, along with 2D and 3D geometry in appropriate software for the product.

3.5. Our aim at Tata Steel is to provide accurate, reliable and accessible digital information on our construction products that support improved information flow and exchange throughout the lifecycle of an asset. This programme will help support our customers, partners and specifiers in delivering a sustainable built environment through a more efficient, collaborative supply chain approach based around an offsite modular construction approach. Enabling wider adoption of BIM platforms across industry will help reduce the costs of design, construction and operation, ultimately helping deliver sustainable built environments as efficiently as possible.

Responsible sourcing

3.6. Responsible sourcing is fast becoming a critical issue for the construction sector and its wider sustainability agenda. Construction clients need to be confident that their sustainable approach is supported by the construction products that they use. Tata Steel has become the largest company to acquire the BRE responsible sourcing standard BES 6001 for its UK construction products. All of our construction products manufactured in the UK are now certified ‘Very Good’ under the British standard.

3.7. The UK Government will soon require all the construction projects it funds to use BES 6001 certified products. As a result, sustainability-minded main contractors, architects and engineering designers are increasingly asking their supply chain partner to verify where their products are sourced and to demonstrate how they are ensuring that the products they use have been produced in as sustainable and responsible a way as possible. Designers and developers can specify and use Tata Steel’s UK-made construction products confident in the knowledge they are fully certified to BES 6001. They can thereby secure maximum credits under the responsible sourcing of materials sections of other standards, such as BREEAM, the Code for Sustainable Homes, and CEEQUAL.

3.8. BES 6001 is an independently certified standard recognising companies that go that bit further to act responsibly and to promote sustainability. The standard not only assesses the sustainability of our own operations but requires us to demonstrate confidence in the responsibility of our raw material suppliers all the way back to the point of mineral extraction. BES 6001 has been developed by BRE Group to enable construction product manufacturers to demonstrate their commitment to sustainability both within their
own operations and through the responsible sourcing of raw materials and other products from suppliers. Certification requires companies to demonstrate that they have systems and policies in place covering many aspects of environmental and social performance, including that their raw materials are traceable back to the point of extraction and that environmental and social responsibility is evident throughout the supply chain.

4. **Threats to this contribution**

4.1. We appreciate that the issues raised in this submission do not directly address some of the Committee’s published terms of reference. But, as described, the UK’s steel sector is closely integrated into the country’s ability to plan, design and create a built environment in a sustainable way. But the UK’s capability to do this is under threat.

4.2. The threats to the UK’s steel industry are increasingly high profile. The sector was seriously damaged by the global recession and never fully recovered. UK steel demand in 2015 is forecast to be ~75% of pre-2008 levels vs. 94% in Germany and 180% in China. We expect this to result in increases to their export volume, which is already at record levels. Additionally, the strength of Sterling against the Euro is having a negative impact on UK demand for steel as UK exporters struggle to compete in European markets.

4.3. On a specific UK policy basis, we have experienced the costs associated with policy and regulations growing at a disproportionate rate during this very challenging time. Energy taxes levied on the business in the UK do not exist elsewhere, leading to our UK energy costs being 2-3 times higher than among EU peers. This comes on top of regulatory costs charged across the EU, such as the EU ETS and considerably higher wholesale costs.

4.4. Adding to this is the costly business rates system. The disproportionately high level of business rates paid in the UK by Tata Steel mean they are treated as a fixed cost and are therefore given prominence over taxes when making investment decisions. The fact they are 5-10 times higher in the UK than among other EU countries clearly reduces the UK’s attractiveness as a destination for investment.

5. **Helping to protect this contribution**

5.1. In terms of protecting the UK’s capability to maintain the built environment, the Committee may wish to examine the policy areas outlined below. These wield considerable influence over the future of the steel industry, and its ability to continue to act as a key strategic supplier to the construction industry. Taking the actions outlined below would help ensure that UK suppliers to those more usually associated with the built environment – architects, infrastructure providers, and housing developers – can continue to engage in this strategically important sector. In this respect, the Committee may wish to examine how to strengthen UK supply chains.
5.2. The value of steel to the UK lies not just in its production but in the way in which it can influence the Total Cost of Ownership of an end product or project. This ‘total value’ approach to procurement is critical if the UK is to optimise its own capability and boost the contribution made to UK supply chains and the wider economy. It is total value, not cost, which will drive economic growth. This is partly how we have arrived at a situation where increased steel demand is being met by foreign suppliers. Although UK steel demand rose 12% in 2014, imports rose by 22% the same year. Clearly this increased demand is not benefiting home producers.

5.3. Foreign competitors will continue to win contracts ahead of UK companies until manufacturing industries are able to work collaboratively get their products through the value chain. Government action on issues such as energy costs and business rates can help this, but when it comes to supply chains, Government can promote procurement strategies that support domestic manufacturers, encouraging innovation and job creation. This will help rebuild the markets we sell to in the UK, such as construction, with the effect that these sectors rely less on imported materials, and more UK-made products are consumed at home and abroad.

5.4. This can be done within EU law (as demonstrated by France and Germany) and would reduce the risk that spending will gravitate towards cheaper foreign suppliers based on short term cost based considerations.

5.5. To achieve this, our understanding of how supply chains are built and operated in the UK must change fundamentally. The majority of industrial supply chains are vertically integrated. The steel industry’s is complex, fragmented and ranges from nuts and bolts to large sections of a power station. Procurement policy must ensure that vertical industrial supply chains are aligned with the metal industry’s horizontal supply chain.

5.6. Sustainability targets can be partly met if the UK better utilised its local supply chains. Sustainability for Tata Steel is a serious concept; it is core to our values and increasingly important to our strategy of differentiation. The BES6001 standard mentioned previously is one such quality mark that Tata Steel supports. Increasing the visibility and emphasis on such quality marks and standards, and approaches such as life cycle analysis, benefits not just the environment but many more responsible participants in the UK supply chain.

5.7. Supply chains can be further nourished by maximising the contribution to major projects by local content. This carries an inherent benefit to local communities in the form of new jobs (both direct and indirect) and voluntary community initiatives. This can be incentivised by introducing: criteria on local economic benefit in assessing tenders for major projects; targets for or local content quotas in major projects or products; and reporting of local content within major projects.
5.8. With a major spend forecast on UK infrastructure (funded through both public and private money), as well as continuing spend in areas such as education and prisons for example, there is ample opportunity to maximise the local content of such projects. This can be achieved through the inclusion of community benefit clauses which ensure that the wider economic benefit of such investment is factored into the project benefits at the CAPEX as well as the OPEX phase.

5.9. This Total Cost of Ownership approach should be transparent and measurable and subject to review after completion of a project. Major projects which are privately funded but with significant Government support, such as infrastructure projects which are attracting private overseas investments but are securing Government subsidy support, should be subject to local content provision which ensures that any public subsidies result in some form of benefit to the local area.

5.10. Such action to rebuild domestic supply chains will make our industrial sectors more competitive. In this regard, it is imperative to recognise the inherent value of securing completeness in UK supply chains. The inability to create many end products solely in the UK is a major driver of the UK’s lower productivity and sectoral competitiveness when compared to other major EU countries. Securing completeness builds a ‘reinforcing circle’ into supply chains. It reduces costs, encourages and enables more focus on innovation and new product development. This also increases the size of the domestic market to sell to and buy from, thereby reducing reliance on imported goods and reducing the UK’s trade deficit. Completeness generates significant value and keeps it in the UK – something which the UK economy does not currently encourage.

5.11. There is a massive opportunity to create new manufacturing jobs, filtering through into other companies engaged in built environment development, if we can revitalise these supply chains. A recent CBI report revealed more than half a million jobs could be created across Britain’s regions if these supply chains are rebuilt. Taking such steps will enable us to retain true UK strategic industries and we will no longer need imported steel to build our bridges, landmark buildings or power stations. These can be created in the UK and revitalise the communities in which they are made.

Mhora Samuel
Director, The Theatres Trust

1.0 Executive Summary

1.1 The Theatres Trust welcomes the establishment of the House of Lords’ Select Committee to consider the development and implementation of national policy for the built environment.

1.2 The Theatres Trust was instrumental in ensuring culture and cultural well-being were included as part of the 12 ‘Core Planning Principles’ when The National Planning Policy Framework (NPPF) was introduced. Whilst the streamlined Planning Practice Guidance (PPG) introduced in March 2014 provided clarity on certain aspects of the NPPF, we are concerned about how NPPF guidance is being implemented and the adverse effect this has on cultural facilities (which includes theatres), cultural and social well-being, heritage, and town centres.

1.3 Details responses to the questions are contained within section 3, however our main concerns are:

- The presumption in favour of sustainable development is unbalanced. Too much weight is applied to the economic component of sustainable development and on housing at the expense of community and cultural buildings and heritage considerations;
- Authorities at both a national and local level generally do not fully understand or value the role culture can play in encouraging economic growth and the development of vibrant communities, especially in town centres;
- Local Plans are being found sound by Inspectors even though they clearly do not reflect the NPPF principles ‘to deliver the social, recreational and cultural facilities and services the community needs’;
- The distinction between ‘harm’ and ‘significant harm’ in the NPPF causes confusion for local authorities when making decisions about listed buildings;
- There is a lack of clarity regarding the policy to support and retain existing community facilities;
• Timeframes do not support the often complex design and long-term capital planning required for theatre buildings;

• A decline in local cultural and heritage specialists in local authorities is leading to negative outcomes for the overall protection of the cultural and historic environment;

• The absence of a definition for the term ‘community facilities’ or ‘community infrastructure’ that clearly includes cultural venues and theatres, and;

• We would welcome a clearly stated commitment to culture and theatres in the National Policy for the Built Environment from the House of Lords Select Committee;

• We would also welcome acknowledgement of the role The Theatres Trust plays in the protection of historic theatres by recommending that the Trust becomes a statutory consultee on statutory designated listed theatres.

2.0 About The Theatres Trust

2.1 The Theatres Trust is an Advisory Arms Length Body of the DCMS. We were established by The Theatres Trust Act 1976 and The Theatres Trust (Scotland) Act 1978 'to promote the better protection of theatres'. These Acts apply to all theatre buildings in England, Wales, and Scotland. The Trust’s 15 trustees are appointed by the Secretary of State for Culture, Media and Sport.

2.2 The Theatres Trust is a statutory consultee in the planning system. Local authorities are required to consult the Trust on planning applications which include ‘development involving any land on which there is a theatre.’ Theatres are *sui-generis* and are therefore considered separately from D1 and D2 uses. The statutory instruments setting out the consultation requirements in England are currently included in The Town and Country Planning (Development Management Procedure) (England) Order 2015. The Trust reports on its pre-application advice and planning application advice annually to the Department of Communities and Local Government. In England, we are also a consultee for Neighbourhood Development Orders and Community Right to Build Orders, and encourage local authorities, parish councils and local groups to consult the Trust on Local and Neighbourhood Development Plans where they involve a theatre.
2.3 The Theatres Trust is therefore a good example of an advisory body that works at local authority level within the areas of responsibility of both the DCMS and DCLG. We are often the only source of expert advice on theatre use, design, conservation, property and planning matters available to theatre operators, local authorities and official bodies. Our statutory role in the protection of theatres means that we are actively engaged in the role of theatres in placemaking and their contribution to the built environment.

2.4 In addition to providing advice in relation to cultural and theatre provision in local and neighbourhood plan consultations, we provide advice to local authorities and those in the development sector on the role of culture and theatres in the built environment. Given the pressures on local authorities to reduce staffing capacity in arts, cultural, leisure, property services and planning departments, with many arts and planning posts having been lost, we have been receiving an increased number of requests for advice.

2.5 The Theatres Trust employs a Planning Adviser, a Theatres Adviser and an Architecture Adviser enabling us to deliver our statutory obligations to provide planning and heritage advice. In 2014/15 this included 8 pre-planning applications, 117 planning applications and 57 listed building applications. The Trust also responded to 298 local and neighbourhood plan consultations and 59 plans were altered to improve policies related to cultural buildings. In addition, in 2015, the Trust identified 31 Theatre Buildings at Risk which we are focusing on to upskill and assist the owners and interested community groups to conserve and save these buildings for their communities.

2.6 Our aim is to promote the better protection of theatres on behalf of the nation, particularly at a time when many more theatres in the UK are facing the prospect of managing their assets on diminishing levels of public subsidy.

3.0 Specific Questions

Policymaking, integration and coordination

3.1 Q1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our
built environment, and how does this relate to the work and role of local authorities and their partners?

3.1.1 In our experience the quality of life and well-being of those living in our cities, towns and rural areas is shaped by access to good quality cultural and community facilities. These facilities include many theatres that are often distinctive cultural buildings, whether dating from the mid to late 1800s such as the Newcastle Theatre Royal, or more recently built theatres and arts centres such as the Lowry in Salford and the Curve in Leicester. Decisions relating to cultural planning of facilities should be made at local level, but should also take account of regional and national provision. This is important to protect the viability of existing theatres reliant on specific catchments of audiences.

3.1.2 When new housing and other developments in the built environment are being planned the inclusion of a new or replacement theatre will often support the success of that development. Not only will a theatre provide an important social and community focus for the new development, it can also support its future viability. A recent example of this is HOME in Manchester. National policy makers should be encouraged to recognise the importance of the inclusion of cultural facilities including theatres in decisions relating to the built environment and should support the ambitions of local authorities and their partners to continue to provide a rich cultural life within our built environment.

3.2 Q2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

3.2.1 We believe that it is important that all Government departments with a role in the built environment should be encouraged to include consideration of the provision of cultural facilities and theatres in their policy making. In particular we would welcome a clearly stated commitment to culture and theatres in the findings of the House of Lords Select Committee’s consideration of National Policy for the Built Environment. We would also welcome recognition of the role The Theatres Trust plays in developing and advising on policy that protects theatres and ensures they are a valued part of the built environment.
3.2.2 The Theatres Trust is a statutory consultee in the planning system, commenting on any developments involving theatres. The impact of this since 1979 is very significant. Today the West End of London has a thriving theatre scene which contributes to the national economy. The role of the Trust has ensured that theatre buildings, required to sustain this economic activity, remain in place or are modernised and replaced to ensure they are fit for purpose.

3.2.3 However The Theatres Trust is not a statutory consultee on listed theatre buildings. This has a negative impact on effective policy co-ordination particularly when a listed theatre may be under threat of demolition and the Trust is not consulted. When the proposed Heritage Bill was being debated the Select Committee and Government of the day recognised the importance of making provision for The Theatres Trust to become a statutory consultee on listed theatres, on a par with the National Amenity Societies. We would welcome recognition by the House of Lords Select Committee that The Theatres Trust be given this status.

National policy for planning and the built environment

3.3 Q3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

3.3.1 In our role to promote the better protection of theatres, The Theatres Trust reviews every local authority Local Plan Core Strategy consultation and considers how it addresses the NPPFs Core Planning Principle (para.17) to ‘take account of and support local strategies to improve health, social and cultural well-being for all, and deliver sufficient community and cultural facilities and services to meet local needs.’

3.3.2 The NPPF also specifically states in para. 70 that to deliver the social, recreational and cultural facilities and services that the community needs, planning policies and decisions should plan for the use of shared space and guard against unnecessary loss of valued facilities. In addition to ensure that established facilities and services are retained and able to develop for the benefit of the community in para. 156 the NPPF states that Local Plans should include strategic policies to deliver the provision of health, security, community and cultural infrastructure.
3.3.3 Policies to protect and provide community and cultural infrastructure to ‘improve health, social and cultural well-being for all, and deliver sufficient community and cultural facilities and services to meet local needs’ do not affect the soundness of a Local Plan. Most English local authorities have at least one theatre or performance space in their community, but in most Local Plans, policies to support and retain existing community facilities are unclear. We would welcome greater recognition of the policies to protect and provide community facilities in tests of soundness.

3.3.4 Although the Planning Practice Guidance (PPG) recommends that a range of issues should be considered through the plan-making and decision-making processes including social and cultural well-being, local authorities tend to focus on the issue of ‘health’ with access to GPs and leisure centres.

3.3.5 We therefore regularly find that The Theatres Trust is having to recommend that guidance for the provision and maintenance of social and cultural facilities be strengthened.

3.3.6 Neither the NPPF nor the PPG specify what is meant by the term ‘social and cultural well-being’, and we therefore suggest for clarity that the Select Committee recommend an explanation for this term is included in guidance documents, as it is evident that many local planning authorities do not know how to interpret this phrase into practical policies.

3.3.7 In our opinion, well-being is having a sense of satisfaction with life. Social and cultural well-being includes the un-measurable personal experiences that make us happy and content. Such experiences are intangible, not financially rewarding, and can either be active or passive. The provision of community infrastructure for tourism (cultural heritage) and town centre vitality (cultural facilities) are vital for their contribution to residents’ and visitors’ life satisfaction. Quality of life is dependent on the provision of a range of community facilities.

3.3.8 The Select Committee could also recommend that the NPPF glossary include a definition for the term ‘community facilities’ or ‘community infrastructure’ that would clearly include cultural venues and theatres. We recommend this succinct description which would obviate the need to provide examples: community facilities provide for the health and well-being, social, educational, spiritual, recreational, leisure and cultural needs of the community.

3.3.9 More guidance should be provided as to how Local Planning Authorities can include policies for cultural facilities in their local plans. As cultural specific criteria were only
introduced with the NPPF in 2012, many local authorities are not sure or even aware they need to include specific policies and many local plans have been found sound without any policy for promoting cultural aspects of the built environment.

3.4 Q4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

3.4.1 We would welcome a greater appreciation of a spatial perspective in national planning policy in relation to cultural planning. Theatre and entertainment producers rely on being able to take their productions, artists, and entertainers on tour throughout the UK, visiting a strong and viable network of theatres, performance venues and arts centres. Each city, town and rural community should have or will have access to a range of suitably sized venues to be able to present shows at all scales – from the large scale musical, the touring theatre production, to the small scale rural touring venue. By introducing a spatial element to cultural planning we can protect this network of theatres and venues, plan for future provision in relation to demand, and secure the viability of theatre buildings and their place within the built environment.

3.5 Q5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

3.5.1 Theatre buildings are unusually complex buildings in their design and location. Provision needs to be made to ensure theatres can be easily accessed by audiences and companies presenting shows through sufficient public and private transport infrastructure, routes and roads. Theatres also often work on 10-year timeframes when planning their capital needs. We would recommend that policy makers be considering at least a 10-year timescale when planning future cultural facilities and provision.

Buildings and places: New and old
3.6  Q6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

3.6.1 No comment.

3.7  Q7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

3.7.1 For built environments to be sustainable and resilient they need to take economic, environmental and social needs into equal consideration. Cultural wellbeing is an important policy direction through which to achieve this and which Government should continue to promote. The quality of the built environment has to support cultural wellbeing. Theatre buildings have a direct impact on this both in relation to their use and their presence within the built environment.

3.7.2 However we consider that more could be done to ensure theatres continue to be viable as needs and circumstances change.

3.7.3 A successful theatre can have a direct positive impact on the economic success of a town centre and the businesses around it. However, theatres can be negatively affected by other development around them, particularly where this challenges their ability to operate economically. Government should be fully aware of the unforeseen consequences of further relaxation of planning legislation which could impact on theatres’ viability, with resulting reduction of economic activity, reduction in the vibrancy of town centres, reductions in employment opportunities and a slowdown in growth.

3.7.4 We also consider more could be done through tax regimes to support theatres and cultural facilities to adapt for environmental change. Theatres are important community and cultural facilities and they often take a lead on forming public opinion and awareness of measures to mitigate climate change.

3.7.5 Many theatres are also listed buildings and wish to make environmental adaptations. We would welcome measures that help to make these adaptations more affordable and possible within the listed building regime.

3.7.6 The Trust is also concerned with the distinction between ‘harm’ and ‘significant harm’ in the NPPF and its implementation in planning decisions. Whilst the new PPG
The Theatres Trust

has somewhat helped to clarify the point, The Trust feels that confusion remains over what it actually means. Many local planning authorities do not have the expertise to assess the level of harm being presented in listed building applications and often the economic considerations of developing a site are given more weight than the preservation of an historic asset. Many historic cultural facilities are being lost or intolerably damaged as local planning authorities push through town centre regeneration schemes.

3.8 Q8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

3.8.1 All Local Plans should begin with the assumption that they exist to protect and enhance the existing built and natural environment before moving onto criteria for new development. As Historic England has stated, ‘There is a huge amount of waste generated by the construction and demolition of buildings, something like 24 per cent of all waste is generated by demolition and construction. It is simply better in sustainability terms to use and recycle old buildings than to demolish them and to build new ones’. Therefore in the absence of a robust and balanced Local Plan, the default position should not be to automatically grant planning permission for new development, but rather to ensure that existing development is conserved and used efficiently.

3.8.2 When the NPPF was introduced, the DCLG established a presumption in favour of sustainable development with the aim of ensuring development was not unduly delayed unless it was against the collective interest to permit it. However, this position does not help conserve or enhance existing cultural and community infrastructure within town centres, nor is it ‘sustainable’.

3.8.3 The Select Committee may wish to review NPPF paragraph 14 so that developers and local planning authorities would need to demonstrate the cultural, social and environmental sustainability of their policies and planning proposals, as well as their economic objectives. We recommend the following additions:

3.8.4 For plan-making this means that:

local planning authorities should positively seek opportunities to meet the development needs of their area, while conserving and enhancing the historic and natural environment and ensuring community facilities meet local needs.
3.8.5 For decision-taking this means:

*Giving equal consideration to the economic, social, and environmental dimensions of sustainable development.*

Skills and design

3.9 Q9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

3.9.1 We are concerned that without adequate cultural planning provision and historic environment professionals within the local authority, the NPPF objectives will not be met.

3.9.2 Whilst the NPPF states that local planning authorities should consult the historic environment records and appropriate expertise (para. 128) in determining applications, the decline in local specialists could have negative outcomes for the overall protection of the historic environment.

3.10 Q10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

3.10.1 The Theatres Trust actively champions best practice in relation to high quality design of theatre buildings and the role of theatres in placemaking. The Trust is able to take a nationwide perspective on the quality of theatre buildings and along with our expert advice also offers peer based Advisory Review on the capital development of theatre buildings. We would welcome recognition of our role by the Select Committee.
3.10.2 We also welcome the role of the Place Alliance in developing national leadership in relation to promoting high quality design and placemaking at national level and are pleased to be part of the Place Alliance.

Community involvement and community impact

3.11 Q11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

3.11.1 It is our opinion that a built environment with a rich, broad range of community facilities has a positive contribution to residents’ life satisfaction and overall wellbeing. Theatre buildings lie at the heart of their communities and make a vital contribution to the vitality of the built environment. We are concerned that too much weight is applied to the economic component of sustainable development, and on housing, at the expense of community and cultural buildings and heritage considerations.

3.11.2 We welcome the role of Civic Voice and we are pleased to be a part of the Localism Alliance in championing the engagement of local communities in local decisions. Active participation serves to encourage personal social responsibility and inspire individuals to contribute practically to the maintenance and improvement of communities and the places where they live.

3.12 Q12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

3.12.1 We believe that more should be done to empower communities to engage with the process of decision making in their locality. We support the principle of putting communities at the heart of the planning system and champion opportunities for
local communities to have greater power in the decision making process surrounding their built environment

Financial measures

3.13 Q13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

3.13.1 Planning Obligations are an important measure by which developers are encouraged to support future planning of cultural facilities. We would welcome measures which further enable developers to incorporate theatre provision in their schemes.

3.13.2 Arts and cultural facilities are important places in their communities and are often a catalyst for regeneration, providing both economic benefit and placemaking (both in terms of brand identity and community appeal). There is real benefit for developers to commit to partnerships with the arts, and we actively promote the role of culture and theatres in promoting quality of life in new developments.

06 October 2015
Dear Sirs,

I wish to highlight the devastating effect that pulsating microwave radiation has had on the homes and lives of Electrosensitive people in the UK. This type of radiation is emitted by mobile phone masts, wi-fi routers from neighbouring properties and smart meters. It penetrates through glass, wood and modern building materials into the homes of sensitive people — against their will causing serious illness and disability. This is contrary to their human rights.

Many such disabled people have been forced to leave their home, and are unable to find suitable jobs or properties away from such man-made wireless radiation. The higher the level of pulsating microwave radiation and the longer the exposure, the more Electrosensitive people become ill — horrific head pain, horrific eye pain and visual disturbance, heart arrhythmia, blood disorders, tinnitus, nausea, dizziness, insomnia, thyroid problems, cancer, depression, Alzheimer’s. There are over 5,000 independent research papers confirming this, and the government must act now to protect the health of the nation and stop dragging it’s heals on this human catastrophe.

Schools, hospitals, nursing homes and other public buildings including places of work should be built with areas considered “white zones” — areas which have levels of pulsating microwave radiation less than 0.02v/m. This is imperative. Suitable building materials should be used to contain these areas to allow Electrosensitive people to live, work, learn and be medically treated safely and equally with all other members of society.

Smoking used to be considered safe, then “no smoking zones” were introduced. But too many people were made ill and died because of lack of a precautionary approach by the government. All new builds should have a percentage of accommodation devoted to “white zones”. This should be set by National policy. It is estimated that up to 35% of the population is now affected in some way by pollution from pulsating microwave radiation.

I have failed to find a retirement property (which are being built by the score) which would be suitable for Electrosensitive people. Flats and apartments are affected by neighbour’s wi-fi which penetrates through party walls. Even detached properties are blighted by pulsating microwave radiation from phone masts, wi-fi from neighbours up to 100 meters away and smart meters on the public highway. This is tantamount to torture and must be seriously considered by this committee.

In 2013 I compiled a comprehensive Case Study Report which was sent to Stephen Dorrell, the then Chair of the Commons Health Committee. In his reply to me he expressed his concern at the lack of action taken by government bodies with regard to this issue. I trust that Electrosensitive people who have become disabled as a result of torture from man-made radiation will be seriously considered by this committee, equally catered for and their human rights to a safe home and work place secured.
I hope that this matter will now be thoroughly and satisfactorily addressed through The House of Lords Select Committee on National Policy for the Built Environment.

01 October 2015
Submission to be found under Professor Jay Ginn
1.0 About the TCPA
1.1 The Town and Country Planning Association (TCPA) is an independent charity working to improve the art and science of town and country planning. The TCPA puts social justice and the environment at the heart of policy debate and inspires Government, industry and campaigners to take a fresh perspective on major issues, including planning policy, housing, regeneration and climate change. Our objectives are to:
- Secure a decent, well designed home for everyone, in a human-scale environment combining the best features of town and country
- Empower people and communities to influence decisions that affect them
- Improve the planning system in accordance with the principles of sustainable development

2.0 Summary
2.1 The TCPA welcomes the House of Lords Select Committee’s timely inquiry into the Government’s approach to securing a high quality built environment. The TCPA’s experience of promoting high quality built environment outcomes for ordinary people spans almost 120 years and it is with regret that we conclude that the Government’s current approach to the built environment represents a historic low point in the finance, policy and philosophy of planning and place-making since the second world war. This is manifest in complex ways from a lack of policy priority given to quality and inclusion in the built environment to the removal of many of the key building standards which are the basis of good outcomes. The current planning framework elevates the needs of landowners and developers to a preeminent position, but fails to account for the long-term benefits of good planning and place-making, for example the benefits of green infrastructure or accessible and energy efficient homes to individuals and the wider economy. There is a general failure to value the multifunctional benefits of actions in the built environment. For example, high quality green infrastructure can help tackle a wide range of challenging problems, including:
- Obesity (good local parks and green spaces encourage activity)
- Air pollution (particle capture by trees)
- Economic attractiveness of places
- Active travel and reduction in over-crowding of public transport
- Reduction in water run-off to drains during storms
- Reduction in over-heating in urban areas (heat-island effect)
- Reduction in stress and better mental health outcomes
- Increased social cohesion.

2.2 The net result of the deregulation of planning and housing standards is that England is falling behind many of our international competitors both in the quality of design and the sustainability of our buildings and communities. For example, the zero carbon homes policy was a world leading initiative for sustainable development, crucial to driving innovation in the development industry and providing a firm foundation for
planning decisions. The cancellation of the policy in July 2015 marks the end of any benchmark for building the high quality, sustainable homes that we so desperately need.\textsuperscript{466} The cancellation of the policy is also a marked contrast to other nations who have created entirely new industries from building highly sustainable new places. The abandonment of any meaningful commitment to sustainable development has removed the core objectives from planning and place-making leaving a fragmented and under-resourced system which often achieves little more than the facilitation of market outcomes rather than the wider public interest.

2.3 HM Treasury’s recent document ‘\textit{Fixing the foundations: creating a more prosperous nation}’\textsuperscript{467} sets out the course of further planning and housing reform which will be implemented by three pieces of legislation and by further policy changes. The paper is significant not simply for the precise policy measures it contains, but because it signals a strong continued commitment to a deregulatory agenda based on an overarching analysis that regulation of the built environment is anti-competitive. It has neither meaningful content on Sustainable Development nor any discussion of how the policy measures set out within it contribute to place-making. Significantly it identifies regulatory costs of planning, but makes no attempt to value the benefits of place making.

3.0 The Select Committees Questions

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

The current administration of policy on planning and built environment in England is confused and dysfunctional. In March 2015 the TCPA published the ‘\textit{Future of planning and place making}’\textsuperscript{468} which concluded that the English planning system was not fit for purpose and required attention to secure clear progressive objectives and a logical structure which reflected the functional geography of England. The paper concluded that England had:

- No effective national spatial planning which resulted in lost opportunities to coordinate housing and infrastructure delivery.
- A dysfunctional sub-national planning framework with the abolition of regional planning and consequent data. The Duty to Cooperate\textsuperscript{469}, a mechanism which requires

\textsuperscript{466} TCPA (July 2015) Cancellation of zero carbon homes policy is bad news for the green economy, the environment and society. TCPA press release: \url{http://www.tcpa.org.uk/resources.php?action=resource&id=1260}

\textsuperscript{469} The Government’s Planning Practice Guidance defines the Duty to Cooperate as: It places a legal duty on local planning authorities, county councils in England and public bodies to engage constructively, actively and on an ongoing basis to maximise the effectiveness of Local and Marine Plan preparation in the context of strategic cross boundary matters. The
local authorities to consult one another, which even where it has been successful in its own terms, has not delivered the benefits of strategic planning.

- A non-spatial National Planning Policy Framework (NPPF) which deprioritised place-making, affordability, equality and inclusion and prioritised the needs of developers and landowners.
- A local plan process which, because of inherent flaws in national policy, led to legal uncertainty and increased levels of successful appeals.
- A demoralised and chronically under resourced planning service.
- A much less powerful local planning framework as the result of wholesale deregulation of permitted development which has removed key controls over the urban environment.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

The TCPA can find no evidence of an overall coordination of policy on the built environment. On the contrary relationships between some Government departments on key policies such as building standards, renewable energy and green infrastructure appear to be strained or absent. This is partly because of unresolved policy conflicts and partly because of a significant loss of experience and expertise from the Civils Service in general and on built environment matters in particular. Solutions lie in a lead department on the built environment, a remit which the Department for Communities and Local Government (DCLG) currently does not fully fulfil. Of particular concern is the apparent lack of specific expertise and insight in the dominant departmental leads of HM Treasury and the Cabinet Office. The ‘Fix the Foundations’ paper demonstrates a lack of understanding of the benefits of a high quality built environment.

The implications of this failure to incorporate place-making into the heart of Government thinking are significant and will have long-term and negative impacts on society and the environment. It will also damage our economy by failing to drive innovation in new technology. The cancelation of the zero carbon homes commitment, a moratorium on onshore wind and the prevention of local authorities from innovating on housing standards in planning all contribute to a sense of a national view which is backward looking. Both the other nations of the UK and our EU competitors have strong regimes of policy to deliver higher quality outcomes. In Wales the Well-being of Future Generations Act 2015 is an example of policy innovation while Denmark, the Netherlands, Switzerland, Sweden, France, and in particular, Germany all have stronger national or local regulatory frameworks to drive innovation in design and implementation.

---

Policy on green infrastructure provided a key illustration of this lack of priority and coordination. Responsibility for green infrastructure is split across a number of Government departments. For instance, Defra has responsibility for policy regarding the natural environment; DCLG is responsible for policy regarding urban parks and green spaces; and the Department for Culture, Media & Sport (DCMS) has policy responsibility for playing fields, and is the sponsoring department for the Royal Parks and Heritage Lottery Fund. There is currently no co-ordination between the departments about policy for green spaces or wider networks of green infrastructure. The recent work of the independent, but Government-appointed, Natural Capital Committee has highlighted the huge economic value of green spaces in and around urban areas, and has recommended that investing in such spaces should be a Government priority. However, implementing these recommendations effectively through policy initiatives will be more difficult than it should be given this fragmentation across departments.

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

The principle of single condensed national policy document is welcome, but the NPPF does not provide a balanced or detailed framework for place-making. This is partly the way it is interpreted by bodies such as the Planning Inspectorate who focus on issues such as the Duty to Cooperate, the viability test and five year land supply much more than a wider sense of high quality place-making. Briefly there are six strategic policy concerns in the NPPF and accompanying NPPG:

1. There is no coherent definition of sustainable development in the NPPF with key aspects of the concept such as social equity, intergenerational equity and resource conservation either absent or deprioritised.
2. The presumption in favour of development where plans are out of date means that NPPF is the key decision making frame for a growing number of developments.
3. The NPPF is not spatial. It does not recognise that differing parts of England may differ in policy approaches or have different policy issues.
4. The NPPF viability test is economically flawed and results in vital place making policy being removed from plans because of the needs of landowners and developers have been made preeminent.
5. The NPPF currently provides almost no guidance about key issues such as green infrastructure, since Natural England’s guidance was archived at the end of 2014. The TCPA, along with other organisations, are currently talking to DCMS about how the NPPG could be updated to include more guidance about green infrastructure and we hope our recommendations will be accepted.
6. The NPPF, for the first time, has a chapter on Promoting Healthy Communities which the TCPA welcomes. Many local authorities are beginning the relationships at improving integration between public health and planning for the built and natural environments. However there should be greater emphasis and integration at Government department level to ensure that planning decisions place health and wellbeing at the heart of considerations.
4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

An understanding of places and their geography is remarkably absent from current Government policy. At a macro level having a sense of the complex functional geography of the nation and being able to shape policy to reflect these realities is obviously an important policy foundation. This appreciation allows for infrastructure to be related to demographic change, to consider long term resource use and most simply to plot strategic flood vulnerability. Such an approach would have allowed HS2 to be planned with a proper consideration for the opportunities for new settlements which might meet housing demands in sustainable new locations.

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

In general our approach to the built environment lacks a long term and strategic component. While 10 to 15 year time horizons are required for local plans in practice planning is focused on short term housing numbers. Plans should address time horizons of 50 to 100 years for key issues and in particular climate adaptation and mitigation. One key example of this is planning for where flood plains will be rather than where they exist now. In relation to coastal communities this is a vital exercise and should have led to radical changes in how housing growth is planned in areas such as the East Coast of England. The detail of how and why these longer-term time scales are a vital part of planning for the built environment are set out in the Planning and Climate Change Coalition manifesto.471

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

The Government has deregulated planning and reduced investment in social and genuinely affordable homes in the hope that the private sector would substantially fill the gap. The results have been deeply disappointing, not only from what has been delivered, for example incredibly small homes such as the 13.1 square metre flats for sale in London472, but in the widening gap between what has being approved through planning and what is being built. In

472 Mail Online (2014) Budge up! Step inside London’s smallest flats where you can reach the hob from your BED (and they're being snapped up in hours for hundreds of pounds a month) http://www.dailymail.co.uk/news/article-2654275/Budge-Step-inside-Londons-smallest-flats-reach-hob-BED-theyre-snapped-hours-hundreds-pound-month.html
the 12 months to March 2015, 261,000 homes were approved in England but the private sector built only 112,270 out of total 137,200. Some of these units are approved through permitted development where planning has no control over quality. What is clear is that consent is now being given for more than the estimated demographic need of 240,000 per annum. The private sector is building roughly around its post war average and may be able to marginally increase output. As these figures illustrate, numbers of planning consents is not the prime cause of the dysfunction in our housing model.

Government is proposing very radical change to the local planning system by introducing a zonal system whereby sites allocated in plans for housing will confer automatic planning permission in principle. These measures to be introduced by the Housing Bill are unlikely to have a direct impact on housing supply. As yet, we have had no indicated that the Government is going to use this legislative opportunity to modernise the existing New Towns legislation to allow for genuinely locally-led new places built to highest design standards. The TCPA has made the case for Garden Cities and multiple benefits they bring for housing supply and in terms of quality outcomes. As yet the Government has neither addressed the issue strategic housing growth nor adopted the place making-standards at the heart of the Garden City model.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

The challenges of climatic change and demographic growth will place increasing demands on our built environment. Climate resilience, in particular, demands new approaches to design and construction and to strategic planning. Almost all of the technologies and design approaches are in place to deal with these challenges but in general we are not creating environments which are resilient to the future. The role of government is to show leadership in setting pathways to a low carbon and resilient future. It should do this by making firm policy commitments to set a direction of travel and backing this up by clear standards.

What is particularly unhelpful, for both communities, councils, developers and investors is making commitments on the environment and then cancelling them. The experience of the cancelation of zero carbon illustrates the short sightedness of this approach.

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

---

475 See the ‘Garden City principles’ page of the TCPA website, at http://www.tcpa.org.uk/pages/garden-cities.html
Town planning was directly informed by those such as William Morris and John Ruskin who had an acute sensitivity to the past, both for its intrinsic value and its ability to inform and guide modern design. This sensitivity, to local vernacular architecture for example, has almost completely disappeared from our dominant housing model which produces ‘units’ which are neither strikingly modern nor rooted in past techniques and materials. The economic value of the historic environment in place-making is also clear, but there is still a cultural sense in much of the development industry of these assets ‘getting in the way’. The historic environment needs to be emphasised as key creative element in place-making.

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

The professions of the built environment do require significant reform. Practices which were once united like planning and architecture are now fragmented with insufficient dialogue and understanding between them. Planning education is in particular need of reform to encompass key skills on climate change, human health and public participation. The position of local authorities is particularly challenging with very significant cuts to planning services and to related skills in energy, climate change, building conservation, biodiversity and sustainable development. The TCPA believes that many authorities have simply been hollowed out with insufficient skills and resources to provide an effective and quality service to both regulate and positively promote changes to the built environment.

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

There is no doubt that national political leadership on place-making would be the most significant starting point in rebuilding quality outcomes. Rather than focusing all of DCLG’s capacity on setting up ministerial groups on the detailed process of plan making, the TCPA recommends more emphasis and capacity is directed to the much more important issues of effective place-making.

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

The TCPA has been actively involved with individual local authorities on reuniting health with planning. The national planning policy on planning for health is clear and the TCPA welcomed the NPPF chapter on creating healthy communities. However the TCPA believes further direction and support from central Government departments on monitoring and evaluation
as part of both the plan-making and development management processes is needed to secure the benefits of current development for future generations.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

The planning system pioneered community participation in decision making, and from the 1960s developed innovative techniques such as Planning for Real to engage a range of communities. However, barriers remain and in some cases have been reinforced by the lack of capacity of the planning service to focus on reaching out, particularly to excluded communities. Barriers remain around technical and legalistic language, around basic knowledge of how the system works and confusion over its powers, given the large scale deregulation of the service. Neighbourhood planning offers a new opportunity to some communities to have a say over a limited range of local issues. However, the lack of democratic accountability in urban areas raises significant questions as to their legitimacy in dealing with complex inner city communities. The TCPA has advocated a comprehensive review of people and planning based on the frameworks of rights set out in the Aarhus Convention.\(^476\) The last Government review into the relative power of people and planning was carried out in 1968.\(^477\) Since that time the asymmetry in the planning system between communities and the development sector has, in general, widened, with a failure to focus Government resources on those communities who need them most.

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

Access to land in the right location and at the right price is the foundation of successful new places. Garden Cities demonstrate how a land value capture can create high quality self-financing places. The TCPA is advocating the use of modernised New Towns legislation which is founded on the use of development corporations. Development corporations have the power through compulsory purchase to deliver comprehensive land assembly. Compulsory purchase powers are a vital part of this effectiveness but changes to the compensation code in 1960s have meant that there is no longer a fair balance between the needs of landowners and taxpayers. This issue is not being addressed by the Government’s forthcoming changes to compulsory purchase which focus on technical issues.

Compensation must be fair to tax payers and the wider public particularly when land is to be used for a purpose which is in the national interest and where increased land values results mainly from the actions of the public sector. This issue is vital because the capture of the uplift in land values, which the granting of planning permission and development creates, is vital to

\(^477\) HM Government (1968) Report of the Committee on Public Participation in Planning (The Skeffington Committee Report)
fund debt repayment and long-term reinvestment in a new community. If land compensation deals are too generous to landowners, this viability may be compromised with less ability to deliver public goods such as social housing or greenspace. If, on the other hand, compensation is unfair, landowners may challenge decisions in the courts. The whole issue of how to strike a fair balance is mired in procedural complexity, but urgent reform is needed, based on the following working assumptions:

1. The value of land is dependent on the use for which it can be developed. The landowner has a right to carry on the current use of land, but has no right (with some exceptions) to develop the land for other uses without the permission of local government. All development rights are effectively owned by the public sector.

2. The increase in land value between current use and the use for, say, housing is an ‘unearned increment’ or betterment, a value accruing to the landowner through the actions of a public authority. The landowner has done nothing to ‘earn’ the new value of their land since they did not own the right to develop it. The value gap between these current use and use for homes is substantial and can be up to 100 times.

3. The logic of 1947 planning system was to tax this value, but despite two further attempts at comprehensive betterment taxation the system was last abandoned in 1985. Since then the exchequer has in practice failed to collect billions of pounds of public assets in what amounts a substantial development subsidy to landowners. The continued logic of this major tax loop hole is unclear particularly in an era of financial austerity.

4. The reason this matters for the development of new Garden Cities is that capturing this betterment as well as the wider rental and land sale income is the main way of financing new development and paying for high quality outcomes and long term management. In short, the public asset of betterment needs to be captured and recycled for public benefit. It was this mechanism that made the mark 1 New Towns program so profitable. This is in stark contrast to the current position where developers of some schemes do not even meet the cost of the direct impacts of development on public services such as education. They can escape such ‘impact fees’ by arguing that schemes are unviable. Viability is dependent on land price, development cost, public investment and acceptable profit margins. The landowner’s expectation of betterment drives inflated land prices and reduced viability.

5. The compensation rules for compulsory purchase for New Towns have changed over time and particularly after the 1961 Land Compensation Act. It is now based on the market value of land. This value is derived not simply from its market value in its current use, typically agriculture and including any valid planning permissions, but also in relation to its speculative future development for uses such as housing. This is known as ‘hope value’. Determining hope value requires a judgment of what the courts have described as a ‘fantasy world’ in terms guessing what might happen to land over time.

6. Parliament tried to restrict the scope of ‘hope value’ by ensuring that the impact of some forms of public development, including New Towns, should be disregarded in

---

478 As a result of the Town and Country Planning Act 1947 the right to develop land is no longer a proprietary right in English land law

479 Hall, P (2014) Sociable Cities 2014 page 224
the calculation of compensation\textsuperscript{480}. The problem is that the law still allows for a reasonable assessment of hope value regardless of whether the New Town was built or not. The allowance for ‘hope value’ based on a speculation of what might have happened to land over time is illogical and represents a real unfairness to the taxpayer and holds back the provision of high quality homes and places by inflating the price which is paid for land through compulsory purchase orders.

7. The landowner is in effect asking not simply for the best current use market value, plus all normal allowances for disturbance, but also for a speculative value based on the future actions of a public authority. They are asking for compensation for development rights which they do not own for betterment values for which they have no logical right.

This conclusion is important because while no one is suggesting that landowners are not treated fairly, and indeed generously, the values at the heart of debate are substantial and need to be dealt with prudently. The question then is how to capture a proportion of these values for public good. The TCPA has set out the case for change in more detail that can be found here, but there is clearly a need for wider debate on fair land taxation in the UK. A return to a general betterment charge collected through corporation tax and capital gains tax which provided a central fund for housing and infrastructure investment it worth exploring.

In relation to new Garden Cities two options should be urgently explored:

- Changes to the compensation rules specifically for New Towns and Garden Cities to restrict hope value planning assumptions, and
- A change to compensation rules for New Towns and Garden Cities to produce a simple flat rate of compensation based on a proportion of final scheme values.

There is a clear legal consensus that the compensation law is outdated and in the TCPA’s view the recent HM Treasury technical review of compulsory purchase orders did not address the core issue of the calculation of hope value\textsuperscript{481}. There is also a consensus represented in the independent Lyons Housing Review final report that some form of land taxation which deals with betterment is both fair and essential in the funding of high quality new places\textsuperscript{482}. The TCPA is asking ministers to agree to an HM Treasury sponsored review of the compensation code. In advance of, and without prejudice to, the outcome of that review the TCPA is calling for an enabling clause which would allow the Secretary of State to set special compensation rules for New Towns and Garden Cities by order at a later date.

Town & County Planning Association and Campaign to Protect Rural England – Oral Evidence (QQ109-120)

Transcript to be found under Campaign to Protect Rural England
Summary
THSG is an organisation which exists to promote the study of links between transport and health and to advocate for the development of a healthy transport system. The key links between transport and health include the role of active travel in physical activity in promoting physical activity, access to health-promoting facilities (including countryside), the role of transport in maintaining social support networks and opportunities for work and volunteering, the climate change impact of transport emissions, other health effects of transport emissions, the role of community severance in disrupting communities and social networks, the stress associated with transport systems, the adverse impact of transport on climate change, inequalities arising from unequal transport opportunities (including issues of isolation for disabled people, older people and poor people in rural areas), the transport needs of the health and social care systems, transport safety and the promotion of safer modes of transport (such as rail combined with walking and cycling separated from cars) in preference to the dangerous modes we currently use (cars, and walking and cycling mingled with cars).

The largest single issue amongst these is the role of active travel in combatting obesity, mental ill health, osteoporosis, heart disease and other diseases of physical inactivity. A healthy transport system would use walking as the prime mode of transport for journeys of up to about a mile, cycling for rather longer journeys of a few miles, and the train/cycle combination for journeys that are too long for cycling alone. There are a number of issues for the built environment in creating such a transport system. They include:

- Developing living streets as the norm for residential areas
- Creating cities designed for walking, cycling and public transport rather than cars
- Mixed development so that people can live closer to their place of work
- Designing homes and neighbourhoods to encourage working from home or from neighbourhood work stations
- Aesthetic enhancement of walking routes so as to encourage people to walk further
- Better arrangements for pedestrians and for cyclists
- Avoiding the use of residential streets as busy access routes for motor traffic
- Avoiding centralisation of facilities to a degree which increases considerably the need for travel
- Pedestrian permeability of street design in new developments. There is evidence that the impact this has on obesity could equate to a difference of 1 death per year per 1,000 population yet pedestrian-impermeable designs are currently being promoted by the police as part of the Safer By Design initiative.

The first six pages of this evidence begin with a cameo of life in a society with a healthy transport system and then set out recommendations for bringing such a system about. These are drawn from our e book Health on the Move 2 and in an appendix we attach further extracts from that e book.
Living with a healthy transport system

This cameo of life in a society with a healthy transport system first appeared in our e book Health on the Move 2. Jean checked her diary for the day. It wouldn’t be necessary to go into HQ. But there were some meetings which would need her to use the video facility at her local neighbourhood work station. She pondered whether to go to the work station for the whole day or whether to work at home in the large office that they had built in the garage when they gave up the cars. She’d rather like the company, she thought, and Angela was always there on a Tuesday so she’d be able to ask Angela for advice about storing her parents’ motorised transport contraptions once they convert their garage into a downstairs bedroom. It had taken her so long to persuade them to do this but, of course, her parents’ generation had grown up in the days of private transport and found it hard to abandon old attitudes. Angela always used the community transport bus door to door whenever she needed to go further than her self-propelled wheelchair could manage. Jean had only ever used this when she had heavy luggage but she wondered if it would answer all her parents’ travel needs too now they had finally given up driving regularly.

Coming back to the present she settled down to eat her breakfast. Bacon from the pig farm in the next village. Eggs from her own hen. Toast and marmalade, made from good Sheffield oranges grown in the multi-storey farms of the Don Valley.

David had overslept. Not surprisingly after the late night he had had the previous evening. As she was finishing her breakfast he joined her, spent a few minutes bolting down some cereal (from the multi-storey farms at Ringway, built on the site of the old airport) and rushed out to get his bicycle.

“It’s pouring down” she said “Why don’t you walk?” “Too late” he said as he pedalled off to the station.

Jean followed him but she walked along the covered walkway to protect her from the rain. It was a nice street. Rose gardens and trees and children’s play areas filled the gaps between the opposing houses. On a sunny day Jean would have wandered amongst them, chatting to neighbours and watching the children play in the street out of harm’s way but today the weather called for being under cover. Half way to the work station there was the facility that Jean had pressed so hard for when the street was being designed – the open air swimming pool. As she passed the swimming pool, the delivery van bringing the shopping up to the local shop for people to collect was picking its way along the carriageway. Unlike the straight direct cycleway, motor vehicles had to negotiate the gaps between the obstacles rather than having a protected carriageway. Jean watched the van, its guidance devices, speed regulators and obstacle detectors all fully engaged, as it inched gingerly along the edge of the pool. It reminded her of the incident last winter when the council had only had enough grit to do the pavements, cycle ways and busways and the roads had been closed. The delivery van driver had foolishly ignored this and had ended up in the swimming pool and winner of You Tube’s Idiot of the Week.
As Jean arrived at the work station, checked her booking of the videoconference for the meeting that afternoon, switched on her computer, and started to write a lecture for medical students setting out the evidence for the powerful health benefits of social networks, David was arriving at the Metro station.

He inserted his card and keyed adult single with cycle to Emmerdale into the journey planner. A recorded voice came over the intercom. “Next but one service from Platform 3. Change at Angerfield, which is the fourth station, for a bus to Emmerdale from stand E.” Then a real human voice replaced it as the controller intervened. “The Emmerdale bus is demand-responsive and you are the only person booked on it today. If you’d prefer we could let you have a car from the Car Club for the normal bus fare and without road charges.” They often made this offer when he was going to Emmerdale. Usually he took it but today he was feeling tired and he didn’t think it would be safe so he declined, collected his tickets and made his way to the platform. The freight train to the shopping distributive warehouse at Angerfield was passing as he reached the platform, then the fast train to the city drew up into the platform making the wayside stop that it made here once an hour instead of running through non-stop as it did the rest of the time.

David knew this train stopped at Angerfield. They wanted him to wait for the tram because he would get no benefit from the train due to the connection and they liked to keep short distance passengers on the trams if they could. But he rather fancied the plusher seats of the train so he climbed aboard, stored his cycle in the cycle van and lounged back into a seat. The train flashed past the three intervening tram stops and overtook the freight train as it manoeuvred itself into the shopping sidings. Then the train drew up at Angerfield. He made his way to stand E and relaxed in an armchair watching the trolley buses come and go as he waited for his own bus.

While he waited, he thought about their holiday. 15 days on a cruise train. They started with a day in Paris, then a slow daytime ride across the Alps with a break at Innsbruck. Full days spent, in Venice, Bled, Dubrovnik, Athens, Istanbul, Samarkand, St Petersburg, Narvik and Bergen, sometimes linked by high speed overnight travel, sometimes interspersed with slow, looking out of the window days. He thought Samarkand and Athens would be the highlights of the trip.

In this little cameo of the future we can see many features of a healthy transport lifestyle. There is powerful evidence that social support benefits health. The living streets that provide opportunities for social networking show how we can learn the lessons of Appleyard & Lintell1 and Joshua Hart that streets full of traffic isolate and separate us. In the future we should find that intolerable. Living streets can also create greener local environments, with the street becoming a shared garden. Evidence is emerging of the importance of pleasant green surroundings to health – even to the point that people recover faster from operations if they have plants in their hospital room or can see the natural environment rather than a brick wall from their window Motor vehicles should not be banned from living streets but
they should, like the delivery van in the cameo, be out of place, picking their way slowly round obstacles.

The guidance devices, speed regulator and obstacle detector on the van reflect the fact that the kind of technological controls that have long been a feature of the railway need to apply on the roads as well. A transport system which doesn’t force people to drive is also safer – David had the choice of the car but chose the bus because he felt tired. Climate change should be a major factor in transport policy. Reduced need to travel and reduced freight distances are achieved by the use of local produce and by local work stations. The use of local work stations rather than home-working is a way to provide facilities – like Jean’s videoconference - that it may not be worth providing to every home. It also sustains the social support of being at work. For many types of employment, similar benefits can be obtained by mixed use in urban planning – close proximity of homes, workplaces, and services rather than siting these in discrete locations. Electric traction should be used as far as possible, although electricity is only clean if it is generated by renewable means.

In the cameo, aviation has been curbed – we propose that it be limited to flights across oceans and polar ice and to islands. Where such travel is unavoidable. International high speed trains would replace it. Although long distance business travel would have declined dramatically with many business meetings and conferences taking place in cyberspace, the world’s ecosystem should be able to afford to provide a reasonable number of long distance holidays.

The car has also been curbed, limited to journeys where there is nobody to share a bus or a train. The combination of the cycle (for short journeys) with the train (for longer ones) has all the flexibility of the car. The cycle is healthier (and would be safer if it didn’t have to mix with heavy traffic) and the train is safer and faster. Active travel - walking and cycling - has an immense potential to enable people to get more daily exercise. Calculations based on American research into the effect of pedestrian permeability, on mean body weight has shown that simply making it easy to walk can have an impact of one per 1,000 per year on death rate. Given the worldwide obesity epidemic these finding are of even greater importance.

The lifestyle described in the cameo is neither an isolated travel-free lifestyle nor an unpleasant restricted one. It is a technologically feasible lifestyle. It is healthy. It protects our environment. It actually offers chances to improve our lives – the extra space in the house because the garage is no longer needed, the extra garden taken from the street, the extra personal time due to shorter journeys and less travel time. Why should it not come about?

**Recommendations to Create a Healthy Transport System**

Our e-book Health on the Move 2 contains a comprehensive list of recommendations for creating a healthy transport system. We have extracted and included in this evidence those
which relate to planning of the built environment. We have left the numbering as in the original document and made minor amendments only (eg removing cross references to material not included and recommendations that have been overtaken by events).

010. We recommend that local transport planning continues to be seen as important and as relevant to health, and that those involved in local transport planning take full account of the above strategies, build health impact assessment into their planning process and pursue the following priority actions.

011. All local transport plans should include an assessment of the carbon footprint of the local transport system and an estimate of the extent to which the plan will reduce it.

012. All local transport plans should include firm plans, committed resources and a target date for completing a cycle network usable by new cyclists as well as established cyclists and for providing cycle parking.

013. All local transport plans should include a timetable (with firm plans and committed resources) for closing rat runs so as to reduce the number of households experiencing heavy street traffic and so as to contribute to recommendation 012.

014. In developing their cycle network, all local transport plans should use a revised hierarchy of provision which gives high priority to linking quiet streets to create a comprehensive quiet cycle network.

015. All local transport plans should include firm plans, committed resources and a target date for improving pedestrian routes by removing engineering obstacles to pedestrians, providing safe crossing points over busy roads, and enhancing pedestrian signage.

016. All local transport plans should include firm plans, committed resources and a target date for aesthetic enhancement of pedestrian routes.

017. All local transport plans should develop plans for bus priority measures which will ensure that the bus network operates freely. Transport planners should have the confidence to transfer road space for this purpose, recognising that the significance of the Downs-Thomson Corollary of Pigou’s Theorem is that a free-flowing bus network will ease congestion but additional road space will not. (Note:- Since this was written the concept has emerged of hotlanes – lanes which can be used not only by buses but also by vehicles paying a toll, the toll being set at a level to keep the lane flowing freely, and flexed so as to favour high occupancy vehicles. Technology has also developed in which induction loops in the road could facilitate management of hotlanes. This concept would have been mentioned as one possible form of bus priority measure if we had been writing the recommendation today).

018. All local transport plans should focus any efforts directed at congestion upon improved public transport rather than new roads. Where bypasses are built to divert traffic, the bypass should be of no greater capacity and no faster than the road it replaces (to avoid
traffic generation) and the old road should be closed to through traffic and traffic calmed. Under no circumstances should money be wasted on enhancing the capacity of the road system. Capacity issues should be addressed by public transport or rail alternatives.

019. All local transport plans should address road safety by area-wide 20mph speed limits in residential areas and at accident black spots on main roads.

020 We recommend that those engaged in spatial planning recognise the significance of the Appleyard / Lintell / Hart findings and proceed on the basis that it is entirely plausible that within the near future it may come to be considered that heavy traffic in a road renders houses bordering that road unfit for long term human habitation.

021. There should be a strict prohibition on new development of any kind being accessed via a residential road (other than a major road with residential development along it) if this would increase the flow of traffic along the road to a steady flow. If it is necessary, in order to avoid this, for the main car parks of a new development to be some distance away with the final access being on foot, then so be it.

022 There should be a strict prohibition on residential properties being built with their principal pedestrian access being from a main road, with exceptions for owner-occupied plots purchased before the policy was adopted, holiday homes, or properties to be used as temporary lodgings.

023 In new residential developments there should be a strict limit on the number of properties that might be accessed by a residential road. Developments larger than this should either have multiple access points or a non-residential access road.

024 Where residential properties have already been built on a main road, spatial planners should facilitate measures to address this, including reorientation of the properties’ relationships to the road, shared gardens or conversion to holiday homes, temporary lodgings, or business premises.

025. The Home Zone should be adopted as the norm for all new residential streets.

026 All future large residential developments should be divided into residential cells, so as to prevent the creation of new rat runs. There should, however, be pedestrian and cycle links between the cells, with only motor vehicles being prevented from passing through.

027. Residential developments should have a pedestrian-permeable street design, with good cycle routes and aesthetically attractive pedestrian routes through them.

029 (Not included in the original but we would add it if writing the recommendations now) There should be a review, including a health impact assessment, of Safer by Design so to bring to an end the situation where this is used as a justification for building pedestrian-impermeable developments)
030. We also recommend that Government recognises the importance of spatial planning to health and other social values, that the NICE work programme on spatial planning cancelled by Ministers in December 2010 be reinstated and that those engaged in spatial planning adopt a policy that the health of the people shall be a material consideration to any development proposal, build health impact assessment into their procedures, and pursue the following actions.

031. Spatial planning should aim to ensure that the whole population can access the sources of a healthy lifestyle – recreational exercise opportunities, affordable healthy food shopping, parks and countryside, work, education, places of social interaction, health facilities.

032. Spatial planning should aim to ensure that people are provided with opportunities to build exercise into their daily lives more easily than to avoid it.

033. Spatial planning should have a goal that people spend as much as possible of their day in surroundings that are green and aesthetically attractive and should to that end make as much use as possible of street trees, grass, open space, green roofs and living walls.

034. Spatial planners should aim to make it easy for people to obtain facilities as close as possible to where they live and work. Much of the movement that we call ‘increased mobility’ is a human benefit but much of it is not – much of it is the hardship of having to travel a long way to find something that once was local.

035. In making provision for transport infrastructure spatial planners should move away from thinking ‘car’ and towards a future that is ‘train, bus, cycle and foot’.

036. Insofar as spatial planning must be intimately linked to economic development, it must recognise good environments as an economic driver since the knowledge-based industries of the future, much freer in the choice of where to site themselves, will want to place themselves where it is pleasant to live.

037. Two of the aims of town planning should be firstly, to minimise journey lengths, by resisting the trend to fewer and larger facilities, and secondly, to ensure that all facilities are easily accessible by foot, bicycle and public transport. This is particularly important for shops, schools, health services, local authority services, recreational facilities and places of employment.

038. Planning should ensure that residential developments can be serviced by public transport. Particular care needs to be taken with areas of low residential density since these tend to be difficult to serve by public transport.

039. (not included in the original but we would add it if writing the recommendations today) The use of viability as an argument for building developments which do not comply with planning policies should be restricted by requiring account to be taken of the social costs,
health damage, and public spending costs that will result if there is widespread non-observance of the policy.
Appendix – other relevant extracts from health on the move 2

Following the words “Why should it not come about?” at the end of our cameo of the future as reproduced above we continued:

In the middle of the last century, a comprehensive rail and bus network provided effective transport for most people. Those who bought a car bought greater freedom and greater speed. But as car ownership grew, this freedom and speed became eroded. People buy a car in order to drive on an open road - a typical advert might show a drive across a Scottish moor. However they use it to inch their way through city centre traffic jams searching for somewhere to park. The car owner today may travel further – and certainly spend more time doing so – but is much less mobile than the car user of the 1950s. Indeed within city traffic, the car owner of today is no faster than the public transport user of the 1950s, although it must be recognised that even in the 1950s rural public transport was often infrequent, so today’s car-based system is more flexible.

If the car owner of today enjoys only slightly better mobility than the public transport user of the 1950s, what about today’s public transport user? Over half of the route-mileage of the railway system has been closed. Rural buses and late night buses have been reduced. Non-radial public transport routes have diminished. Public transport is no longer a comprehensive network. In order to have access to a comprehensive network, it is necessary to buy a car. And so the vicious circle takes another twist. The vision of increasing car ownership points us towards the situation of Los Angeles, where two-thirds of the land area is occupied by roads and car parks and smog is a major hazard.

Yet there is another vision. Fast, modern, comfortable, frequent public transport systems can provide cities in which everybody can travel without encumbrance. In recent years, new stations and the Channel Tunnel high speed railway have been opened, with new high speed railway routes planned. New developments such as people movers (small personalised computer-controlled tracked vehicles) make it possible for public transport to meet even the unusual and individual transport needs for which the car has hitherto been the only possible system.

Trains can now travel at speeds of more than twice the motorway speed limit, light rapid transit offers the only hope of congestion-free city centres, and people movers can challenge the car even in the area of lightly trafficked distinctive journeys, so some people now argue that the car and lorry are in the situation that the horse was in between the opening of the Stockton and Darlington Railway in 1825 and the railway boom of the 1840s. Its dominance of the transport system was complete. The alternatives were scattered and the idea that they could be made comprehensive was visionary. Yet the end of the horse as the main mode of transport was as inevitable as its inevitability was, to many, imperceptible. Those towns and nations who were the first to see the future gained an economic advantage which lasted for many decades.
Is this political and economic argument one that has relevance for public health or are transport and public health separate spheres of human activity? The Transport and Health Study Group believes that transport is a public health issue. Public health must consider the socially unequal distribution of opportunities for access to such health promoting facilities as shops selling healthy food, sports centres and the countryside. Opportunities for social networking and for children’s independent travel and play are public health issue and we cannot overlook the potential that traffic-calmed streets hold out for enhancing community life. Roads were made for cars, but streets were made for people.

Much of this policy statement consists of detailed analysis and proposals. Yet behind the detail there is a vision. It is a vision of a society where we no longer accept that children cannot play in the streets for fear of being killed, that disabled people should be confined to the home, or that the poor cannot have access to healthy lifestyles because they cannot travel to their sources. It is a vision of a people who enjoy the beauty of their cities instead of scurrying along narrow pavements, who breathe unpolluted air and who read and chat as they travel rapidly and unimpeded about their business. It is a vision of a people who can choose to live in rural areas and know that they can readily access the goods, services, and people they need without needing a car for most journeys. It is a vision of a future where people will no more accept road crash deaths than we accept maternal mortality or diphtheria.

Public health has always been driven by such visions. The vision of clean water and sanitation in the 19th century; the development of housing standards and the eradication of infectious diseases in the 20th century; the virtual ending of maternal mortality in western countries; the idea of a clean atmosphere in which you could stand on top of a Pennine hill and see the industrial town below; the idea that people in workplaces and public places shouldn’t poison their neighbour with cigarette smoke in the 21st century. These are the visions, dismissed as crackpot when first articulated, fought for against powerful economic interests, and yet, today, accepted without question as part of the inevitable onward flow of civilisation.

The health of the people is a fundamental social value. In comparison with the battles we have fought and won in the past, our vision of a healthy transport system does not seem at all ambitious.

1.4.3 Is it realistic to plan for such changes?
Almost everybody who now works as a transport planner or transport system manager has spent their entire career in an atmosphere of retrenchment where the emphasis is on squeezing more and more through the existing system and where it has been assumed that the trend towards the car is unstoppable. It is not surprising therefore that many of them have expressed unease at the scope of the measures which we describe as the minimum necessary. And yet, the wider societal costs of transport in urban areas in England has recently been estimated as costing £38 – 48billion.

As we have already said, public health is used to being described as “unrealistic” – even “crackpot” - when it advocates the inevitable. The transport system that we advocate is no
more unrealistic than the building of the sewers or the removal of industrial and domestic smoke from the air was in the 19th and 20th centuries, respectively. What is totally unrealistic is to believe that as a species we will allow ourselves to become extinct because we refuse to use available technologies to stop carbon emissions destroying us, or that we can tolerate a situation where it becomes normal to be obese, or even that we will allow our large cities to grind to a halt in gridlock. We are the realists. It is those who pretend that we can avoid these measures who lack an understanding of reality.

*Extract from chapter 12 – Lessons for Transport Professionals. We have extracted the section relating to urban design.*

### 12.8 Urban design: home zones, walkability and social support

The replication by Hart of the earlier study by Appleyard & Lintell now makes it clear that motor traffic in residential streets diminishes social support networks amongst residents and also leads to a lack of sense of possession over large areas of the street. The implications of this are very serious – social support is a major factor reducing mortality while areas of street over which residents do not feel possession will increase crime, disorder and vandalism. It should now be regarded as unacceptable for a residential street to have a steady flow of traffic and development control must prevent any further such situations on new developments.

A major rethink of the street system is necessitated by the recognition of the high public health priority attached to walking and cycling coupled with the recognition from Appleyard/Lintell/Hart’s work that steady traffic flows in streets have a serious impact on the health of residents. The urban street system needs to be seen as fulfilling three roles. It is the final link in the urban road system allowing vehicles to reach homes, shops, workplaces and businesses. It is the gap between houses – a community open space with important functions in maintaining social networks and community interaction. It is a set of routes that can be used to make provision for walkers and cyclists away from main roads. The problem for the highways engineer is how to balance these three roles. This balance may not be achieved by unthinkingly applying traditional design approaches which give pre-eminence to its role as a passage for local traffic.

#### 12.8.1 Walkability: permeability and pedestrian priority

According to the DfT National Travel Survey 2007, the majority of adults agreed everyone should be encouraged to walk for their health (97%), the environment (94%) and to ease congestion (92%). However, only 41% of men and 33% of women questioned in a general population survey reported walking ‘brisk or fast’ for ten minutes in the previous four weeks. Nationally, 11% of commuters walk to work.

Residents in a high walkable neighbourhood are likely to take more steps per day and walk more for transport than residents in a low walkable neighbourhood. This is particularly pronounced for adults who previously had a preference for non-active transport and/or a low intention to walk or cycle. Pedestrian-permeable street designs are associated with 6lb
lower mean population weight than pedestrian-impermeable environments.60 This difference in weight is equivalent to an annual death rate of 1 per 1000 – which means one extra death every ten years in a population of 100, which could be as few as 25-30 houses.

Walking more slowly than needed to increase fitness still aids weight control, as the same amount of energy is used up almost independent of the speed walked. The key elements of a walkable neighbourhood are small block sizes and low, slow traffic flows.

Block size is usually determined by architects, so a key role of transport professionals is to influence designs at an early stage, referring to best practice such as the Urban Design Compendium

Slow traffic flows means traffic should move at 20mph or less. Driving two miles at 20mph takes 6 minutes, as opposed to 4 minutes at 30mph or 3 minutes at 40mph. There is little to be gained by driving faster than 20mph in residential side streets or streets outside schools, and therefore the safety of pedestrians in these areas should be the clear priority. 20mph zones should therefore be the standard in residential areas and outside schools at the beginning and end of the school day. Manual for Streets provides the key design guidance on how to create these.

Where closure or diversion is proposed of minor urban roads (eg alleys) or rights of way used for utility walking it is important to be aware of the fact that utility walking is very distance sensitive. Any diversion of more than about 50 metres needs to be thought of very carefully and diversions of more than 100 metres should be seen as seriously affecting a walking route. This is important when alleygating proposals are concerned. Alleygating of a back alley which is no more attractive than the parallel main street may well be acceptable. This cannot be said for gating of cross alleys, link passages or routes that are more attractive than the proposed alternative. Other solutions must be found to security problems. If 30 houses suffer loss of pedestrian permeability then, if there are on average just over 3 residents per house, there will be one extra death every ten years. We cannot solve problems of minor antisocial behaviour by killing people.

12.8.2 Social support
Research has shown that strength of social support is associated with a four-fold difference in all-cause mortality – a difference comparable in magnitude to the effects of poverty. The effect was so striking that the researchers initially refused to believe it, and undertook extensive further studies which confirmed the effect.

Studies by Appleyard & Lintell in San Francisco, repeated more recently in Bristol by Joshua Hart, show that motor traffic levels in streets are a key determinant of the strength of social support – the greater the traffic levels, the less likely people were to know and interact with their neighbours. However, street design can also promote community networks, by providing space to interact and play.
Access to state social support such as health services requires there to be relevant transport services. Hospitals with poor public transport access or located at the top of a hill will not provide as good a level of social support to people without access to cars as they would if provided with comprehensive public transport and a good walking environment.

12.8.3 Severance

Severance was defined in the late 1970s as: “the sum of the divisive effects a major urban road has on the inhabitants on either side of it.” Severance results in: “pedestrian delay, trip diversion and suppression, pollution, perceived danger and overall unpleasantness.” Because severance disproportionately affects pedestrians and cyclists, it also encourages modal shift towards the car, or trip suppression where people do not have access to a car. Severance by major roads or train lines also creates noise, pollution and frequently leads to visual blight. Community severance can give rise to stress and isolation, by increasing the effective distance to places of employment and health promoting facilities such as schools, parks, shops, leisure centres, and health services. This means that community severance is linked to social exclusion and its associated health disbenefits. In addition to causing stress, noise can also impair health by causing a lack of sleep. A 2006 survey found that half a million Britons move house each year because of noise, although it is not clear to what extent traffic is the cause. However noise effects can to some extent be designed out – quieter road surfaces such as porous asphalt can reduce noise by 4-8 decibels, equivalent to almost halving the volume of traffic.

Community severance cannot be quantified effectively at present. Valuable indicators of community severance that could be empirically assessed include traffic volume, noise levels and pedestrian delay in crossing roads. In 1969, the Urban Motorways Committee proposed pedestrian delay as the most important indicator of severance by major urban roads, and pedestrian delay was used in the willingness to pay study of traffic calming by Garrod and colleagues. In San Francisco, 94% of pedestrians on the light traffic street reported waiting not at all or only a few seconds, compared with 49% on the street with medium, 25% heavy and 19% very heavy traffic. The Kensington Environmental Management Study considered that a peak figure of 300 vehicles/hr provided an appropriate standard. However the amount of traffic is mediated by the road layout: the Buchanan report ‘Traffic in Towns’ showed that the wider the road, the lower the volume of traffic required to cause the same pedestrian delay. The Standing Advisory Committee on Trunk Road Assessment (SACTRA) and the Transport and Road Research Laboratory (TRRL) proposed that vulnerable groups be identified, the facilities (such as post office or health centre) they are likely to use be listed, and the catchment areas of those facilities be delineated. The number of people living within this catchment area but separated from these facilities by major roads would form a measure of severance.
Unfortunately, however, decisions regarding the critical delineation of these catchment areas remain arbitrary. The TRRL approach specifically involved creating a severance index which considered how many people (especially vulnerable people) have impaired access to their nearest facilities, together with traffic density and a mitigation factor representing the presence and acceptability of crossing facilities.

Although there is not yet a widely accepted methodology for assessing, quantifying, and monetarising severance, there is an assessment of severance in DfT transport analysis guidance (Web TAG), meaning that new infrastructure that would sever communities should be avoided. Where existing infrastructure or physical features such as rivers exist, the priority should be increasing the density of pleasant, safe, and universally accessible crossing points.

These crossing points should be at grade, since steps and ramps add distance and time to walking and cycling trips, and can be insurmountable barriers to less mobile people. Subways and bridges can also be dangerous and unpleasant for users.

**The Crossing of Roads by Pedestrians: minimising physical severance**

Roads on which traffic creates a steady flow without many gaps or on which traffic is fast require safe crossing points. It is essential that these crossing points are located on pedestrian desire lines and do not require deviation — because each step is noticed, pedestrians are highly sensitive to deviation from their intended direction and will often take unsafe routes where a direct crossing is not provided.

It is tempting to provide crossing points on the basis of observed flows of pedestrians. However this approach is open to the very powerful criticism that there may seem to be no demand to cross the road simply because it is too dangerous for people to attempt it and hence the pedestrian cross flow is small. Such assessments should be replaced by a deliberate planning of pedestrian flows based on an assessment of local trip generators and attractors, and the desire lines between them. These should be provided in such a way as to minimise pedestrian deviation when accessing key destinations along the road (e.g. bus stop, school entrance) and destinations past the road (e.g. hospital or train station one block back from a main road).

If we had been writing this today we would have added something about the time allowed to cross at light-controlled crossings which is often inadequate for older people.

Where there is no ‘stand-out’ trip attractor, crossings should be provided at regular intervals to ensure that pedestrians are not deviated unacceptably from their desire line. Where pedestrian networks are carefully designed so as to provide flows of pedestrians separate from flows of motor traffic a safe crossing point should be provided wherever a pedestrian route crosses a road with steady or fast traffic. This same principle can be followed for allowing walkers on rural footpaths to cross the main road – wherever a footpath crosses a road there should be a safe crossing and wherever a footpath ends on a road there should be a safe crossing before the next footpath on the other side of the road.
On roads with speeds above 40mph only signalised or grade-separated crossings will suffice for this purpose. At-grade crossings are preferred whenever they are feasible due to a myriad of problems with grade-separated problems: not only are they often unattractive and leave pedestrians vulnerable to attack, they are also difficult for people with mobility difficulties to access, whether it is stick-users for whom flights of stairs are a major barrier, wheelchair users for whom extensive ramps are too large a challenge, or scooter users who can frequently have their path blocked by barriers intended to prevent cycle access.

On roads where visibility is greater than sight stopping distance at the actual traffic speed, zebra crossings can be a satisfactory alternative to signalised crossings. On such roads central refuges may suffice if the traffic flow is small enough that gaps in the traffic will occur every minute or so even if only in one direction although it is important to note that a study of elderly pedestrians and scooter users found that feeling in control of traffic (using signalised or zebra crossings) was key to a feeling of safety on crossings.

When speed falls to less than 20mph and cars and pedestrians mix more as equals, the majority of crossings are likely to be at informal locations. However even in these areas, regular formal crossings should be provided with raised tables and tactile pavings, to ensure that people who need these facilities are adequately catered for.

### 12.8.4 Aesthetics

Studies have shown that aesthetically attractive settings, particularly those including greenspace or water features, may diminish physical ill health. Conversely, traffic impacts that preclude tranquillity such as heavy traffic or aircraft noise have been shown to have negative impacts on health.

Traffic, whether moving, stationary or parked, reduces the visual amenity of streets. A 2007 survey by the Commission for Architecture and the Built Environment (CABE) found that 31% of residents in new developments thought that roads and car parking dominated their development. Aesthetics are also key to establishing the priority on a street – whether it is a place for people or a link for vehicles. In streets where the majority of gardens have been converted into parking bays the width of the road is effectively trebled, leading to increased traffic speeds and increased risk and occurrence of accidents. Conversely, streets where trees, benches, and grassed areas are used instead of chicanes or road humps as natural obstacles to slow traffic benefit from an attractive public realm and better traffic control.

### 12.8.5 Urban Residential Streets

Hart’s replication in Bristol of Appleyard & Lintell’s San Francisco study about the effect of traffic in streets on social networks has far reaching consequences for design of residential streets.

It should now be regarded as unacceptable for a residential street to have a steady flow of motor traffic that interferes with its use for community networking. The first impact of this should be on the attitude taken to rat runs – streets which are not intended to be major roads but have come to have heavy traffic flows because they form short cuts. Such rat runs should be closed to through motor traffic. This has two benefits;
the residents are given back their lifesaving tranquillity and if a passage is retained for cyclists a new cycle route is created. The closing of rat runs has in the past often been a last resort, partly because of technical difficulties and partly out of a sense that motorists have the right to use the highway system. In future it should be the first and immediate professional response to steady traffic building up in a residential street due to a through traffic flow developing on what was meant to be only a local road. Rising bollards can be used as the obstruction if there is a wish to allow selected traffic (e.g. residents, buses, refuse vehicles, emergency vehicles, delivery vehicles).

The second impact should be on the advice highways engineers give in relation to planning applications which route traffic along residential streets as their means of access or which create a risk of such a route being chosen. Highways engineers should strenuously object to any development which will create a steady traffic flow along a residential street for a significant part of the day (there may perhaps be a balance to strike if it is only for a very limited part of each day). If this means that car parking must be remote from the development and access on foot then so be it. Where the development is accessed by a proper access road, but there is a risk of traffic ignoring that and taking short cuts along a residential street, highways engineers should ask that the developer is required to fund the closure of the potential rat runs.

The third impact should be to render out of date the traditional design of the street as consisting only of carriageway and footway. The aim in future should be to carve areas for community interaction from the street—perhaps a tree with a seat around it, perhaps a play space, perhaps a communal garden to be maintained together, perhaps extensions to private gardens to be maintained privately but to be walked through and enjoyed together, or perhaps zanier ideas like a swimming pool. A residential street is the gap between houses. It needs to be possible to walk along it and move vehicles along it and there needs to be space to park vehicles but there can and should be other things as well. The carriageway may in the end be merely the gap between obstacles and in this context parking spaces can be arranged so as to serve as obstacles and to provide chicanes to slow traffic down and barriers to protect gardens or communal areas.

12.8.6 Urban Shopping Streets

Just as we must now think of urban residential streets as primarily for community interaction so we should think of shopping streets as being primarily for shopping. Studies conducted in Austria 10 years ago and in the UK recently found that retailers greatly overestimated the importance of the car and how far their customers travelled and underestimated how many of their customers walked, cycled or used public transport and how many shops they each visited.

The passage of heavy traffic between rows of shops served from narrow pavements is unpleasant to shoppers. It removes spontaneity from crossing and recrossing the street, which becomes a barrier. It is dangerous in enticing people into dangerous crossing movements.
Where the street can be pedestrianised (except for cycles, buses and access) this should be the norm. It may be, however, that this is impossible without routeing through traffic along residential streets, which need protection even more. A “high street” design with wide pavements, frequent crossing points, and controlled traffic speeds is the solution to such situations. Traffic should be slowed both for safety and also to increase the capacity of constrained road space so that the traffic flows freely but slowly.

Extract from chapter 20 – Other strategies - we have extracted the sections that relate to spatial planning

20.1 Planning and development control

20.1.1 Spatial planning
Mean population weight is 6lb lower in areas with good pedestrian permeability. A 6lb difference in mean population weight is important – equivalent to a death rate of one per 1,000 per annum. Pedestrian permeability should not, therefore, be lightly sacrificed. For example, some police architectural liaison officers argue against pedestrian links for crime prevention reasons. These arguments can seem compelling if the health implications seem minor or theoretical, but are obviously less important than the health issue when the health impact is large. For example, Home Office guidance on Alleygating commends as an example of good practice a local authority which had closed a pedestrian passage that was being used for young people to gather and engage in minor antisocial behaviour. This closure affected walking routes to local shops but the Home Office commented that the diversion was “only” 450 metres. For many people, the distance they are willing to walk is about 1km (less for many elderly or disabled people) so a diversion of about half that length will seriously reduce walking. Some local authorities have therefore not proceeded with gating alleys because of concerns about reducing walking although this effect of alley gating is not mentioned in Home Office advice to the public A walkability index has been developed in the USA.

In the scientific section of the book we described the evidence for the effect of traffic volume and speed on community severance and the use of streets for social and communal purposes. Traffic is also a major deterrent to cycling and to walking, particularly regarding crossing roads. No new developments should be allowed to create the situation of a steady flow of traffic in a residential street. There should be limits to the number of houses that can be accessed via any residential road. Industrial developments or other developments generating high traffic flows should have their own access roads and not be accessed through residential neighbourhoods. If this necessitates placing car parking some distance from the development then so be it – this will also promote walking.

Spatial planners should ensure that residential streets do not become thoroughfares carrying long distance traffic, as is currently often the case in rural areas. Where this has occurred it should, if possible, be reversed by closing the street to through traffic but in some situations where it has already happened, the situation may be irreversible. For
example, many cities have houses lining the main roads into and out of the city, as do most villages. If the road is wide enough to segregate part of it as an access road it might be possible to separate this from the main road by a hedge or even a glass barrier similar to those used alongside a motorway that runs through a residential area in Dordrecht, creating effectively a lightly trafficked street alongside the main road. It is plausible that social interaction similar to that achieved in quiet streets can be created by use of communal gardens. Sometimes pedestrian access to the houses can be relocated to the back. In irreversibly heavily trafficked streets close to town centre, it may be that houses as they become empty should be turned into shops, offices or housing for temporary use such as holiday lets.

Spatial planners should ensure that there is a high frequency public transport network and that development is designed to make use of it. Development should also be designed with cycle and walking access strongly encouraged. Spatial planning can make the largest contribution to the distances travelled to access goods and services. Residential areas located at a distance from commercial districts, entertainment areas, shopping precincts, all separate from each other, are not conducive to walking and may not be feasible for cycling. Keeping distances short has sound economic and environmental reasons but also promotes social inclusion. This requires both mixed developments and increased density. Parks and greenspace are important contributors to walking and so is the retention of city farms or country parks within the city. Living walls (walls with plants climbing up them), green roofs, green security (thorny hedges rather than metal fences), gardens and street trees should all be encouraged by spatial planners for a number of reasons. They contribute to overcoming the urban heat island effect, there is increasing scientific evidence that they improve health directly by promoting tranquillity, but they also make pedestrian routes more attractive and therefore more likely to be used.

20.1.2 Local Transport Planning
The promotion of walking and cycling (active travel) is an essential part of the strategy to address obesity, mental health, and osteoporosis. The contribution it can make is substantial and it should be seen as lifesaving and a core public health goal. As an indication of its significance, lack of pedestrian-permeability raises death rates by one per 1,000 per annum (equivalent to one extra death every 10 years in a population of 100; this could be as few as 25 to 30 houses).

Key policy measures to promote active travel include infrastructure and the physical environment; information, education and marketing (‘smarter choices’); partnerships; commitment to and resources for the plan; and evaluation and monitoring. Promoting cycle friendly streets and road design using the ‘hierarchy of provision’, combined with measures to reduce the speed and volume of motor traffic, are necessary to increase the attractiveness of cycling as a travel mode and divert drivers out of their cars. Reducing the use of the private car contributes to addressing climate change.

The Downs-Thompson Corollary of Pigou’s Theorem shows that once the road system is saturated road congestion will be influenced most by the availability of alternatives to the
car as this provides an additional alternative to using a car or not travelling and therefore raises the equilibrium speed at which congestion leads people to make a decision not to travel. Hence expenditure on roads is wasteful and useless. Downs and Thompson specifically advocated investment in public transport but for reasons described above this is a limited perspective and to address congestion local transport planning needs to focus on the development of walking, cycling and public transport and do that in parallel with spatial planning measures. A typical road lane can carry seven times as many bicycles as cars.

The promotion of walking requires attention to pedestrian needs in relation to road crossings, junctions and the like. People will walk further if routes are attractive so the development of an aesthetically attractive network is important.

20.1.3 Development Control
Development control needs to be deployed to address the above objectives. There is no point having a local transport plan emphasising walking, cycling and public transport if developers are routinely asked to pay for road improvements and are rarely asked to contribute to developing walking and cycling networks. There is no point having a spatial plan which emphasises local facilities if centralised facilities are allowed to expand and develop without taking steps to establish local outposts. There is no point having a walking strategy which calls for the creation of walking networks if planning applications are approved which close pedestrian routes without adequate replacements or which build loop and lollipop cul de sac designs without pedestrian interconnections to make the area pedestrian-permeable.

The replication by Hart of the earlier study by Appleyard & Lintell now makes it clear that traffic in residential streets diminishes social support networks amongst residents and also leads to a lack of sense of possession over large areas of the street. The implications of this are very serious – social support is a major factor reducing mortality while areas of street over which residents do not feel possession will increase crime, disorder and vandalism. It should now be regarded as unacceptable for a residential street to have a steady flow of traffic and development control must prevent any further such situations on new developments. They should limit the number of houses that can be accessed by a residential road either by preventing houses being built on the access road or by requiring large developments to be broken up into residential cells with multiple accesses and no through vehicular routes (although there should be through cycle and pedestrian routes). They should prevent existing residential streets being used as access routes to developments likely to generate substantial traffic, even if this means that parking for the development must be some distance away. This principle should be seen as a high priority and not lightly sacrificed to conflicting considerations – the time may well come when we will see houses built on heavily trafficked roads as unfit for human habitation.

Development control officers have to weigh conflicting considerations and it is important that the development framework emphasises the priority to be attached to the above strategies.
Often development control officers are blamed for failing to enforce the above strategies when, in reality, they have not been provided with the clear policy frameworks that would justify them so acting. In order for development control officers to act as enforcers of local transport plans, spatial plans, and traffic-free residential streets, the plans need to be clear and unequivocally incorporated into the policy framework applicable to the development control process.

The power of development control was undermined both by the Thatcher Government and the Blair Government. The former imposed a presumption in favour of development which diminished the power of development control to pursue desirable and preferred development instead of simply judging what was laid before them. The latter established a strong drive to make decisions to fixed timescales so that many planning departments shifted their role effectively to making defensible decisions within those time limits rather than taking the time to get decisions right. At the same time an increasing tendency to award costs at planning enquiries made it difficult for planners to listen to communities – indeed it was even sometimes suggested that commitment to the views of a local community was an improper bias.

The Coalition Government was committed to giving more power to local communities and this might have empowered Development Control officers to support local communities in shaping patterns of human settlement, regaining in the process much of their lost vision and purpose. However deregulatory impulses and antipathy to local government eventually prevailed.

20.1.4 Less Road Building
The belief that road building relieves congestion and stimulates economic regeneration is not supported by the evidence. In fact road building generates traffic increasing road use by as much as 8-10% per year until congestion, possibly on other parts of the road network, is undiminished. Then there may be demands for yet more road building. This is self-defeating and damaging to the public health. Decisions regarding investment in public transport and new roads should use comparable criteria. These should monetarise all social and environmental costs and benefits, including effects on pedestrians and local employment. Such comprehensive cost benefit analysis would result in more investment in public transport and less in road building.

The decisions should also be made together. Often they are made separately so that roads are built because rail planners are not engaged. The idea of a rolling motorway through the Woodhead tunnel instead of the damaging road improvements planned is a classic example of an idea which was difficult to advance in a system where rail and road planning are completely separate.

Indeed, looking to the future, it is questionable whether road building ever makes sense now that it is vital to start to reduce the role of the private car and lorry. It is like investing in
an ostler’s business in the 1830s: it may have seemed sensible, it may even have met short term economic tests, and no doubt many people did it. But actually it was taking passage on a sinking ship.

06 October 2015
1.0 Introduction

1.01 What is TDAG?

The Trees and Design Action Group (TDAG) established in early 2007 and now a registered charity is an a-political pioneering group of individuals, professionals and organisations from both the public and the private sectors who have come together to increase awareness of the role of trees in the built environment throughout the United Kingdom.

TDAG set out a 10 point action plan and central to these was the requirement that all TDAG guidance on the value of trees in integrated urban solutions is backed by evidence based research (see Appendix 3).

1.02 Why evidence on trees in the built environment?

The majority of people live in urban environments and this percentage is expected to significantly increase over the next two decades. We need to act now to ensure that the built environment is sustainable, resilient and liveable and contains all those elements that contribute to the welfare of both people today and for future generations.

Trees have a key role in integrated solutions for the financial, environmental, social and health benefits that they bring.

1.03 Trees? The history of urban trees is very interesting as described in a recent book. Apart from parks and gardens significant street tree planting really began with Haussmann in Paris and was developed in the UK with major infrastructure projects such as the Bazalgette Embankment (1865). At this stage trees were part of the townscape and amenity value of the place. See Embankment images in Appendix 2.

1.04 One of the reasons for tree losses today is the lack of including trees in integrated solutions. This is having an impact of health (and the NHS budget), on higher energy consumption and poor air quality. Meanwhile research has identified quantifiable social, environmental and economic benefits provided by urban trees (see London i-Tree Report and work of US Forest Services) and this has placed trees as the largest living organism at the heart of much infrastructure planning and development. It is TDAG’s contention that integrating green, grey (engineered) and blue (water) infrastructure to provide a sustainable integrated infrastructure should be at the heart of urban planning and development. (Several research projects are working on this; see also the UK Water Partnership).

1.05 The benefits of urban trees (the urban forest) are extensive (see diagram in Appendix 4).

---

To identify a few:

**1.06 Health Benefits:**

Dr William Bird (Intelligent Health) and others have identified the physical and mental health benefits of trees and urban greening such as:

- Improving the environment to encourage walking and cycling
- Access to green space reduces stress and improves mental health
- Areas of London with trees have been shown to have a lower use of anti-depressant drugs.
- It is estimated that the NHS bill would be directly reduced if there was adequate integration of trees in the built environment.

**1.07 Physical benefits:**

Climate change means that our cities will face serious impacts if they are to be resilient to the anticipated changes. The most serious are probably firstly those linked to water management and secondly to what is called the ‘urban heat island’ effect. Trees have a major role to play in both these instances. Trees also have a major role to play in supporting urban biodiversity on which we do all depend. As farming has become more ‘industrialised’ it is often urban areas that support the greatest diversity.

**1.08 Social benefits:**

Research has shown that trees offer a range of social benefits:

- Crime reduction
- People feel better
- Cities are competing globally and air quality, comfort and resilience as to the attractiveness of a city to investors and professional people.
- Sense of place and identity. As trees are (and should be) long-lived they can span generations and provide a local identity. An example of this is Berkeley Square in London where many of the original 18th century buildings were bombed and have been replaced but several of the 18th trees are still there and Berkeley Square has become identifiable more by its trees and garden than by its buildings. So trees have a major role to play in place-making. The TDAG evidence will not expand on this as we know that the wider subject of place-making has been discussed by others.

**1.09 Economic benefits:**

The i-Tree studies that have been carried out or are planned in London, Edinburgh, Glasgow, Torbay and other UK cities demonstrate quantifiable benefits in terms of the ecosystem services provided by urban trees. Headline figures from New York City showed that investing
$1 in trees could return $5 in quantifiable benefits.$^{485}$ Trees can also improve local economies and retail uptake.$^{486}$

The London i-Tree Survey shows that there is currently only one tree for each Londoner. Should we not be aiming to improve on this? Headline figures from the London survey (due to be published in the first week of December 2015) include the value of the services that London’s trees provide – see table below.

This is not insignificant in financial terms and justifies investment in the planting and maintaining of our urban forests.

1.10 How do we ensure that trees are integrated into our urban environments?

Over the last 7-8 years TDAG has endeavoured to encourage an integrated approach to planning, design and delivery. This means that we need to overcome the ‘silo effect’ at national and local government level as well as taking a cross-disciplinary approach by built environment professionals and delivery teams. (See Collaboration for Change, Paul Morrell, former Chief Construction Advisor and The Edge as well as the work of the Farrell Review and the Place Alliance). This integrated approach has been achieved in other countries for example the Greater Lyon Authority has published its second Tree Charter (available in English at [www.tdag.org.uk](http://www.tdag.org.uk)). TDAG is making small advances in that our latest guidelines *Trees in Hard Landscapes, A Guide for Delivery* was developed in partnership with cross-professional institutions ICE, CIBSE, CIHT and the ICF with a forward by a transport minister from DfT.

2.0 Specific questions

Having given some background as to why we think it is so important that urban trees achieve the necessary recognition in this Committee’s inquiries we will now give a tree-focused input to your specific questions.

2.01 Policymaking, integration and coordination

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

**TDAG**: National policy makers need to provide clear leadership on matters of the environment (energy, water management, soil), the built environment, infrastructure including transport, health and education. Local authorities can then ensure that this is included appropriately (given regional differences etc) in their own local plans and in terms of development it would ensure that all involved (developers, built environment professionals) would be working to the same requirements.
In terms of ‘trees’ it would be very valuable to have a National Tree Charter or Framework incorporating trees in integrated urban solutions.\footnote{487 See also Greater Lyon Authority Tree Charter available in English at www.tdag.org.uk (http://blogs.grandlyon.com/developpementdurable/files/downloads/2015/06/Charte-v-british-complete-2.pdf) \footnote{488 See work by Dr William Bird, CEO Intelligent Health and promoter of the Natural Health Service and the work of Dr Matilda van den Bosch (http://www.slu.se/en/departments/work-science-business-economics-environmental-psychology/staff/matilda-van-den-bosch/) \footnote{489 Lord Framlingham put this question in a House of Lords environment debate 15th January 2015}}

TDAG proposes that there is an urgent need for \textit{Trees in Towns III}. This would follow on \textit{Trees in Towns II} researched in 2004 and provides the baseline survey information on the present state of our urban forest to better inform policy. DCLG supported the earlier document. It would be helpful if government could help to support the follow up which is in line with the DCLG recommendation that this should be undertaken every 10 years.

2. \textit{How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?}

\textbf{TDAG:} We would like to add health and education to the departments listed above. It has been estimated that the NHS is limited in what it can do to improve health, perhaps 10\% of health problems, while the other 90\% are usually linked to life-style diseases and the quality of the public realm and built environment would be beneficial here.\footnote{488}

From an urban tree perspective, which government department is responsible for urban trees? DCLG linked to planning? DfT linked to highways? Both? Neither? The fact that we do not really know is indicative.\footnote{489} One of the problems with government departments, looking from the outside, is that there is quite a rate of staff turnover i.e. people get knowledgeable in an area and then seem to be moved. Is there a cross-departmental team supported by external advisors who could, for example, help to support a more integrated approach?

2.02 National policy for planning and the built environment

3. \textit{Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?}

\textbf{TDAG:} Not sufficiently in our view. From an urban tree perspective a few minor changes in the NPPF such as the inclusion of the word ‘trees’ at appropriate places would be helpful. TDAG has prepared a paper on this if it would be helpful.

Defra set up the Natural Capital Committee under the chairmanship of Professor Dieter Helm. The work of this committee should be a material consideration in built environment planning and development decisions.
4. *Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?*

**TDAG:** Yes it is. The loss of regional planning is very unfortunate. Indeed, just as our Regional Spatial Strategies were about to be disbanded a visiting American academic commented that they were considered essential by American Planners who suffered from a more localism based agenda⁴⁹⁰.

5. *Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?*

**TDAG:** When discussing urban trees, these are long-lived and can be cross-generational and so trees planted today could live for 100+ years. Once planted and established they should become part of the elements in the environment taken into account regardless of future development plans. Trees tend to deliver their greatest benefits at 30+ years.

2.03 **Buildings and places: New and old**

6. *What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?*

**TDAG:** This is outside the tree remit

7. *How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?*

**TDAG:** Trees have a major role to play in a sustainable and resilient urban environment. Trees have a role in the local micro-climate and therefore in the performance of buildings as well as local water management (SuDS etc). This is not always well understood in the UK.

8. *To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?*

**TDAG:** The historic environment has a significant role to play in identity and placemaking. Heritage trees also have a key role in continuity of the environment – we also need to be aware of the heritage trees for tomorrow and so must restrain ourselves from cutting down trees that have that potential just because a developer and their design team does not want

⁴⁹⁰ Ellen Dunham-Jones  ([http://www.arch.gatech.edu/node/142](http://www.arch.gatech.edu/node/142))
Trees and Design Action Group – Written Evidence (BEN0182)

to accommodate them. Some historic trees (100+ years) are as important and valuable in the built environment as historic buildings.

A recent RICS report compared housing values and found that the greatest value was Accordia in Cambridge and the existing historic landscape which gave a sense of immediate identity and permanence to the new housing would seem to be a major element in this. (Placemaking and Value. RICS 2015 - https://consultations.rics.org/consult.ti/placemaking)

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

TDAG: There needs to be a much more integrated approach to planning, design and delivery (as first proposed by Latham in 1992). As far as built environment professions which include landscape architects are concerned this could relate back to initial training and how it should be more holistic for future practice. The Edge/Morrell report on Collaboration for Change includes education and it is a topic that is exercising built environment educational establishments as some courses are more integrated than others.

When talking about a more integrated approach it is also important to engage early with all involved on both the supply and the demand side. If local authorities are charged with ensuring that planning applications are properly interrogated and then delivered, it is important that the overall cost-benefit of this ‘service’ is properly understood and supported financially.

10. Are we using the right tools and techniques to promote high quality design and ‘placemaking’ at the national level? How could national leadership on these matters be enhanced?

TDAG: From a tree perspective we would like to see a National Tree Framework or Strategy (our document Trees in the Townscape, A Guide for Decision Makers sets out 12 principles which could be the basis for this for urban trees) to which all departments and local authorities could subscribe. This would also signal a value for urban trees that would encourage the owners of the c. 70% of urban trees on private land to be seen as valuable assets not potential liabilities and there could, perhaps, be a way of rewarding private tree owners for looking after their trees as they contribute significantly to the urban forest and the city wide benefits that this delivers. A modest reduction in council tax, for example?

2.04 Community involvement and community impact

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the
impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

TDAG: In our introduction we describe some of the benefits of urban trees in these areas. Some local authorities are better than others at engaging with the community/public on street tree planting for example. Well-informed developers engaging delivery teams that involve the right professions at the right time should be sufficiently knowledgeable and able to understand the impacts of all aspects of the built environment and put forward proposals that will improve those environments.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

TDAG: Certainly with trees it is important to have community support and even involvement in caring for trees to prevent vandalism etc. There are examples such as Rocky Park in Bethnal Green⁴⁹¹ where the local community got together and created liveable, pleasurable gardens and green spaces on socially deprived estates. When developing new sites without an existing community, could community members such as those who inspired Rocky Park comment on proposals? Facilities Managers are increasingly included early in the design of buildings, so perhaps we need proven community builders to advise on housing projects?

2.05 Financial measures

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

TDAG: Time and again developers are telling us that they will go the extra distance to plant trees if there is a level playing field so that all developers have to achieve the same standards. National leadership is desperately needed to provide that level playing field. By breaking down silos at government and local authority level it would be possible to provide budgets across departments. For example, street trees have a role in highways for traffic calming, improving uptake of passenger numbers on bus routes (see case studies in Trees in Hard Landscapes) and so street trees and 5 year maintenance programmes could be part of the highways budget which has more funds than the ‘green space’ budget.

The health benefits of trees could help to reduce the NHS bill and so some funds that would go to health could go to improving the built environment so that it has health giving properties.

⁴⁹¹ Rocky Park established by Teesdale and Hollybush TRA
http://www.towerhamletshomes.org.uk/growing_communities/hollybush_rocky_park.aspx
Beyond the role of trees but linked to it as we would like to see more trees in developments, the London Borough of Islington has an consultation SPD on Development Viability (http://www.islington.gov.uk/publicrecords/library/Planning-and-building-control/Publicity/Public-consultation/2015-2016/(2015-07-09)-Development-Viability-SPD-Consultation-Draft-(July-2015).pdf)

At a recent tree seminar we discussed the question of land value and one conclusion was as quoted below: “All costs of development, including landscape, should come off the land price and this needs to be compulsory on all to be taken into account by the developer/contractor for them to reflect it in their bid price for land otherwise competition leads them to ignore it.

In this situation the developer/contractor shouldn’t care, in a level playing field, except that the big firms, particularly house builders, are also land owners and thus oppose anything of this nature, thus the opposition to SUDS.

There is always going to be a conflict between development for private profit and the public good, Planning post WW II was established for this purpose, but all the political parties are signed up to the mantra of ‘sustainable development’ where usually it is the development that triumphs rather than sustaining life.”

If we are serious about a future resilient built environment for people and nature then we need to take some bold approaches to the conservation and perpetuation of our urban trees.
Some specific physical benefits provided by urban trees.

**Trees combat climate change**

Excess carbon dioxide (CO2) caused by many factors is building up in our atmosphere and contributing to climate change. Trees absorb CO2, removing and storing the carbon while releasing the oxygen back into the air. In one year, an acre of mature trees absorbs the amount of CO2 produced when you drive your car 26,000 miles.

**Trees clean the air**
Trees and Design Action Group – Written Evidence (BEN0182)

Trees absorb odours and pollutant gases (nitrogen oxides, ammonia, sulphur dioxide and ozone) and filter particulates out of the air by trapping them on their leaves and bark.

**Trees provide oxygen**

In one year an acre of mature trees can provide enough oxygen for 18 people.

**Trees cool the streets and the city**

USA trials show that average temperatures in Los Angeles have risen 6°F in the last 50 years as tree coverage has declined and the number of heat-absorbing roads and buildings has increased. Trees cool the city by up to 10°F, by shading homes and streets, breaking up urban “heat islands” and releasing water vapour into the air through their leaves.

**Trees conserve energy**

Three trees placed strategically around buildings can cut summer air conditioning needs and protect people in streets from the heat. By reducing the energy demand for cooling we reduce carbon dioxide and other pollution emissions from power plants.

**Trees save water**

Shade from trees slows water evaporation from grassed areas. Most newly planted trees need only fifteen gallons of water a week. As trees transpire, they increase atmospheric moisture.

**Trees can help to manage storm water**

Trees can help to reduce peak flows in increasingly heavy rainfall events.

13 October 2015
Dr Shann Turnbull – Written Evidence (BEN0110)

1. This submission to the House of Lords Select Committee of Inquiry into National Policy for the Built Environment is made in response to their “call for written evidence” of July 27, 2015.

2. The submission may be made public and reflects the views of the writer, Dr Shann Turnbull, and does not necessarily represents the views of the New Garden Cities Alliance (NGCA) of which he is a founding member. Founders of the NGCA are listed on its Home page at: http://gardencities.info/. I was invited to make this submission when attending a “Principles” working group meeting of the NGCA in London on September 23 when all three directors of the NGCA were present. A draft was distributed on September 29th.

3. This submission builds on the expression of interest sent by my colleague, Thomas-Emanuel Hoepfner of May 30, 2014 to The Hon Nick Clegg and The Hon Rt. Eric Pickles pursuant to a prospectus issued in April 2014 inviting expressions of interest for initiating “Locally-led Garden Cities”492. Thomas Hoepfner became a founding director of the NGCA. His expression of interest was co-drafted by myself and can be viewed at: https://drive.google.com/file/d/0B13bh2n3zrFAVDczQkVFcjVtSGs/edit?usp=sharing.

4. I am a resident of Sydney, Australia and would I welcome the opportunity to answer any questions as may be desired by Skype. A bibliography of my writings on reforming the theories and practices of capitalism are posted at: https://independent.academia.edu/ShannTurnbull. My articles on reforming the invisible ownership, control and financing arrangements for the built environment are archived by the NGCA at: http://gardencities.info/reference-documents/01-principles/community-land-bank-clb/community-land-bank-bibliography/.

5. There are three fundamental intellectual gaps in policy regarding the built environment:

   5.1 The invisible architecture of ownership, control and financing of the built environment is not considered as a policy variable;

   5.2 The existing invisible architecture creates gross inequality, inequity and alienation of citizens to deny them access to affordable housing;

   5.3 Citizens lack the power to directly initiate changes to correct the above problems.

6. To correct all three problems it is recommended that Parliament:

   6.1 Amend the Local Government Act 1972, or introduce other facilitating legislation, to allow citizens to initiate local referendums493 within their local government areas to redesign the invisible architecture of their built environment to allow urban sites and

493 Like holding a “local re-set referendum”. However, different conditions are suggested in this submission.
services to become self-financing to remove the cost of land for home owners and commercial developers/investors.

6.2 Not undertake, approve or permit any major urban infrastructure expenditure unless the ownership and control of the land whose value is significantly increased by such expenditures becomes mutually owned and controlled by all resident voters of the affected precincts. In particular, this condition should apply to any expenditure pursuant the prospectus issued by the Department of Local Government and Communities in April 2014 referred to above. Otherwise the expenditures will become counter productive in providing affordable housing by increasing the cost of land and so housing. Mutual ownership of land, but not necessarily any of its improvements is a core requirement for a precinct to be recognized as a Garden City by the NGCA.

7. The right to call a “Locally-led” referendum would depend upon one or more developers providing a feasibility study that the precinct is sufficiently large to capture sufficient uplift in values from its development or redevelopment to make the ownership of sites and services self-financing. This would eliminate the cost of land for both homeowners and commercial developers. The land value of UK housing can be expected to be at least half the price of a dwelling if it follows US and Australian and experience. Making urban land self-financing would then half the cost of housing and also create a compelling magnet to attract commercial developments. This would reinforce the self-financing processes by attracting further investment to generate a virtuous self-reinforcing further uplift in land values and sources of rent/rates to cross subsidize the housing sector. Details of how land sites and services can be made self-financing are indicated in a study by the London Center for Land Policy Studies and in my feasibilities studies and articles.

8. Only residents in the precinct with citizen voting rights would vote in the referendum. A vote of say 75% of eligible voters would oblige all owners of property to exchange their existing title deeds for two separate but stapled deeds to allow the ownership of all land in the precinct to become mutually owned through a Cooperative Land Bank (CLB). This would

---

498 Ibid.

500 Lord Glassman suggested on June 30, 2014 that a 75% vote would be sufficient to protect members of the House of Commons from undue influence of property owners in any of their constituencies that may be affected. He made this suggestion after opening the second Garden Cities conference at Letchworth.
create a “Duplex” title system. Existing private ownership of any improvements on the land would be retained on a negotiable basis. So no lender with a mortgage over existing titles would be disadvantaged as no equity values are lost and could well increase even without re-development proceeding. No-residents would obtain equity in the form of non-voting participating redeemable and negotiable preference shares. Only residents obtain voting shares to enrich democracy to further local self-determination.

9. If more than one developer provided a feasibility study then citizens could also vote for which developer was employed by the CLB. All residents whether owners or renters would vote to control the CLB. This constitution of the CLB would possess provision for any affected stakeholders to form their own advisory councils to create an inclusive “Network” system of governance as described at: https://tinyurl.com/NetGovernance to promote self-governance and so further and enrich democracy with local self-determination.

10. It is important for Law Makers and their constituents to understand the differences between a CLB and the more widely known Community Land Trusts (CLTs). CLTs were developed and established by my close associate Robert Swann, the President of the E.F. Schumacher Society in the US. He promoted the CLB concept in various seminars, lectures and publications from the 1980’s as he recognized how they made a fundamental difference in ameliorating the inequities, inefficiencies and alienation created by current system of owning, controlling and governing the built environment as noted below because:

10.1 CLT’s require public money or private grants to acquire land to perpetuate the current inefficient and inequitable system of property rights;

501 Equity value could increase because the CLB would be sharing the value of land not previously privately owned in the precinct. The CLB could be considered like a Real Estate Investment Trust (REIT) that did not necessarily own any buildings on the land. The value of CLB shares would be established in a similar way to a REIT.

505 Pat Conaty, one of the three directors of the NGCA, was largely responsible for introducing the CLT concept to the UK. Both CLTs (pp. 85-100) and CLBs (pp. 289-295) were featured in his 2012 book co-authored with Michael Lewis: The Resilience Imperative: Cooperative Transitions to a Steady State Economy, Gabriola Island, BC, Canada: New Society Publishers.

10.2 CLTs exacerbate inequality by not sharing uplift in site values with residents who contribute to their creation because CLTs do not issue shares to residents;

10.3 CLTs make housing affordable by removing land values from the market and so in the words of Kelso & Kelso\(^{507}\) on page 33 they introduce “the sterilization and morbidization of capital ownership”.

10.4 CLTs do not provide a basis for transforming the ownership and control of the existing built environment to a more equitable, efficient and sustainable system as proposed in paragraph 6.1.

10.5 Because of point 10.1, CLTs do not operate at a scale to:

(a) Establish viable garden cities in green or brown field sites;
(b) Provide competitive advantages in attracting commercial developments to cross subsidize affordable housing on a sustainable basis;
(c) Possess the bargaining power to attract new commercial investment on a basis that denies the overpayment of investors in perpetuity;
(d) Establish a viable independent currency region.

11. The writer could provide further information as may be desired by Skype. For completeness, brief answers to the 13 questions raised by the Select Committee on “Policy making, integration and coordination” are set out below in italics. - The answers are made on the assumption that the recommendations in paragraph 6 are implemented.

**Policymaking, integration and coordination**

1P. Are the decisions that shape England’s built environment taken at the right administrative level? *No – There is little meaningful involvement at citizen level*

   What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners? *Policy makers should restrict their involvement to indirect empowerment as recommended in paragraph 6.*

2P. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? *No comment*

   How could integration and coordination be improved? *No comment*

**National policy for planning and the built environment**

3P. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? *Policy cannot possibly be sufficient, as it is not guided by the citizens affected.*

   Are some factors within the NPPF more important than others? *Yes – Citizen*

engagement to enrich the quality of democracy and self-determination.

If so, what should be prioritised and why? Answer in previous question.

4P. Is national planning policy in England lacking a spatial perspective? Yes, Kate Henderson, TCPA Chief Executive said508: “England is alone in North West Europe in having no national or sub-national spatial planning approach to the major challenges that face us as a nation, including housing, climate change and rebalancing the economy”.

What would be the effects of introducing a spatial element to national policy? Views on how to answer this question are currently under consideration by the NGCA.

5P. Is there an optimum timescale for planning our future built environment needs and requirements? Timescale is to sustain humanity on the planet with minimum intergeneration changes.

How far ahead should those involved in the development of planning and built environment policy be looking? As above.

Buildings and places: New and old

6P. What role should the Government play in seeking to address current issues of housing supply? Government role should be indirect by providing facilitating legislation as recommended in paragraph 6.1 and directly by not aggravating affordable housing with tax benefits, grants and subsidies, etc as proposed in paragraph 6.2.

Are further interventions, properly coordinated at central Government level, required? Only as proposed in paragraph 6.

What will be the likely effect upon housing supply of recent reforms proposed for the planning system? No comment as no knowledge of recent reforms. But they are most likely to be based on simplistic grants, subsidies and so counterproductive as described in paragraph 6.2.

7P. How do we develop built environments, which are sustainable and resilient, and what role should the Government play in any such undertaking? Introduce mutual ownership and control of urban sites and services as described above.

Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? Not efficiently unless the current ownership and control system of sites and services are mutualised as described above.

How can the best use of existing housing stock and built environment assets be made? It requires a case-by-case analysis. This would be required on a case-by-case basis to mutualise the ownership and control of all sites and services.

8P. To what extent do we make optimum use of the historic environment in terms of future
planning, regeneration and place-making? *No comment.*

How can more be made of these national assets? *No comment.*

**Skills and design**

9P. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? *No – because they are poorly aware of the invisible structures of urban environments are not fit for purpose and lack an education in how to design their governance infrastructure*\(^{509}\).

How could we begin to address any skills issues? *Sponsor education for governance architects*\(^{510}\).

Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas? *No skill or resources available to plan or shape the invisible governance architecture described in footnotes 12 & 13.*

10P. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? *Adopt the two recommendations set out in paragraph 6.*

How could national leadership on these matters be enhanced? *Adopt the two recommendations set out in paragraph 6.*

**Community involvement and community impact**

11P. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? *No – because they have no knowledge of network governance described in footnote 12.*

How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities? *Introduce network governance to promote political, economic, social and resource self-sufficiency and self-governance.*

12P. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? *Cannot be as effective as it could be because network governance is not adopted.*

Are there any barriers to effective public engagement and, if so, how might they be addressed? *Public engagement cannot be meaningful with government based on top down command and control hierarchies.*

**Financial measures**

\(^{510}\) [https://drive.google.com/file/d/0B13bh2n3rzFABiVm5zhWVzIXNDA/view?usp=sharing](https://drive.google.com/file/d/0B13bh2n3rzFABiVm5zhWVzIXNDA/view?usp=sharing)
13P. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Yes, introduce legislation to facilitate “Locally-led” initiatives to adopt self-financing mutually owned land ownership and control as recommended in paragraph 6.

Are there financial or other mechanisms that would encourage better design and place-making by private sector developers? Yes, by locally led bottom up feedback inherent in the governance architecture of Cooperative Land Banks.

06 October 2015
SELECT COMMITTEE ON NATIONAL POLICY FOR THE BUILT ENVIRONMENT

Written Evidence from UK-GBC

The UK Green Building Council (UK-GBC) is an independent, membership-based, not-for-profit organisation committed to radically improving the sustainability of the built environment by transforming the way it is planned, designed, constructed, maintained and operated.

UK-GBC campaigns for buildings which benefit people and the environment. Energy efficiency in buildings is vital for reducing energy demand and cutting the UK’s carbon emissions. But buildings can also play a key role in improving the health and wellbeing of people who live and work in them, and UK-GBC is part of an international campaign, Better Places for People511, which aims to highlight this link.

Policymaking, integration and coordination

Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

Although many decisions that shape our built environment are most suitably made at the local level, where need and capacity can be effectively evaluated, a clear long-term ‘destination’ or ‘aspiration’ from central Government is needed to deliver a sustainable built environment. Currently this leadership is missing.

Even in the relatively quantifiable area of carbon, where we have the carbon budgets, we don’t have clear enough targets by sector to translate the need to drastically reduce our carbon emissions into clear strategies and backstops for our built environment – e.g. what emissions reductions should we be achieving from commercial buildings or homes by 2020? Without a sense of the destination, it is impossible for the different administrative and industry players to work out how to get there.

The built environment industry needs, at a minimum, this long-term direction to enable investment, innovation and the reduction of costs for delivering sustainable and future proof new communities and regeneration of existing communities.

There is a clear role and responsibility of policy at local and national level to deliver socially and environmentally desirable outcomes within our built environment.

511 http://betterplacesforpeople.org/
In some significant cases there are no drivers outside of policy to clearly direct the market to deliver. One such area is the delivery of energy efficient and sustainable new homes. Consistency and policy clarity are essential pre-requisites for continued private sector investment and innovation. In this market, we strongly believe that consumer demand alone will not be enough to drive the delivery of energy efficient, well-designed sustainable homes.512

In the removal of the zero carbon homes policy (which expected to be introduced next year) and through the levelling of national housing standards as a result of the Housing Standards Review, the Government has removed the national policy driver as well as removing the ability of local planning authorities (LPAs) to promote locally relevant ambitious policies to deliver energy efficient and sustainable homes. Furthermore, with the removal of the Code for Sustainable Homes Government has removed the common language that has been used by LPAs and housebuilders or developers to negotiate or work in partnership to deliver better than regulated standards.

How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

The lack of policy coordination across the main Governmental departments responsible for buildings has been made very clear over the last few months. Announcements made within the same week from DCLG on the scrapping of the zero carbon policy that would have delivered highly energy efficient new homes and DECC on the importance of improving the energy efficiency of our homes sent highly contradictory messages.

In the UK we do not have a Minister for Buildings or the Built Environment, neither do we have a national policy for the built environment, which means there is no portfolio in which holistic consideration for all types of buildings and the interconnections between them sits. We have also recently lost the role of the Chief Construction Advisor which only indicates that the currently not-joined up situation will continue if not worsen.

National policy for planning and the built environment

Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

512 Reasons for this include: the shortage of homes resulting in a lack of choice for buyers; the market value of a home not reflecting the long term costs/savings of a home; poor knowledge/awareness of labelling schemes amongst the public; a lack of knowledge about the improved comfort/cost savings of living in a more efficient home etc.
The presumption in favour of sustainability in the NPPF does not provide enough guidance on the balance between social, environmental and economic balances.

Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

Planning for our future built environment needs to take into account the incredibly long lead times for delivering developments and even longer times for infrastructure projects which can easily extend to three decades.

The carbon budgets provide us with one certain factor by which we can undertake such long term planning. The buildings we build today will still be standing beyond 2050, by which date the 80% carbon reduction target will require us to largely decarbonise the building sector. Therefore planning and policies that define our built environment must be brought into line with and expressed in the terms of the requirements of the Carbon budgets.

Buildings and places: New and old

What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

Government’s most recent intervention in the housing supply market – the scrapping of the zero carbon policy and the Code for Sustainable Homes, does nothing to address some of the primary barriers to more homes being built but has ensured that the large numbers that are built will not be built to appropriate standards.

There is no clear evidence that the removal of the zero carbon standard, which will have devastating effects on the sustainability and energy efficiency of our new homes and on the green construction industry, will enable more homes to be built.

Tighter regulated standards for energy performance do not drive up the purchase price of new homes, rather the potential additional construction costs impact the purchase price of land.

DCLG identified small builders as the business group which it predicted would be most negatively affected by higher energy performance standards (in the Department’s Nov 2014 consultation on an exemption for small sites to the zero carbon definition). However, the business challenges for small house builders were summarised in a recent NHBC report (Oct 2014). The top barriers identified (unprompted) by small housebuilders and developers were: planning and process conditions, obtaining finance, availability and cost of land, and
skilled labour and cost of labour. Legislation/red tape received only 4% of the responses (363 companies surveyed).

How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

Retrofitting the existing building stock to reduce energy demand will be crucial to tackling emissions from buildings and achieving the UK’s carbon targets. But improving millions of homes and commercial properties represents a significant challenge in driving interest among owners and facilitating effective improvements. Given the scale of this challenge, improving the energy efficiency of existing building should be recognised as a national infrastructure priority, backed by a long term infrastructure strategy and Government capital investment.

An infrastructure strategy should be based around ambitious long term strategic outcomes and overall demand reduction rather than the success of individual policies. Before its cancellation, the zero carbon policy for new homes provided this form of long term certainty and was extremely successful in driving innovation and cutting costs. Particularly for existing housing, this approach would allow demand drivers and finance mechanisms to be developed which are bespoke to different tenures and household circumstances.

Government has a key role to play in helping to drive the link between energy efficiency and property value. Minimum standards for privately rented properties are due to be introduced in 2018 but are already beginning to have an impact on business investment decisions. The use of operational energy ratings through Display Energy Certificates also has the potential to create a reputational driver for businesses to choose more efficient properties and reduce energy usage. Similarly, homeowners could be incentivised into buying more efficient properties by factoring energy efficiency into stamp duty rates and mortgage affordability calculations.

To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

Skills and design

Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could

513 UK-GBC has produced recommendations for a long term policy framework for home energy efficiency:

514 For more information about factoring energy efficiency into mortgage affordability calculations, please see:
http://www.ukgbc.org/resources/publication/role-energy-bill-modelling-mortgage-affordability-calculations
we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

Skills are a significant issue for both public and private sectors.

We are concerned that there is a skills shortage in Development Control which has been exacerbated by public sector cuts. This is impacting on the ability of local authorities to seek out the requisite expertise to ensure that development is appropriate and meets high sustainability standards. Under-resourced Local Authority Planning Departments pose significant risks in slowing down appropriate development and the delivery of appropriate and unsustainable development. Local Authorities need to be supported to build up expertise in planning and development control.

Professionals within the built environment in the UK are well-skilled and diverse. A broad range of interrelated skills will be vital to deliver low environmental impact, healthy and productive buildings and communities. Everyone – from architects to law firms to building managers need to continue to learn and take, on new information as the sustainability challenge evolves. Skills development and training at all levels and in all professions needs to respond in advance to future needs and trends.

The industry has made huge progress to develop the skills and techniques needed to deliver sustainable built environments and thriving communities. However the industry will find it very difficult to continue to invest if there are no clear signals provided by a national strategy or direction.

The recent announcements around the scrapping of the zero carbon targets, the removal of the Code for Sustainable Homes and the abandonment of the Green Deal have sent a very damaging message to the industry on future intent.

Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

Building design in the UK is greatly influenced by the structure of Part L of the Building Regulations and by SAP and SBEM as the tools used to prove compliance with Building Regulations. A recent UK-GBC Task Group made a suite of recommendations on essential improvements to Part L and SBEM.

Community involvement and community impact

Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?
The body of evidence on the impacts our buildings have on the health, wellbeing and productivity of the people who live, work and learn in them is growing and UK-GBC is making a significant contribution to this work (see UK-GBC’s health, wellbeing and productivity work).

Consideration of a number of factors that if overlooked can impact heavily on the health impacts of new homes has been lost with the removal of the Code for Sustainable homes and not picked up through either Building Regulations or the new national standards. Daylighting, sunlighting, ventilation, overheating (and the important interplays between them) are not dealt with effectively under the Building Regulations only system. Furthermore, Building Regulations do not encourage a focus on the materials used in new homes and the ‘off-gassing’ of VOCs can have one of the greatest impact on indoor air quality in a new building.

As recommended by the Housing Standards Review Challenge Panel, these issues need to further investigation.

How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

Financial measures

Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?
Q251 The Chairman: Welcome to this evidence session of the Select Committee on National Policy for the Built Environment. You have in front of you a list of the interests that have been declared by Members of the Committee. A transcript of the meeting will be taken and published on the Committee website. You will have the opportunity to make corrections, where necessary. Can you just introduce yourself with a small background for the purpose of the transcript?

Louise Sunderland: My name is Louise Sunderland. I am the senior policy adviser for the UK Green Building Council. I specialise in new-build policy in the UK Green Building Council, although we have a large programme of work on the existing building stock. I undertake some work in a freelance capacity working mainly on European energy efficiency delivery and policy.

The Chairman: Thank you very much. What would be the main impacts on sustainable development resulting from the abolition of the zero-carbon homes requirement?

Louise Sunderland: I think a colleague of yours, Lord Deben, put it very well last week when the Committee on Climate Change, which he chairs, launched their report on the fifth carbon budget. He said that with the scrapping of the zero-carbon targets we are in danger of building homes today that will need to be retrofitted tomorrow. I totally agree with that. I would go
further and say that we are not in danger; these homes will need to be retrofitted tomorrow. The contribution that will be necessary from the building stock is very clear in the carbon budgets. That is a very large contribution. Our homes will need to be incredibly energy efficient and, unfortunately, the regulated standards that we have today do not get our new homes to that standard for the future. I do not need to explain to the Committee the added difficulty of retrofitting homes when householders are living in them and when a lot of structural decisions have already been made. There are multiple barriers to doing that work at a later stage.

On the ground, we are in real danger of standards going backwards. We have had a situation in the past where, driven by the zero-carbon policy which was announced in 2006-07, we had a very clear trajectory. Local authorities, where they have seen viability and need in their area and where they have been ambitious, have encouraged and required higher standards. Certainly from the UK Green Building Council’s membership’s point of view, there are a lot of housebuilders and developers who have sought to pursue higher standards. That has meant that we have seen quite a lot of developments coming forward. We are talking about some very large numbers of above building regulation standards.

The combination of the scrapping of the zero-carbon policy, on the one hand, and the housing standards review, on the other, which has restricted local authorities’ powers to require higher standards in their planning policies, means there are very few drivers for going above building regulations. Where we have seen collaborative or voluntary action, pushing the standard a little higher, I feel there is very little to continue to drive that. Arguably, that is now prevented, given this combination of the zero-carbon policy going and the housing standards review restricting local authorities’ powers. That means we have gone from building regulations holding the role that regulation should have, which is to bring up the bottom, to a point where building regulations become almost a ceiling, and that is an incredible worry.

The other important point to make is there are very few market drivers for energy efficient homes. So this is an area where regulation is incredibly important. Lots of factors prevent a true and strong signal coming from the market to a housebuilder to illustrate that investment
in more sustainable housing will be rewarded, valued and eventually work within their business model.

We have lack of supply, which is incredibly evident, but also lack of choice and larger factors that influence a house buyer’s choice of home—not least school catchment area, access to public transport, those kinds of things—which mean that, even if a house buyer would choose a more efficient home over a less efficient home, we are not seeing those signals because they are being clouded by all these other factors. That is quite bleak. I do not feel I have dressed up that situation at all; it is a fair and accurate analysis of the situation for housing standards.

Perhaps I could say a couple of other things about the broader carbon objectives that will suffer and the industry perspective. From the point of view of broader carbon objectives across the piece, I think everyone will know the zero-carbon standard for homes had within it two major pieces. One was a minimum standard that needed to be delivered in the home, or on the site of the home, through fabric improvements—insulation—and potentially renewable energy. Then between the minimum standard and the full target there was a flexibility element, cognisant of the fact that some sites have restrictions on them. If the stretching standard could not be cost-effectively delivered on one site the offsetting mechanism allowed the costs not to be pushed too high for those particular sites. That allowable solutions mechanism, which was how it was termed, provided a huge potential for a national fund or locally delivered solutions to overcome some of the barriers to delivering other built environment sector solutions. We might be talking about decentralised heat and retrofitting of existing stock, two really big challenges that I think we are yet to tackle effectively.

At the time the Productivity Plan was launched in July, the UK Green Building Council membership had a group in place looking at how the building sector could get most value and most carbon value out of that allowable solutions mechanism. This is another huge piece that has been lost, aside from the individual homes and the minimum standards delivered there. This allowable solutions mechanism was another piece of potential that the building sector was keen to pursue that has been lost through the loss of this standard.
The only other thing to say from the broader perspective is that we did not only have in place a zero-carbon homes standard, but we also had a standard for zero-carbon non-domestic buildings to follow in 2019. We should be clear that that standard has been scrapped as well. The two sister policies sitting together have been got rid of. This does not follow from the justification that was given for the removal of the homes standard, which was about the housing crisis and needing to deliver more homes, more quickly, and reducing regulation. We do not have a non-domestic buildings crisis in the same way as we have a housing crisis. It is very difficult to understand why that target was also scrapped.

Touching on the impact on the industry, we have a housebuilding industry that has spent the last 10 years preparing for this, and they have spent an awful lot of money. Anecdotally, a single member puts the amount of money spent and wasted in the tens of millions. That is a single member. We have 400-odd members just in our membership. The industry is much broader than that.

Lord Inglewood: What do you mean when you say they have spent this money?

Louise Sunderland: That would be on research and development in moving the house designs from delivering previous standards in expectation of delivering the higher new standards. I do not have the figures, unfortunately, but I could look to provide them to the Committee, of the construction products industry, which has to move faster than the housebuilding industry. That industry has to move much earlier with research and development to bring products to the market to offer to the housebuilders to include in their designs, and their investment would be huge.

The Chairman: If you have any other ideas on that particular aspect, could you drop us a note about it?

Louise Sunderland: Yes, I will. The final point is that we are now slightly adrift. In the last 10 years we have had this very clear trajectory and everyone has known where they are going and have had a lot of time to put in place the strategies. Now we do not know where we are going. We do not know when the next update to building regulations might be and, therefore, industry has nothing to place its investment in. Not only have we had wasted investment, but
we now have no replacement trajectory. The arguments for repeated investment next time, based on a governmental policy, will be much harder to make.

**The Chairman:** My final question is: who is making the Government aware of all of this? Are you? Is there a trade association? Is there an institute? Is there anybody who is bringing the cause up and showing them, as you have done to us very clearly, what the problem is?

**Louise Sunderland:** There are a lot of us trying. The UK Green Building Council has a very long history, particularly with the zero-carbon policy, because we were involved in its origination. The Zero Carbon Hub was set up as a collaboration between industry and government to work out the technical standards. Certainly on the zero-carbon perspective, we have shouted as loud as we can, to be honest with you. With a vast group of other commercial organisations, green groups and membership organisations, we have also made representations to the other Committees in the House of Commons who are looking at similar issues around green growth and the building sector. We have made representations.

**Q252 Baroness Andrews:** I want to ask a couple of quantifiable questions. In percentage terms, how much do our homes contribute to our carbon emissions?

**Louise Sunderland:** Off the top of my head I think it is around 22%.

**Baroness Andrews:** In relation to new homes, can we quantify the increase in our emissions? Can you work that figure out for us?

**Louise Sunderland:** I am sure the Committee on Climate Change has those figures. I do not have them to hand here, but I could certainly follow up with those.

**Baroness Andrews:** How much is it going to save developers? What is the economic argument for making this change in terms of development costs of new housing?

**Louise Sunderland:** The most recent cost analysis of delivering the previously defined zero-carbon standard was done at the beginning of 2014. That looked at the entire cost, both delivering the minimum standard and the cost that might be offset through the allowable solutions mechanism. That came at an average cost of around £3,600 per unit. That is not the minimum or the maximum. Obviously flats being delivered would have an extra over-cost of much lower than that. The important point from that report was that this was the second of these analyses—the first was done in 2011—and they had seen a 50% reduction in those three years in the extra over-cost, so in the extra cost for a developer to deliver this standard.
Baroness Andrews: It had come down 50%.

Louise Sunderland: It had come down 50% in three years. This was two years ago and they projected that the costs would fall hugely. It is also important to say that costs fall with volume. Things become cheaper, products become cheaper and designs and delivery become cheaper when the supply chain is well-oiled and delivering a lot of volume. We saw that 50% reduction in cost when there was not a huge volume of that standard of homes going through. Some of the major housebuilders were involved in a project, which I can send you information on, AIMC4, where housebuilders came together to look at how they could deliver homes to code level 4 on energy efficiency at the same price as the previous standard. They were confident at the end of that to say they had not delivered those homes at that standard for the same price yet but, with volume, they would.

Baroness Andrews: Have the developers joined with you in telling the Government that this is not cost-effective, or are the developers really pleased that this “burden” has been taken off them?

Louise Sunderland: Obviously I speak for our members, who are members of the UK Green Building Council, which indicates they may be more progressive. I cannot speak for the rest of developers and housebuilders in the country, but from our membership, on which sit some of the biggest housebuilders, there was a complete willingness to deliver this standard. All of the work that was done by the Zero Carbon Hub, which is part funded by NHBC, and had a lot of the major housebuilders on the working groups, delivered a standard they were happy to deliver. They did not sign up to a standard that was impossible.

Q253 Earl of Lytton: I can relate professionally to everything you have said. There are a couple of things I want to ask. Given the high standards of insulation that are required in a zero-carbon home, first, is construction quality an issue? Secondly, because I come across this quite a lot, is there a problem with the user interface in relation to people not understanding how very efficient and highly insulated homes should work, things like people drying their washing in the living room because they do not have another facility to do it, and condensation arises? Are we getting near to cracking some of these problems? I do not know whether there is a particular problem with construction quality among people who are
members of your organisation, but I have come across some elsewhere. Is that going to be an issue? Technically, this is a legacy that could damage downstream satisfaction on both counts.

Louise Sunderland: In the UK, we need to improve upon construction quality across the board. I find a slightly artificial differentiation between quality of insulation standards, or sustainability standards, versus build quality, full stop. It has been repeatedly said that we need to improve the building control and checking of our homes. For example—not in domestic buildings—at the moment the UK Green Building Council members are coming together to look at delivering designed performance, ensuring that what we deliver actually does what we design it to do. That is in commercial buildings, but the Zero Carbon Hub has done a very similar piece of work for homes. There is work going on specifically to look at, if we measure a building after it has been constructed and, for some reason, its running cost, carbon impact or kilowatt hour per metre squared is higher than we expected, what are the causes? What are the individual elements that we need to address in the construction process? There is a lot of work going on there.

The first thing I would say on the user interface is that I feel a lot of housebuilders—and this is evidenced by the AIMC4 project that I referenced earlier—would rather deliver high standards through fabric efficiency and efficient systems that a householder is relatively familiar with, a very efficient gas boiler, for example, rather than adding a lot of technologies that, as housebuilders, they may feel are not so attractive in the market. That design approach mitigates against a lot of what you are saying. That is not to say there are a lot of technologies that can work blind. Increasingly, design is going the way that the home should provide an environment that is comfortable without the user having to interact too heavily.

One area that potentially we need to continue to look at and change is air quality and ventilation. There is a lot of work going on at the moment to look at what is the best solution to ventilation: is it mechanical ventilation that the user has to interact with, or can we produce for example passive stack ventilation that people do not have to interact with so much? They are all issues that are being addressed and looked at. Along with the overheating issue, I feel they are issues that, as we push for better standards, we will discover and address as an industry. They are not necessarily issues that should be used to get in the way of still pushing for those higher standards.
Q254 Baroness Young of Old Scone: We have talked a lot about zero carbon. Can we move to some of the other sustainable building standards? I was rather fond of the Code for Sustainable Buildings. How far do you think building regulations have now taken account of standards across the board in relation to sustainable building? How far are there holes that are not being filled?

Louise Sunderland: That is an excellent question. I have already noted that the housing standards review, which was part of the mechanism that got rid of the Code for Sustainable Buildings, to which you are referring, is silent on energy, because it expected energy to be dealt with by the zero-carbon standards. There is a big hole in higher energy standards. What is more, we have gone from the Code for Sustainable Homes, which provided quite a holistic framework. It looked at a number of different building elements: energy and carbon, water, materials, waste, pollution, and health and wellbeing - which increasingly is becoming very important. We have had a few of those issues taken into the new building regulations framework, but there are a lot that are now outstanding. We are particularly worried about daylighting. Previously, daylighting was a design consideration that the Code for Sustainable Homes required a design to look at. That is not now included in building regulations. There is very little to encourage daylighting and sunlighting to be considered in the design of our homes. For me, that is a very important factor, as are indoor air quality and the materials used to build homes. Those are huge omissions that could lead to some very disappointing and potentially quite damaging results, particularly in the area of health and wellbeing. A focus on the sourcing of materials – to consider their embodied impacts, as in the carbon that goes into making them - but also as some materials have the potential to “off-gas” in a home, in an environment where families live and work. A failure to consider materials alongside a failure to adequately address indoor quality and potentially look at daylighting and sunlighting - all those things add up to massive oversights in the new framework that we have. This is something that the UK Green Building Council, as we engaged in the housing standards review, highlighted at the time. The comment we made was that we generally supported the move to nationalisation of standards, as long as building regulations were up to the task. Building regulations need to set out the very strong trajectory of ambition for a lot of these issues—as we had with zero-carbon policy, but have no longer—but also a trajectory of trying
to bring in some of these now overlooked issues so that they encourage a more holistic approach to design.

**Q255 Lord Freeman:** The Government seem determined to reach a target of 200,000 houses being built each year. One can understand that pressure but do you believe that can be achieved consistently with meeting the sustainable design standards which you have talked about? Do you think there is a conflict and, if there is, do you think it can be reconciled, and quickly?

**Louise Sunderland:** I do not believe there is a conflict; I do not think there needs to be and I have certainly not seen evidence of a conflict. I will back up that position if I may but, before I do so, let me ask: would we ask the same question about the presence of fire regulations? Would we ask the same question about the presence of structural regulations? Would we compromise on some of the health and safety and other important elements of our building regulations to deliver homes? Of course not—I really hope not, but of course we would not. What that illustrates is that we are still seeing sustainability, and particularly the energy and carbon elements of sustainability, as a “nice to have”—as something we are happy to have as long as it does not impact on delivering homes. It is not optional, particularly in the context of this week, with the COP21 negotiations in Paris opening yesterday with statements from world leaders. I noticed there was a consistent message, which was basically that this is the last chance we have. We have been through something like 15 years of these negotiations and we have not really achieved what we need to. That sounds very emotive, but it is important to frame that question in those terms. The impact of not delivering on our carbon targets may not be felt immediately by the family in a home which does not have a smoke alarm and therefore is terribly affected by a fire, but it will be felt by a much larger number of people and by the natural world.

That is the rather emotive bit, but turning to the evidence for why I take the position that there does not need to be this conflict, first, there is no evidence at all to say that the removal of a zero-carbon standard will help any more homes be built. There is an important misconception that we should level. Higher building standards do not lead to higher home costs; they do not exacerbate the affordability crisis. Housebuilders cannot dictate the price they sell their houses for; that is driven by the market. The potential extra cost of delivering
a home to a higher standard therefore influences the value of the land and the price the housebuilder can afford to pay for the land. The beauty of regulation is that every housebuilder bidding on that land is affected equally, so we get a situation where it is potentially the land market that has shifted but that does not mean more expensive houses. That is a common misconception.

The second point is that, as I said, the extra price for delivering the zero-carbon standard has been falling drastically. Regulation is, once again, one of the most important drivers for reducing the cost of delivery, because it creates volume in the market and therefore the market and the products in it can respond. The bigger, overarching point is that there are a lot of other barriers preventing the number of houses that you have referred to coming forward. Until we see the removal of those barriers, we will never see the much smaller evidence of the impact of the higher standards. Many recent reports have referenced this, including the Lyons review last year, looking across the whole country. Interestingly, the NHBC did a survey last year of smaller housebuilders. The Government is very concerned with supporting small housebuilders, who will be looked at to deliver some of these larger numbers of new homes, new entrants to the market being very important. The NHBC survey asked small housebuilders what the barriers to their business were, and the results revealed obtaining finance, which we have all heard before, availability and cost of land, and the cost of labour. Regulation and red tape was only reported by 4% of respondents. It is slightly ridiculous to use higher standards as a reason for the number of houses we need not being brought forward when we have these other huge barriers, which will still be there.

**The Chairman:** Can I just interject a thought? Part of the reason you cannot understand why everybody is not carbon-free is that the jury still seems to be out among government Ministers in both Houses of Parliament about whether or not we should spend a lot of money on this, when some of the cases have not been proven, and the other side of the coin is we do not create as much of this problem as China and other countries. People do not understand the size of it. It has not been very well or very simply explained. When we are told that we need a zero-carbon house, most men and women in the street would say, “What is the advantage? Why do we have to pay more for it?” There is a psychological problem.
Louise Sunderland: I think your second point about the house buyer perhaps not having been communicated to in the right way in the past is a very pertinent one. Certainly the industry has responded quite quickly, I would say, to the recent changes in the regulatory framework by putting a lot more focus on communicating with house buyers in ways they understand. There are two major initiatives coming at the moment that look to grade homes in line with the priorities people have, which might be costs, or health and wellbeing, but, as you say, carbon is sometimes an esoteric term.

Lord Inglewood: Is there any evidence about whether or not a green house or a zero-carbon house will command a higher price? Has anybody done any work on that?

Louise Sunderland: There is work going on at the moment by the BRE, who used to oversee and provide the assessment background to the Code for Sustainable Homes. That programme having been around for long enough now, they are looking at a piece of research on the resale value of higher-graded homes as opposed to other market homes or lower-graded homes. The research is due to come out very soon on whether those Code for Sustainable Homes accredited, high-standard homes, would command a higher price, and I would certainly recommend that the BRE come to the Committee when they have it.

Q256 Lord Inglewood: I was going to come back to a point in the argument which we left some time ago. On the assumption that we must improve energy efficiency in the buildings we have, what measures do you think are needed from the centre in order to assist bringing that about?

Louise Sunderland: There is a headline answer to that question, which the UK Green Building Council, along with a huge coalition of other organisations, is supporting as one of the most important measures that could be put in centrally, and this is for energy efficiency of the existing stock to be considered as a national infrastructure priority. A lot of research work has been done to look at how viable and effective this might be, and certainly an energy efficiency improvement programme across the existing stock meets the definition of infrastructure as set out by HM Treasury, the European Investment Bank and the International Energy Agency. So, it is possible within the framework we already have. Analysis has been done of the costs and benefits, and it has shown that there are net benefits to the economy and to the Treasury
of £8.7 billion over 10 years from this investment. I can forward to the Committee that research and a shorter briefing paper.

**The Chairman**: That would be really useful.

**Louise Sunderland**: That really would unlock funds and also stability for a programme delivering energy efficiency going forward.

**Q257 Baroness Rawlings**: I wanted to come in on this energy efficiency question. Earlier you mentioned ventilation, not in private homes but in public buildings, and energy efficiency. Why is there a law that requires air conditioning or something that is on all through the winter, and even in the summer, when opening windows would save a fortune? Nobody ever mentions that officially you have to have air conditioning otherwise you cannot take a building—it is mainly commercial; I am not talking about private because anyone can do what they want, but there is a huge amount of waste when even in the winter air conditioning is used.

**Louise Sunderland**: Obviously, what you are pointing to is how buildings are run, and you have pointed to a conflict between people having heating on and opening the windows or air conditioning on in the winter when it is far too cold, and that is very much about how a building is run by its facilities manager—there will normally be one in place in commercial buildings, as you say. This is an area that the industry is aware of, and the group I am working with at the moment on the gap between design and performance is looking at how those facilities managers could be better equipped to understand the buildings and the systems and that they do not come into conflict. That is quite separate from any regulatory drivers; it is literally about practice. For me, it is about making sure that the facilities managers, the people in control of the building systems, have a closer relationship with those building users, and that they get better and more feedback about how they feel and what they want to experience in their building. If you think about commercial offices, it all adds to the desirability of that building, because obviously people are happier and more productive in environments which they find comfortable.

**Q258 Baroness Young of Old Scone**: Coming back to the energy efficiency of the existing building stock to be made a criterion for national infrastructure, if that does not happen, what is the answer?
**Louise Sunderland:** That is a very good question. A big piece of the puzzle is mechanisms to move the market so that the housing market better reflects a more efficient home versus a less efficient home. That would potentially unlock some of that householder capital that is spent on bathrooms and kitchens to make investment, because they will see a return. We are currently doing work, which started through a piece of research with University College London, looking at mortgage lenders making better assessments of the energy bill of a future home in their affordability assessment for the lending. That research showed there could be a huge differential between the lendable amount on an efficient home versus an inefficient one, given that the running costs of that home would be lower and therefore the household budget would be lower than that for a less efficient home. This is a project we are pursuing over the next year or two. Those kinds of mechanism which help the market illustrate difference and illustrate value would be helpful.

However, I do not think we can escape the fact that we need a national programme. The Green Deal provided potential for that but, unfortunately, it was slow to be taken up and there were a number of structural issues with the lack of incentives surrounding the finance mechanism that did not enable it to see its full potential. In the absence of the Green Deal, there is very little at the moment that could lead us to this kind of national programme. Of course, there is the huge issue of fuel poverty; it is a national disgrace that we have people who are choosing between heating and eating, and who obviously cannot access some of the programmes of finance such as the Green Deal because their income is too low and they would be reluctant to take on debt. There needs to be a nationally funded programme of work to help those households.

**The Chairman:** What about smart meters? They have really been kicked into the long grass, have they not? If most consumers and householders knew about the savings they could make on ever increasing energy bills just by knowing and turning things down, they could make sure they do not leave the lights on and all the rest of the things we know about but do not do because we do not even know what the impact is. There have been no friends in high places looking after that issue.

**Louise Sunderland:** I think smart meters could be useful, but I do not think they are a solution in themselves. If the Committee would allow a small anecdote, I had a smart meter installed
in my own house two weeks ago and the installer came in, telling me every smart meter has to be accompanied by an in-home display that tells you what your home is using at the moment in terms of energy, which is the tool that you are pointing to that would allow people to better understand their usage. The installer plugged it in, left it in the kitchen, pressed a few buttons and explained how it works, and then said, “Don’t worry. You can unplug it and leave it in a cupboard”, which obviously is not the point. That is a small illustration of the fact that putting the meter in place as a tool that would potentially better inform householders about how to use their energy is helpful, but on its own it does nothing. If people become better informed about their household energy bills and their energy use, they could make the behavioural changes you are pointing to, but they also need the ability to make the more structural changes that will significantly reduce their bills.

The Chairman: If they are doing nothing at the moment, even that is something, is it not, until you get into a regulatory system where you are going to have to have structural changes? I think there is a lethargy about this section of the market, with people complaining bitterly about high energy bills and doing nothing about it.

Louise Sunderland: I agree with you that certainly smart meters, if rolled out in a more constructive way, with some compulsory time spent explaining how these things work, would be a much more useful tool. There is a fear, however, particularly with very low-income households, that raising awareness of the bill that is to come could add stress to someone’s lifestyle if they live in a home that is very difficult to heat adequately, yet they can see the pennies ticking over. Without giving people the real capacity to actually do something about it, that is a relatively damaging awareness to have.

Q259 Baroness Young of Old Scone: One last question on the private rented sector or the rented sector generally. There are few mechanisms for getting retrofit of energy efficiency into the rental sector, and the economic incentives are the wrong way round. Is there any solution to that?

Louise Sunderland: We obviously have the minimum energy efficiency standards that will come in to address the lowest-performing rented homes and commercial buildings from 2018 if they are in either a G or an F EPC banding, which are the bottom two. That is an incredibly important piece of legislation. There are concerns at the moment about enforcement and
how enabled tenants will be to come forward and have anything done about it if their property does fall into a G or F banding. The better news about that piece of legislation is that in the commercial market we are already seeing a “brown discount”, so in expectation of that legislation coming in in 2018, those offices that are rented out that fall into one of those two lower bands are now starting to be discounted in the market because there is an acknowledgement that in the very near future they will not be market-suitable. That illustrates, quite a long way before the legislation necessarily bites, the power of that kind of tool. Obviously, in the housing sector the importance will then be on enforcement and the capacity of the local authority, which will be charged with enforcement, to make sure those pieces of legislation are brought into effect.

Q260 Baroness Rawlings: Finally, a theme that has been going through all our meetings so far which we have not touched on today is: are the right training and skills programmes in place to support the delivery?

Louise Sunderland: That is a really important question, and I am not surprised it has come into your Committee’s inquiry. I am probably not the best expert to ask on this issue. I can point you to work that is going on in this area. Labour is an issue at the moment, and we need to invest in the right skills, and adequate sustainability skills. Leading on from the local authority point, I have a concern around capacity and skills in local planning authorities, local building control, and in the enforcement of things like the minimum energy efficiency standards, because local authorities have suffered with cuts, they have lost staff, and in some local planning authorities in particular they have lost very experienced staff. That is a key challenge in terms of delivering where we do have good regulation. From the industry’s point of view, another overarching point is that the industry is relatively good at responding in training and development where there are clear signals. The current very wishy-washy regulatory framework—the policy direction that seems to have completely stalled if not gone backwards—is giving the wrong signals to the industry, which will find it more and more difficult to invest in training and skills if it does not see a need and demand for those specific skills, and of course, it is sustainability skills I am thinking of here. There are a couple of organisations doing a lot of work on this. The Green Construction Board has a knowledge and skills working group, and they have a priority action plan which looks at skills development
through a lot of stages—through colleges, further education and all the way through professional development. The main point is that sustainability skills in particular should not be an added extra at this point in the development of the agenda. For every designer, contractor and builder, this should be as essential as any other part of the core curriculum, and we are not quite there yet.

**The Chairman**: Thank you very much indeed, and thank you for taking the time and trouble to give us very detailed answers to our questions. It has been very useful to us. We have not had another green/sustainable witness giving us this sort of information, which we must have, otherwise our final report will be lopsided. Thank you very much indeed.

**Louise Sunderland**: Thank you very much for the opportunity.

*01 December 2015*
UK Health Forum – Written Evidence (BEN0024)

About the UK Health Forum

1. The UK Health Forum (UKHF), a registered charity, is both a UK forum and an international centre for the prevention of non-communicable diseases (NCDs) including coronary heart disease, stroke, cancer, diabetes, chronic kidney disease and dementia through a focus on up-stream measures targeted at the four shared modifiable risk factors of poor nutrition, physical inactivity, tobacco use and alcohol misuse. UKHF undertakes policy research and advocacy to support action by government, the public sector and commercial operators. As an alliance, the UKHF is uniquely placed to develop and promote consensus-based healthy public policy and to coordinate public health advocacy.

2. UKHF recognises that tackling the risk factors for NCDs demands action to address the wider economic, social and environmental determinants of disease, and that doing so will have potential co-benefits for health inequalities, sustainable development, climate change and social justice.

3. We appreciate the opportunity to respond to this evidence call.

Summary of Submission

3. Our submission focuses on two main points:

- The Government should support the development and re-development of sustainable and resilient local environments that support health and economic growth.

- The use of Health Impact Assessments, and tailored resources and tools, will assist local communities to shape their environments to better support health and wellbeing.

Questions

Q7. How do we develop built environments which are sustainable and resilient, and what role should Government play in any such undertaking?

4. UKHF believes the state has the ultimate legal and moral responsibility for the welfare and future prospects of new generations. Health is a public good and defined by the UN’s
Universal Declaration as a human right.\textsuperscript{515} The UKHF believes the UK Government has a responsibility to protect the population from new health threats, promote good health and wellbeing, and prevent disease. This includes the role our built environments have on both climate and human health. All Government departments should routinely consider their impact on the health of the population when developing and appraising social, economic, fiscal, infrastructure and environmental policy.

5. UKHF strongly encourages the Government to use the new UN Sustainable Development Goals (SDGs) as a guide for cross-Government contributions to creating sustainable communities. While the SDGs are designed for both developing and developed economies, there are a number of key goals pertaining to built environments (i.e. access to green space, air pollution, active travel infrastructure, etc.) and the UK will be expected to lead by example in striving to reach these goals.\textsuperscript{516}

Q11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

6. There is a growing body of evidence which demonstrates that the built environment is one of a range of important factors that influences people’s physical activity, consumption of healthy food and social interaction. These are key socio-environmental determinants, which are in part responsible for the rising rates of preventable, non-communicable diseases (NCDs) and widening health inequities in the UK. For example, we know that licensing and planning laws allow (or dis-allow) for adding new fast food and hot food takeaway establishments to areas with already high saturations - a determining factor in local access to healthy food.\textsuperscript{517}

7. Those involved in delivering and managing our built environments have begun to understand and take into consideration the significant role the places where we live and work play in our mental and physical health, but they could be doing more. UKHF suggests the incorporation of Health Impact Assessments (HIAs) into all new local infrastructure projects to ensure the health and wellbeing needs of a given population are taken into

\textsuperscript{516} UK Health Forum. 2015. UKHF response to International Development Committee’s Inquiry: Sustainable Development Goals. Available at: \url{http://nhfshare.heartforum.org.uk/RMAssets/NHF_Consultations/2015/UKHF%20response%20to%20International%20Development%20Committee_090915%20(2).pdf}

\textsuperscript{517} Mitchell C, Cowburn G, Foster C. Report. 2011. Assessing the options for local authorities to use the regulatory environment to reduce obesity. The National Heart Forum. Available at: \url{http://nhfshare.heartforum.org.uk/RMAssets/UKHFreports/Assessingoptionsregulatoryenophysicalactivity.pdf}
account in planning and building projects. UKHF would also encourage those working most closely on local built environments to engage with Public Health England, and its counterparts in the other home nations, along with local public health teams to better understand the needs and public health goals of local populations.

8. To aid in this engagement, UKHF has developed a unique, online, evidence-based resource - Healthy Places - that provides tools to local authorities and public health leads in England for developing healthier and more sustainable neighbourhoods. The site contains innovative regulatory options and explains law often not fully understood, or, not recognised at all as having a potential impact on health in a local area. The resource showcases opportunities to promote local active travel and active communities, access to healthy food and local alcohol control measures, and is developing themes on fuel poverty and air pollution.

30 September 2015

UK Indoor Environments Group – Written Evidence (BEN0112)

Evidence Statement for House of Lords Select Committee on National Policy for the Built Environment

Statement prepared by the UKIEG Chair, on behalf of the UK Indoor Environments Group (UKIEG) Committee, 5th October 2015

1. About the UK Indoor Environments Group (UKIEG; www.ukieg.org)
   1.1. UKIEG was set up in 2003 with the goal of co-ordinating and providing a focus for UK activity concerned with improving indoor environments for people. It has some 250 members from academic, industry, government and practitioner organisations and disciplines, including architects, engineers, environmental scientists, toxicologists and medics.

   1.2. UKIEG works as an unfunded networking group to encourage research and appropriate policy developments to improve health and wellbeing in indoor environments, including homes, schools, hospitals, workplaces and public places.

   1.3. The following statement has been prepared by the UKIEG Chair, on behalf of the UKIEG Committee which includes members with expertise in building design, epidemiology and public health, indoor air quality, toxicology, policy development and implementation. Further details on the UKIEG are available on www.ukieg.org.

2. Questions within the call that this statement is relevant to
   2.1. This statement focuses on the need to explicitly consider the quality of the indoor environment and its impact on the health and wellbeing of occupants in any future policy relating to development of the built environment.

   2.2. The statement is specifically relevant to point 7 (developing sustainable and resilient built environments) and point 11 (how the built environment affects those who live and work within it). More broadly, the statement addresses the lack of coordination at policy level on matters pertaining indoor environments, health and wellbeing, relevant to point 2.

3. Relationships between the indoor environment and health & wellbeing of building occupants
   3.1. There are a number of building-related factors that can have direct and significant effects on human health and wellbeing. These include indoor air quality, temperature and noise levels. There are also a number of other factors including lighting,
ergonomics and visual aesthetics that contribute to occupant wellbeing and satisfaction.

3.2. People typically spend around 90% of their time indoors, with the majority of this in a workplace or in the home. Even if only quality of the air is considered, for many pollutants the indoor environment makes as great if not greater contribution to personal exposure than exposure from the outdoor environment.

3.3. Current legislation recognises the significance of lethal indoor pollutants such as carbon monoxide and mandates specific actions, for example around the installation of appliances and alarms and requirements of landlords to conduct annual checks. There is also a substantial body of evidence that thermal discomfort affects satisfaction and productivity in the workplace (Lan et al 2011). There are also well established relationships both for heat and cold of temperature-related morbidity and mortality, and it is likely the indoor environment plays a major role in determining exposures and health burdens. Thermal comfort is well recognised in guidance (for example, ASHRAE 2013, CIBSE 2013) and has led to actions such as programmes of home insulation, particularly in social housing. However, more needs to be done, and other aspects of indoor environments that affect occupant health are currently poorly considered and are not subject to the same policy actions.

3.4. There is growing evidence that ventilation rates in many buildings are below the levels required for occupants. Recent evidence from controlled chamber studies shows a direct relationship between ventilation rate (and hence CO₂ concentration from exhaled breath) and decision making performance (Satish et al 2012). There might be a correlation between poor indoor environments in offices and increased absenteeism (Milton et al 2000), and calculations for American offices have suggested that poor ventilation may have a substantial economic cost through reduced productivity (Fisk et al 2011). Workplace design can affect workers performance in many ways (Clements-Croome, 2015). Several studies carried out in schools have shown that many have very low ventilation rates which directly result in excessive CO₂ concentrations, increased illness absence and symptoms (Mendell et al 2015, Chatzidiakou et al 2015) and reduced learning capability and performance (Shaughnessy et al 2006, Haverinen-Shaughnessy et al 2011). There is also some evidence that poor ventilation is associated with increased risk of disease transmission (Menzies et al 2000, Sun et al 2011) resulting from less effective dilution of pathogens (Gilkeson et at 2013).

3.5. A review conducted by some of the world’s leading experts in indoor air quality recommended current building ventilation rates in many cases were too low (Sundell
et al. 2011). This was followed by the more recent HealthVent project in Europe (HeathVent, 2104) which recommended the “health-based reference minimum ventilation rate” of 4 l/s/person, when WHO indoor air quality (IAQ) guidelines are fully respected and the only pollutants are human bio-effluents (CO₂) – both situations that rarely arise in reality. This project also proposed that the lowest ventilation rate for schools should be 8 l/s/person.

3.6. Whilst further research is needed on the dose-response relationships between exposure to a range of indoor factors and health outcomes, WHO has developed guidance for selected indoor pollutants (WHO, 2009 and 2010), but this is rarely translated into practice within the UK. This is for various reasons, including lack of awareness in the construction industry, and difficulties associated with translating threshold levels of exposure into design parameters/solutions, which in turn require assumptions on factors such as ventilation levels, emission rates, and behavioural aspects. Greater collaboration is required between the construction industry, public health professionals, researchers and policy makers on how to design and manage buildings which are supportive of occupants’ health and wellbeing.

3.7. Of particular concern is the relationship between energy efficiency and indoor environmental quality. A growing number of studies show that increasing the air tightness of buildings to improve energy efficiency, particularly in homes, can result in very poor environmental quality measured by a number of different indicators. Key UK studies set out these unintended consequences of energy saving measures and the potential impact on human health - including for example potential increases in radon concentrations and associated lung cancer risk (Milner et al, 2014; Shrubsole et al 2014, Zero Carbon Hub 2013, Hamilton et al 2015).

3.8. A potentially significant area is the wider relationship between the design and management of workplaces and employee health and wellbeing. This includes, for example, the influence of design on activity levels and hence the contribution that workplace design – and more broadly the indoor environment - can make to facilitate physical activity and reduce sedentary behaviours. ‘Active Design’ is an emerging field that is the focus of several research studies (Marmot and Ucci, 2015; Center for Active Design, 2010), but should be considered when making future policy decisions.

3.9. Personal exposure also needs to be considered both in terms of exposure to pollutants in the domestic environment coupled with those in the workplace. Consideration of the additive effects of exposure within each environment should be taken into
account (Myers and Maynard, 2005; Ashmore and Dimitroulopoulou, 2009; Terry et al., 2014).

4. Need for a coordinated approach

4.1. Many critical aspects relating to the quality of the indoor environment, while acknowledged in guidance, are often given little attention in built environment development projects. This may result from a desire to reduce costs, a narrow focus on energy efficiency or poor knowledge among design teams. There is a strong possibility that the lack of consideration for indoor environmental quality has a substantial consequence for health of the UK population and hence economy and society.

4.2. There is at present in the UK a lack of a coordinated approach to the indoor environment, health and wellbeing, especially with regard to policy development. This is particularly important because of the pulls and pushes of different, sometimes conflicting, government policy imperatives that address, for example, energy efficiency, building design and construction, product emission standards, ventilation standards and air pollution guidelines/limit values. Moreover, there is no one particular department or agency that has overall responsibility for issues relating to the indoor environment, or even specifically to indoor pollution.

4.3. We propose that there is a clear need to establish a process or mechanism by which it will be possible to develop coordinated policy on issues pertaining to the indoor environment and human health and wellbeing; this should result, amongst other things, in the ability to provide information and guidance - to public and professionals alike - that leads to a better understanding and management of the health risks and benefits associated with the design, construction and use of buildings and other internal environments.

4.4. We suggest that there are three necessary elements:

- The naming of a specific government department (or agency) to take lead responsibility for issues relating to the indoor environment and public health.
- The establishment of a forum of representatives of government departments and agencies with interests and responsibilities in the indoor environment, including Defra, DH, DCLG, DECC, DfT, BIS, PHE and HSE, and other interested parties/organisations such as CIBSE, RSPH, RIBA, CIEH and GHA as well as the UKIEG.
- The establishment of a process by which scientific questions pertaining to the indoor environment can be addressed by independent scientists – this may
involve existing committees (such as COMEAP, COT, HSAC, BRAC) and/or the establishment of a new committee or new sub-groups in existing committees.

Some of these points were addressed in a statement produced by the UKIEG and submitted to COMEAP (Committee on the Medical Effects of Air Pollution). The statement was discussed at the COMEAP Strategy meeting in May 2015. COMEAP’s response, and the original UKIEG Statement, are available on the UKIEG website (www.ukieg.org, News page).

5. Some Specific Current Needs

5.1. We suggest that the following topics should be given priority when developing future policy relating to housing development:

- Ventilation control of dwellings and the health risk-benefit trade-offs of reducing air exchange for the purpose of improving energy efficiency in housing;
- The role of housing/building policy in preventing summer and winter-related mortality and morbidity;
- The role of housing/building policy in adapting appropriately to climate change;
- The health risks associated with specific pollutants of the indoor air, and the potential cost-benefit of different forms of remediation;
- Overcrowding in dwellings and the principles for establishing health-based standards of adequate space;
- Design aspects relevant to the positive promotion of health and wellbeing through such measures as the selection of low-emitting materials, improved natural lighting, noise control, improved outlook, sound insulation and provision of private space.

5.2. There are additional important issues concerning other indoor spaces, including workplaces, schools and hospitals. Whilst these environments have more detailed design guidance available, there is still a lack of correlation between the rationale for design parameters and the resulting environmental quality. Schools are a clear example of this, where the design ventilation rate regularly leads to poor quality indoor environments (Bako-Biro et al., 2011; Montazami et al., 2015). There is therefore a need for a recognised source of information for public and professionals on health risks and benefits linked with the quality of the indoor environment.

5.3. It is worth noting that the health effects of PM$_{2.5}$, NO$_2$ and O$_3$ are among the current priorities for COMEAP, due to pressing needs from Defra (see COMEAP’s response to UKIEG statement, www.ukieg.org). Whilst much of the focus around these pollutants relates to outdoor air, exposure is also highly dependent on time spent in the indoor environment, the characteristics of buildings, people’s activities and indoor sources.
This highlights the importance of taking an integrated approach that takes account of indoor environments when assessing the health impact of outdoor pollutants. UKIEG contends that this aspect requires greater attention than presently demonstrated by government departments with responsibility for pollution and public health.

5.4 The UKIEG note that the lack of a government department lead for the indoor environment (which is also acknowledged in the COMEAP’s response, see earlier), highlights the fact that there is no government department with the responsibility to: create leading national policies and legislation on the indoor environment and account to Parliament; support the provision of funding, innovation and research; encourage those committed to working in this arena. More broadly, a strategy addressing indoor environments, health and wellbeing is needed, to lead and coordinate activity in the UK.

6. **UKIEG’s Role**

6.1. The UKIEG acts as a hub for expertise in indoor environments in the UK and hence a catalyst for action. UKIEG have no central funds, but would be willing and able to produce a range of pertinent and evidence based ‘position statements’ for consideration by government departments, agencies and expert committees, as appropriate. These documents would discuss concepts and points of principle with reference to published scientific literature to develop thinking, action and assist in the prioritisation of policy development.

6.2. UKIEG is also able to undertake the organisation of relevant fora, meetings and workshops with key researchers and other stakeholders, to facilitate discussion of the available evidence, to develop strategic research questions and encourage funding of research to aid future policy development.

Dr Marcella Ucci, Chair of UKIEG.

Call for Written Evidence

Policymaking, integration and coordination

1. The Counties should be the prime strategic decision makers as they can see the big picture for infrastructure needs and problems and rural protection. Individual LPAs do not have this overall view.

2. Short term financial and economic gain for developers, LPAs etc seem to be the criteria. A house is for ever, and blighting the countryside is permanent. There needs to be an overall criterion of preserving the precious value of unspoilt countryside and unspoilt views for future generations to enjoy. This is also good for tourism today.

National policy for planning and the built environment

3. Brownfield sites should be the priority. There should be a presumption that the countryside is off limits to development unless the parish councils affected also agree. Too little weight is given to parish councils who know their area. Too often decisions are made by people who know nothing of the areas involved.

4. A spatial element in national policy might be more effective in directing attention to towns and cities and the thousands of acres of brownfield derelict land within towns and cities. This reduces the pressure on building roads, commuter trains etc. if development is kept within towns and cities.

5. It would help if we didn’t have to accommodate an increasing population to the equivalent of a new Birmingham every two years. The only solution to be consistent with the above answers, is to build more high rise flats in existing cities, as was done to accommodate an influx of millions of refugees in Hong Kong after the war. It is easier to build infrastructure (overhead trains etc) in a city than in the countryside.

Buildings and places: New and old

6. A fluid housing market is required once development zoning in existing town/city boundaries is agreed. This means scrapping stamp duty and capital gains tax, both of which inhibit the purchase and sale of properties. Most of the 2 million buy to let landlords are from class C1, not A & B) who are trying to boost their pensions. They want to sell on retirement but prevented from doing so by a 28% capital gains tax. Old people wanting to downsize are prevented by stamp duty charges if buying a smaller home. By reducing taxation, the market can then better satisfy demand. Activity brings revenue to the government through VAT on all goods and services involved in people moving house. This
should more than compensate for the loss of stamp duty and capital gains tax revenue, neither of which are large revenue earners.

7. Better to give tax breaks to refurbish terraced houses in northern cities in particular, many of which are empty.

8. Tourism is an important industry and our historic assets and the character of historic village and towns needs protection. The state sponsored vandalism of the 1960s destroyed the historic 16th/17th century hearts of towns like Worcester, and Gloucester and it was fortunate that the 1970s recession stopped even more damage. Parish Councils should be much more involved when it comes to local development, and the Counties should also be involved much more than now as they can see the overall value of tourism and preserving historic areas for future generations.

Skills and design

9. There should perhaps be in every county, a “culture tsar" whose role is to advise government departments, direct LPAs, liaise with parish councils and with those bodies involved in the protection of landscape and historic buildings and assets. Many of the professionals usually involved are only interested in their own sphere of expertise, and are often motivated more by the short term financial and economic outcomes than the concept of preserving the well-being of the countryside for present and future generations. Such a tsar would need to have the power of veto and referral to an Inspectorate whose mission would be to give weight to protecting the countryside and its historic assets and who would then adjudicate.

10. The only national input should be to lay down guidelines for the culture tsar and inspectorate in “9" above, that local character should be preserved. In other words, Cotswold stone in Cotswold villages etc.

Community involvement and community impact

11. There is little consideration given to the rural environment. As said above, more development on brownfield sites in towns and cities will reduce the traffic chaos in the countryside, and the consequent reduction in the quality of life for those living in the country, those wanting to live in the country, and tourists.

12. Local authorities do not give sufficient attention to parish councils or local groups involved in protecting the countryside and historic assets. Parish Councils need the right to appeal to the Planning Inspectorate against unwelcome decisions made by LPAs.
Financial measures
13. Market forces should not be inhibited by stamp duty and capital gains tax. The majority of affordable housing needs to be in towns and cities rather than in the countryside because that is where the jobs tend to be, and for people of limited means, living in the country is more expensive because two cars are often needed per household. Developers need to contribute to build infrastructure needs, whether roads, schools, medical facilities etc.

06 October 2015
Professor Vincent Goodstadt, Professor Cecilia Wong and Dr. Mark Baker
Centre for Urban Policy Studies (CUPS), the University of Manchester

We have set out below our responses in relation to questions 1-5 of the Committee’s call for evidence:

Policymaking, integration and coordination

**Question 1a:** Are the decisions that shape England’s built environment taken at the right administrative level?

**Response:**

To answer this question, it needs to be recognised that the National Planning Policy Framework (NPPF) is not currently a planning framework that sets out the policies (and therefore decisions) that ‘shape England’s built environment’. Rather, it is essentially a collection of policies that has to be applied locally to ensure a consistent approach to local planning at the local level. However desirable these policies are, they do not shape the future of England’s built environment. They are necessary but not sufficient to secure the future quality and condition of England’s built environment. The following notes amplify this fundamental issue.

The effectiveness of our national planning process can be judged by its outcomes in terms of the scale, distribution and impact of development change in our towns, cities and countryside. By any measure we are failing as a nation in this respect. This failure is demonstrated by the following:

- The scales and range of new housing developments are totally inadequate;
- Traffic conditions are becoming unacceptable in many areas and the capacity of our strategic transport networks is exceeded throughout the country;
- Our core infrastructure provision (e.g. water, energy) is similarly at risk;
- The indigenous economic potential is not being harnessed (e.g. the potential of the Higher Education sector);
- Our ecosystem services upon which our urban areas (i.e. the built environment) are dependent are at increasing risk.

Herein lies the central conundrum facing the future well-being of this country. Despite having a sophisticated planning system, the question that needs to be asked is “Why are the resulting patterns of development less than those aspired to in the visions set out in the NPPF nationally or in local plans?”
The key to answering this question lies in recognising that our system assumes that making decisions at a local level by local councils or neighbourhood fora (where necessary acting jointly at the local level) will, when aggregated, produce the right scale of development in the right locations to meet the long term needs of England, in full, in both quantitative and qualitative terms. The reality is that they do not. Local decision making based local perspectives of needs alone is inevitably sub-optimal because it lacks context (see below). The cumulative effect of these development decisions is to under-achieve development targets, create stress on core infrastructure and have cumulative adverse environmental impacts.

Despite the current commitment to localism and decentralisation there are key areas of decision making that must be taken at regional and national levels of governance. The nature of the problems, the functional areas of interdependency and the stakeholders that need to be involved mean that certain decisions have to be taken at a national of mega-regional level (i.e. wider than current regional units). It is therefore not so much whether decisions are taken at the right level but whether the decisions that have to be taken to secure the stated objectives and goals for the future of England are being taken at all. Such decisions fall into the following categories:

- **a) National requirements** in terms of economic growth (e.g. the directions of change and sources of growth clusters); national ‘social’ targets (e.g. housing; renewal; and health); the environmental framework (e.g. ecological footprint; renewed capital; spatial units); the national and international core networks in terms of capacity and constraints (e.g. airports; ports; IT, Energy).

- **b) Inter-regional balances** which set out broad scales & directions of change in terms of labour (numbers & source/migration), housing (numbers & quality) and environmental action (e.g. renewable energy, forestry) and based on a broad impact assessment in terms of additionality, displacement and diversion.

- **c) Border Issues** arising from such factors as inappropriate Standard Regions (e.g. South East/London/East of England), national boundaries (e.g. Severn Estuary, Scottish Links and N & S Ireland) and issues related to inter-regional Interdependence (e.g. North West and South Yorkshire).

- **d) National Flagship Priorities** in terms of the Economic Growth Poles which are linked to financial instruments (e.g. Enterprise Zones); Social Priorities (e.g. former Pathfinder Areas); Environmental Action (e.g. Community Forests, Flooding, Renewables); and infrastructure (e.g. short term - long term programming).
In effect there are limits on applying the ‘Principle of Subsidiarity’. The problem is that the decisions that should be being taken at the regional or national level suffer from an endemic fragmentation:

- Fragmentation of area, since the administrative areas at a regional and local level often have no relationship with the true functional geography within which people make choices in terms of such matters as housing and labour markets, and natural ecosystems;
- Fragmentation of functions between the silos of government their agencies;
- Fragmentation of policy objectives, e.g. areas being promoted for large-scale housing development within regions vulnerable to water shortages; and
- Fragmentation of analytical understanding, e.g. the aspirations for the Northern powerhouse and the ONS based forecasts used for planning.

As a result, many of the key decisions that have to be taken at a regional or national level are either sub-optimal or they are not being taken at all.

**Question 1b: What role should national policymakers play in shaping our built environment?**

**Response:**

**An Approach to the National Planning Policy Framework (NPPF)**

Three principles, in particular, underpin the Government’s agenda for the planning system – a strengthened *local input* into planning decisions, clearer *national policies* and a true commitment to *sustainable development*. The integrity and coherence of the system depends upon the delivery of all three. Without *national spatial planning*, local decisions will be without context and potentially in conflict not only with that of their neighbours but also with national interests. Similarly, sustainable development will remain mere rhetoric unless *national spatial planning* pins down the sustainability tests that need to be applied at local and national level.

**The Purpose**

The overall national planning goals are therefore to promote the balanced and sustainable development of England by setting out a framework for sustainable development; and of the priorities for economic, social and environmental regeneration; and for maintaining and

---

enhancing the quality of the natural heritage and built environment. The challenge is how this can be operationalised.

Experience shows that national spatial planning has greatest added value if it is underpinned by one or more over-riding concept which creates real synergy between the necessary separate strands of government and helps deliver the priorities of the Government. In the current context ‘Economic Growth’ is the immediate priority and ‘Security’ is the longer-term need and therefore ‘Securing the Growth of the Nation’ or its equivalent could form the focus for national spatial planning. The key point is that this is to see national spatial planning as more than a mere administrative document (which, in essence, the current NPPF is) but to be a tool for re-engineering the nation.

The National Balance Sheet

Linked to this, national spatial planning could set out the ‘balance sheet’ and ‘future business plan’ for the development of the nation, which would summarise the key components of UK plc, for example:

a. A State of the Nation Report setting out:
   i. The aggregate capacity for development;
   ii. The underused capacities in our national stock (e.g. housing) and infrastructure systems;
   iii. The pinch points in our national infrastructure;
   iv. The scale and any identified priorities for urban regeneration;
   v. The ‘condition’ of the natural environment (e.g. level of risk).

b. The ‘Shifts’ in the Nation setting out:
   i. The economic, social and environmental trends; and
   ii. The national flows and goods, services and people; and
   iii. The external relationships.

c. The national Perspectives on:
   i. The directions and distributions of change; and
   ii. The potential ‘futures’ that national spatial planning seeks to accommodate and enable.

National Development Priorities

Therefore in addition to the guiding principles of sustainable development and the framework of nationally applied planning policies in the NPPF, national spatial planning should set out the national development priorities required to safeguard and deliver the economic, social and environmental future of England. These should include:
(i) The **National Hubs** which drive and secure the economic and social future of Britain. These would include amongst other things
- Airports
- Ports
- Inland freight terminals
- Knowledge/research centres of excellence
- Power supply
- Water Supply

(ii) The **National Networks** upon which all communities are dependent for accessing the national hubs and Major metropolitan areas, including, inter alia:
- Rail (passenger and freight)
- Road
- Canals/river systems
- Power grids
- Telecommunications
- The Water Catchment / Ecosystem Framework of England
- Green Grid, including Green Belts, National Park Systems, protected habitats and AONBs

(iii) The **National Flagship Projects** to transform the competitiveness and quality of life of England which are recognised as national economic, social and environmental priorities, and could include for example:
- Internationally important projects (e.g. The Olympics/Commonwealth Games)
- Transport Projects of National Significance (e.g. HS2, Cross-rail)
- Blue-Brown Priorities, i.e. Regeneration Priorities (e.g. UDCs) or New Town or equivalent projects
- Blue-Green Priorities (e.g. new Green Belts, New national parks or National Forestry Projects)

**Safeguarding the National Interest**

It is also important that national planning goals are safeguarded. If this is to be achieved within the context of Localism (and thereby minimise the need for national intervention in local decision making), we need to move from the current reactive approach to a more proactive open planning model whereby local communities have confidence because of the clarity about where there is a national interest that has to be taken into account locally. **National spatial planning** therefore needs to be clear about where the direct, cumulative and indirect wider impacts of development may raise national concerns, based around a presumption that the supply of development land should ensure that the national need for development is met in full, is deliverable and avoids blight, in particular to deliver the national planning priorities.
**Question 1c: How does this relate to the work and role of local authorities and their partners?**

**Response:**

The relationship between national and local policy making is critical because of the need in policy terms to square the circle between the apparently conflicting positions of Localism and UK plc. The nature of this conflict is that the localism agenda (by whatever name it is called) gives priority to local interests even when they are in conflict with national interests. This is reflected, for example, in the institutionalised nymbyism that is practiced by many local authorities and communities which seeks to minimise the scale of new housing developments in the locality and therefore has cumulatively contributed to the underachievement of housing targets nationally.

Similarly, national constraints have inhibited locally sensitive policy making or local entrepreneurship. This is typified in the capacity of councils to promote sustainable transport and public transport investment, in contrast to municipalities abroad who have much greater control of their own finances and tax raising powers. The net effect is that local aspirations far exceed resource availability. Historically, it was estimated that this could be in the order of threefold over bidding for new investment. The consequence is that such local plans become mere bidding documents and not a clear framework for programming development. More effective spatial planning, as indicated in the answer to the previous question, therefore has a two-fold benefit:

1. It gives confidence to local decision makers that their decisions will not be undermined and encourages joint working because of the clear framework;
2. It gives confidence nationally that local decisions will have the aggregate impact that is needed, for example, in terms of job growth and housing provision or in terms of the investment required.

**Question 2a: How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage?**

**Response:**

As indicated in the responses to the preceding questions, the answer is that policy is not well coordinated across government departments. The silo based approach is generally accepted. The work of C. Wong et al. for the Royal Town Planning Institute (refer: *A Map for England: Spatial Expression of Government Policies and Programmes*) is a very clear demonstration of this.
Question 2b: How could integration and coordination be improved (between departments)?

Response:
The related work by C. Wong et al ‘A Compendium of Spatial Maps for England’ demonstrates that it is highly feasible to draw existing policies and programmes of government together in terms of their spatial implications (i.e. their implications for specific areas /regions / localities). It should therefore be a requirement for all policies and programmes to be expressed spatially as a form of audit (comparable to other forms of audits of policy). In addition, it is also possible to require policies, and especially programmes, to be funded on the basis that they have demonstrated their spatial implications for different parts of the country. This is comparable to the policy approach advocated by the Royal Town Planning Institute in its paper on strategic planning. ‘Effective Cooperation for Planning Across Boundaries’.

National policy for planning and the built environment

Question 3a: Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment?

Response:
As indicated in our answers to Question 1 above, the policies in the NPPF merely ensure local decisions are taken on a consistent basis in accordance with agreed national policies. They are essentially reactive and not creative. They do not set out an overall vision of the scale and direction of change for the country, nor do they indicate the relative national role that they should perform (e.g. in terms of jobs and housing growth). What is required is a much more proactive spatial framework, as described earlier.

Question 3b: Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

Response:
All the factors in the NPPF are relevant to the practice of good planning. The essence of planning is to take an integrated approach to all factors. In any particular situation, the balance, synergies and trade-offs between factors will be different. The NPPF should not therefore seek to prioritise the range of factors it lists, but rather give greater guidance in terms of how decisions should be taken when these factors are in conflict. For example, there
are inherent potential conflicts between the short term economic goals and long term sustainable approaches to sustainable development, or between people’s aspirations to a ‘better life’ in terms of material well-being (e.g. mobility provided by cars) and the impact of climate change. However such guidance cannot be effectively given without a clear spatial framework against which to assess relative impacts.

It is therefore considered that a more integrated approach might be more useful to get away from the checklist approach that the current NPPF encourages. An initial assessment would suggest that these could be encapsulated in a concise Framework of Policies based on three key themes, as illustrated below, all of which are capable of being interpreted without needing major explanation (i.e. documentation):

(a) Support and promote sustainable development by:

- Promoting urban renewal and regeneration in preference to further urban expansion;
- Providing a co-ordinated approach to rural areas, reflecting the varying needs within them;
- Maintaining the vitality and viability of town centres;
- Locating new development where it is linked to sustainable transport;
- Identifying opportunities for the development of renewable energy.
- The strategic management and development of the national transport network;
- Designating long term Green Networks including Green Belts.

(b) Identify opportunities to meet the local need for development by providing:

- A settlement strategy which has a 20 year horizon;
- A related supply of land for industrial and business development, and the safeguarding of national economic development priorities identified in the NPPF;
- A minimum 5 year effective housing land supply in each Housing Market Area, giving priority to the use of brownfield land;
- A land bank for aggregate minerals of at least 10 years and the safeguarding of mineral deposits for future extraction;
- A spatial strategy for dealing with waste management and disposal;
- A zero-carbon society;
- A framework for the development of sports and recreational facilities, and open space;

(c) Protect, enhance and create environmental resources & ecosystems including:

- Habitats and species of national and international significance;
- Prime land and other important agricultural land;
- Landscapes of international, national and local importance;
- The historic environment, including archaeology;
• Coastal areas;
• Other areas subject to significant change from climate change;
• Woodland and forest resources; and
• River catchments and watersheds, including areas liable to flooding.

**Question 4a: Is national planning policy in England lacking a spatial perspective?**

**Response:**

Yes. There is no spatial perspective in the NPPF or NPGs. Nevertheless, as illustrated by the work of Professor C. Wong et al and other authors, all government policy has implicit, if not explicit, spatial implications (refer: ‘A Map for England : Spatial Expression of Government Policies and Programmes’ and ‘A Compendium of Spatial Maps for England’). The issue is that, in most cases, they have not been prepared with that spatial perspective in mind (i.e. a perspective of the desired impact on different parts/communities throughout England) nor any assessment of the differential impacts on the various component regions/areas of the country that would arise as a result of national planning policies, nor the relationship to their interaction with other policies of other Government departments in terms of their spatial impacts.

**Question 4b: What would be the effects of introducing a spatial element to national policy?**

**Response:**

The effect of introducing a spatial element to national policy would be beneficial in the following terms:

a) local planning would have a clearer understanding of the contribution to national objectives;
b) there would be reduced potential conflict between sectoral policies (e.g. housing and transport);
c) there would be a more joined up approach to government whereby departmental policies and programmes would be synergistic and not competing;
d) there would be more effective use of and targeting of resources nationally;
e) less wasted time and effort in resolving conflicts, especially between national local concerns, through the litigious processes; and
f) there would be more confidence for investors to press ahead with their projects.

**Question 5: Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?**
Response:

A spatial framework should be generational in its timescale, for example to 2050. The precise horizon is not critical but it should relate to the timescale within which the national goals will be met. It is not just about the time horizon within which we can make confident forecasts because, by its very nature, a national planning process should be based upon a *scenario* approach and not just trend projections. Currently approaches are based on extrapolated trends which by their very nature are inaccurate and tend to lock-in historic spatial patterns of decision making (e.g. where housing consents have been granted historically) which may often be sub-optimal, and sometimes wholly inappropriate for longer term horizons, and preserve the status quo rather than encourage more innovative approaches.

At present the Government has long term goals (e.g. a fairer society or a better balance between the north and south of the country) but only short term policies and programmes. There is little link between these in the sense there is no real measure of the degree of change required in society and within what timescale. This means it is not currently possible to have any confidence that these long term goals will be met.

Vincent Goodstadt, Cecilia Wong & Mark Baker, CUPS, University of Manchester

29 September 2015
How Development Viability is Undermining the English Planning System

This submission addresses Question 3 in the scope of the Select Committee concerning National Planning Policy and the NPPF.

It draws attention to the profound community and environmental implications of “viability assessment” introduced in the NPPF 2012. It calls on the Committee to urge withdrawal of this part of the NPPF, and in the meantime, to recommend full public disclosure of viability assessments, and the introduction of a consistent and fair methodology.

This submission draws on my experience as a senior local government planning officer for over 20 years and as an academic housing researcher. I have recently completed with the Open University a two year ESRC funded study of housebuilding in Northamptonshire and Milton Keynes. I have written a number of articles on viability and planning, and gave an invited presentation on “Viability Assessment and Freedom of Information” to the Information Commissioners Office in February 2015.

In 2014 I appeared as an expert witness on viability assessment on behalf of local community organisations at Information Commissioner Tribunals into the Greenwich Peninsula development, and the Heygate, Southwark development.

Viability Assessment Guidance

Paragraph 173 of the NPPF and subsequent guidance introduced the requirement that Local Plans and Planning obligations (Section 106 agreements and Community Infrastructure Levy) should be subject of development viability assessment.

It stipulates that Local Plans and planning decisions will need to consider the manner in which viability impacts upon the deliverability of housing schemes, taking into account the cumulative effects of local planning policies and standards. “Plans should be deliverable ..... To ensure viability, the costs of any requirements likely to be applied to development should, when taking account the normal costs of the development and mitigation, provide competitive returns to a willing land owner and willing developer to enable the development to be deliverable” (para 173).

In 2012, the Department of Communities and Local Government (DCLG) invited planning applicants to request amendments to planning conditions made prior to 2010 on the grounds of changed economic circumstances. The Growth and Infrastructure Act 2013 permits the review of previously agreed Section 106 conditions for affordable housing - subsequently
filled out by DCLG guidance issued in April 2013 to explain how this should happen. This guidance gives applicants until 2016 the right to apply to a local authority to modify a Section 106 Agreement where it is being argued that the terms of the Agreement now render the development economically unviable.

This new emphasis on viability throughout the planning system makes it essential that viability assessment is fair, transparent and reliable. It is our contention that it is none of these things.

Viability assessment is causing distortion and injustice in the planning system in the following ways:

(a) Viability assessments are open to manipulation by developers and landowners because there is no agreed methodology for viability assessment (see LBI Draft Development Viability SPD, 2015). With multiple variables and many different ways to measure construction costs, development values, profitability and fees, development viability assessment is highly contested, with little basis for consensus.

(b) There is now in my view a bias in the assessment system because the development industry can employ significantly more resources than other stakeholders in making development data fit their case for reductions in affordable housing. There is a viability industry of consultants is generating “deliberately pessimistic” viability assessment to escape planning obligations particularly for affordable housing.

(c) In other words, completed developments are often systematically undervalued to reduce viability and planning obligations for affordable housing. In the case of the Greenwich Peninsula, the developers viability assessment led to a loss of 527 affordable units. But when this assessment was interrogated by myself and other local experts it was clear that the reduction in affordable housing was due to a highly unreliable viability assessment which the Council had not investigated thoroughly. If the viability reports had been available to the local community (in full) at the time of submitting the planning application, this needless loss of affordable housing could perhaps have been avoided. (http://www.theguardian.com/cities/2015/Jun/25/london-developers-viability-planning-affordable-social-housing-regeneration-oliver-wainwright)

(d) It has been estimated that undervaluation of development schemes in viability assessments has led to a significant reduction in the amount of affordable housing (20-30%) below plan targets, which is obviously going to have implications for addressing the housing situation;

(e) Viability is having a damaging effect on the credibility of the plan-led system. Statutory plans, created after extensive public consultation and examination, are...
being undermined because viability assessment is being used as a “trump card”
to reduce or remove plan requirements (John Wacher, “Viability: what does it
mean for the plan led system?”; RTPI, 18th September 2015))

(f) Although viability assessment was initially justified by Government as a recession
measure to encourage development the policy remains in place in spite of
booming housing markets and large increases in developer profits. While the
review of affordable housing obligations has a sunset clause (ending in April
2016), the NPPF guidance on viability does not.

(g) Viability assessments are very often not made publically available on the grounds
of “commercial confidentiality” i.e. developers in the Greenwich and Heygate
cases claimed there would be “commercial damage” if the detailed modelling
data were shown to the public. The Information Commissioner Tribunal decision
on Greenwich Peninsula in 2014 overturned these arguments saying that the
claims of commercial damage were unfounded and unproven

(h) Viability assessment is causing delays and increasing the costs of processing
planning applications because local authorities have to undertake innumerable
viability assessments employing consultants, sometimes at considerable public
expense. It is hard to see how the Government can achieve its objective of 1
million new homes by 2020 if the current approach to viability is not radically
changed.

The fundamental issue that I ask the Committee to address is this:

- The NPPF has changed the planning system from one based on land use
  considerations, to one based on financial viability. It has become no longer an
  examination of the planning merits of land uses in particular locations, or the
  environmental impact of schemes, but is a highly contested debate about the
  viability of individual proposals as promoted by individual developers or landowners.
  Turning the planning system upside down in this way is neither fair nor just for local
  communities.

What should be done?

It is my contention, shared by many others in the planning professions and in the
community, that viability is so susceptible to unreliable measurement and manipulation, it
should be withdrawn from guidance on Local Plans, planning applications and planning
obligations.
Viability assessment may have a place in preparing Community Infrastructure Levy tariffs, where strategic infrastructure funding is at stake, but it does not have a place in individual site development.

In the meantime, all viability assessments should be fully disclosed to the general public before planning decisions are made by the local authority. This means they should be un-redacted, and made available in good time to enable proper public scrutiny. It is not sufficient in our view to say that the local authority has seen the un-redacted VA.

30 September 2015
Questions

Policymaking, integration and coordination

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

Policy across both Central Government and local authorities has been poorly co-ordinated under all government administrations. This has been invariably due to silo thinking and departmental responsibilities and reporting lines. There is a fundamental need to collaborate across departments. This can result in a more efficient and effective allocation of resources. The Urban Design Group has been campaigning on health and urban design focusing on the links between transport, planning, health and design. The publication of design guidance that operates across service areas can bring a new dimension to policy making. By promoting walkable neighbourhoods and mixed use living creates a more sustainable form of development. People living in car dependent suburbs are reckoned to be less healthy than those which are served by high frequency rail transport. Encouraging more children to walk and cycle to school helps to reduce obesity levels and hence reduces the demand for National Health Service appointments. The New York Active Design Guidance is a valuable tool in promoting cross departmental collaboration.

National policy for planning and the built environment

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

The guidance on the preparation of Local Plans encourages a more policy orientated plan with little evidence of spatial content. Moreover, the preparation of Local Plans goes in parallel with the preparation of transport plans. The development of cities and its infrastructure needs to be integrated and it is suggested that a single spatial plan be prepared, which will avoid some duplication of resources as there is a transport input to Local Plans but will lead to improved collaboration across policy areas.

4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?
There is currently no national spatial planning framework in England. This is in contrast with Scotland and Wales which have national spatial plans. In England, national planning guidance is in the form of the National Planning Policy Framework. It lacks any spatial dimension on where new infrastructure should be planned in relation to city expansion and the protection of the countryside. Whilst there is a National Infrastructure Plan this is not related to the vision for our towns and cities. The new National Infrastructure Commission outlined at today’s Conservative Party Conference could be given this role to prepare a National Spatial Framework for England.

Skills and design

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

Urban Design has been recognised for its role in bringing together a range of skills in design and this pan-professional skill set is so fundamental in understanding our cities and the complex processes of change. There is a concern that many students studying urban design are from overseas rather than from the UK and there this may result in a deficiency of skills in this important area.

The Institute of Historic Buildings Research note 2013/1 indicates that Conservation staff in England fell by 6% in 2011 and anecdotal evidence suggests that further falls have occurred since then. A high proportion of Conservation staff also work as design advisers and care multi-skilled professionals with qualifications in architecture, urban design, planning and conservation. These reductions come at a time when the development industry has seen an upsurge in building activity. A number of local authorities do not have specialist advisers in place yet the NPPF requires local authorities to put in place arrangements for design review. Whilst a number of design review panels have become established the picture across the UK appears to be rather patchy.

Local authorities are now focussed on development management and have put less resources into quality spatial planning that seeks to provide frameworks giving developers clear guidance on where and how to develop sites within and around our cities. The Urban Design Group calls on the Government to place more emphasis on place-based proactive urban design.
10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

There are tools and techniques that we could use that are employed in European cities such as local authorities identifying land for development and selling it on with clear guidance on design. The use of plot based urbanism can facilitate development for self-build entrepreneurs.

Urban Vision Enterprise – Written Evidence (BEN0026)

Introduction

Urban Vision Enterprise is a community interest company providing professional services in town planning and urban regeneration at national and local levels. Urban Vision North Staffordshire is a partner organisation and a charity, operating in North Staffordshire (The Centre for Sustainable Regeneration and Design).

The Urban Vision organisations specialise in planning policy, neighbourhood planning, heritage-led regeneration and conservation, urban design, independent design review, community engagement and consultation, community projects, third sector organisational development, training and education.

Clients include UK and national professional and membership organisations, local authorities, local councils, neighbourhood forums and local community groups.

Urban Vision Enterprise is a partner in delivering the Government’s Neighbourhood Planning national support programme.

Questions

Policymaking, integration and coordination

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

We support the localism agenda and especially the introduction of neighbourhood planning. We believe that neighbourhood planning has rejuvenated the planning process, bringing in a much wider range of skills and knowledge.

However, we are concerned that the neighbourhood and local levels are too close together, leaving a large gap between national and local. This has resulted in a strategic vacuum in governance and policy across England. An obvious solution is to lift the local level to city-region. Thus there would be 3 tiers: national, city-region, and neighbourhood. Consideration should be given to formalising the neighbourhood tier of governance by introducing town/parish councils in urban areas. City regions should be defined through cooperative working between clusters of local authorities, as has happened in Greater Manchester.

In addition, we are concerned that some decisions are being imposed from national level, undermining localism. This is especially the case with permitted development rights, which have been introduced without any apparent analysis of economic outcomes, including negative effects. An example is permitted development rights to change the use of commercial premises to residential, which is clearly based on London and south-east
assumptions. In many areas of the country, the challenge is in attracting employment and commercial investment and development. Such development triggers demand for housing, as people move to the area to take advantage of new jobs. The loss of commercial capacity in urban centres can undermine economic and physical regeneration.

Poorly thought-out permitted development rights can undermine neighbourhood plans which have an economic development focus, and run counter to aims to create a Northern Powerhouse. We can’t emphasise enough the importance of national policy being based on proper evidence.

We accept that there is a justification for calling in planning applications, where they have significant implications. There is also a need for national government to set out more clearly the skills requirements required by local authorities to deal with planning applications in a competent manner. We are especially concerned that some LPAs do not have adequate skills in urban design, building conservation and other built environment matters. This can result in poor decisions, poor development or excessively onerous requirements being placed on developers.

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

The separation of heritage from the planning ministry that occurred in 1990 has been very damaging. Shifting heritage to the Culture ministry means that it is viewed in very narrow cultural terms, rather than emphasising the social, economic and environmental values of historic buildings and areas.

Our recommendation would be to reintegrate heritage with planning and regeneration. This would ensure that heritage is considered not just for its cultural value, but also as part of the infrastructure of modern places and as a powerful driver for economic and physical transformation.

In particular, we would like to see more emphasis on heritage in economic development. This includes:

- Ways in which historic areas can underpin physical and economic transformations (heritage-led regeneration).
- The role of older areas in supporting enterprise, small businesses and social enterprises
- The utility value of heritage, as part of the infrastructure of our towns, cities and rural areas
- The importance of refurbishment to the construction industry and as a means to creating more skilled and higher paid local jobs
- The role of heritage in supporting choice and diversity
- Historic areas as a basis for sustainable development
National policy for planning and the built environment

3. Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

In general, we support the simplification of planning policy, brought in by the NPPF. However, we do have certain reservations.

- There should be a much stronger emphasis on the role of robust planning in creating investor and business confidence.
- Stronger policies are required to ensure that new retail development is located in existing town and city centres. We are concerned over the level of out-of-town consents being obtained under current policy. Existing town centres must receive a higher priority when planning for retail, cultural and recreational facilities.
- We would like to see a greater recognition of the neighbourhood level of planning, including advice that Local Plans should focus on strategic matters and strategic level site allocations.
- There is an incompatibility in heritage policy between the term ‘significance’ used in the NPPF and the terminology used in legislation (‘special architectural or historic interest’ and ‘setting’). This confusion is exacerbated by English Heritage’s (now Historic England) Conservation Principles, which do not mesh with the legislation.
- We would like to see a stronger recognition of the link between quality of place and an area’s ability to attract jobs, investment, visitors and residents.

4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

We are firmly of the view that policy-making reflects a strong London-centric bias, often based on assumptions of the economic conditions of the south-east. Notwithstanding the current debate around the ‘Northern Powerhouse’, there is a lack of coherent urban policy to incentivise development in the north of the country.

The key aim of policy should be geographical rebalancing of the economy. Land and housing inflation is a serious problem in some parts of the country, especially London and the south-east. At the same time, there are many parts of the country, including many areas in the north, where the development sector has yet to recover. In other parts of the country, there is an imbalance between costs of housing and the strength of the local economy, fueled by a
range of factors like second home ownership and commuters (for example Cornwall and rural Norfolk). In many rural areas, high house prices exclude those working in the rural economy. The severe imbalance in the rates of growth in different parts of the country represents a serious threat to the recovery.

The London-centric focus of policy-making damages not just the Northern economy, but the national economy and London’s interests too. London is a global city and we recognise that the solution to the imbalance is not about restricting development in high growth areas, but in incentivising development in under-performing areas.

To achieve rebalancing, a wider review of Government initiatives is necessary. For example, the Community Infrastructure Levy (CIL) and New Homes Bonus generate money for areas where there is high growth and inflationary pressures, but do nothing to stimulate growth in under-performing areas where development land is available, but not viable. An assessment should be made of the economic impact of recent changes to permitted development, in particular looking at whether changes of use from commercial to residential is reducing employment capacity in northern towns and cities.

A national spatial plan may lay the foundations for a more robust urban policy, to incentivise development in areas with land capacity, but underperforming and marginal land economies. This could address issues like land reclamation and infrastructure deficiencies. This is an absolute key requirement and is as important as improving transport infrastructure in terms of delivering sustainable growth across the country and delivering the Government’s aspirations for a Northern Powerhouse.

Clearly, meeting social and economic objectives will require the plan to address infrastructure. Transformational infrastructure projects should be reviewed to make sure they are accompanied by wider activities to create benefits to the North. A spatial plan could highlight the need to address the gross imbalance in public expenditure per head of population between London and elsewhere in the country. This includes expenditure on transport and activities which develop social capital like the arts and culture.

The delays to upgrading rail infrastructure across the north of the country, recently announced, are at odds with the rhetoric on the Northern Powerhouse.

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?

Plans need to put in place long-term goals, recognising that it often takes decades to address ingrained economic, social and environmental issues. At the same time there is a need for plans to be reviewed on a fairly short-term basis, responding to a fast changing world, whilst maintaining long-term goals.

Effective planning requires up-to-date plans which are regularly subject to review. This is
only possible if local planning authorities are properly resourced to ensure the necessary skills and capacity are available.

Buildings and places: New and old

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

There is unlikely to be significant progress in increasing housing supply unless three key factors are understood:

- ‘Investor developers’ have fundamentally different needs than ‘trader’ developers. The latter have a short-term outlook. The former, with their longer-term outlook, rely on certainty, provided by the planning system. This includes effective development management and up-to-date local plans and neighbourhood plans.
- The current housing market is self-regulating. Increasing the rate of supply significantly would result in lower prices, reducing profit margins and, in some areas, making sites unviable.
- The construction sector has limited capacity. This is not just about overall capacity, but also skills gaps.

Neighbourhood plans are sometimes proving to be an effective means of increasing the level of housing site allocations, especially as local communities become more aware of gaps in housing provision, such as smaller accommodation for the elderly and first time buyers.

One issue with the Government’s current approach is the narrow focus on new-build. A widening of focus is necessary, encompassing the regeneration of existing housing and neighbourhoods. This could include removing VAT on house renovation. There are many low demand areas and poor neighbourhoods that need direct intervention and support (for example in Stoke-on-Trent). Building new houses alone will not renew these places.

More emphasis needs to be placed on community-led housing, both as a means to increasing supply and to stimulate development activity in under-performing areas. The use of publicly owned property and land could be a key component in facilitating community-led housing. Additional support should be provided to self-build schemes too. This includes consideration of affordable borrowing which is designed for the realities of self-build.

As the banking crisis demonstrated, there is a fundamental relationship between national economic performance and the rate of delivery of new housing.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How
can the best use of existing housing stock and built environment assets be made?

The towns and cities that have undergone the most dramatic economic and physical transformations over the past couple of decades have understood the importance of quality of environment in attracting investment, transforming perceptions, creating confidence and delivering growth. A key theme of Government should be delivering high quality in new development, as a means to fostering confidence, improving image, attracting investment and creating quality of life.

Similarly, many towns and cities have understood the economic importance of heritage, especially in supporting enterprise. Heritage-led regeneration is a key element in the delivery of sustainable development and regeneration. Throughout the country there are examples of historic buildings and areas, including former manufacturing areas, that have provided flexible and affordable accommodation, essential for business start-ups, micro-businesses, creative industries and social enterprises. This has created investor confidence, sometimes leading to dramatic economic and physical transformations. In addition, tourism and visitor economies are often based on historic town and city centres (for example, Chester, York and Liverpool).

We are concerned that there is a lack of appreciation of the role played by older areas and buildings in helping places to transform and modernise, physically, economically and culturally. There needs to be wider recognition of the value and attraction of heritage assets, adapted for new uses by contemporary interventions, in contributing to economic vitality.

Much of the focus on sustainability and carbon use has been on building performance and micro-generation. These are important, but there is a need to discern between high impact issues and green bling. Most importantly, more focus needs to be made at the level of local places, which brings in issues of land use and travel. This requires a focus on good urban design, place-making, mixed-use and integration and re-use of heritage and existing housing. Again, we would emphasise the relationship between the quality of an area’s environment and its economic performance.

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

As stated above, responsibility for heritage should be shifted from DCMS to DCLG. This is essential to change the current narrow cultural focus on heritage and to ensure that wider economic, social and environmental values are considered.

National policy and programmes should take full account of the role of heritage in delivering economic development. This includes support for:

- Using historic areas to deliver physical and economic regeneration, including the
creation of enterprise hubs.

- Ensuring that historic buildings and places are in productive use, fulfilling their economic potential, especially in under-performing areas
- Promoting heritage skills training in the construction industry
- Promoting the visitor economy and use of culture as a means to economic development.

**Skills and design**

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

We recognise the good work done previously by the former Government design adviser, CABE, and through the network of architecture centres in delivering training and awareness raising for local authority officers, elected members, the professions and developers, as well as the general public.

However, there has been a noticeable drop in the level of skills and expertise in local authorities over the past few years and this is undermining the growth potential of many areas. This includes a loss of specialist skills and staffing capacity in things like economic development, regeneration, heritage, urban design and community engagement. In some local authorities, there are now real questions over whether they are able to deliver basic statutory planning functions in a satisfactory manner.

There is a need to develop skills in the development sector, both private and not-for-profit. Delays in the planning process are not only a consequence of inadequately resourced planning teams, but also professional teams working for developers, but lack the skills to formulate viable proposals.

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

The decision to cut funding to the former national adviser on design (CABE) was a mistake. We believe that this is due to a failure to appreciate the relationship between quality of place and an areas ability to attract investment, employment, population, and visitors.

We would suggest that there is a need for a national adviser (Place/Design England?). The remit of such a body should include promoting good design as a means to delivering effective and sustainable growth.
We would emphasise the importance of effective community engagement at an early stage of the design and development process. This allows the knowledge and aspirations to inform the brief for development. Too often, communities are engaged at a late stage, with a focus on tweaking aesthetics, rather than informing the fundamentals.

**Community involvement and community impact**

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

This is a fundamental principle of the planning system. Planning should ensure that the wider impacts of development are considered. Such impacts can affect communities, local environments, towns, and wider local economies.

Developers vary hugely. Whilst ‘investor’ developers tend to take an interest in the wider social, economic and environmental context, this is less so with ‘trader’ developers. In this way, the activities of trader developers can harm the interests of investor developers, unless the planning system creates a level playing field.

A fundamental aim should be to create a sustainable, supportive human habitat. This means a physical environment which promotes and facilitates social interaction and meets our cultural and physical needs. Clearly, this will be achieved only through close working with local communities. Neighbourhood plans are an example of how local communities can lead in the planning of their local places, drawing on a range of local knowledge and skills.

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

Our experience of working with communities on neighbourhood planning and community projects suggests that communities are not only able to engage in the planning of their areas, but to take on a lead role.

With regard to local authority-led planning, there is a very mixed picture. Many local authorities engage effectively with communities and understand the value of this in formulating realistic and deliverable plans. However, there are also examples of very poor practice. This can include:

- Hostility and resistance by officers and/or elected members to neighbourhood planning.
- Consultation occurring too late in the process.
- Lack of in-house skills in community engagement.
Our experience suggests that neighbourhood planning is helping to deliver culture change in local government, by demonstrating the benefits of more participatory forms of planning.

**Financial measures**

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

Practical measures to deliver housing and land supply include:

- **Community-led Housing and Enterprise**: Grants to allow community organisations to acquire land and buildings for the purposes of delivering community-led housing and enterprise schemes. Such funding should cover things like land-remediation, project design, professional support, business planning and capital costs where there are local viability issues.

- **Neighbourhood area schemes**: Area grant schemes to help deliver growth in neighbourhood areas where there is a neighbourhood plan (or emerging plan). These could fund things like land remediation, bringing floorspace back into use, public realm works and environmental improvements.

Practical measures to deliver better design and place-making by private developers include:

- **National Design Advisory Body**: Creating a new design advisory body. This should focus on guidance, training, advice, research and national design policy. There may be merit in considering an integrated national place-making body, dealing with design and heritage.

- **Design Review**: Funding independent local design review panels. These should be at a fairly local level to allow site visits for all schemes.

- **Public Bodies and Programmes**: There is a clear need for public bodies, local authorities, LEPs, RSLs, and others to embrace high quality design as an essential element for achieving effective and sustainable outcomes.

30 September 2015
URBED – Written Evidence (BEN0032)

BREAKING THE BARRIERS TO QUALITY GROWTH

As the founder Director of URBED, which this year celebrates our 40th anniversary, I welcome the initiative you have taken, and the excellent questions you have raised. Having tackled most of the issues, I am focussing my response on two which hold the key to breaking the barriers to quality growth, and I have backed up my suggestions with a couple of research reports you may find useful.

URBED’s experience

Founded in 1976 to offer ‘practical solutions to the problems of regenerating run-down urban areas’, URBED has worked in most parts of the UK on issues as diverse as reusing old buildings, revitalising town centres, and increasingly on building the new homes the country desperately needs. We work with community groups, local authorities and increasingly for major private developers, and our work has been recognised in a number of awards, as well as in winning the 2014 Wolfson Economic Essay prize for our Uxcester Garden City submission.

Our experience is set out in a book by David Rudlin and Nicholas Falk Sustainable Urban Neighbourhood: building the 21st century home, which was republished by Routledge in 2009, and more recently I helped Sir Peter Hall produce his final book Good Cities Better Lives: how Europe discovered the lost art of urbanism. We therefore know a great many good projects, but are also well aware of how far the UK has lagged behind much of the rest of Europe, especially in the last two decades.

Good advice is therefore not enough. Some radical changes are needed in the way we plan and deliver major or strategic housing schemes, and these form the subject of this evidence.

Building Places New and Old

If we are to double housing output, as all political parties seem to agree, then we have to go beyond redeveloping brownfield sites. Our work on Tapping the Potential for the Department of Communities and Local Government established the need for to identify appropriate sites, with some 40% on undeveloped land, if only to cope with household growth. Yet fragmented local authorities, short-sighted landowners, and the abolition of any kind of regional planning machinery has left England at least incapable of breaking the fundamental barrier, which is the availability of land in the right place and right price.

There are some promising exceptions, such as the Southern Fringe of Cambridge, where the local authorities and landowners have subscribed to a Quality Charter for Growth, or the
centre of Manchester, where URBED helped produce the Design Guide. But in general we are failing to produce enough of the kinds of homes needed to overcome well-organised opposition by groups such as the Campaign for Protection of Rural England, and the natural tendency of those who are adequately housed to resist further development.

Consultations with leading developers and case studies of good projects, for example published last year in the Housing Forum’s The ABC of Housing Growth and Infrastructure confirm the need for radical changes to the way development sites are identified, plans are prepared, and land is brought forward. Local authorities need to play a more proactive role, and ways found of stopping land owners sitting on sites waiting for values to rise.

Having undertaken a major research study for the Joseph Rowntree Foundation to share experience between innovative housing schemes, those involved concluded that we had most to learn from what has been built in the Netherlands. This is not just about design, but about pooling land and installing the infrastructure required for a host of builders to meet different needs, as our report Learning from the Netherlands illustrates. Encouragement can be taken from the positive responses to what is being built in Cambridge’s Southern Fringe and also on University land in North West Cambridge, where the lessons from Europe are being applied.

Fiscal Measures

David Rudlin and Nicholas Falk won the 2014 Wolfson Economics Prize against 276 other competitors because URBED’s submission showed how to build garden cities that were visionary, popular and above all viable. We provided the financial calculations to prove that major extensions to places where people want to live and work, such as Oxford or York, could fund the necessary infrastructure to deal with congestion and flooding, which are top priorities for existing residents.

Subsequently the five shortlisted teams agreed on a paper aimed at the new government on what needed to be done to overcome the barriers, and go to scale. (extract attached) While opinions may differ on how best to avoid speculation, we believe that the German model for land assembly is readily replicable, and similar approaches are used throughout Northern Europe. There is potentially enough private finance to back good projects without adding to the national public deficit. But nothing will change without some concerted changes as spelt out in the attached paper.

URBED would go further not only in calling for the increased use of Development Corporations to resolve conflicts and lack of capacity in growth situations such as Oxford, but also for a Municipal Investment Corporation on the lines of the Dutch investment bank BNG in order to scrutinise major projects and encourage collaboration. All of these ideas are
developed at length in various reports, which we would willingly share. Indeed the House of Lords would be admirably placed to call for the Royal Commission we believe is needed to agree the best places for growth, and the necessary powers to deliver quality places on the scale required.

Dr Nicholas Falk, founder director URBED www.urbed.coop

September 30th 2015

Priority Actions to Start the Delivery Process

To put the principles into action, and overcome the practical barriers to delivering New Garden Cities over the next parliament, there are three clear steps that the next government must take to make New Garden Cities a reality.

1 Set up an independent Royal Commission to identify broad locations for New Garden Cities

The next government should establish a Royal Commission to identify the broad locations for New Garden Cities within 18 months where a combination of existing and planned infrastructure, economic drivers and a lack of significant environmental constraints combine to create a climate for growth. The Commission should encourage local authorities, landowners and others to put forward potential sites for consideration, but should not be limited to these as the right locations may not be supported by the right stakeholders (and vice versa). Garden City principles can be applied to a variety of types of development, from new villages to in-fill sites and urban extensions, so the commission should not be constrained to identifying locations for free standing new settlements only.

Once broad locations have been identified, the process of specifying individual site boundaries needs to be locally driven, championed by local political, business and community leaders working with the local authority and willing landowners. New Garden Cities should be rooted in partnerships and should not be undemocratically imposed on unwilling communities – but it must also be recognised that all communities contain multiple and diverse voices, and that the views of those in need of homes and jobs must be heard alongside those who are well provided for, potentially via local referendums.

2 Establish special purpose delivery vehicles

Appropriate delivery vehicles, with the right powers and governance mechanisms, are needed for Garden Cities to be delivered at the scale and pace required. As New Garden Cities will suit a variety of development typologies and locations, different delivery vehicles will be appropriate – including private companies, trusts, public-private partnerships or public sector development corporations.

Whatever vehicle is chosen for each location, it must enshrine the principle of retaining value in the place for the benefit of the local community; without this, New Garden Cities will not thrive and will be victim to the same economic, social and political vulnerabilities as conventional development schemes. This means that delivery vehicles must have planning and compulsory purchase powers, or at the least ready recourse to these through their
public sector partners. Combining these powers in focused delivery agencies is vital to making New Garden Cities a reality.

Development corporations with these powers can be created using existing or amended legislation, to remove planning risk, allow easier access to long term funding and co-ordinate infrastructure provision and community benefits. The government should urge the Homes & Communities Agency (plus the Greater London Authority and any new devolved structures that take on the HCA’s role in city-regions) to use its existing powers under Section 13 of the Housing & Regeneration Act 2008 to create development corporations to deliver New Garden Cities in the locations identified. Where traditional development corporations are not deemed appropriate, new delivery vehicles could operate on a joint venture partnership basis, bringing together landowners, local authorities, developers and the local communities to share in the success of the development. Any private sector/partnership bodies to be granted Garden City status must make an explicit commitment to sharing development value more equitably among all the stakeholders in the Garden City.

3 Reform CPO legislation

Acquiring land at reasonable costs is critical to the Garden City concept. Compulsory purchase should always be a last resort - but New Garden City delivery vehicles need the powers to strengthen their negotiating position. Small legislative changes are required to make this process work efficiently.

The existence of strong CPO powers incentivises landowners to negotiate reasonable prices rather than to hold out for the additional ‘unearned increment’. Ironically, if CPO powers are strong enough they rarely need to be used. The New Town Development Corporations used CPOs to acquire land at existing use value, then granted planning permission and used the uplift in value created to fund the infrastructure and affordable housing needed for the new towns. The legislation to create New Towns Corporations and use CPOs is still in force today, but its efficacy has been reduced by case law and its strategic function has fallen into disuse.

Credible CPO powers are also essential to prevent landowners from holding out and encouraging land speculation. This is particularly the case if landowners are unwilling to engage, if a ‘ransom’ situation arises, or if a multiplicity of landownerships need to be amalgamated.

The Treasury is currently conducting a review of CPO processes which it is hoped will result in the legislative change necessary to revive the strategic use of CPOs. The easiest way to achieve this is probably to amend the Land Compensation Act 1961 to remove, explicitly, the consideration of ‘hope value’ from the compensation offered to landowners, and to require the price to be defined in relation to existing use value. The amount of compensation that landowners could expect under CPO could be capped as a proportion above existing use value, with a higher rate for greenfield than brownfield.
Comment:

Wappenham Parish Council considers that it is able to effectively engage with the local planning authority (South Northants Council) and that there are no barriers which prevent it from doing so. In general the planning authority has due regard for comments submitted to it, either referring to them directly in officers’ reports or by referencing the Parish Council’s Village Design Statement which was adopted by the planning authority several years ago. The planning authority effectively communicates consultations and any noteworthy changes to the system.

03 October 2015
Introduction

- This evidence focuses on matters falling within the ambit of Questions 3 and 10 of the Call for Written Evidence, i.e.

**Q3:** “Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?”

and,

**Q10:** “Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?”

- The specific matters raised here (relating to either/both of the two questions identified above) are:

  ◆ whether the National Planning Policy Framework (NPPF), as presently worded, sufficiently empowers local planning authorities (“LPAs”) to develop detailed, innovative and effective design codes – in particular, codes that are fit to combat the problem of excessively ‘bland’, featureless design; and

  ◆ whether lessons can be learned from the approach to planning taken in other countries.

The NPPF and the focus of planning intervention in design

- Paragraphs 56 to 68 of the NPPF (“Requiring good design”) contains the core provisions of the Framework that relate to the architectural design of buildings.

- A key theme of this set of provisions is that local planning policies should address questions of building design at a high level. Design codes that contain prescriptive, detailed rules are, according to the NPPF, to be avoided. Paragraph 59, in particular, states:

  ◆ “…design policies should avoid unnecessary prescription or detail and should concentrate on guiding the overall scale, density, massing, height, landscape, layout, materials and access of new development in relation to neighbouring buildings and the local area more generally.”
The philosophy that (presumably) lies behind this injunction is easy to appreciate. If LPAs set down detailed, prescriptive design codes this might involve usurping the role of developers in determining how private development is designed. In other words, architects and not planning authorities should design buildings. The NPPF acknowledges that important high level aspects of design – in particular, the overall size, and even the layout, of the development may be controlled by design policies. But surely (so the philosophy goes) matters of *detail* – things like the sizing, spacing and shape of entrances and windows – must be, in the first instance, matters for the developer? Indeed, otherwise, what will be left for the project’s design team to design?

**The problem of “under-design”**

Such a philosophy – matters of detail should be within the jurisdiction of the planning applicant – is premised on the idea that a typical developer comes brimming with positive ideas for a whole raft of detailed elements that they wish to include in their design. The LPA’s role is, then, that of a neutral, dispassionate gatekeeper, making sure that none of these proposed elements cause positive harm by, say, affecting the character of the area or leaving inaccessible areas of open space. So in the imagined paradigm case, the developer comes along wishing to implement ideas ‘A’, ‘B’, ‘C’, ‘D’, ‘E’, … ‘etc.’. Local planning guidance or decision-making may mean, for instance, that idea ‘D’ must be dropped, e.g. because it means that it means the building will exceed local guidance on height limits, but the remainder of the raft of ideas (‘A’, ‘B’, ‘C’, ‘E’, etc.) can be implemented. Where this model applies, the developer will, indeed, be the author of most of the design detail.

This premise, and the accompanying model, breaks down, however, if developers, on the whole routinely seek permission for designs that incorporate very low levels of detail – that is, if, in other words, there is *no* set of individuated ideas ‘A’, ‘B’, ‘C’, ‘D’, ‘E’ etc as to detailing and, instead, the design involves little more than an undifferentiated box, or series of boxes, meeting the high-level local planning rules regarding size, massing, height and overall scale. Bland, featureless design, whatever its other merits or demerits, poses a challenge to the model described above. For where an application with such characteristics is made it may be hard to say that the developer rather than the planning authority is truly the author of the design, since most of the salient aspects of the building will have been determined by the planning guidance even though such guidance remains restricted to the sort of high level matters envisaged by paragraph 59 of the NPPF. If such applications are routinely made, then:-

- The primary justification for LPAs to be discouraged from producing guidance on matters of “detail” logically falls away, since developers are, anyway, in effect, abdicating design responsibility by producing designs that do little more than adhere to the broad, outline limits placed by the LPA’s planning rules.
The only tool that local planning officers can use to combat bland, unstimulating design is ad-hoc decision-making – or negotiation with developers – to the extent that such strategies is permitted under the LPA's planning rules and the NPPF. If LPAs have to routinely make such interventions, this would seem to raise the question of whether it might be more efficient (both for developers and LPAs) for there to guidance which descends to levels of detail so as to provide developers with an adequate 'steer'. This issue is discussed further below.

**Evidence for the problem of under-design**

- Anecdotal evidence for the prevalence of the problem of under-design comes from the apparent frequency with which objections are made by public interest organisations, critics and members of the public to proposed developments on the grounds that the external appearance of the designed building will be 'bland', excessively regular or predictable.

- A recent example is provided by the (ultimately successful) campaign to prevent a proposal by King’s College to build a new extension on the Strand involving the demolition of a historic row of buildings. Telling, although the campaign focused, naturally-enough, on the destruction of heritage that the plans entailed, much was made of the suggestion that replacement building would, in the words of one campaign group, be “terrifically bland” (source: http://www.bbc.co.uk/news/uk-england-london-32681126); a public petition opposed to the development which attracted over 10,000 signatures reflected this sentiment, noting that the plan “replaces [the original buildings] with something bland” (source: https://you.38degrees.org.uk/petitions/don-t-demolish-152-158-the-strand-london?source=facebook-share-button&time=1430315541)

- Looking at the matter from a different angle, the research of Colin Ellard, an environmental neuroscientist at the University of Waterloo in Ontario provides evidence as to the psychological consequences of 'bland', low-detail architecture. The
Committee is urged, if time permits, to consider an article by Ellard published in *Aeon* magazine (http://aeon.co/magazine/culture/why-boring-cities-make-for-stressed-citizens/) explaining the relevant research and the lessons he urges people to draw from it. In summary, though, Ellard makes the following points:

- The results of his 2011 study into the psychological effects of different types of urban environment indicate that outside of blank, 'impermeable', low-detail façades, people have worse emotional states (ie they are less happy and less alert) and show higher levels of physiological stress than they do outside variegated, complex, permeable façades.

- Ellard suggests these negative psychological and physiological consequences stem from boredom: low-complexity environments are under-stimulating. He notes that such under-stimulation may plausibly have long-term health effects, given that there is a well-established link between boredom and physiological stress.

- Earlier research (2006) carried out by Danish urban designer Jan Gehl demonstrated that people walk more quickly in front of a blank, impermeable façade than they do in front of other types of façade. The implication is that this aspect of design affects behaviour. People pause, absorb and want to engage with their environment when it is visually interesting.

- Internationally, there are, it is said several cities that have taken account of such findings by implementing building codes that prevent excessively bland façades from being built (Ellard cites Stockholm, Melbourne and Amsterdam). Under such codes there are, notably, said to be prescriptions such as:-
  - “... a hard lower limit on the number of doorways per unit of sidewalk length, and there are specifications for transparency between the building and street in the form of clear windows with two-way views”

The rationale for such prescriptions, it will be appreciated, is to make for more engaging, more interesting urban environment.

- Ellard speculates that the prevalence of “featureless” buildings in modern towns and cities is down to a combination of economics, architectural theory and other cultural factors.

Concern that paragraph 59 of the NPPF is too restrictive as to LPA’s powers to implement detailed design codes

- It is instructive to consider the example, referred to at paragraph 10.d above, of design policies (adopted by cities in other countries) that make relatively detailed prescriptions as to the organisation of building façades to combat the tide of ‘featureless' buildings.
One has to ask, would, in the UK, such an approach pass muster under paragraph 59 of the NPPF which, one will recall, demands that local design codes “avoid unnecessary prescription or detail” and “concentrate on guiding the overall scale [etc] … of new development”?

Or, to put this another way, would a local authority otherwise tempted to deal with the problem of under-design in this sort of way – say, by incorporating a rule in a particular area that should normally be at least 1 doorway on any façade for every 5 metres of pavement distance – be confident that such a rule would, in light of paragraph 59, be safe from challenge? Perhaps such a rule would qualify as guiding “overall … massing” or “layout”. But equally plausibly the reverse can be argued: a LPA might conclude that laying down such detailed guidance goes against the overall tenor of the relevant paragraph, which again, cautions against “unnecessary prescription or detail”.

Going further, would the NPPF endorse, or would it, conversely, weigh against, the promulgation of a local building code that specified, say (to imagine some more contentious examples):

- ‘… where brick is used as a primary construction material, at least a portion of the brickwork should be laid to incorporate a decorative pattern’;

or that

- ‘… sculpted relief in the form of moulding bands around apertures such as windows and doors, pilasters and columns (which do not have to be in any conventional style) is encouraged’?

General problems with planning policies that control high-level aspects

As noted above, the overall tenor of UK planning policy, as exemplified by the NPPF, is that planning authorities should be empowered to control high-level aspects of the design of new development (ie the envelope of space taken up by buildings), but all matters of detail are, in essence, within the jurisdiction of the individual developer.

The problems with this approach are as follows:

- LPAs lack, it can be argued, effective tools to combat the problem of design ‘featurelessness’, since their powers are, it would seem, understood to be limited to promulgating guidance limited to high-level aspects of the design which by, definition, excludes matters of detail.

- It is true that LPAs may be able to combat dull, featureless design by way of ad hoc decision-making, eg via their jurisdiction to refuse permission in respect of “… poor
design that fails to take the opportunities available for improving the character and quality of an area” per paragraph of 64 of the NFFP. But ad hoc decision-making has drawbacks:

- If planners are routinely having to intervene in this way against featurelessness (and the trends identified by Ellard suggest that the problem is indeed routine), then this involves expense and delay all round. Permission for otherwise viable developments may be refused on the grounds that they fail to meet a standard of visual interest that developers do not instinctively seem to understand and yet planners are disabled (by the taboo against guidance on matters of detail) from properly articulating in the guidance they provide.
- If planners and developers become engaged in a form of horse-trading in which planners demand that submitted plans be revised to incorporate more visual interest, one has arguably reached the stage where planners are intimately involved in the details of the architectural design. As earlier pointed out, if this Rubicon is routinely crossed, the justification for the presumption that design codes abstain from making detailed or prescriptive detail falls away.
- More detailed design codes – ones which descend to questions of whether or not brickwork should incorporate decorative pattern or not – may actually be a genuine help to developers by providing useful guidance. They can help in setting expectations, and focus minds. Developers no longer have to second-guess what planners are looking for.

- A serious argument can be made that a 'high-level' approach to planning control may actually be aggravating the problem of bland, featureless design:

  - All the efforts of the developer and the design team in putting together a planning application are focused on making sure that the design fits within the 'outline' guidance. Questions of overall height, dimension and whether the development is 'broadly in keeping' with existing development assume an arguably disproportionate importance compared to questions of articulation and original decorative detail.

  - Developers/architects may, not unreasonably, feel that under the existing regime they can only incur a penalty in planning terms (in terms of increasing the chances of refusal) by including a raft of specific decorative details (eg intricate column designs), because, on the one hand, any one of those details may risk offend vaguely defined notions that the design should eg “respond to local character and history, and reflect the identity of local surroundings and material” (NPPF, paragraph 60), but on the other hand, there are no positive requirements requiring the inclusion of such elements.

  - Closer guidance, perhaps applicable to a particular area, on the number of doorways, the inclusion and spacing of bays or columns, the shape of windows, etc, might actually give architects the confidence to express creativity at lower
levels of design detail. Indeed, under a more prescriptive regime, there is less chance of the overall design approach being rejected (because this has already been determined by the LPA's guidance) and the time spent considering these details consequently being thrown away.

◆ Standing back, it seems we have a situation where all parties are abdicating responsibility for the problem of detailing. Developers are, as a whole, showing no will to design lively, decorative façades, whilst planners are reluctant to intervene or issue guidance in this area because the prevailing philosophy is that such matters are for the individual developer/architect. There is, thus, a 'detail vacuum' in the design process.

Counter-concerns

◆ A concern in the other direction, as it were, that comes to mind is that any change to national planning policy that would increase the powers of local authorities to implement more prescriptive design codes (eg, perhaps, by re-wording paragraph 59 of the NPPF) might have the concern of restricting or holding up needed development. It is submitted that such a concern is more apparent than real for the following reasons:-

◆ Any attempt by an LPA to deliberately obstruct development by imposing unfeasibly tight restrictions on the design of new buildings would, presumably, be legally challenge-able for being ultra vires/an abuse of the relevant power.

◆ Flexibility could be required by the NPPF—for instance, prescriptive codes should allow developers to show good reason why the requirements of the code should not apply.

◆ As noted at paragraph 17.c above, more prescriptive local design codes may actually be a help, rather than a hindrance, to prospective developers, by guiding expectations more effectively than vague, high-level desiderata.

Sharing evidence of international practice in the development of design codes

◆ Any discussion of UK planning policy, it is submitted, should take account of the approach to planning in other jurisdictions around the world. Other countries, in formulating planning policy, are generally addressing the same set of concerns that we are in the UK, in particular how development, which is invariably undertaken either by private bodies and individuals for narrow goals of private economic gain or public bodies with public-orientated but often equally narrow remits, is channelled to promote sustainability, preservation of the natural environment and heritage, and well-designed buildings and communities. If there are lessons to be learned from how other countries are tackling these problems, we should seek to learn them.
The author of these submissions can offer only limited observations on the subject of planning policy abroad; a proper study of the matter, perhaps taking evidence from an expert in the field of comparative planning, is recommended. However, the small glimpse provided by the research referred to a paragraph 10.d above indicates that such study might well reveal that:

- other planning systems take, in some respects, a quite different approach to that of the UK;
- the practical and philosophical assumptions that underpin those approaches may be at variance from the assumptions that underpin the UK approach. This is something which ought, at least, make us pause to consider whether the prevailing assumptions in this country are indeed sound or whether these need to be revisited.

Consideration might also be given as to whether adequate mechanisms exist for the sharing of information about international planning practice at the local level, where planning policies are ultimately formulated.

26 September 2015
Weedon Bec Parish Council

Select Committee on National Policy for the Built Environment consultation

Response from: Weedon Bec Parish Council

Response Date: 6th October 2015

Reponse to:

Community involvement and community impact

Question 12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

We have recently had direct experience of a large scale housing proposal in our local community and had an opportunity to witness local 'engagement' first hand. Weedon Bec Parish Council were active in ensuring the village was informed of the plans and set up a series of public meetings to gain an understanding of public opinion and to help inform a response.

Weedon Bec Parish Council worked closely with local people and with the Weedon Action Group in formulating a response to the application which resulted in a very large number of objections to the proposal (537 letters plus a technical objection report from Action Group). Daventry District Council listened to these objections and unanimously rejected the proposal. On this basis we must conclude that local engagement is alive and well.

The efforts of the council and action group was a necessity as information from the applicant was minimal if non-existent i.e. a leaflet was only delivered to a few houses in the village and they did not approach the Parish to discuss prior to submission. The applicant actions or lack of, has caused much upset and heartache for many of our residents and the outcome is still uncertain and could still have a drastic effect on our community.

Unfortunately, all efforts of local people and communities to play an active part in the decision making process was rendered mute when the decision was overturned at a national level (Planning Inspectorate) with apparent disregard for local opinion and disregard for the fact that our district are meeting their responsibilities in terms of housing supply.

It is this disconnect between local and national decision making that we believe threatens the future of local engagement. Unless the ability to overrule local sentiment is more carefully controlled, the feeling of 'what's the point, they will win eventually' will persevere and local engagement will dwindle.
As two Planning appeals were running concurrently earlier this year, when the outcome of both were announced within a couple of weeks of each other, it left our residents completely dumbfounded and questioning the role of the Planning Inspector. They could not understand why one outcome upheld the appeal and one refused the appeal when both were being considered at the same time thus against same policies and criteria. It brought to the forefront of all our minds the role of inspector; that we should witness conflicting decisions, interpretation of policy, subjective versus objective decisions. This instils no confidence or trust in these decision makers and the process. (Planning Applications subject to appeal at same time: DA/2014/0455 as APP/Y2810/A/14/2228921 and DA/2014/0369 as APP/Y2810/W/14/3001704)

A Neighbourhood Plan is currently being produced for Weedon Bec at parish level. The lack of support, advice and recurring delays at local authority level has been hugely disappointing and has caused much frustration and delays to producing the plan. Creation of Neighbourhood Plans have been advised by government however the necessary support from local authority has not been in place. Equally the cost in terms of volunteer effort and financial overheads are also, to some degree, under-valued by the local authority.

7 October 2015
**Welton Parish Council Written Evidence (BEN0050)**

**Policy making, integration and coordination**

1. Parish Councils should be given more power to make and appeal against decisions concerning the built environment. For instance they have the statutory right to be notified of planning applications in their local area but lack the statutory right to appeal on the same basis as developers. This system seems weighted against local communities.

   National policy makers should revise the National Planning Policy Framework with particular reference to the five year land supply issue which is the ‘major factor in deciding planning applications’ (CPRE Fieldwork Winter 2014). Weighting towards this factor clearly impacts on Local Authority decision making to the detriment of other key factors in the NPPF.

2. The Implementation Task Force chaired by the Secretary of State for DCLG could pull together these components whilst driving efforts to increase the supply of additional housing.

**National policy for planning and the built environment**

3. Amendments to the NPPF need to be made. Careful consideration of the CPRE’s recent paper ‘Targeting the Countryside’ is urged. For instance CPRE argue in the case of paragraph 14 that housing demand should not have greater weight than environmental and social sustainability when planning decisions are made, for the sake of future generations. This paper also recommends a more flexible approach to the five year land supply issue, a recommendation which we support, and raises major concerns about the 20% buffer. A rebalancing of factors is essential whilst acknowledging the urgent need for more houses.

4. Planning and built environment policies need to be projected for at least a generation. The local master plan for our district extends to 2040, which is positive.

**Buildings and places; new and old**

5. The Government should implement a ‘brownfield first’ rule as a priority, building on its promises regarding such sites. Effective identification of smaller brownfield sites which could be developed more quickly to meet demand is also important. This strategy would also enable smaller scale builders to become more involved. Strategic land banking by large developers may require Government intervention. Compulsory registration of land ownership and sales with the Land Registry is also required.
6. Government should take the lead role in consultation with local government, including local councils, NGOs/charities and community groups. Clearly the impact of an ageing society, the need to ensure affordable homes for young people, decisions about energy use, health, education, transport, amongst other issues, should be given careful consideration in the planning process.

7. The National Trust, English Heritage, et al, would be in a better position to provide relevant information here.

Skills and design

8. Higher Education should be a key stage in addressing this holistic approach to the built environment. Government should make strenuous efforts to bring national associations of architects, engineers, planners, etcetera together to pursue this issue. National/local shortages of experienced planners in the public sector remain a major concern. Improved terms and conditions including professional development and career routes making planning a highly desirable profession, are essential.

9. Ensure that Chapter 7 of the NPPF ‘Requiring good design’ is given the appropriate weighting by Government.

Community involvement and community impact

10. Decision-makers: again a holistic approach is essential. In addition to factors mentioned in response 7, careful consideration needs to be given by planners and politicians to the availability of open spaces, the mix and density of housing, and light reduction measures.

Improving consideration of the impacts of the built environment: this can best achieved by acting on the views and recommendations of local communities as well as organisations such as the NHS and Police.

11. Neighbourhood Plans are enabling communities to engage. Consultations on Strategic Local Plans have also been widespread. However in the case of the latter completion times have been slow which can affect further public engagement. More consultative and decision-making powers should be given to local parish and town councils re existing built environment issues and future developments affecting them. For example Parish Councillors could be involved in attending Planning Committee meetings and giving their decisions on applications relevant to their parish.

Financial measures

12. Changes in the tax system so that better financial incentives could be offered to developers who take on brownfield sites should be investigated. Good design and
place-making should be amongst the decisive factors affecting decisions by Local Planning Authorities and the Planning Inspectorate.

Geoffrey Smith
Parish Councillor, on behalf of Welton Parish Council, Welton, Northamptonshire

04 October 2015
SELECT COMMITTEE ON NATIONAL POLICY FOR THE BUILT ENVIRONMENT

Call for Written Evidence

The House of Lords has established a Select Committee to consider ‘the development and implementation of national policy for the built environment’.

**Policymaking, integration and coordination**

**Question 1.** Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

Paragraph 1: Westbere Parish Council feels it is insufficiently qualified to comment.

**Question 2.** How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

Paragraph 2: Westbere Parish Council feels it is insufficiently qualified to comment.

**National policy for planning and the built environment**

**Question 3.** Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

Paragraph 3: Westbere Parish Council feels it is insufficiently qualified to comment.

**Question 4.** Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

Paragraph 4: Westbere Parish Council has grave concerns regarding the current lack of a spatial perspective, and considers the introduction of a spatial element to be beneficial. Currently each local authority considers its housing land supply in isolation, without communicating with neighbouring local authorities. For example, Manston airport has the
potential for development of thousands of new homes, but is being considered without consultation throughout east Kent.

Paragraph 5: Westbere Parish Council believes that a better approach to achieving new housing numbers is to design and establish new towns in clear open environments. This would be far superior to adding uncoordinated development to existing built up areas with the resulting congested urban sprawl. These new towns could be designed specifically for those people who live and work in them. They would include the infrastructure necessary for their population and include school(s), medical services, businesses, shops and leisure facilities. They could be designed with parks surrounding them for easy access and leisure activities and would become attractive places in which to move to and live. As successful living and working environments there would be far less opposition from the current population as they would be purpose built.

**Question 5. Is there an optimum timescale for planning our future built environment need and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?**

Paragraph 6: Westbere Parish Council considers this a very difficult question to answer as circumstances can change rapidly – who could have foreseen the current migrant crisis adding enormous additional pressure to the housing number requirement.

**Buildings and places: New and old**

**Question 6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?**

Paragraph 7: Westbere Parish Council agrees there is a clearly identified local and national need for new homes. This is becoming more and more acute. Central co-ordination is critical.

**Question 7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?**

Paragraph 8: Westbere Parish Council would like to see more action taken in respect of empty homes and second homes to make better use of the existing housing stock.

**Question 8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?**
Paragraph 9: Westbere Parish Council firmly believes that the country’s national assets should be protected, and conservation areas enhanced and protected. For example, Canterbury is a medieval town that is crippled by traffic congestion and its major ancient monuments – the Cathedral, the Norman Castle and the Westgate Towers – are being ruined by traffic pollution.

One solution could be to build ring roads around ancient towns like Canterbury to protect the historical centre and improve traffic flow, then the narrow streets could be pedestrianised.

Paragraph 10: For place making???, for new development, take design cues from the heritage assets and ensure that the new development is respectful and subservient to them.

**Skills and design**

**Question 9.** Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

Paragraph 11: Westbere Parish Council feels it is insufficiently qualified to comment.

**Question 10.** Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

Paragraph 12: Westbere Parish Council feels it is insufficiently qualified to comment.

**Community involvement and community impact**

**Question 11.** Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it?

Paragraph 13: Westbere Parish Council believes it is the responsibility of the designers/architects to take account of the people who will live and work in their schemes.

**How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?**

Paragraph 14: Westbere Parish Council believes in the introduction of a ‘local connection criteria’ for affordable housing allocations.

Within sizeable developments there is a statutory requirement to provide an element of affordable housing. Westbere Parish Council welcomes affordable homes as there is an identified local need but would want a ‘local connection criteria’ (see example of criteria
below) for tenants of the affordable housing. This would ensure that the local need is met and that the homes remain for local people in perpetuity.

The Canterbury district has examples of such schemes in the district being allocated but they are all rural exception sites. Currently, such a criteria cannot be applied to a normal development site. This means that, where the affordable level kicks in, the allocations would not be under any local control.

Canterbury City Council does not currently have a housing allocation policy that allows a local connection to be included. Several local parish councils are currently lobbying Canterbury City Council to introduce a local connection criteria in new development sites with a sizeable element of affordable housing. This would ensure that at least a percentage of these homes could be allocated to tenants with a local connection to the area in any consent of that development where there is a desire for this to be introduced.

Wording along the following lines for prospective tenants could be used:

“All applicants shall meet at least one of the following Criteria (and in the case of joint applicants where at least one of them meets at least one of the criteria).

(a) Shall currently be resident in the parish of xxx having been so for a minimum of 10 years

(b) Shall have been previously resident in the parish of xxx for a minimum of 10 years but have moved away from the parish to secure affordable and/or appropriate accommodation as there was not such accommodation in the parish at the time

(c) Is the mother or father, son or daughter, the brother or sister of a Family which meets the criteria set out in (a) and (b) above and whose application is evidenced by proof that continuing care to or for members of the family is necessary.

Applicants who having resided away from the parish of xxx for a period exceeding 20 years shall not be considered eligible unless the application meets the criteria set out in paragraph (c) above

If there are insufficient applicants who fulfil the 10 year and other requirements as set out in clauses (a) to (c) then endeavour to allocate to persons who currently live in the xxx Parish - in considering such applications preference shall be given to persons who have resided in xxx for the longest periods and who still reside there.”

This criteria could of course be expanded or changed perhaps for individual schemes, for example, to expand the relatives in (c) could perhaps include grandchildren.
Question 12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

Paragraph 15: Westbere Parish Council engages in consultations such as the district Local Plan but are concerned that their representations are not carefully considered and actioned. They feel that the local plan creation process is very difficult for individual involvement and that the majority of individuals lack the knowledge and capacity to comment. Equally Canterbury City Council (like any other local authority) struggles to engage individuals. It is easier for collective bodies like parish councils, CPRE, Natural England etc to give constructive considerations.

Financial measures

Question 13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

Paragraph 16: Westbere Parish Council feels it is insufficiently qualified to comment.

Eofs.

05 October 2015
To whom it may concern,

RE: Select committee on national policy for the built environment

The following comments are offered on behalf of the West of England Nature Partnership, the Local Nature Partnership for the West of England, which covers the area of the Unitary Authorities of Bath and North East Somerset, Bristol, North Somerset and South Gloucestershire.

Local Nature Partnerships, are prescribed bodies detailed in section 33A(9) of the Localism Act (2011) and were established to embed the value of nature into decision making, and for the purpose of this response, we have concentrated on the importance of effectively integrating the value of the natural environment into the built environment, through good quality design, and integration of green infrastructure (GI). The National Planning Policy Framework (NPPF) defines GI as ‘a network of multi-functional green space, urban and rural, which is capable of delivering a wide range of environmental and quality of life benefits for local communities’. Green space is taken to include rivers, standing waters, coastal waters and estuaries.

Yours sincerely,

Shelly Dewhurst (Coordinator)
on behalf of The West of England Nature Partnership
SUMMARY

1) POLICYMAKING, INTEGRATION AND COORDINATION
The national policy framework through which green infrastructure is supposed to be embedded within the built environment feels too weak at present (and falls short of what is envisaged in the EU Green Infrastructure Strategy). Whilst it is appropriate for much of the decision making process around the built environment to be made locally, there are frameworks within which that decision making process has to take place. National policy could do much more to direct that decision making process. There is no mechanism we are aware of which ensures that the aspirations of the White Paper are reflected in approaches to planning.

Responsibilities are divided across departments, and some departments with a strong interest are not currently engaged in this process, for example Public Health. We would encourage better integration and coordination across departments, to ensure that GI is recognised as a ‘win-win’ opportunity and fully embedded into place making plans. It would be easy to recommend a ‘green infrastructure commission’, or similar: what is really required, though, is policy at the national level that establishes mechanisms through which the value of GI is to be realised at the local level, so enabling Government to deliver on its aspirations in the Natural Environment White Paper (NEWP 2011).

2) NATIONAL POLICY FOR PLANNING AND THE BUILT ENVIRONMENT
The challenges indicate that horizons for planning urgently need to be stretched in time. There is a need to visualise the future, and to ‘plan’, in the true sense of the word, for the future that we want to inhabit. The horizons, and tools, that policy makers need to consider will have to be adapted accordingly, with potentially significant ramifications for landowners and would-be developers. The role of the policymaker, should not be underestimated here, ensuring that the strategies designed to safeguard the natural environment are fully embedded into planning policy are critical to delivering a truly sustainable built environment.

3) SKILLS AND DESIGN, COMMUNITY INVOLVEMENT AND COMMUNITY IMPACT
Communities should not be excluded from the decision making process, as they are the ones who will live, work and ultimately benefit from that environment. Early engagement can result for a win-win for both community and planner, if well designed and delivered.

4) BUILDINGS AND PLACES: NEW AND OLD
Often it is not the case that one size fits all when it comes to housing supply and we would encourage a cautious approach that considers a combination of different factors and priorities, alongside purely economic and growth drivers.
5) FINANCIAL MEASURES

Clearly the benefits of good quality GI merit the cost of creating and maintaining it. Who bears this expense should be given consideration. With regards to the built environment, it would seem pertinent for developers to pay for any environmental loss or damage, and for creation of new GI, through suitable compensatory mechanisms, whilst the other beneficiaries could also contribute, recognising the multi-beneficial outcomes derived for good quality GI.

POLICYMAKING, INTEGRATION AND COORDINATION

1) Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

a. A fundamental decision relating to the built environment should be how the natural environment is effectively integrated into the built environment for the benefit of people and wildlife. We believe decisions around GI should be well informed, and made with the most up to date information. In addition to this, decisions regarding GI should be made across the building life cycle as examples of GI “have the potential, when integrated properly into the built environment to provide vast arrays of functions and benefits to all stakeholders” (UK Green Building Council, 2015)520

b. There is a growing body of European and national policy that supports the need to conserve and enhance the natural environment, with GI being cited as a practical, cost effective way to deliver this. Appropriate integration of GI within urban and rural landscapes, and maintenance and enhancement thereof, can bring a range of benefits generally captured under the heading of ‘ecosystem services’: these relate to provision of marketed goods and services, but more importantly, to those which are generally not traded in markets, including improved health (through recreational access and removal of air pollutants), improved water quality, reduced susceptibility to flood risk and climate regulation. In the context of buildings, temperature regulation and diminishing stress levels are also likely to be important.

520 UK Green Building Council, Demystifying Green Infrastructure
http://www.ukgbc.org/resources/publication/uk-gbc-task-group-report-demystifying-green-infrastructure
c. At the **European level**, the EU Green Infrastructure Strategy was adopted in May 2013 to *promote the deployment of green infrastructure in the EU in urban and rural areas*. The EU strongly recommends that GI should be integrated into other policies at a national level with special focus on spatial planning\(^{521}\). In addition to their recommendations on GI, they are also promoting ‘nature-based solutions’ in the built environment, recognising the strong role the environment can play in mitigation and adaptation to climate change, enhanced resilience, safeguarding water and air quality and protecting biodiversity\(^{522}\).

d. At a **National Level**, the National Policy Planning Framework (NPPF) recognises the importance of GI in meeting the challenge of climate change, flooding and coastal change, and in conserving and enhancing the natural environment as stated in para 114 which states local planning authorities should *plan positively for the creation, protection, enhancement and management of networks of biodiversity and green infrastructure*. However, as far as we are aware, there is no national strategy on green infrastructure, something which was foreseen by the EU Green Infrastructure Strategy. The Natural Capital Committee has proposed a 25 year plan to protect and improve natural capital, which the Government has committed to in its response. There are National Policy Statements for different types of infrastructure, but it is worth noting, there is no NPS for green infrastructure, nor any equivalent.

e. **Local and Neighbourhood Plans** enable national policies to be expressed locally, whilst ensuring they complement and make links to other local strategies and priorities, such as Local Transport Plans, Open Space Strategies and Catchment Flood Management Plans.

Local Plans have to have regard to national policy: in this respect, it is important to note the relevance of the Natural Environment White Paper (NEWP 2011), which made clear the desire of Government to ensure that the state of the natural environment would be left in a better condition for the next generation. Even so, other than through having regard to this, those tasked with planning policy might not feel responsible for its delivery: indeed, it is less than clear that there is *any* delivery landscape for this, let alone, any framework for measuring progress. By what process, for example, is the aspiration as stated in the white paper to be delivered on the ground? If land use planning has no role here, then what are the alternative mechanisms? More plausibly,

---

\(^{521}\) An EU-wide strategy on Green Infrastructure: Enhancing Europe’s Natural Capital
http://ec.europa.eu/environment/nature/ecosystems/index_en.htm
land use planning does have a role here, but there has been no attempt to cascade the over-arching objective down to the local level.

2) How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

f. Our response focuses on green infrastructure, of which responsibility is in effect, split between different Government departments. Whilst Defra is responsible for landscape and countryside, DCLG is responsible for urban green spaces and planning policies. Where major infrastructure projects are concerned, National Policy Statements have a vital role to play, and the Planning Inspectorate is effectively charged with making decisions. The content of the different NPSs is highly variable where GI is concerned – there is, it seems pertinent to point out, no NPS for GI.

g. It is of interest to us that there is no mention of the Department of Health. It is increasingly well-recognised that the built environment, because it shapes the places in which we live, has an effect on the health of citizens. The importance of embedding green infrastructure within the public realm, and in reducing the incidence of non-communicable diseases, including obesity, diabetes, stress and depression, suggests that health professionals and health commissioning bodies might have a strong interest in supporting the case for green infrastructure provision: the preventive role played by GI in relation to health matters indicates that there are potentially significant savings to health budgets to be gained from appropriate place shaping.

h. Given the multi-functional benefits provided by GI, we would like to see more integration between the departments, bringing together the social, economic and environmental strands, along with consideration of policies for public health, transport and climate change. The Natural Capital Committee found that carefully planned investments in natural capital, targeted at the best locations, will deliver significant net benefits for society, with respectable benefit to cost ratios523. There also exists evidence that high quality environment can contribute to an uplift in property values, with a study in the North West reporting up to 20% rental uplifts as a result of GI524.

524 Mersey Forest http://www.merseyforest.org.uk/BE_group_green_infrastructure.pdf
In Summary: Policy Making, Integration and Coordination.

The national policy framework through which green infrastructure is supposed to be embedded within the built environment feels too weak at present (and falls short of what is envisaged in the EU Green Infrastructure Strategy). Whilst it is appropriate for much of the decision making process around the built environment to be made locally, there are frameworks within which that decision making process has to take place. National policy could do much more to direct that decision making process. There is no mechanism we are aware of which ensures that the aspirations of the White Paper are reflected in approaches to planning.

Responsibilities are divided across departments, and some departments with a strong interest are not currently engaged in this process, though enlightened Directors of Public Health in local authorities have a commendable appreciation of the relevance of this issue. It would be easy to recommend a ‘green infrastructure commission’, or similar: what is really required, though, is policy at the national level that establishes mechanisms through which the value of GI is to be realised at the local level, so enabling Government to deliver on its aspirations in the White Paper.

NATIONAL POLICY FOR PLANNING AND THE BUILT ENVIRONMENT

3) Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?

a. At the core of the NPPF is a presumption in favour of sustainable development. In particular we support the principles set out in paragraphs 110 - 118 which are concerned with minimising the impact the built environment has upon biodiversity, whilst conserving and enhancing the natural environment. We also support paragraph 109 which calls for recognition of the wider benefits of ecosystem service. Given the importance of services ecosystems provide, we would like to see them considered and accounted for more generally in the decision making process for the built environment, both strategically and locally. Whilst we feel there is sufficient guidance within the NPPF, it leaves too much to interpretation in how this can be translated into action and operationalised on the ground.

b. The NPPF remains the only mechanism through which local decision makers can consider the appropriate means to integrate green infrastructure within their spatial plans. The extent to which the NPPF gives clear direction on this would need to be
judged through reference to the empirical evidence in respect of how local planning authorities are giving substance to the NPPF. It might be foolish to imagine, however, that the NPPF is sufficient, in this regard, to deliver appropriate quality development, in which the value of nature is fully recognised in the shaping of the built environment.

4) **Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?**

c. The planning system in England has undergone fundamental change through the Localism Act and the National Planning Policy Framework, which have shifted power to the local and neighbourhood levels while continuing to emphasise the importance of sustainable development in supporting the objectives of the Natural Environment White Paper. We feel these changes, coupled with the devolution debate, are leading us towards a more localised approach to decision making. Introducing a spatial element at the national level might not be entirely productive from this perspective. The role of national policy should be, as per our response to question 1, to establish the framework within which local decision making takes place. An appropriate national level response might be to outline how local planning authorities should incorporate a spatial element within their plans.

d. For Local Nature Partnerships, such as ourselves, having local autonomy means we can shape their own agendas based on local needs and priorities. As LNPs are still relatively in their infancy, and some are more developed than others, we would hope that they are given more time to fully establish to enable them time to deliver tangible results.

e. We support the National Capital Committees recommendation for a 25 year plan for the environment, and recognise the value of setting the plan nationally. This will require local knowledge and expertise for delivery, for example within the West of England we have developed a 'State of Environment Assessment' which has analysed local data to help determine where restoration effort would be best placed. This local setting of priorities will help strengthen any national plan.

5) **Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and built environment policy be looking?**

f. There are a number of challenges which confront those involved in planning and in the built environment as we look forward. Some of these challenges that we have never had to confront in the past; the potential consequences of climate change, and the need to
provide an adaptive response to this, is a critical matter. In our region, there are enterprise areas that have been, and potentially, will be, identified which are at significant risk of flooding. To the credit of some, the potential threats from sea level rise, and the inundation which would result, are being recognised, though somewhat after the fact. Furthermore, the nature of the response to the threat is still being considered. Of course, this issue does not only affect these areas.

g. The houses and other infrastructure that we do build will also reflect choices that we make: what type of places do we want citizens to inhabit in the future? Understanding the role that developing green infrastructure has to play in this, then it seems reasonable to believe that trees will be part of that infrastructure. How long will it take to grow the trees in the developments of the future.

**In Summary: National Policy for Planning and the Built Environment.**

The challenges indicate that horizons for planning urgently need to be stretched in time. There is a need to visualise the future, and to ‘plan’, in the true sense of the word, for the future that we want to inhabit. The horizons, and tools, that policy makers need to consider will have to be adapted accordingly, with potentially significant ramifications for landowners and would-be developers. The role of the policymaker, should not be underestimated here, ensuring that the strategies designed to safeguard the natural environment are fully embedded into planning policy are critical to delivering a truly sustainable built environment.

**BUILDINGS AND PLACES: NEW AND OLD**

6) What role should Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

a. We recognise that housing supply is a pressing issue for the Government and would assert that sustainable development can and should be the only way to address this demand. Development should never, in our opinion, come at the cost of the natural environment or biodiversity. We believe the built environment can be sympathetic to the natural environment, and advocate well designed, thought out developments that enhance nature, increase biodiversity and recognise the value of ecosystems and the services they provide. We would welcome interventions that support these values. We are also repeatedly told that we are facing a housing crisis, and that we urgently need to build more houses, large numbers of them being affordable homes. At some point, we
might wish to ask the question as to whether there is merit in seeking to shape the nature of demand for housing, unless the intention is to build ever more dwellings.

b. Furthermore, we would want to see any relaxation of planning policy carefully thought out to avoid any undue pressures being placed upon biodiversity and the natural environment. An example of this would be 'the sweeping away of brownfield site rules' (Conservative Party Conference 2015), which often overlooks the high biodiversity value of some of these sites, for example Open Mosaic Habitat on previously developed land (OHM) is home to many rare and endangered invertebrates, birds, and plants.

c. It is well recognised that Green Infrastructure has a significant role to play in building a sustainable and resilient built environment. In meeting the challenge of climate change, GI can help mitigate against the effects of climate change and support adaptation to extreme weather events, through carbon sequestration the use of trees for solar shading, the use of green space, green roofs and walls to alter surface albedo, and reduce the heat island effect, through flood attenuation whilst providing a habitat for wildlife, and so forth. We would hope the Government recognises these benefits and will provide grants and funding, or mechanisms for other payments to ensure GI is considered as key to future proofing our built environment in the face of changing needs and circumstances. Ideally, we would encourage GI to be included in the planning and design phase (RIBA design stage 0 - 4) with consideration of the construction and handover phase (RIBA design stage 5 - 7). Where appropriate retrofitting GI into existing developments should also be considered.

d. Recognising and accounting for ecosystem services will also be vital, acknowledging the services nature provides such as flood mitigation, air and water cleansing, water purification and waste recycling - services that are often hidden, therefore, overlooked and undervalued.

e. We also believe that GI should be promoted on a 'significant scale' and encouraged across our urban and rural landscapes, linking cities and countryside. This could be achieved through the roll out of more Nature Improvement Areas that encourage landscape-scale conservation by establishing large ecological networks, by working with existing and planned land-uses.

7) How do we develop built environments which are sustainable and resilient, and what role should the Government plan in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?
In Summary: Buildings and Places: new and old

Often it is not the case that one size fits all when it comes to housing supply and we would encourage a cautious approach that considers a combination of different factors and priorities, alongside purely economic drivers.

SKILLS AND DESIGN

8) Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

a. In order to ‘plan positively for Green Infrastructure’, the professions will need to work in a holistic and integrated manner. In line with the principles set by the TCPA on biodiversity and GI, we support the assertion that GI will be successful when the right people come together in partnership – planners, landscape architects, facility managers, ecologists etc. We would also hope to see GI’s value recognised, avoiding the temptation to ‘value engineer’ GI out of plans early on.

9) Are we using the right tools and techniques to promote high quality design in ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

b. National standards on GI could provide the legislative support required for a shift change in the way GI is planned, designed and incorporated into the built environment as “GI can be harnessed as a positive ‘place-shaping’ tool, and where appropriate can be used to positively transform local characters”⁵²⁵. DCLG Eco-towns SPD suggests a minimum of 40% of the total land should constitute GI. Whilst we may recognise the benefits, policy ought to help secure the funding support. Measurable standards for GI could be integrated into place making policies, example existing standards include Capital Asset Value for Amenity Trees (CAVAT⁵²⁶), Natural England’s Accessible Natural Greenspace

---

⁵²⁵ TCPA: Planning for a healthy environment
COMMUNITY INVOLVEMENT AND COMMUNITY IMPACT

10) Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

a. Good quality, accessible green space and infrastructure can provide many potential health and wellbeing benefits, including increased life expectancy and reduced health inequality; improvements in levels of physical activity and health; and promotion of psychological health and mental well-being.\textsuperscript{533} It has been estimated that the NHS could save £2.1 billion a year if everyone had access to green space\textsuperscript{534}. Despite these proven benefits, GI still is not seen as a must have for new and existing developments.

11) How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?

b. Community participation in the development and maintenance of GI should ideally start at the planning stage. This ensures that communities can take ownership of their own spaces resulting in a long-term commitment to community maintenance (n.b it may be necessary to provide expert ecological and horticultural expertise to ensure GI is appropriately designed for biodiversity). Community ownership has been shown to be

---

\textsuperscript{532} http://www.naturalcapitalproject.org/InVEST.html
\textsuperscript{534} http://www.bbc.co.uk/news/science-environment-24806994
an effective and low cost way of promoting good quality GI, for example community gardens, meadows, allotments, and networks of private gardens transformed for wildlife, are all good for wildlife, whilst providing countless health & wellbeing benefits and contributing to community cohesion. With this in mind, we feel GI should be prioritised within planning policy, especially in areas of greatest need.

c. For engagement to be effective, consideration must be given to the following; who is the community; how are they being engaged (is it in writing, in person), is the communication method appropriate for that community; how is the consultation being delivered and by whom; what are the timeframes. Community consultation is meaningless without the due consideration being given to some of these questions.

In Summary: Skills and design, community involvement and community impact.

Communities should not be excluded from the decision making process, as they are the ones who will live, work and ultimately benefit from that environment. Early engagement can result for a win-win for both community and planner, if well designed and delivered.

FINANCIAL MEASURES

12) Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

a. It would be sound economics to require developers to make compensation payments to local authorities where they undertake development on land which provides ecosystem services: compensation would be linked to the nature of land being used. Given that, in our experience, local authorities are concerned that too many housing developers are delivering low quality development (both in terms of build, and the quality of place that they engender), then the level of compensation that developers pay could also be linked to the extent to which they gave substance to various matters related to quality, including the extent to which green infrastructure was embedded within the development.

b. The compensation funds so generated could be used to invest in natural capital in a strategic manner within the region, thus moving away from the piecemeal approaches typically considered under Section 106 agreements. The WENP has developed the concept of the Natural Capital Trust to play just such a role. National government would do well to establish principles such as these, thus giving substance to its commitment to
sustainable development, and making it more likely that the objective set out in the White Paper will be met.

c. Alternatively, government could consider the design and implementation of a land-use change levy. The merit of such a levy would be two-fold: it would be another way (in addition to the aforementioned approach) through which to give substance to the principle of compensation (if a developer imposes costs on society by building on land, then there should be compensation for the services lost), but it would also have the potential effect of eliminating, at least in part, the rents which landowners currently gain from the enhancement in land values from consents awarded for development. This is not entirely novel: states in the US have, for example, implemented taxes on areas of hard-standing to reflect the enhanced risk of flooding that hard surfaces represent.

d. An alternative mechanism would be (in line with our view in respect of Q1) to have Government identify clearly minimum standards in respect of new housing developments, both in terms of the build quality, but also, the provision of green infrastructure, active travel routes, and sustainable systems of drainage. Over and above these measures, and in the spirit of payments for ecosystem services models, developers of significant projects could have their plans considered by a committee of beneficiaries, including (for example) directors of public health, health commissioning bodies, water companies, NGOs, local authorities (as lead local flood authorities) and bodies such as Natural England and the Environment Agency. These potential beneficiaries could offer to fund measures over and above the level of provision of GI in line with potential benefits that alterations to the scheme could provide. This measure would function best against the backdrop of a forward-thinking minimum standard, which itself was considered to provide a benchmark for genuinely sustainable development.

In Summary: Financial Measures.

Clearly the benefits of good quality GI merit the cost of creating and maintaining it. Who bears this expense should be given consideration. With regards to the built environment, it would seem pertinent for developers to pay for any environmental loss or damage, and for creation of new GI, through suitable compensatory mechanisms, whilst the other beneficiaries could also contribute recognising the multi-beneficial outcomes derived for good quality GI.

06 October 2015
Submission of written evidence to the Select Committee on National Policy for the Built Environment

West Malling is a historic market town of around 3,000 people in the Tonbridge and Malling district of Kent. It has a main line railway station with a journey time of 60 minutes to London as well as easy access to several motorways, including the M25, coastal ferry ports and the Channel Tunnel.

Councillors are very much aware of the need to provide a better environment for future generations and wish to pass on the following comments. Please note that these responses are listed in the same order as the questions on the Call for Written Evidence dated 27 July 2015.

Policymaking, integration and coordination

1. The role of a national policy must be a “light touch framework” which considers the way in which infrastructure and economic development align with energy provision, specialist industry, higher education, demographic change and environmental issues like flooding and the green belt as well as housing growth. While the built environment should be ultimately in the national interest, such a policy would be either too weak to be able to address local issues or too prescriptive and inflexible to deliver well designed and viable communities. A National Policy must be drawn up primarily from the regions upwards and not passed down from central government and the work and role of local authorities should be expanded to give Parish Councils a higher profile in recognition that their input is based on personal knowledge and experience of their parish.

2. Whilst a policy may be common to several Government departments, invariably each one interprets it from their own perspective. To achieve an integrated, properly coordinated and workable policy, the recipient’s perspective must be the guiding principle. The man in the street (and his successors) is the one most affected by poor housing, design, transport etc. By acknowledging this, each department can still offer their own perspective around the guiding principle as well as retaining flexibility to embrace change.

National policy for planning and the built environment
3. The three principle dimensions (economic, social and environmental) in the National Planning Policy Framework (NPPF) require the planning system to administer a number of roles to lead sustainable development. However, allowing a single policy to oversee such a wide range of elements inevitably leads to difficulties in finding the right balance between development and the environment. Decisions can appear to be made by ticking boxes rather than taking time to consider the costs and benefits to the community both existing and future. Sustainability has to be considered a prime factor. Without it, future generations will lose basic day to day rights and freedoms as their choices become non-existent from poor decisions made now.

4. National planning policy no longer has an effective spacial element. By re-introducing it, decisions will have to take into account the effect on neighbouring communities, whether across a number of local authorities or a larger area (e.g. county or region). This must lead to greater discussion of and possible challenge to, planning policies but will ensure that decisions are made with enhanced transparency.

5. Any timescale should include frequent, if not continuous review to allow for changes in the economy, its principle driving force. Thus the targets the policy sets could be arrived at by averaging out good years with bad to provide better management and engagement with the community’s needs. Currently, a 20 year timescale seems reasonable and practical.

Buildings and places: New and old

6. Under occupation is an unsustainable aspect in the present supply of housing and commercial property. Many existing properties are simply the wrong size; larger buildings are uneconomic to upgrade and difficult to convert to current environmental targets. Building sustainable units and maintaining that sustainability by preventing extension and alteration (without a special case being proved) would provide residential property suitable for the modern family or business without the need to seek new areas of building land.

7. Sustainability is achievable by providing smaller, eco-friendly buildings more suitable to the modern family and offering financial help to those who wish to downsize; also smaller start-up type of units to small to medium businesses. The government would need to play a major role as financial incentives would be required to kick start this kind of strategy.
8. The historic environment should remain exactly that; cherished as part of our history, culture and national inheritance and not be subjected to inappropriate development.

Skills and design

9. Most local planning authorities have a good knowledge base of existing legislation but change should drive education while recognising the value of experience.

10. Again, while there is extensive knowledge at all levels, new strategies must be supported by education. This should include investigating existing skills and encouraging development of new approaches to achieve policy aims.

Community involvement and community impact

11. The developers and decision makers of the built environment are driven by different needs to those of the people who live and work in the results. It is these people who will form a viable community and they are the ones who must have a greater say in how and where their homes and workplaces are provided. Mental, physical and behavioural issues within a community are not a new problem but as has been proved in the past, tearing down buildings and providing what is considered “ideal” can make these issues worse. Better results would be achieved by developers and local authorities working in partnership with the community to discover the existing needs before creating further problems with inappropriate decisions.

12. It can be difficult for a community to engage in decisions about its future. Most decisions are currently made by various committees at many levels of government and getting to the right place at the right time to take part in these discussions is not always possible. Increased use of social media and the internet must be investigated and better use made of local district, borough and parish authorities as conduits for information and discussion.

Financial measures

13. Developers should take on the financial burden of providing infrastructure not only within their proposal but also recognise the financial cost to the existing infrastructure e.g. roads, schools and community facilities.
West Malling Parish Council – Written Evidence (BEN0119)

While this is already available to some degree through Section 106 contributions, the opportunity to strengthen and enforce this approach to development afforded by revising national policy for the built environment cannot be missed.

06 October 2015
Summary

WWT invites the Committee to consider the importance of drainage infrastructure within the built environment and the fact that it is struggling to cope.\textsuperscript{535} Sustainable Drainage Systems offer an alternative to hard infrastructure that will help reduce surface water flooding, whilst improving the living environment of urban communities and providing wildlife a valuable urban habitat. We urge the Committee to consider sustainable drainage systems and the need to incorporate sustainable drainage into planning and retrofit within the built environment if we are to address the issue of surface water flooding. Sustainable drainage systems need to be designed and managed to optimise multiple benefits such as health and well being and biodiversity.

We recommend:

- **The Housing and Planning Bill should be amended to require “permission in principle” for brownfield site development to be conditional on no increase in runoff rates or surface water flood risk.** New Starter Home developments should include sustainable drainage options designed to achieve run-off rates equivalent to greenfield sites.

- **The National Infrastructure Commission should consider the need for green and blue infrastructure in its work on transport and energy infrastructure.** The Commission is expected to focus on transport in the north and London and on future-proofing energy infrastructure. Its conclusions will not be robust without consideration of the importance of natural infrastructure options, which can manage risks like flooding and provide important urban habitats for wildlife and corridors between them.

- **The Government should publish guidance for cities and local authorities to produce a sustainable drainage strategy** for retrofitting into both domestic and commercial/public sector buildings and grounds. This would follow the example of the London Sustainable Drainage Action Plan and help to safeguard cities from flooding while improving the urban environment.

\textsuperscript{535} WWT is a leading wetland conservation charity working to protect wetlands, their wildlife, and the services they provide in the UK and globally. We manage nine Wetland Centres across the UK. A million people visit our centres each year to learn about the benefits wetlands bring and to enjoy wetlands and their wildlife. We provide formal learning about wetland wildlife to more than 60,000 school pupils each year. We have much practical experience in using natural processes to improve the built environment. We are submitting evidence as experts in wetland conservation and water management but also representing our 220,000 members.
Main comments

1. To date, the Committee’s oral evidence sessions have focused largely on the UK’s housing needs, the associated costs and practical challenges and social aspects around sense of place. The evidence the Committee has heard has paid less attention to the need to deliver truly sustainable development, delivering high quality housing in communities where people want to live and are resilient to climate change whilst making space for wildlife and nature.

2. One evidence session looked in detail at green infrastructure, but even this session did not cover the fact that our current drainage systems are struggling to cope. Over three million properties are already at risk of surface water flooding and many drainage systems are over-capacity. The impact assessment for the Flood and Water Management Act 2010 estimated current annual damages due to surface water flooding to be between £1,304 million and £2,237 million. It estimated that climate change and increased urbanisation will produce an additional 30% to 110% (over 50 years) increase to current surface water flooding damages.536

3. Sustainable Drainage Systems can help alleviate this risk. They seek to manage rainfall in a way similar to natural processes, by using the landscape to control the flow and volume of surface water, prevent or reduce pollution downstream of development and promote recharging of groundwater. If designed and managed appropriately they can also provide a wealth of additional benefits including water quality, health and wellbeing and wildlife habitat.

4. The Flood and Water Management Act 2010 Impact Assessment predicted net benefits of £138 to £6,107 million for SuDS in all developments of over 1 dwelling. However, earlier this year the Government decided not to require SuDS to be designed into small developments, or even into large developments if the costs to development did not add up. DEFRA believes that this decision will cause over £100 million of flood damage each year, as new development floods neighbouring homes and businesses. These costs will be borne by the public, in flooded homes and in higher water bills and insurance premiums.

5. This decision seemed to take no account of the benefits to the people living in these developments: reduced flood risk, potentially reduced insurance rates, increased house prices, and amenity value. SuDS have also been shown to reduce the urban heat island effect and provide valuable urban habitat for wildlife.537

6. There is much evidence of the cost benefit of using sustainable drainage systems as opposed to more traditional methods. A report commissioned by the Committee on Climate Change (2012) looked at such evidence and concluded that “SuDS can be significantly cheaper to install than traditional drainage...The maintenance costs for SuDS are also lower than traditional drainage for many schemes. Therefore the whole life costs for SuDS are likely to be less than equivalent traditional drainage systems in the majority of cases”.538

7. It is also hugely important that SuDS are not just installed within new development but that retrofitting is encouraged. WWT retrofitted 10 schools in the Pymmes Brook catchment in London to show the range of SuDS that could be fitted even given some very limited spaces. The additional educational benefits of such projects should not be underestimated. More information can be found at http://sudsforschools.wwt.org.uk/. There are many opportunities for retrofitting SuDS such as those described in the London Sustainable Drainage Action Plan https://beta.london.gov.uk/sites/default/files/lsdap_final.pdf.

8. We would also like to draw the Committee’s attention to the need for improved water efficiency in housing. Water efficiency measures should be considered as vital as energy efficiency and should be mandatory in new housing. Worldwide classifications consider the UK to be under medium to high water stress.539 Yet our water usage is around 150 litres per person per day compared with Belgium where it was 110 litres per person per day in 2007.540 Water meters can help people manage their water use more efficiently and save them money on their bills and yet wide roll out of water meters is not currently a consideration in the UK.

9. Rainwater is not waste; it is a valuable resource which, if managed sensitively, could help avoid water scarcity as well as surface water flooding. For example businesses able to use rainwater harvesting and use grey water for use in toilets and potentially for actual business processes not only reduce the overall demand on water but make themselves more resilient to times when water may be more scarce.

10. The creation of a new National Infrastructure Commission is a valuable opportunity to consider innovative, cost-effective ways of developing new infrastructure like housing and transport links in a way that contributes to green infrastructure, rather than damaging it. For example, new trans-Pennine transport links could be accompanied by sustainable drainage technologies. They could also provide wildlife links to join up

538 Royal Haskoning DHV (2012) Costs and Benefits of Sustainable Drainage Systems, Committee on Climate Change.
539 http://www.wri.org/resources/charts-graphs/water-stress-country
important areas of habitat, as recommended by the Lawton Review. Similarly, the new developments proposed in the Housing and Planning Bill should be ecologically designed from the outset, using natural processes to guard against flooding and improve quality of life; this will guard against the need for retrofitting in future and could help to alleviate planning concerns associated with new development.

Submitted on behalf of the Wildfowl & Wetlands Trust.

We are grateful for the Committee’s consideration of these issues.

13 November 2015

---

1. Introduction

1.1 This submission has been developed by The Wildlife Trusts in response to the Select Committee’s inquiry into National Policy for the Built Environment.

1.2 Wherever you are, there is a Wildlife Trust caring for wildlife and wild places near you. We have a shared mission to create an environment rich in wildlife for everyone and to inspire people to value and take action for nature. We are actively engaged in the planning system, promoting opportunities to improve the natural environment and reviewing more than 60,000 planning applications a year. We have more than 800,000 members including 150,000 members of our junior branch Wildlife Watch. Every year we work with thousands of schools and our nature reserves and visitor centres receive millions of visitors. Each Wildlife Trust is working within its local communities to inspire people about the future of their area: their own Living Landscapes and Living Seas.

1.3 A Living Landscape is a recovery plan for nature championed by The Wildlife Trusts since 2006 to help create a resilient and healthy environment rich in wildlife and to provide ecological security for people. In A Living Landscape habitats are restored and reconnected on a large scale with the local community closely engaged. The vision is a primary objective of The Wildlife Trusts and builds on a groundswell of landscape-scale activity at a county level. The Wildlife Trusts have a long track record of delivering landscape-scale conservation. Across the UK there are now more than 150 Living Landscape schemes covering an area of more than four million hectares. These are being delivered in partnership with many different individuals and organisations, including farmers and landowners, water companies, land-based industries, local authorities, other NGOs, statutory agencies, local communities and volunteers.

1.4 We have an interest in this inquiry because we believe that nature has an important part to play in creating healthier and more attractive places for people to live and work. By integrating nature into policy, design and planning for the built environment, we not only protect and enhance the natural environment but we also help to tackle other ‘people’-related issues through the provision of high quality green spaces. These include health and wellbeing, community cohesion and environmental hazards such as flooding.

1.5 There are many inspiring examples from across England of Wildlife Trusts working with developers to integrate nature into masterplans and designs for new built developments. These are included within Annex 1 (Nature-filled areas: good for wildlife, great for people). However, there are also a number of barriers to achieving such integration, which we have highlighted below, along with recommendations on how these might be addressed.
1.6 This submission answers the questions from the call for evidence that we believe are most relevant for the Committee’s consideration of how national policy for the built environment could be better integrated with natural environment policy and considerations.

1.7 We would be willing to provide oral evidence to the Committee.
2. Executive Summary

2.1 Integrating nature into the design and delivery of high quality built environments enriches people’s lives, protects wildlife and contributes to a wide range of government policy objectives including improving public health and wellbeing, tackling crime and inequality and creating community cohesion.

2.2 However, this integration will only be achieved if joined-up policy making across government departments becomes a reality. The Government’s proposed 25 year plan for nature provides an opportunity to improve the management of the natural environment and deliver multiple benefits for society but the success of this will depend on effective inter-departmental co-ordination and strong leadership from the Government.

2.3 Whilst the National Planning Policy Framework includes some positive policies on ecological networks, it does not provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment. A stronger steer from government is needed if ecological networks are to be fully embraced by the local planning process.

2.4 The current legal and policy framework for the protection of nature has been vital in securing the nature we have left, but it will not be sufficient to bring about the change required to protect nature and secure its recovery in the longer term.

2.5 We believe that legislative change is needed. A Nature and Wellbeing Act will ensure that nature is valued properly and put at the heart of decision-making, nationally and locally, including on decisions on the built environment.

2.6 Creating an ecological network is a “place-making” process, aiming to make every locality one which functions environmentally and which can therefore provide the multitude of benefits that local people need, whether in a rural or urban setting.

2.7 It is of great concern that there is often an inadequate awareness and resourcing of the ecology function within local authorities, with many lacking the capacity and expertise to analyse and evaluate the ecological content of planning applications and monitor and enforce planning conditions on built developments. Adequate resourcing of in-house ecological expertise within local authorities will be essential if local ecological networks are to be consistently developed and integrated with other objectives as part of the local strategic planning process.

2.8 Ensuring a rigorous level of scrutiny and oversight on government policy will also be important, especially on the environmental impact of new policies and spending plans. This could be done by setting up a new Office of Environmental Responsibility or extending the remit and lifetime of the independent Natural Capital Committee.
2.9 The public benefit of maintaining and enhancing green spaces in towns and cities is undeniable and many Wildlife Trusts have been working in partnership with local authorities and others landowners to improve parks and green spaces for wildlife and people. Increasing the extent, accessibility and quality of natural green space in all settlements should be a priority for national and local government, with a requirement to ensure that everyone has a minimum level of access to natural green space.

2.10 We encourage the Government to think ambitiously and demonstrate strong leadership on the natural environment, just as it has done on other policy areas.
3. **Policymaking, integration and co-ordination (question 2)**

Policy co-ordination across government departments

3.1 In the current UK central government structure, at least seven departments are of importance to domestic policy-making on the natural and built environment, including DECC, Defra, the Department for Transport, BIS, DCMS, CLG and the Treasury, as well as, of course, the central co-ordinating bodies of the Cabinet Office and Prime Minister’s offices.

3.2 Given this, there is a strong imperative for joint working and activities across government so that policies on the natural and built environment are designed and delivered in a complementary way.

3.3 Co-ordination of policy making for the built and natural environment will result in the creation of better places for people to live and work. The presence of nature in and around our built environment is good for our heath, wellbeing and productivity. The greater the join-up across government departments, the more that nature will be delivered in and around developments and the greater the contribution to the delivery of other policy objectives such as improving public health, reducing crime and preventing flooding.

3.4 The Government agrees with the Natural Capital Committee that getting natural capital into the national accounts by 2020 is a priority. Equipping the Natural Capital Committee with the resources and remit to allow it to exercise oversight of these national natural capital accounts would be one way of holding all of government to account and ensuring that policy co-ordination is taking place.

3.5 The Government has agreed to develop a 25-year plan for nature, which provides an opportunity to improve the management of the natural environment, including the delivery of multiple benefits; the success of this will depend on effective inter-departmental co-ordination.

We would therefore like to see:

- Government adopting a much more integrated approach to the design and development of the built environment to ensure that it delivers inspiring new built developments, created with consideration for the needs of both people and the natural environment and which provide healthy and attractive places for people to live and work;\(^\text{543}\) (R1);

\(^{542}\) The Government’s response to the Natural Capital Committee’s third State of Natural Capital Report

\(^{543}\) Case studies for developments where The Wildlife Trusts have worked with the developer to design new buildings and settlements with nature at their core
- Joined-up working between government departments which is needed to ensure that the protection, restoration and recovery of the natural environment is integrated into wider policy at the national and local level (R2);

- A strong 25 year plan for nature which adopts the recommendations of Wildlife and Countryside Link (see annex 2, Wildlife and Countryside Link 25 year plan for nature\(^{(544)}\)) (R3).

\(^{(544)}\) http://www.wcl.org.uk/docs/Link%2025%20year%20plan%20for%20nature%20Aug%202015.pdf
4. National policy for planning and the built environment (questions 3 and 4)

The National Planning Policy Framework (NPPF)

4.1 The benefits of ecological networks were recognised in both the Lawton Review and the Natural Environment White Paper, which identified their potential for fulfilling wider policy objectives such as flood resilience, provision of clean water and creation of attractive and sustainable places to live. The White Paper recognised the need for ecological networks to be delivered via the planning process through “ecologically coherent planning”. This was reflected in the NPPF which makes specific reference to the creation of ecological networks.

4.2 However, the White Paper failed to introduce any sort of national commitment to, or framework for, the creation of ecological networks. This is needed to ensure that local networks are designed and implemented across England to create a network that functions at a national level.

4.3 In partnership with the RSPB, we have commissioned research to assess the extent to which the biodiversity-focused policies of the NPPF have been positively integrated into new Local Plans across England. This assessed 30 English local planning authorities’ plans on their treatment of biodiversity, ecological networks and green infrastructure. Our research found that NPPF policy for biodiversity planning has not been widely embedded in Core Strategies, with less than one third presenting a clear strategic approach to planning for biodiversity and only 20% identifying cross-boundary biodiversity matters that might need to be addressed in co-operation with other local planning authorities.

4.4 The NPPF requires local authorities to identify and provide for the protection of Local Wildlife Sites through local policy. Yet our research also found that locally designated sites are not usually illustrated within Core Strategies and are instead retained as mapped elements of saved plan proposals, which risks out of date data on Local Sites being used in decision-making. A study undertaken by The Wildlife Trusts in 2014 found that 717 out of 6,590 Local Wildlife Sites were reported lost or damaged in the five years between 2009 and 2013, with development cited as a key threat by more than half of England’s Local Wildlife Site partnerships.

4.5 It is clear therefore that the NPPF does not provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment. Despite the inclusion of positive policies in the NPPF, local ecological networks are not being consistently developed or integrated with other objectives as part of the local strategic planning process. Whilst there are other barriers to embedding ecologically coherent

---

546 The Natural Choice: securing the value of nature, Defra, 2011
547 National Planning Policy Framework, CLG, 2012
planning within local planning documents (for example, a lack of ecological expertise in local authorities, as described in section 5), there is no doubt that a stronger steer from government is needed if ecological networks are to be fully embraced by the local planning process.

4.6 The vast majority of the natural environment is not priority habitat yet it supports considerable levels of our biodiversity. An overly rigid interpretation of priority and non-priority habitats is leading to perverse decision making on habitat protection. The NPPF should be revised to clarify that the biodiversity value of all habitats should be adequately considered in the planning process. Warwickshire for example has developed a Biodiversity Impact Assessment Calculator which objectively measures the biodiversity value of any given site and assigns it a score measured in ecological units. It then requires that development on the site meets or exceeds this score and provides the mechanisms and funding to achieve no net loss in perpetuity.

We suggest these issues should be addressed through:

- Robust implementation and clarification of the natural environment policies in the NPPF (R4);
- A place-based strategic vision for the protection and restoration of biodiversity (R5);
- Improved access to up to date and robust ecological expertise and information (R6).

The benefits of introducing a spatial element to national policy

4.7 Introducing a spatial element to national policy has many benefits, including the use of visual concepts, such as ecological networks, that people can understand and relate to.

4.8 Spatial plans for local ecological networks would provide a focus for investment in nature. They can be used to target public and private sector funds where they are most needed to help restore ecological degradation, create new links in the landscape between different habitats and green spaces and ensure that investment is targeted in places where nature restoration can also bring the greatest benefits for people.

4.9 This would promote a sense of trust within local communities that the environment is not being sacrificed in the short term in order to address other issues; instead, it is being protected and invested in for the long term. This is particularly critical in urban areas where a high quality natural environment is usually under greater pressure (and vulnerable to other land-use investments) but provides an important range of benefits for local people.

4.10 Spatial plans provide a common vision for nature and can be used as a mechanism to co-ordinate local initiatives, such as Local Nature Partnerships, Local Enterprise Partnerships
and Local Health and Wellbeing Boards, integrating approaches on the design and location of new housing, flood alleviation, preventative health delivery and job creation.

4.11 Nature Improvement Areas (NIAs) are a good example of where a spatial element in national policy could have provided a strategic mechanism for targeting effort and resources on areas of nature most in need of improvement and enhancement. They were inspired by The Wildlife Trusts’ Living Landscapes, recommended by the Lawton review (in which they were termed Ecological Restoration Zones) and introduced through the Natural Environment White Paper. However, the approach adopted within the White Paper failed to identify areas in a strategic manner or to provide the political emphasis needed to embed them in planning or other decision-making processes. Despite this, individual NIAs made a difference: in the first year, just £7.5m helped to leverage an additional £40m in both cash and in-kind contributions. As an intervention they were not designed as a nationally strategic tool to focus resources on where nature or people need them most. Government funding for these areas ended in March 2015.

4.12 Creating an ecological network is an evidence-led process, built on a scientific evidence base of what is needed where, and the priorities for delivery. It is also a “place-making” process, concerned primarily with making every locality one which functions environmentally and which can therefore provide the multitude of benefits that local people need, whether in a rural or urban setting: special places to enjoy for recreation, attractive green spaces in cities, towns and villages, a vital element in protection from flooding and drought, important areas for food production, a carbon sink to reduce greenhouse gas emissions and a fundamental part of local landscapes, which in turn support tourism and a recreation economy.

We therefore recommend that there should be:

- A requirement for Government to set the policy and legislative framework for the creation of a national ecological network built at the local level, and knitted together across administrative boundaries (R7);

- Guidance for local authorities on how to identify, map and deliver an ecological network, to ensure common principles are applied across England (R8);

- A reporting requirement to ensure that Parliament is kept informed of progress on creating the national network (R9).
5. **Skills and design (question 9)**

5.1 Planning for and managing the built and natural environment in a holistic manner requires local authorities to have ready and sufficient access to skills, data and expertise in ecology, to ensure that biodiversity is factored properly into decisions.

5.2 In practice, there is often an inadequate awareness and resourcing of the ecology function within local authorities, and many lack the capacity and expertise to analyse and evaluate the ecological content of planning applications and monitor and enforce planning conditions on built developments.

5.3 Many local authorities no longer have in-house ecologists. In 2011, about 40% of local authorities had an in-house ecologist and there have been further reductions since then. For example, in Lincolnshire only 2 out of the 9 local authorities have such roles, which are essential in working with and advising their planning colleagues on ecological issues. In Lancashire, the County Council has withdrawn completely from providing ecological expertise to district councils on development management. Whilst a small number of these have contracted external agencies for ecological advice, the majority have no permanent arrangements in place.

5.4 Local Environmental Records Centres, which manage biodiversity records, are important resources, often holding the most comprehensive ecological data within a local authority area, but they are poorly used and resourced by local and central government.

5.5 Natural England no longer routinely provides advice on individual planning cases, instead relying on generic standing advice which, by its very nature, is unable to take account of local issues or circumstances. Its increasing focus primarily on statutory sites inevitably means that the broader ecological infrastructure is often not considered or commented on. As a statutory consultee, the information from Natural England carries weight, so where its advice is either absent or non-specific, a local planning authority will often be making decisions based on incomplete information.

5.6 The result of all of this is that ecological issues are frequently not being adequately considered in planning decisions, resulting in poorer outcomes for biodiversity and missed opportunities to deliver built development that is nature-proofed and integrated with the natural environment.

5.7 Whilst we understand the difficult financial position of local authorities, we are concerned that decisions to further reduce the amount of available ecological expertise would be counter-productive and form a significant barrier to the Government’s target to halt biodiversity decline by 2020.

5.8 This lack of ecological expertise is one of the reasons why local ecological networks are not being consistently developed or integrated with other objectives as part of the local
strategic planning process. The absence of any national commitment to, or framework for, the creation of ecological networks means there is a significant disconnect between plans for ecological networks and local authorities’ plans and strategies.

5.9 The Wildlife Trusts have worked in partnership to develop a range of models and approaches for creating ecological network maps across the country to meet local needs and requirements. All of these have a number of critical ingredients in common, so whilst the map outputs might be different the underlying elements are consistent. The creation of ecological networks and these maps should be extended across England and must be fully embedded in local plans so that they can be given weight in development management decisions.
We therefore recommend that there should be:

- Adequate resourcing of in-house ecological expertise within local authorities (R10);

- Guidance for local authorities on how to identify, map and deliver an ecological network, to ensure common principles are applied across England (R11);

- A duty on local planning authorities to identify, map and embed ecological networks in local plans (R12);

- A duty on all relevant public bodies (including Natural England and the Environment Agency) to contribute to the planning and delivery of local ecological networks (R13).
6. National leadership on high quality design and place-making (question 10)

National leadership

6.1 National leadership from the Government is essential to deliver ecologically coherent planning across England. The Government is about to embark on the preparation of a 25-year plan for nature, which provides an opportunity for it to promote its ambition and vision for the natural environment and articulate how this contributes to place-making and other government commitments such as improving public health and wellbeing and delivering a healthy economy.

6.2 We encourage the Government to think ambitiously on the natural environment as it has done on other policy areas such as housing, where it recently announced an ambition\textsuperscript{549} to build one million homes by 2020.

6.3 Whilst the current legal and policy framework for the protection of nature has been vital in securing the nature we have left, it will not be sufficient to bring about the change required to protect nature and secure its recovery.

6.4 We believe that legislative change is needed. A Nature and Wellbeing Act – as set out in a Green Paper\textsuperscript{550} prepared by The Wildlife Trusts and the RSPB – will ensure that nature is valued properly and put at the heart of decision-making, nationally and locally.

Joining up the activity of public bodies

6.5 The only way that plans for ecological networks will attract the investment and commitment needed to ensure their delivery is to place them at the core of processes and decisions that determine how land is used, public funds are allocated and policy targets are delivered.

6.6 Therefore, plans for the creation of ecological networks must become the concern of all relevant government bodies whose objectives can be delivered locally by a healthy, functioning natural environment. This is particularly relevant for bodies working on built environment policy, as there is significant potential to integrate policy more closely and identify win-win scenarios where multiple outcomes are achieved from single interventions, saving money for the public purse.

6.7 Supporting integration at the strategic local scale (for example, through Local Nature Partnerships) would help to mainstream government policy and strengthen the economic case for investing in the natural environment.

Effective scrutiny

\textsuperscript{549} http://www.bbc.co.uk/news/uk-england-34209027
\textsuperscript{550} A Nature and Wellbeing Act: A Green Paper from The Wildlife Trusts and the RSPB
6.8 The process of external scrutiny and audit of government policy can lead to more robust decisions. Following a recommendation in the Natural Environment White Paper, the Natural Capital Committee (NCC) was set up to advise government on the state of our natural capital.

6.9 Whilst this is welcome, it does not amount to the effective scrutiny that is needed on the Government’s national leadership on the natural environment. The NCC suffers from being time-limited and under-resourced and will most likely cease to exist at the end of this Parliament, which will curtail the important work it has begun on assessing the state of our natural capital.

6.10 Other areas of government policy benefit from more effective scrutiny, which is provided at a relatively low-cost (for example, the Committee on Climate Change and the Office for Budget Responsibility, which have a secretariat of 30 and 24 respectively).

Greater national leadership is therefore needed through:

- A bold and ambitious government vision for the natural environment that defines its role in place-making and promoting health and wellbeing (R14);
- An overarching legal framework provided by a Nature and Wellbeing Act (R15);
- A requirement on national bodies to work through a shared framework for investment in nature to join up national and local activity and deliver better outcomes (R16);
- Giving legal basis to a cross-government body to scrutinise the environmental impact of new laws and exercise oversight of government spending plans – this could be done by setting up a new Office of Environmental Responsibility or extending the remit and lifetime of the Natural Capital Committee (R17).
7. **Community involvement and community impact (question 11)**

7.1 Nature has immeasurable social, spiritual and emotional value. It is vital for our health and wellbeing and provides multiple benefits for the economy and society. For example, individuals with easy access to nature are three times more likely to participate in physical activity and 40% less likely to become overweight or obese\(^{551}\), and nature near the home reduces the risk of crime, aggression and domestic violence\(^{552}\). Yet the value of nature is routinely overlooked or underestimated in decision-making on the built environment.

7.2 People are increasingly disconnected from nature, which has an impact on their health and wellbeing. This is especially acute for the poorest and most vulnerable people in society. In England, the most deprived communities are 10 times less likely to live in the greenest areas. Income-related inequality in health is related to the extent of exposure to green space\(^{553}\). Those with close access to green space live longer than those with no green space, even when adjusted for other relevant factors such as smoking. Nature-rich green spaces have greater psychological benefits, especially for the most economically deprived communities.

7.3 In urban areas, protecting green spaces should therefore be a priority for local planning authorities in planning or spending decisions, with an emphasis on working to build a mosaic of high quality green infrastructure, achieving benefits for people and wildlife. For example, there is no use having a park if people are separated from it by a dual carriageway

---

\(^{553}\) Natural solutions for tackling health inequalities, UCL Institute of Health Inequity, 2014
with no footbridge; nor is “green space” delivering its full benefits if it is just a patch of grass covered in litter and dog mess.

7.4 Local authority spending on open spaces was cut by an average of 10.5% between 2010/11 and 2012/13, but improving access and quality of green space is a low cost way to broaden the benefits of access to nature in cities, including tackling health inequalities and wellbeing. There is a major risk that as local authority budgets are cut further, green space quality and condition will deteriorate, and councils will view open spaces as surplus to requirements, resulting in potential disposals for other land uses such as housing.

7.5 Access and quality are also important in rural areas. In fact, recent research suggested that children and families in urban areas felt more connected to nature. Sometimes, in rural communities, busy roads or private land can separate children from good-quality green space.

7.6 The provision of new or improved natural green space would, of course, overlap with and contribute to the creation of ecological networks in local areas and provide a very important mechanism through which to increase the presence of wildlife in our villages, towns and cities, improving the connection between people and nature.
Many Wildlife Trusts have been working in partnership with local authorities and other landowners to improve parks and green spaces for wildlife and people. For example:

- **Avon’s My Wild Street**[^554] – Avon Wildlife Trust has teamed up with leading UK law firm Burges Salmon to create a community project that will bring natural wildlife to the doorsteps of an urban street in Easton, an inner city area in Bristol;

- **Birmingham and the Black Country NIA**[^555] – the NIA, which was a partnership between the Wildlife Trust for Birmingham and the Black Country, local authorities and others, delivered a large number of improved and new habitats such as woodland, grassland and heathland. The NIA project involved 2,000 volunteers, 30 schools and 100 community groups, all of which was achieved within the Birmingham and Black Country conurbation.

To address these issues, we recommend that the Government should commit to:

- Increasing the extent, accessibility and quality of natural green space in all settlements (R18);

- Setting targets for the provision of natural green space to a minimum standard in all settlements, and providing guidance on how these targets should be met (R19);

- Placing a duty on local planning authorities to ensure that every household within their area has a level of access to natural green space that complies with national targets (R20);

- Publishing an annual report to Parliament on progress on meeting natural green space targets (R21).

The Wildlife Trusts, 6 October 2015

Annex 1: Nature-filled areas: good for wildlife, great for people

Trumpington Meadows

Trumpington Meadows is a development of 1,200 homes and forms part of a string of developments on the southern fringe of Cambridge. Respecting Cambridge’s character as a compact city with networks of green space connecting the city to surrounding rural areas, the new developments aim to link into these green corridors.

Trumpington Meadows Land Company wanted to create a high quality development with its own character and sense of place and viewed a new country park as integral to this. It carried out extensive consultation with local communities and stakeholders prior to submitting the planning application, which reduced objections and highlighted concerns at the outset.

The Wildlife Trust for Bedfordshire, Cambridgeshire & Northamptonshire was selected in advance as the land managing organisation and engaged with the landscape architect on design and creation of the development’s green infrastructure to help secure better outcomes and limit future problems. By overseeing the creation of new habitats, the Wildlife Trust was able to work with trusted local suppliers and contractors resulting in significant financial savings.

Local play areas, swales and tree avenues are included throughout the development and the 58 hectare country park is designed to be both a space for people and a ‘nature reserve’. There are a network of surfaced and grassy paths and other features such as arts & play features, benches and cycle racks. Its staged creation which includes areas of existing arable land, as well as new species-rich meadows, hedgerows, woodlands and restored floodplain meadows, began prior to the building of the first houses to allow the landscaping and habitats time to mature.

The country park was designed to follow the River Cam and include its floodplain. A river restoration scheme was developed by the local authority ecologist to improve the river habitat and reconnect the river with its floodplain meadows, providing a small reduction in flood-risk downstream. New houses were built away from the flood plain to reduce flood risk and the drainage system is engineered to include a balancing pond with overflow area and open ditch (swale) features. All of which provide additional habitat and biodiversity benefits.

Tadpole Garden Village

Tadpole Garden Village is a modern day 21st Century Garden Village located to the north of Swindon, a short distance from the village of Blunsdon and the River Ray. The development,
comprising approximately 143 hectares, will feature 1,695 residential homes as well as a school, shops, a pub, and a community centre. Inspired by the original Garden Cities principles and Crest Nicholson’s own Garden Village Framework, the vision is for a holistically planned, new community with strong character, design, landscaping, and public open spaces. The green infrastructure is supported by a strategy for its long term management and maintenance by the Wiltshire Wildlife Trust.

As former farmland, the site has been designed and developed around many existing natural features, including hedgerows, established woodland, ponds and ditches. In total more than 68 hectares of green space weave through the village landscape, offering open spaces, sports pitches, woodland, play areas, cycle routes, footpaths and a new Nature Park for both people and wildlife. Crest Nicholson is working in partnership with Wiltshire Wildlife Trust to create the Nature Park, which will see the conversion of more than 48 hectares of arable land to wildflower species-rich meadows, providing essential habitat for plants, invertebrates, bats, birds and mammals, such as the brown hare. The Nature Park will also provide vital links in the green corridor that runs along the River Ray to the north Wiltshire countryside.

Crest Nicholson is funding the creation of the Nature Park with the Wiltshire Wildlife Trust committing to a 125 year lease to assist in its the quality design and implementation, as well as ensure its successful long term management and maintenance. The Trust will also provide 100 days of engagement activities to secure community interest and pride by local residents. The Nature Park is supported by an endowment from Crest Nicholson and an annual service charge payable by residents.

**Portbury Wharf Nature Reserve**

Portbury Wharf Nature Reserve is a condition of the 2,650 dwelling, Port Marine development and the outcome of a unique partnership between North Somerset Council, the developers, the residents and Avon Wildlife Trust.

Located between the town of Portishead to the west and the Royal Portbury and Avonmouth Ports to the east, Portbury Wharf is a gateway to the wildlife-rich Gordano Valley -providing a green link for people and wildlife between the Severn Estuary and the Gordano Valley. It lies next to the foreshore of the Severn Estuary, where the second
highest tidal range in the world is found – making it unique and important for wading birds and wildfowl, and as a feeding ground for migrating birds.

The Reserve comprises 47 hectares of wetland, open water, grazing marsh areas, hay meadows and hedgerows and is home to many rare and endangered species including water voles, brown hares, curlews, skylarks, lapwing, snipe, oystercatchers, greater horseshoe bats and otter/s (spraints have been found).

Persimmon, the developers, were largely responsible for the creation of the Reserve. This involved extensive earth moving and landscaping; the creation of open water in large ponds and scrapes; the construction of footpaths and bridleways; the erection of fencing, gates, footbridges and signposts; the installation of ‘public art’ features and the construction of boardwalks and 3 bird hides.

Avon Wildlife Trust has managed the Reserve since October 2010 and will become the full owners upon completion of the development. The ongoing costs for the reserve are met by the owners of the new houses. The annual charge to residents is fixed each autumn by an intermediary management company. The revenue funding received by the Trust pays for reserve management and community engagement. In return, residents qualify for free membership of the Trust, a regular newsletter, and access to nature on their doorstep.

Cambourne

The new settlement of Cambourne was conceived in the 1990s as a series of three interlinked villages and comprises 4,200 dwellings. The settlement’s design respected the existing landscape character, identifying existing habitat features and using them as the building blocks for the network of green spaces. The green spaces framed, joined and permeated each of the three villages - giving residents and wildlife easy access to the whole network. This consideration to design has made Cambourne a safe and attractive place where people want to live and engage with their local environment and where wildlife can thrive.

Green space makes up 60% of the settlement and includes pre-existing and new woodlands, meadows, lakes, amenity grasslands, playing fields, allotments and formal play areas. There are 12 miles of new footpaths, cycleways and bridleways and 10 miles of new hedgerows.
The new grassland areas are rich in ground nesting birds such as sky larks, meadow pipits and corn buntins which have had great breeding success over the years. The lakes and ponds that serve to prevent flooding also provide great habitat for wildfowl and dragon flies.

Management of the green spaces is undertaken by the new Cambourne Parish Council and The Wildlife Trust for Bedfordshire, Cambridgeshire & Northamptonshire. The land will eventually be transferred to each of these organisations. Negotiations between The Wildlife Trust, developers and the local authorities secured an agreement that the Trust would manage the green spaces in return for office premises, initially rent free, with full ownership after ten years. Cambourne is still evolving and The Trust continues to work closely with the developer.
Annex 2 Wildlife and Countryside Link 25 year plan for nature

Introduction

The 11 headlines below represent Link members’ views on the essential components of a 25 year plan for the natural environment as a whole.

*We recommend that the 25 year plan be:*

- Developed and delivered through an integrated approach, coordinating input and resources from all Government departments
- Subject to a broad, open consultation, including the public, business and civil society
- Scrutinised by a Select Committee of the House
- Published within 12 months, giving time for consultation, but allowing for the early action necessary to achieve the targets already established in *Biodiversity 2020*
- Supported by an effective framework of monitoring and reporting on agreed outcomes

The architecture of a plan

*We recommend that the 25 year plan:*

1. **Sets out a new vision for a thriving natural environment**

   Developed in consultation with the public and stakeholders, this vision for nature should illustrate the importance of the protection and recovery of biodiversity, landscape character and natural capital, as well as improving public access to green spaces for the UK’s economy, society and well-being. By connecting people with nature, and increasing our natural wealth, it should set the UK on a course where protecting and enhancing nature and our landscapes are the cornerstones of our long-term economic plan and the transition to a sustainable, resource efficient and low-carbon economy.

2. **Establishes overarching goals for government for the protection and recovery of nature**

   To realise the vision, the protection and recovery of nature should be a high-order objective of all Government policy. Clear objectives should be established for a full range of natural assets including species, habitats, water, air, land, seas and minerals. These should apply across Government and overall responsibility should rest with the Prime Minister.

3. **Contains clear objectives and five year milestones with accountability to Parliament**

   To ensure the necessary effort is invested now to take us to our long-term goal, the plan should set out clear objectives and five-yearly milestones against which government can monitor progress and be held publicly to account, informed and updated by independent scientific advice.

4. **Sets the right institutional framework and aligns resources, for meeting environmental goals across Government**
This should include a stronger Natural Capital Committee, with responsibility for setting and reviewing milestones, as well as the impact of new law and policy on their achievement. The development of the plan should be based upon the recommendations already made by the Natural Capital Committee. The plan should identify essential national and local Government functions (including statutory agencies), and areas of spending that can be used to protect and enhance natural capital.

5. **Builds on existing policy and legislation**

The plan should include a review of policy affecting nature, such as planning, economic and fiscal policy, to ensure they contribute to the achievement of the natural environment goals. It should include a timetable for full implementation of vital European Directives. New mechanisms will be required to mainstream nature into decision-making, stimulate innovation in the way we capture the value of our environment in public policy and consumer decision-making, facilitate new markets to generate funding and income for the countryside and to drive private sector innovation and investment in areas such as infrastructure development, planning policy and macroeconomic management.

6. **Ensures the terrestrial and marine planning systems enhance landscapes and nature, delivering an ecological network**

The plan must enhance protection and management of special places, both rural and urban, linked within a wider landscape that makes room for people and nature - an ecologically coherent network on land and at sea. Regulators will need access to high quality ecological expertise and information to enable them to plan and manage nature-positive development, infrastructure and other activities, including the provision of natural and green spaces.

7. **Delivers for our seas as well as land**

Our seas are under threat and still need considerable action to reverse their decline. The plan must include measures to deliver an ecologically coherent network of well managed marine protected areas to protect biodiversity and deliver ecosystem services. A suite of measures to tackle fisheries, pollution and wider biodiversity issues are also needed if our seas are to achieve Good Environmental Status by 2020.

8. **Supports people working together for nature**

The engagement and contribution of communities is essential for conservation. The plan must enable people to benefit from and contribute to the protection and enhancement of the natural world—including businesses, local communities and the health sector—through civil society cooperation, improved Local Nature Partnerships and local involvement in strategic planning. It should set out how learning from, and connection to, nature can be improved for our children.

9. **Sets out stronger safeguards for threatened species and habitats**

As well as protecting and restoring nature in the wider landscape, the plan should include stronger safeguards for protected species, habitats and landscapes that are at risk, so that our wildlife and habitats are protected and restored across the UK.

10. **Includes the UK Overseas Territories and our impact on natural capital abroad**
The plan should improve natural capital in our Overseas Territories, meet international commitments and set an example of responsible governance. It should incorporate metrics to measure UK impacts and dependence on key commodities such as carbon, forests and fish in other countries.

**11. Has a statutory basis**
To ensure the plan is viable beyond the life of this Parliament, to give certainty to businesses and landowners, and to create the goals and implementing powers needed to give the plan a strong backbone, key elements of the plan should be underpinned by legislation and/or by regulatory mechanisms.

**Wildlife and Countryside Link**

06 October 2015
**Woodland Trust – Written Evidence (BEN0130)**

1.0 THE WOODLAND TRUST

1.1 The Woodland Trust is the UK’s leading woodland conservation charity. We have three aims: to protect native woods, trees and their wildlife for the future; to enable the creation of more native woods and places rich in trees; and to inspire everyone to enjoy and value woods and trees. We own over 1,250 sites (around 23,000ha) and have over 500,000 members and supporters across the United Kingdom.

2.0 POLICYMAKING, INTEGRATION AND COORDINATION

2.1 (Question 2) Coordination across government departments

2.2 The Woodland Trust (The Trust) works across a number of governmental departments and regularly sees a lack of coordination between and within them. For example Highways England in delivering the Government’s Roads Investment Strategy of new and upgraded roads has a commitment to deliver net-gain to biodiversity by 2040\(^{556}\). Yet Network Rail (government owned) and High Speed 2 Ltd (HS2) are making a weaker commitment to no net loss of biodiversity. It seems that there should be a common governmental standard across all departments and schemes. Furthermore Government should be proving to private developers and local authorities that major infrastructure projects can be delivered with environmental gains.

2.3 A key practical example of how coordination could be improved is through the implementation of cross department plans. The Conservative manifesto set out the very welcome ambition to develop a “25-year plan to restore the UK’s biodiversity”, stating that they would work with the recommendations of the Natural Capital Committee “to ensure that both public and private investment in the environment is directed where we need it most”. The Trust warmly welcomed this commitment and saw it as an opportunity for cross-departmental working to really embed biodiversity aspirations across government. In more recent conversations with DEFRA it is unclear what shape the plan will take but that it is likely to be internal, relating only to DEFRA. This would be a missed opportunity.

3.0 NATIONAL POLICY FOR PLANNING AND THE BUILT ENVIRONMENT

3.1 (Question 3) Does the NPPF provide sufficient guidance?

---

3.2 Whilst the NPPF provides some warm words on protecting the built and natural environment these are seriously undermined by the overall tone of the document which when read as a whole puts economic growth above the protection of our most important natural and built assets.

3.3 A key example of this is the definition of sustainable development. On Page 2 the NPPF sets out the definition of sustainable development citing the UK Sustainable Development Strategy Securing the Future and referencing environmental limits. Paragraph 7 of the NPPF sets out the balance between economic, social and environmental factors, yet in paragraph 6 sets out:

The policies in paragraphs 18-219, taken as a whole, constitute the Government’s view of what sustainable development in England means in practice for the planning system.

3.4 This creates ambiguity as it appears that the NPPF informs the definition rather than the definition leading the NPPF. The Trust would like paragraph 6 to be removed to create a much clearer picture of sustainable development within the NPPF to enable better and more balanced decision making.

3.5 Whilst the Select Committee’s title only references the built environment this question also mentions the natural environment. The Trust would like to take the opportunity to highlight the disparity between protection of natural and built heritage assets.

Paragraph 132: .......Substantial harm to or loss of designated heritage assets of the highest significance, notably scheduled monuments, protected wreck sites, battlefields, grade I and II* listed buildings, grade I and II* registered parks and gardens, and World Heritage Sites, should be wholly exceptional.

Paragraph 118: ......planning permission should be refused for development resulting in the loss or deterioration of irreplaceable habitats, including ancient woodland and the loss of aged or veteran trees found outside ancient woodland, unless the need for, and benefits of, the development in that location clearly outweigh the loss;........

3.6 Ancient woodland is defined as an irreplaceable natural resource that has remained constantly wooded since AD1600. The length at which ancient woodland takes to develop and evolve (centuries, even millennia), coupled with the vital links it creates between plants, animals and soils accentuate its irreplaceable status. The varied and unique habitats ancient woodland sites provide for many of the UK’s most important and threatened fauna and flora species cannot be re-created and cannot afford to be lost. Approximately one quarter of priority UK BAP species are associated with woodland habitats. Forests, woods, and trees make a significant contribution to biodiversity, and ancient sites are recognised as being of particular value. Due to
their longevity, ancient woodlands are more species rich, and are often refuges for specialist woodland species that struggle to colonise new areas.

3.7 Yet in this wording the NPPF shows a clear bias in favour of the protection of built heritage assets over natural irreplaceable habitats. The Trusts urges the Committee to recognise that our natural and historic assets are of equal value and should be treated as such in planning policy terms.

3.8 It must also be recognised that the NPPF is increasingly sitting in a policy vacuum as supporting policy is being stripped away, leading to increasing ambiguity and uncertainty. We would bring to your attention the current standing advice on Ancient Woodland. Initially published in 2011 the current version is dated August 2015. There have been many different amended versions between the publication of these two documents. The guidance has been consistently watered down and amended, undermining the certainty that planners and the development industry are known to seek. The Trust would ask the Committee to consider the guidance that sits alongside the NPPF as part of its considerations.

4.0 BUILDINGS AND PLACES: NEW AND OLD

4.1 (Question 7) Creating built environments that are sustainable and resilient.

4.2 The Trust believes that the natural environment should be at the heart of all decision making. The current language surrounding the housing crisis focuses on numbers rather than building high quality communities that people will want to live in for generations to come.

4.3 We have produced a guidance document on how best to incorporate woods and trees into new developments. With over 80 per cent of the population now living in towns and cities, it is critical that Local Planning Authorities and developers step forward to ensure they are healthy, happy and productive places to be. These communities need to be multi-faceted and resilient to the challenges posed by climate change, an ageing population, the obesity crisis and increasing budgetary constraints. The importance of trees and green space in delivering high quality places to live, work and spend leisure time is now widely recognised. These vital spaces can be taken for granted but add significant value to developments in terms of social, economic and environmental benefits. Integrating trees and green spaces into developments early on in the design process minimises costs and maximises the benefits they can provide.

4.4 The Government has a role to push for higher standards to create high quality homes. The Government’s decision not to proceed with Zero Carbon Allowable Solutions is very disappointing, particularly as this mechanism could have funded the

Woodland Trust, Residential Developments and Trees, July 2015

Page 1953 of 1964
creation of new woodland, which would provide multiple additional benefits to society as described in the Third Report of the Natural Capital Committee. The house building sector had been preparing for the introduction of the regulations for nine years, and the previous administration’s own final impact assessment stated that the Allowable Solutions mechanism could be introduced at no cost to the house building sector yet generate revenues in excess of £2 billion annually. Certainty has been shown to speed up the development process, but the plan sets out that the approach to energy efficient standards is ‘under review’. The Trust asks the Committee to examine the value of this decision.

5.0 SKILLS AND DESIGN

5.5 (Question 9) Skills issues

5.6 Planners are generalists by nature who need technical support from numerous specialists including ecologists.

5.7 From research undertaken by ALGE in 2014, it is known that only one third of planning authorities in England have access to their own ‘in-house’ ecologist. A large number of planning authorities (c.65%) have no or only limited (i.e. part-time or shared with another authority) access to any ‘in-house’ ecological expertise. When considered in the context of District Authorities across the country considering more than 400,000 application per annum this figure is very worrying. This lack of expertise can lead to delays and confusion and as the cuts deepen many Local Planning Authorities are failing to fulfil statutory duties. This not only poses the problem of biodiversity loss and damage but increased risk of legal challenge.

06 October 2015
Policymaking, integration and coordination

1. Are the decisions that shape England’s built environment taken at the right administrative level? What role should national policymakers play in shaping our built environment, and how does this relate to the work and role of local authorities and their partners?

1.1 It is very important that decisions at the national level are designed to enable work at the local level. Some of the current decisions made at national level seem not to promote good practice when it comes to development. Withdrawing the Code for Sustainable Homes appears to have sent a signal to developers that sustainability measures are less important than before, meaning that councils wishing to promote better environmental performance in new development will struggle to deliver higher standards. For example, Local Plan policy promoting sustainable building practices has had to be compromised by these changes and lower standards are now seen to be acceptable.

1.2 The revocation of Regional Strategies has left a policy vacuum that Local Plans, through the duty to co-operate, are struggling to fill. Where growth pressures require development and infrastructure (both grey and green) that crosses administrative boundaries, there is no simple mechanism for agreeing its scale and location. These issues create significant uncertainty and delay. These problems are not easily solved by the new geographies of the LEPs which, although they may – to an extent – represent functioning economic geographies, do not necessarily represent the natural geographies of cross-boundary development.

1.3 There is a need for national policy on green infrastructure. Guidance and leadership from Government is essential in delivering high quality outcomes and a national spatial approach can only be effectively delivered by national (and perhaps UK-wide) policy frameworks with the requisite promotion and leadership at the highest levels (see below for further comments on this).

2. How well is policy coordinated across those Government departments that have a role to play in matters such as housing, design, transport, infrastructure, sustainability and heritage? How could integration and coordination be improved?

2.1 There are some concerns over how well policy is coordinated across built environment related Government departments, with a range of policy arrangements from different departments which do not always seem to co-ordinate or relate one
to another. For example, the Department for Business Innovation & Skills provided announcements on re-use of brownfield land without reference to planning, flooding, or the health agenda, which appears to indicate that they have not consulted with other departments.

2.2 Many brownfield sites will already include valuable green infrastructure resources which can be incorporated into the development and provide ecosystem services for the new communities. These can be linked to flood management measures and health improvements, to assist in creating a sense of place. None of this has been recognised in recent policy announcements which have focused on a single message of building more homes as opposed to building quality new homes and sustainable communities.

2.3 Mixed messages on renewable energy from national government can undermine progress; the scale of proposed cuts to the feed-in tariff will render many schemes unviable, and increasingly stringent planning tests for renewable energy will hamper scheme delivery. The impression given is that DECC’s policy-making is being driven by the Treasury, and this undermines confidence in the government’s commitment to a more sustainable approach to energy and local efforts to promote decentralisation of energy generation and potential for renewable heat networks.

National policy for planning and the built environment

3. **Does the National Planning Policy Framework (NPPF) provide sufficient policy guidance for those involved in planning, developing and protecting the built and natural environment? Are some factors within the NPPF more important than others? If so, what should be prioritised and why?**

3.1 The National Planning Policy Framework includes many valuable policies, including on the natural environment and green infrastructure. Indeed the wording, tenor and tone of paragraphs such as 9, 109 and 118 provide welcome guidance on implementing sustainable development that recognises environmental limits and delivers net gains for nature. The NPPF recognises the importance of environmental, economic and social considerations, but in practice it appears that some issues — particularly viability and the five year housing land supply - take precedence over others, such as protection of the environment.

3.2 The Planning Practice Guidance (PPG), being an online tool, is not very user-friendly; it is difficult to navigate and disjointed, and the inability to look at the full guidance as a whole is a major concern as this promotes "silo" thinking. Whilst the PPG provides some high-level guidance on issues such as green infrastructure, additional information and guidance that was formerly available has been removed from the government webpages. This makes it extremely difficult to interpret some of the national policies and more importantly to deliver aspirations for multifunctional green infrastructure networks. For example, the removal of the Planning Policy Statement 1 Eco-Towns Supplement - which contained guidance on green
infrastructure - made it difficult for the Local Authorities and other partners to interpret policies and plan positively for GI through both Local Plans and planning decision making.

3.3 Similarly, the recommendations of the Pitt Review in relation to water and flood management have been weakened under the current Government, with a move from rigorous and independent assessment of surface water management to merely including this within the planning process, where is it only one of a number of material considerations.

4. Is national planning policy in England lacking a spatial perspective? What would be the effects of introducing a spatial element to national policy?

4.1 Yes it is and the problems caused by this - for example a disjointed approach to GI and general infrastructure provision, a reliance on the rather poorly defined duty-to-cooperate and inconsistencies in cross-border working - may be compounding the difficulties felt with Nationally Significant Infrastructure Projects and delivery of high volumes of housing in the right locations at the right time. We feel that it is very important that national planning policy contains a spatial element. It would provide more clarity and allow for integration of various planning policy areas, in particular in relation to historic environment, ecology, green infrastructure and wider infrastructure work. There are various examples of infrastructure projects offering opportunities for integration and creation of multifunctional green infrastructure networks; however, the lack of a spatial approach at the national level makes implementation of these projects difficult.

4.2 Cross-boundary housing need is currently considered through the Duty-to-Cooperate. The result of this is that development and its associated infrastructure requirements are being planned in a piecemeal way. A strong spatial framework at a greater than local level would enable better planning for housing based on sustainable criteria and for infrastructure to be considered and developed in parallel.

5. Is there an optimum timescale for planning our future built environment needs and requirements? How far ahead should those involved in the development of planning and environment policy be looking?

5.1 There is no optimum timescale for planning future built environment needs and requirements. Timescales will vary depending on the type of environment and planning work involved, and the planning system should have an element of flexibility embedded within it. For example, it is impossible to exactly predict when flooding events are going to occur – therefore common timescales such as "1 in 100 years" flood events should be used with caution. Similarly, Local Plans currently use 10-15 year timescales, however local circumstances change more often which is why Plans are often due for review sooner than the planned timescales.
5.2 It feels that planning should be led more by outcomes than timescales, and should embed risk management within the process.

5.3 At the national level there should be a stronger focus on continuation of policies rather than changing them under the pretext of making them better. The delivery and implementation of policy at the local planning authority level is constrained due to national guidance and policy changes adding confusion and putting strain on planning resources.

Buildings and places: New and old

6. What role should the Government play in seeking to address current issues of housing supply? Are further interventions, properly coordinated at central Government level, required? What will be the likely effect upon housing supply of recent reforms proposed for the planning system?

6.1 It appears that Government policies addressing housing supply issues are a continuous flux of moving targets, changes and reforms. As stated above, it would be useful to have some continuity in planning for housing stock and new developments. This "no intervention" approach would allow local authorities to develop appropriate processes to address housing issues rather than constantly catching up with the changes.

7. How do we develop built environments which are sustainable and resilient, and what role should the Government play in any such undertaking? Will existing buildings and places be able to adapt to changing needs and circumstances in the years to come? How can the best use of existing housing stock and built environment assets be made?

7.1 The introduction of a national policy on green infrastructure, supported by comprehensive and consistent guidance, would be a positive step to delivering sustainable and resilient built environments in the UK. Making green infrastructure a statutory requirement for new development would allow the costs of providing such infrastructure to inform development viability from the outset, and therefore prevent subsequent viability concerns eroding development quality. Unless green infrastructure becomes a compulsory requirement, we will continue to deliver tick-box, unsustainable and uninspiring developments.

7.2 National policy should enable statutory agencies to promote a partnership approach to working towards delivery of green infrastructure on development sites. Over the last five years, Worcestershire’s GI Partnership of statutory agencies, the voluntary sector, local authorities and developers, has successfully worked to ensure that new strategic development in Worcestershire delivers high-quality and multifunctional GI networks. The Partnership prepares GI 'Concept Plans' which contain high-level priorities for networks of green infrastructure assets on and outside these strategic sites, agreed by multidisciplinary panels including landscape, biodiversity, historic
environment, water management and flooding, and access and recreation representatives. The Partnership then works closely with developers to ensure these priorities are correctly embedded within their masterplanning, implementation and future management of the sites.

7.3 This partnership way of working is successful in Worcestershire and greater promotion of such an approach should be encouraged through stronger national policy. Statutory agencies are key members of the Worcestershire GI Partnership, but their ability to engage in detailed work is constrained by resource issues. Adequately resourcing the statutory agencies would allow them to better support partners in the efficient delivery of GI across the country.

8. To what extent do we make optimum use of the historic environment in terms of future planning, regeneration and place-making? How can more be made of these national assets?

8.1 Nationally, planning for the historic environment has a strong focus on designated assets. Designated assets are important, but they should not be the only consideration. There is a need to look at the wider landscape character of an area and better integrate the historic environment with other work areas to achieve improved environments. A stronger focus on the multifunctionality of historic assets and landscape character should be encouraged. The historic environment should not be looked at in isolation, and the way in which these environments interact with people should be a consideration in planning for the historic environment.

Skills and design

9. Do the professions involved in this area (e.g. planners, surveyors, architects, engineers etc.) have the skills adequately to consider the built environment in a holistic manner? How could we begin to address any skills issues? Do local authorities have access to the skills and resources required to plan, shape and manage the built environment in their areas?

9.1 Generally, there is a shortage of skilled professionals in the above work areas. This is due to financial and procedural constraints put on statutory agencies. Natural England’s resource constraints mean it can only become directly involved in the largest developments and unfortunately are not able to offer advice on complex and difficult matters, even if this would assist in the planning process. The Environment Agency is restricted to commenting on main river matters, and the Forestry Commission has no powers of objection to developments affecting woodland or trees.

9.2 Local authorities are unable to bridge this skills gap, primarily as a result of financial constraint, and so there is a lack of a holistic approach to issues faced when planning for the built environment.
9.3 The Government should ensure that statutory agencies are resourced to take on a leadership role in the built environment, including on green infrastructure and flood management. They should be enabled to take on a pro-active role in championing good practice in development and supporting delivery at the local level.

10. Are we using the right tools and techniques to promote high quality design and ‘place-making’ at the national level? How could national leadership on these matters be enhanced?

10.1 There needs to be an increased dialogue between various players on the design and place-making agenda. This cross-sectoral working should be championed at the national level. In particular there is a need for more clarity on the role and status of the Local Nature Partnerships in relation to planning and development. Furthermore, there should be a stronger emphasis on the Local Enterprise Partnerships working with other partners, including those with environmental interests, in particular Local Nature Partnerships.

10.2 There is a significant body of good practice guidance available from a range of organisations including the Wildlife Trust, Town and Country Planning Association, Natural England, CIRIA, etc. It would be helpful if Government could provide strong leadership in embedding these current tools and instruments in place-making. The wording in the NPPF provides key hooks and agenda-setting commentary on this (for example para 109 on ecological networks and 165 on the need to base decisions on up-to-date information) but all too often the excellent strategic guidance in the framework is not backed up by the detailed ‘how-to’ commentary required for developers and LPAs to deliver the best results. By sign-posting, championing and providing guidance in these areas the Government could develop a truly sustainable approach to place-making and help to deliver better places, of higher quality for future communities. This needs to be coupled with better resourcing of local authorities and other partners, and would, we anticipate, deliver higher quality and more timely results than implementing further reforms and policy changes.

Community involvement and community impact

11. Do those involved in delivering and managing our built environment, including decision-makers and developers, take sufficient account of the way in which the built environment affects those who live and work within it? How could we improve consideration of the impacts of the built environment upon the mental and physical health of users, and upon behaviours within communities?

No comment

12. How effectively are communities able to engage with the process of decision making that shapes the built environment in which they live and work? Are there any barriers to effective public engagement and, if so, how might they be addressed?
12.1 The current planning process is not very successful in engaging with local communities. The complexity of and continuing changes to the planning system make it extremely difficult for the wider community to understand how and when to get involved in planning, in particular the development of Local Plans. As a result community involvement tends to be focused on planning applications and development control decision making processes.

12.2 The Neighbourhood Planning process was supposed to enable local communities to influence decisions about their local areas. Whilst this true for some communities, only those communities which have people willing to take action - very often in rural and affluent areas – tend to be successful in this process. This creates a very patchy distribution of Neighbourhood Plans, with areas of higher need and urban areas often left out of the process.

12.3 Whilst local authorities are willing to support the Neighbourhood Planning process, their ability to do so is constrained by limited resources. For example, whilst the Worcestershire GI Partnership tends to share appropriate evidence on green infrastructure with Neighbourhood Plan groups in the county, it has no capacity to interpret this information at the local level.

Financial measures

13. Are there fiscal or financial measures potentially available which would help to address current issues of housing and land supply? Are there financial or other mechanisms that would encourage better design and place-making by private sector developers?

13.1 More clarity on the Community Infrastructure Levy and Section 106 would help to address current issues around housing and land supply. Continuous changes to these instruments create general confusion around what financial support is available for what type of projects or work areas. The Government should allow the CIL mechanisms in their existing form to settle and allow for efficient delivery. Lessons learnt from the process could then be used to further refine these mechanisms.

Lords Select Committee

Dear Sirs,

Re: Select Committee on National Policy for the Built Environment - submit written evidence

We are writing in response to your consultation and we would like to state that local residents are the ones who know their area best yet our views are never taken into account.

Yours sincerely

S Haywood
Samantha Haywood

Clerk to Yelvertoft Parish Council
