

Contribution from Frances G. Boul Hay

In 2010 it is noted just over 65% of the voting population actually voted, leaving 35% not voting. Of the 65% that votes, 52.8% of the vote was cast for losing candidates. Using a rough mathematical calculation it can be concluded that a party or group of individuals has great power with just 31% support of the voting population. Not exactly a democracy where majority rules?! Using Technology to engage the public in the democratic process is very important. These statistics along with the discussions that have been held clearly illustrate that the public, particularly the young are disengaged with the current democratic system. A Chiralkine Voting System can empower people to engage in the political process and result in a true democracy.

A Chiralkine voting system is based on mathematics that is very different from those on which all existing voting systems are based. This system is to voting as stereoscopic vision is to sight. It is handed, like your left and right hands. It could transform democracy, because every person has a reason to vote using it, whether they like or dislike any, all or none the options being presented to them. You can find more on this by following the link below:

A prototype of the a Chiralkine Voting System will be available shortly. Addressing the issues in a new digital age requires a new digital voting system. A Chiralkine Voting System could be the answer.
